UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation) **Docket No. _______**
)

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF CRITICAL INFRASTRUCTURE PROTECTION RELIABILITY STANDARDS

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5 of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[2] the North American Electric Reliability Corporation ("NERC")[3] hereby submits for Commission approval the following eleven proposed Critical Infrastructure Protection ("CIP") Reliability Standards:[4]

- CIP-002-7 - Cyber Security – BES Cyber System Categorization
- CIP-003-10 - Cyber Security – Security Management Controls
- CIP-004-8 - Cyber Security – Personnel & Training
- CIP-005-8 - Cyber Security – Electronic Security Perimeter(s)
- CIP-006-7 - Cyber Security – Physical Security of BES Cyber Systems
- CIP-007-7 - Cyber Security – Systems Security Management
- CIP-008-7 - Cyber Security – Incident Reporting and Response Planning
- CIP-009-7 - Cyber Security – Recovery Plans for BES Cyber Systems
- CIP-010-5 - Cyber Security – Configuration Change Management and Vulnerability Assessments
- CIP-011-4 - Cyber Security – Information Protection
- CIP-013-3 - Cyber Security – Supply Chain Risk Management

---

[1] 16 U.S.C. § 824o.

[2] 18 C.F.R. § 39.5 (2023).

[3] The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006) *order on reh'g & compliance,* 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa, Inc. v. FERC,* 564 F.3d 1342 (D.C. Cir. 2009) [hereinafter ERO Certification Order].

[4] Unless otherwise indicated, all capitalized terms used in this petition shall have the meaning set forth in the Glossary of Terms used in NERC Reliability Standards ("NERC Glossary"), https://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf.

For the reasons discussed below, NERC requests that the Commission approve the proposed Reliability Standards, provided in **Exhibit A** hereto, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. NERC also requests approval of: (1) four new and 18 proposed revised definitions, as shown in **Exhibit A**, for inclusion in the NERC Glossary; (2) the associated Implementation Plan (**Exhibit B**); (3) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (**Exhibit F**); and (4) the retirement of currently effective Reliability Standards.[5]

As required by Section 39.5(a) of the Commission's regulations,[6] this petition presents the technical basis and purpose of the proposed Reliability Standards, a summary of the development history (**Exhibit G**), and a demonstration that the proposed Reliability Standards meet the criteria identified by the Commission in Order No. 672[7] (**Exhibit C**). The NERC Board of Trustees adopted the proposed Reliability Standards on May 9, 2024.

I. SUMMARY

Over the past decade, technology supporting and enabling the industrial control systems that operate the Bulk-Power System has evolved rapidly. Along with that evolution, the risks facing the Bulk Power System and the methods for mitigating those risks have also evolved. To accommodate this evolution, the NERC CIP Reliability Standards must provide Responsible Entities[8] the flexibility to adopt new and innovative technologies to operate their systems effectively and efficiently while maintaining a robust security posture.

---

[5] NERC is requesting the retirement of CIP-002-5.1.a, CIP-003-9, CIP-004-7, CIP-005-7, CIP-006-6, CIP-007-6, CIP-008-6, CIP-009-6, CIP-010-4, CIP-011-3, and CIP-013-2.

[6] 18 C.F.R. § 39.5(a).

[7] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, 114 FERC 61,104 at PP 262, 321-37 (2006) [hereinafter Order No. 672], *order on reh'g*, Order No. 672-A, 114 FERC 61,328 (2006).

[8] As used in the CIP Reliability Standards, a Responsible Entity refers to the registered entity responsible for the implementation of and compliance with a particular requirement.

One such technological advance has been the proliferation of virtualization technologies. The National Institute of Standards and Technology ("NIST") defines virtualization as "the process of creating virtual, as opposed to physical, versions of computer hardware to minimize the amount of physical hardware resources required to perform various functions."[9] The proposed revisions to the CIP Reliability Standards and NERC Glossary are designed to support reliability by addressing the use of virtualization technologies in environments subject to the CIP Reliability Standards. The proposed standards provide Responsible Entities an opportunity to take advantage of the newer concepts and efficiencies facilitated by virtualization as well as implement innovative security techniques enhanced by virtualization. Under the proposed revisions, Responsible Entities may still maintain perimeter-based network security but may also choose to adopt different, but effective, security approaches, such as Zero Trust Architecture,[10] around communications with applicable systems.

The suite of cyber security CIP Reliability Standards is a framework that applies protections to BES Cyber Systems based on their impact to the Bulk Electric System ("BES") if rendered unavailable, degraded, or misused. This framework categorizing BES Cyber Systems into high, medium, and low impact was established in the "Version 5"[11] Reliability Standards

---

[9] *Virtualization and Cloud Computing Services, Notice of Inquiry*, 170 FERC ¶ 61,110 at P 4 (2020) (citing the National Institute of Standards and Technology, Guide to Security for Full Virtualization Technologies, Special Publication 800-125 (Jan. 2011), https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublication800-125.pdf.)

[10] According to the NIST, Zero Trust Architecture is defined as "A security model, a set of system design principles, and a coordinated cybersecurity and system management strategy based on an acknowledgement that threats exist both inside and outside traditional network boundaries. The zero trust security model eliminates implicit trust in any one element, component, node, or service and instead requires continuous verification of the operational picture via real-time information from multiple sources to determine access and other system responses." NIST, *Developing Cyber-Resilient Systems: A Systems Security Engineering Approach*, Special Publication 800-160, Vol. 2, Rev. 1, App. A pg. 70 (Dec. 2021), https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-160v2r1.pdf.

[11] The "Version 5" Reliability Standards refer to CIP-002-5.1a, CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1.

that became effective in the United States in 2016. During implementation, industry recognized opportunities for improvement to the standards, including addressing the use of virtualization.

As discussed below, the use of virtualization, which provides for the separation, or abstraction,[12] of the physical components from the software components (such as an operating system), is not specifically addressed within the currently enforceable CIP Reliability Standards framework. The current framework, adopted as part of the "Version 5" revisions, was designed around the concept that devices have a one-to-one relationship between software and hardware. Many of the required controls are thus designed to fit that concept. A fundamental element in the currently enforceable CIP Reliability Standards revolves around implementation of a "perimeter-based" security model, through the establishment of an Electronic Security Perimeter, to manage communications to BES Cyber Systems through an Electronic Access Point.

This approach, however, does not allow for Responsible Entities to take full advantage of the benefits of virtualization, including the adoption of other security models, such as Zero Trust Architecture, that are enhanced with virtual network technologies. For instance, with Zero Trust Architecture, Responsible Entities can manage communications in a granular, "no trust" manner to address threats that could exist inside traditional, perimeter-based models.

The proposed CIP Reliability Standards and associated definitions are thus designed to facilitate the use of the full range of virtualized technologies securely. The proposed Reliability Standards not only allow entities to more fully implement virtualization, but they also address the risks associated with virtualized environments, such as "side channel" attacks where virtual systems executing on the same hardware could affect one another. The proposed standards do so by leveraging "security objectives" to focus requirements on the essential elements a

---

[12] Abstraction in the virtualization context means the separation or isolation of software, such as operating systems, and other data from the underlying hardware.

Responsible Entity must meet to support reliability. The use of security objectives establishes a framework that could adapt to newer technologies and innovative security models. Recognizing that virtualization technologies will not be adopted uniformly across all Responsible Entities or across all Responsible Entity environments, the proposed CIP Reliability Standards would permit Responsible Entities with more "traditional" architecture to continue with their current configurations.

The most significant changes in the proposed Reliability Standards occur to the "technical" CIP Reliability Standards (i.e., those standards focused on technical as opposed to administrative or procedural controls) and their associated definitions: proposed Reliability Standard CIP-005-8 – Cyber Security – Electronic Security Perimeter(s), proposed Reliability Standard CIP-007-7 – Cyber Security – Systems Security Management, and proposed Reliability Standard CIP-010-5 – Cyber Security – Configuration Change Management and Vulnerability Assessments. These changes addressing virtualization fall into four general categories:

1. Support of different security models by adjusting language around perimeter-based models to accommodate other security models, where more granular, policy-based controls may be used;
2. Recognition of virtualization infrastructure and virtual machines through new and revised terms in the NERC Glossary;
3. Broadening of change management approaches beyond a baseline-only configuration to recognize the dynamic nature of virtualized technologies, such as container technology[13] where applications are "virtualized" and no longer installed on specific servers; and
4. Managing accessibility and attack surfaces of a virtualized configuration.

---

[13] *See* Section IV.A.1 of this petition for background on some key concepts of virtualized technologies.

Each of these changes was considered in the context of the CIP framework and incorporated to support the current security posture of Responsible Entities and to allow for enhanced security posture when using other, newer technologies.

In addition to addressing virtualization, the proposed Reliability Standards support reliability by clarifying concepts that NERC, the Regional Entities, and Responsible Entities identified during implementation of prior versions of the CIP Reliability Standards, including Interactive Remote Access, CIP Exceptional Circumstances, and Technical Feasibility Exceptions.[14]

NERC requests that the Commission approve the proposed Reliability Standards and associated definitions as just, reasonable, not unduly discriminatory or preferential, and in the public interest. The proposed Reliability Standards enhance reliability with security objectives that help transform the CIP Reliability Standards into a framework that can support cyber security of the grid now and into the future.

---

[14] Technical Feasibility Exceptions are defined in Appendix 2 to the NERC Rules of Procedure, https://www.nerc.com/AboutNERC/RulesOfProcedure/Appendix%202%20eff%2020240627_signed.pdf.

II. NOTICES AND COMMUNICATIONS

Notices and communications with respect to this filing may be addressed to the following:[15]

Lauren Perotti Assistant General Counsel Marisa Hecht Senior Counsel North American Electric Reliability Corporation 1401 H Street NW, Suite 410 Washington, D.C. 20005 202-400-3000 Marisa.hecht@nerc.net Lauren.perotti@nerc.net	Soo Jin Kim Vice President and Director of Engineering and Standards North American Electric Reliability Corporation 3353 Peachtree Road, N.E. Suite 600, North Tower Atlanta, GA 30326 404-446-2560 Soo.jin.kim@nerc.net

III. BACKGROUND

The following background information is provided below: (a) an explanation of the regulatory framework for NERC; (b) a description of the NERC Reliability Standards Development Procedure; and (c) the history of Project 2016-02.

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[16] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Bulk-Power System, and with the duty of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1) of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards.[17] Section 215(d)(5) of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard.[18]

---

[15] NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203, to allow the inclusion of more than two persons on the service list in this proceeding.

[16] 16 U.S.C. § 824o.

[17] *Id.* § 824(b)(1).

[18] *Id.* § 824o(d)(5).

Section 39.5(a) of the Commission's regulations requires the ERO to file for Commission approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to make effective.[19]

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA and Section 39.5(c) of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.[20]

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standards were developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[21] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[22] In its ERO Certification Order, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain criteria for approving Reliability Standards.[23] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders.

[21] Order No. 672 at P 334.

[22] The NERC Rules of Procedure are available at https://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx. The NERC Standard Processes Manual is available at https://www.nerc.com/AboutNERC/RulesOfProcedure/Appendix_3A_SPM_Clean_Mar2019.pdf.

[23] ERO Certification Order at P 250.

Further, a vote of stakeholders and adoption by the NERC Board of Trustees is required before NERC submits the Reliability Standard to the Commission for approval.

C. Development of the Proposed Reliability Standards

As further described in **Exhibit G** hereto, NERC initiated standard development Project 2016-02 Modifications to CIP Standards ("Project 2016-02") to address the directives from Order No. 822[24] as well as issues identified during implementation of the CIP Reliability Standards approved in Order No. 791.[25] Given the highly technical nature of the proposed revisions and the need to respond to Responsible Entities' comments for maintaining perimeter-based controls while also allowing for different security models, the Project 2016-02 drafting team dedicated several ballot periods to developing the language that achieved consensus: one initial comment period and ballot, and four additional comment periods and ballots. In addition, the Project 2016-02 drafting team completed several other items on its SARs, such as addressing FERC directives from Order No. 822 regarding protection of transient electronic devices, protections for communications network components between Control Centers, and revising electronic access controls for low impact BES Cyber Systems, among others, prior to focusing on virtualization. The first draft of the proposed standards were posted for an initial 60-day formal comment period and ballot from January 22 – March 22, 2021.

As the Reliability Standards achieved consensus during different additional ballot periods, the following tables provide the approval percentage for those Reliability Standards that passed in the third and fourth additional ballots.[26] The final ballot percentage approvals are

---

[24] *Revised Critical Infrastructure Protection Reliability Standards*, 154 FERC ¶ 61,037, Order No. 822 at PP 32, 73, *reh'g denied*, Order No. 822-A, 156 FERC ¶ 61,052 (2016).

[25] *Version 5 Critical Infrastructure Protection Reliability Standards*, 145 FERC ¶ 61,160, Order 791 (2013) [hereinafter Order No. 791], *order on clarification and reh'g*, Order No. 791-A, 146 FERC ¶ 61,188 (2014).

[26] Results from all ballots conducted as well as results of non-binding polls are provided in **Exhibit G**.

included in a separate table. The proposed new and revised definitions and the Implementation Plan associated with the Reliability Standards were included in the following ballots but not as a separate ballot pool.

The following Reliability Standards received the requisite approval during the third additional ballot from August 17 – October 7, 2022:

Standard	Approval	Quorum
CIP-002-7	94.63	77.89
CIP-006-7	92.60	78.07
CIP-008-7	95.67	77.74
CIP-009-7	95.38	77.74
CIP-011-4	82.59	77.74
CIP-013-3	82.88	77.74

The following Reliability Standards received the requisite approval during the fourth additional ballot from October 3 – November 29, 2023:

Standard	Approval	Quorum
CIP-003-10	93.80	82.94
CIP-004-8	84.73	84.41
CIP-005-8	72.73	84.41
CIP-007-7	89.32	84.41
CIP-010-5	74.46	84.75

The final ballot was conducted from April 3 – April 12, 2024, with the following final ballot results:

Standard	Approval	Quorum
CIP-002-7	94.37	84.62
CIP-003-10	93.63	85.86
CIP-004-8	86.3	86.1
CIP-005-8	75.73	86.1
CIP-006-7	94.7	83.84
CIP-007-7	90.24	86.1
CIP-008-7	96.05	83.84
CIP-009-7	95.8	83.84
CIP-010-5	76.98	86.44
CIP-011-4	86.21	83.84
CIP-013-3	86.47	83.84

As noted previously, the Board adopted the Reliability Standards and associated definitions on May 9, 2024.

IV. JUSTIFICATION FOR APPROVAL

NERC submits for Commission approval 11 proposed cyber security CIP Reliability Standards and four new and 18 revised defined terms used in the proposed standards for inclusion in the NERC Glossary. The proposed standards and definitions improve upon the current standards and definitions by further refining the standards' focus on security through the (1) use of objectives to permit use of a broader variety of security controls, (2) revision of requirements that focused more on compliance documentation, and (3) clarification of issues identified during implementation of prior versions of CIP Reliability Standards. As discussed below and in **Exhibit C**, the proposed Reliability Standards were developed in a fair manner and are just, reasonable, not unduly discriminatory or preferential, and in the public interest.

As noted above, there are four basic categories of the revisions in the proposed Reliability Standards: (1) addressing use of virtualization; (2) clarity on Interactive Remote Access; (3) additions to the application of CIP Exceptional Circumstances; and (4) revisions to Technical Feasibility Exception language. This section provides justification for each of these categories of revisions and then provides additional detail on the revisions within each of the standards and definitions.

Accordingly, Section IV is organized as follows: Sections IV.A-D provide high level overviews of the categories of proposed revisions, and Section IV.E provides more detail on the revisions and explains how those categories are incorporated into each standard and definition. Section IV.F provides an overview of other administrative, minor, conforming, or clarifying changes within the proposed CIP Reliability Standards. Section IV.G addresses the enforceability of the proposed Reliability Standards.

A. Addressing Use of Virtualization

As discussed above, the most significant revisions proposed herein are designed to better facilitate use of virtualization under the CIP Reliability Standards. The proposed Reliability Standards leverage security objectives, which not only facilitate use of virtualization but also further support adoption of evolving technology to help ensure resilient operation of industrial control systems.

Section IV.A provides background on the need for the revisions addressing virtualization as well as the justification for how these revisions accommodate certain aspects of virtualization. Section IV.A.1 provides background on virtualization concepts that can help to understand the infrastructure design. Section IV.A.2 describes the need for the proposed revisions to address these virtualization concepts within the CIP requirements. Finally, Section IV.A.3 provides a high-level overview of the revisions addressing virtualization throughout the suite of cyber security CIP Reliability Standards. Within Section IV.A.3, the justification for the proposed revisions is divided into the following subcategories: (1) support of different security models; (2) recognition of virtualization infrastructure and virtual machines characteristics; (3) broadening of change management approaches; and (4) managing accessibility and attack surfaces of a virtualized configuration.

1. Background on Virtualization Concepts

As noted previously, virtualization is "the process of creating virtual, as opposed to physical, versions of computer hardware to minimize the amount of physical hardware resources required to perform various functions."[27] There are several concepts behind virtualized

---

[27] *Virtualization and Cloud Computing Services, Notice of Inquiry*, 170 FERC ¶ 61,110 at P 4 (2020) (citing the National Institute of Standards and Technology, *Guide to Security for Full Virtualization Technologies,* Special Publication 800-125 (Jan. 2011), https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublication800-125.pdf.).

environments that factored into the proposed revisions. This section provides high-level descriptions of some of the concepts most relevant to understanding the proposed Reliability Standards and definitions.

a. Shared Resources

A core tenet of virtualization is the ability to share hardware (both physical and virtualized), central processing units, memory, storage, and other resources among various virtualized operating systems, called "guest operating systems." The use of virtualization abstracts the software layers from the underlying hardware infrastructure so that it may be shared. Then, in some configurations, a hypervisor manages the interactions between shared resources and guest operating systems, helping to ensure isolation and control access, as appropriate. Depending on the form of virtualization, hypervisors run directly on the hardware (known as bare metal or native virtualization) or on a "host operating system" (known as hosted virtualization).[28] In other configurations, a container engine abstracts applications from the host operating system.

b. Virtual Machines

A virtual machine is a computing stack inside a virtualized host that consists of the guest operating system, one or more application programs, and at times, middleware.[29] Virtual machines can be created and destroyed dynamically and are neither always running nor tied to specific hardware. A "dormant" virtual machine is not currently executing or instantiated (i.e.,

---

[28] National Institute of Technology ("NIST"), *Guide to Security for Full Virtualization Technologies*, Special Publication 800-125 (Jan. 2011) at pg. 2-2, https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublication800-125.pdf.

[29] NIST, *Secure Virtual Network Configuration for Virtual Machine (VM) Protection*, Special Publication 800-125B (Mar. 2016) at pg. 1, https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-125B.pdf. Middleware is "software that lies between an operating system and the applications running on it…middleware enables communication and data management for distributed applications." Microsoft, *What is middleware?* https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-middleware (last visited Jul. 8, 2024).

"booted up"). Dormant virtual machines exist as a file and may be dormant for a long period of time. Whereas "traditional" Cyber Assets on a network would be patched and updated on a regular basis, virtual machines are managed such that they would be updated as soon as they begin to instantiate after being in a dormant state. A virtual machine instantiates ("boots") from a disk image file. Since the boot "disk" is a file and not a physical disk, many individual virtual machines can use the same "parent" image as the basis for their own "child" image. Among other things, this allows for patching of an operating system to occur to a parent image, and the child images incorporate that patched image upon their next instantiation. A common use of parent and child images is virtual desktop infrastructure that delivers a temporary desktop environment to each remote user for the duration of a session that are virtual machines instantiated from a parent image.

c. Containers

Also called "application containers," containers are a form of virtualization at an individual application level, bundling the application code and its runtime environment into a self-contained, sandboxed environment that is separate from infrastructure, including from the host operating system. The application can then be instantiated dynamically on one or multiple dynamic hosts. The benefit is it makes the application or logic as portable as possible and able to be instantiated as-is without modification on a developer's workstation, a test environment, or a production data center without the notion of installing the application or the various runtime dependencies into a particular operating system instance.

2. Need for Proposed Virtualization Revisions

The following section provides detail on the need for the proposed revisions related to virtualization and is organized as follows: Section IV.A.2.a provides background information on the recommendations for revisions resulting from lessons learned during implementation of

Version 5 standards and discusses the benefits of virtualization; Section IV.A.2.b describes the security models that are facilitated by virtualization; and Section IV.A.2.c discusses how the proposed revisions help to ensure that the CIP Reliability Standards continue to accommodate future technologies.

a. Recommendations for Revisions Based on Version 5 Implementation

During implementation of the "Version 5" CIP Reliability Standards, NERC and the Regional Entities collaborated with industry stakeholders to help ensure a smooth transition to the revised framework of CIP Reliability Standards. This effort was in response to the Version 5 CIP Reliability Standards' shift in the way Responsible Entities classified BES Cyber Systems as low, medium, and high impact from previous versions of cyber security Reliability Standards. As a result, NERC, the Regional Entities, and industry stakeholders had the opportunity to assess potential issues with implementation of the Version 5 standards to consider whether further revisions were needed.[30] Among other things, this effort identified that the Version 5 CIP Reliability Standards did not specifically address use of virtualization. Accordingly, with the increasing use of virtualization in industrial control system environments, a drafting team needed to consider revisions to the CIP Reliability Standards that would clarify the permitted architecture and address the security risks of virtualization technologies.

While the effort during implementation of the Version 5 Reliability Standards identified an opportunity for revisions to address virtualization, NERC, the Regional Entities, industry stakeholders, and FERC recognized that virtualization could have benefits for Responsible Entities.

---

[30] NERC, *CIP V5 Issues for Standard Drafting Team Consideration* (Sept. 15, 2015), https://www.nerc.com/pa/Stand/Project%20201602%20Modifications%20to%20CIP%20Standards%20DL/Transfer_Issues_V5TAG-SDT_1st-final-03232016.pdf.

As discussed in the Project 2016-02 drafting team's white paper entitled "Virtualization and Future Technologies Project 2016-02 Standards Drafting Team: The Case for Change" (**Exhibit D**), the Project 2016-02 drafting team highlighted the following reliability benefits of virtualization:

- Virtualization facilitates increased uptime, fast recovery capability, and flexible architecture that can instantly adapt to changing workloads;
- Virtualization allows for racks of central processing units, memory, and disks to be considered "raw" computing resources within high speed mesh networks;
- If the workload on a particular virtual server is nearing capacity, the infrastructure orchestration system can create and configure an additional server on demand, bring it online to help with the peak workload, and then destroy it when it is no longer needed;
- If a physical machine runs out of resources, the workload can be moved to another physical machine dynamically based upon relative load. When a virtual server or workstation is not in use, it is similar to a physical server that is powered off;
- This flexible and dynamic architecture also allows Responsible Entities to leverage security controls such as those provided by micro-segmentation; and
- Users can be granted access to specific workloads that can be placed dynamically throughout the infrastructure with managed access to provided services.

Similarly, public commenters provided input on the benefits of virtualization in a Commission proceeding in Docket No. RM20-8-000. In a Notice of Inquiry, the Commission sought comment regarding the potential benefits and risks associated with the use of virtualization and cloud computing services in association with Bulk Electric System operations.[31] In response, commenters provided the following benefits of virtualization:

- Faster recovery of systems;
- Faster and more standardized deployment of systems and maintenance;
- Flexibility of resource allocation;
- Scalability of environment and potential cost savings;
- Ability to use products only supported by a virtualized environments;
- Reduced dependency on older hardware; and
- Allows for the pooling of excess hardware capacity for meeting peak workloads.[32]

Based on comments received, the Commission recognized that the commenters generally agreed that virtualization can bring significant benefits as long as risks are mitigated.[33] In addition, the Commission noted it supported NERC's efforts to assess the CIP Reliability Standards to facilitate adoption of virtualization and complete Project 2016-02, noting that virtualization should continue to be voluntary for entities.[34] As described below, the Project 2016-02 drafting team determined that any revisions to the CIP Reliability Standards must permit Responsible Entities the opportunity to take advantage of the benefits of advanced virtualization features while also preserving their choice to maintain current secure perimeter-based network architecture, which continues to be a valid network security model.

[34] *Id.* at PP 14-15.

b. Virtualization and Security Models

As mentioned above, with the benefits of virtualization, Responsible Entities also need effective security models to mitigate any risks. While Responsible Entities can deploy the perimeter-based network security model to virtualization, other security models are available and allow access controls at a much deeper level within the infrastructure. One such model is Zero Trust Architecture. According to NIST, Zero Trust Architecture is "[a] security model, a set of system design principles, and a coordinated cybersecurity and system management strategy based on an acknowledgement that threats exist both inside and outside traditional network boundaries. The [zero-trust] security model eliminates implicit trust in any one element, component, node, or service and instead requires continuous verification of the operational picture via real-time information from multiple sources to determine access and other system responses."[35] As described in this section, Zero Trust Architecture has been supported by the White House in dictating how the federal government should approach cyber security as well as the Commission in other proceedings.

In 2021, President Biden issued an Executive Order on improving the nation's cybersecurity.[36] One aspect of the Executive Order directed the federal government to "advance toward Zero Trust Architecture" as part of modernizing federal government cyber security.[37] To carry out the Executive Order, the White House issued a memorandum outlining a zero trust

[36] Exec. Order No. 14,028, 86 Fed. Reg. 26,633 (May 12, 2021), https://www.govinfo.gov/content/pkg/FR-2021-05-17/pdf/2021-10460.pdf.

[37] *Id.* at 26,635.

strategy for federal government, noting that "[a] transition to a 'zero trust' approach to security provides a defensible architecture for this new [threat] environment."[38]

Furthermore, the Commission itself has encouraged use of zero trust principles in the CIP Reliability Standards. In Order No. 887, the Commission directed NERC to develop requirements for internal network security monitoring for all high impact BES Cyber Systems and medium impact BES Cyber Systems with External Routable Connectivity, stating that internal network security monitoring is a "fundamental element of a zero-trust architecture."[39] Based on the focus of the federal government on advancing Zero Trust Architecture as a security model, it follows that NERC should ensure that its CIP Reliability Standards do not prevent entities from adopting this security model.

c. Forward-looking

The proposed revisions are also needed to help ensure the CIP Reliability Standards are forward-looking and continue to allow Responsible Entities to adopt different security models as emerging risks evolve. Specifically, the proposed revisions accomplish this through security objectives. Many of the basic concepts of the CIP framework are essentially unchanged from the Urgent Action 1200 standard in 2003. The primary focus of those standards was the "critical cyber asset," an "electronic device" such as a server, workstation, or relay as a physical object. It had an operating system, always on and performing its function, and communicating with other components over routable protocols. It was protected by traditional firewalls at the network edge

looking at source and destination protocol addresses and ports as the only mechanism by which to make network access control decisions.

Today, newer technology has changed this scenario. With virtualization, physical devices are no longer the primary units of organization. An entire control system infrastructure can be virtualized (such as “software defined data centers”) and only exist as logical constructs. An energy management system database server may never exist as a discrete physical object. With containers, there may not be a concrete tie between application logic and an operating system. Virtual machines can be created and destroyed dynamically and are neither always on, nor tied to specific hardware. Workloads may mirror their information for reliability purposes across great distances without using routable protocols. With microsegmentation, network access control lists are now much more granular than internet protocol addresses at a perimeter. They are enhanced by policy-based control templates enforcing access at a “user to workload” level throughout the system infrastructure. Electronic access control may no longer be based solely on routable protocol addresses or found only at an Electronic Security Perimeter boundary.

In addition to virtualization, there are other technologies on the horizon that may become commonly used for industrial control systems. The Commission itself has recognized that, “[v]irtualization is a necessary technical enabler if the functions of BES Cyber Systems are to be moved to a cloud computing environment since a customer choosing to migrate one or more on-premise systems to the cloud will need to virtualize those systems for use in the cloud.”[40] Cloud services already permeate several aspects of the corporate side of utility businesses, as well as storage of BES Cyber System Information. In the same Notice of Inquiry into virtualization benefits and risks, the Commission solicited comment on performing BES operations in the

---

[40] *Virtualization and Cloud Computing Services*, Notice of Inquiry, 170 FERC ¶ 61,110, at P 6 (2020).

cloud. Moreover, the Commission directed NERC to initiate a study of BES operations in the cloud.[41] Based on that study, there is a Standard Authorization Request looking into revisions to the CIP Reliability Standards regarding use of cloud.[42] While virtualization and cloud services are different, the use of security objectives in the proposed revisions help to advance the CIP Reliability Standards toward maintaining relevance in light of changing technologies.

3. Overview of Proposed Revisions Addressing Virtualization

As noted above, there are unique characteristics and benefits of virtualization that are addressed in the proposed CIP Reliability Standards revisions. This section provides an overview of the proposed revisions addressing virtualization that fall into the following four general categories: (a) support of different security models; (b) recognition of virtualization infrastructure and virtual machines characteristics; (c) broadening of configuration change management approaches; and (d) managing accessibility and attack surfaces of virtualized configurations.

a. Support of Different Security Models

As discussed in Section IV.A.2.b of this petition, one of the driving needs for revisions to the CIP Reliability Standards was to accommodate different security models. In particular, the requirement in CIP-005-7 to implement a perimeter-based network security model limited Responsible Entities to a single security model. As such, the Project 2016-02 drafting team developed revisions to Requirements R1 and R2 in CIP-005-8 (more fully detailed in Section IV.E.5 of this petition) to focus on the security objective of securing communications to and

from BES Cyber Systems. In addition, the proposed revisions permit Responsible Entities to either continue with the perimeter-model configuration or leverage more granular, policy-based controls facilitated by virtualized environments. Throughout the CIP Reliability Standards, the Project 2016-02 drafting team updated language to remove concepts such as “inside” an Electronic Security Perimeter and replaced that with more inclusive phrases such as “protected by” an Electronic Security Perimeter in recognition of security models that may have policy enforcement points controlling access to BES Cyber Systems rather than a “perimeter.”

In conjunction with the revisions in CIP-005-8, the drafting team revised the definitions of Electronic Security Perimeter, Electronic Access Point, and External Routable Connectivity to further support adoption of other security models (more fully described in Section IV.E.1 of this petition).

b. Recognition of Virtualization Infrastructure and Virtual Machines Characteristics

At their inception, the current suite of CIP Reliability Standards did not contemplate virtual machines, application containers, and other virtualized infrastructure. As such, Responsible Entities face challenges in applying the requirements to virtualized infrastructure. The proposed revisions to the Reliability Standards and definitions recognize the unique characteristics of virtual infrastructure and address how hardware relates to the software and data.

For example, the NERC Glossary term Cyber Assets is defined as “programmable electronic devices, including the hardware, software, and data in those devices.” As this definition includes hardware components for each device, it does not account for devices in virtualized environments that share hardware resources. The Cyber Asset definition assumes a one-to-one relationship between a device, such as a BES Cyber Asset, and its hardware. Virtualization, however, changes that relationship to a "one-to-many" because in some cases, hundreds of virtual BES Cyber Assets can share a pool of hardware resources (compute, network, and storage resources). As such, the Project 2016-02 drafting team sought to develop revisions to the suite of CIP Reliability Standards that recognize the following three asset classes that exist with the introduction of virtualized technologies in industrial control systems:

- Self-contained devices that are composed of dedicated hardware, some form of operating system or firmware, and the application code. This is the traditional definition of a Cyber Asset and applies to things such as digital relays, remote terminal units, physical operator workstations, and dedicated physical servers.
- Virtual "cyber assets" composed of an operating system and applications or containers minus any dedicated hardware. These types of assets are logical or virtual constructs by nature and exist only in memory or files. They can, however, appear from a network perspective the same as any other host.
- Shared infrastructure consists of the hardware resource pools (compute, network, and storage) and is shared by virtual cyber assets and can host numerous virtual cyber assets, networks, or storage locations.

In addition to recognizing the different asset classes listed above, the revisions that fall under this category recognize that the proposed requirements must address controlling access and communications to the management plane of shared infrastructure. Access to the management plane (also known as the interface or console) permits users to create, modify, or delete virtualized objects (such as servers, networks, switches, firewalls, or storage) or even entire virtualized infrastructure. Moreover, access to the management plane permits users to move virtualized objects from one security zone to another.

In recognition of the characteristics of virtual machines and their underlying infrastructure, the proposed revised requirements and new and revised definitions apply protections where they are needed rather than relying on the one-to-one relationship between hardware and software in the currently defined Cyber Assets. As a result, the proposed requirements permit Responsible Entities to use protections that are appropriate and secure for virtualization. The proposed revisions help to address risks, for example, by preventing use of "mixed trust" environments where virtual machines of varying impact levels share the same central processing units, among other components, and the occurrence of "side channel" attacks where virtual systems executing on the same hardware could affect one another. Moreover, the proposed requirements include appropriate protections for the management plane to secure access. The following proposed definitions and revisions account for the characteristics of virtual machines and underlying infrastructure:

- Cyber Asset and Virtual Cyber Asset definitions (see Section IV.E.1)
- Shared Cyber Infrastructure development (see Section IV.E.1)
- Management Interface development (See Section IV.E.1)
- Cyber Systems (See Section IV.E.1)

c. Broadening of Configuration Change Management Approaches

The proposed Reliability Standards broaden configuration change management approaches to reflect certain characteristics of the technologies enabled by virtualization. According to NIST, configuration management is "[a] collection of activities focused on establishing and maintaining the integrity of information technology products and information systems, through control of processes for initializing, changing, and monitoring the configurations of those products and systems throughout the system development life cycle."[43]

As part of that management, Responsible Entities need to control for configuration changes to help ensure that neither adverse impacts nor unauthorized changes occur. In the virtualization context, there are several unique characteristics, such as shared infrastructure, remediation Virtual Local Area Network,[44] containers, parent and child images, and dormant virtual machines that require a broader approach to configuration change management than currently exists in the CIP Reliability Standards. For instance, the dynamic management of application containers, with the ability to instantiate the application on the best "node" (e.g., server) at the moment, renders the current CIP Reliability Standards more of a documentation exercise of that dynamic management rather than a true focus on the security of changes made in a virtualized environment.

As such, the proposed revisions in Reliability Standard CIP-010-5 focus on a security objective of controlling the implementation of intended changes to software or settings that could weaken certain cyber security controls rather than only software items listed in a baseline configuration. Moreover, the focus of change management around the technical controls in CIP-005 and CIP-007, with comprehensive evaluation and testing of the potential impacts to those controls, should provide Responsible Entities with an accurate picture of the current and future

---

[43] NIST, *Security and Privacy Controls for Information Systems and Organizations*, Special Publication 800-53 rev. 5, at App. A pg. 398 (Dec. 2020), https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-53r5.pdf.

[44] NIST defines Local Area Network as "a group of computers and other devices dispersed over a relatively limited area and connected by a communications link that enables any device to interact with any other on the network." NIST, *Mobile Device Security: Corporate-Owned Personally-Enabled*, Special Publication 1800-21 at App. B at p. 165 (Sep. 2020), https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.1800-21.pdf. A remediation Virtual Local Network is a network segment in which a Cyber Asset or Virtual Cyber Asset is placed so that its security posture can be evaluated before joining its intended network. Upon passing the configured policy checks or being remediated such that it passes, it is then allowed to connect to or communicate on its intended network.

state of the Cyber System. In so doing, the proposed revisions provide Responsible Entities the opportunity to focus more on a forward-looking authorization of a change rather than a backward-looking baseline update for compliance purposes. These proposed changes are further described in detail in Section IV.E.10 below.

d. Managing Accessibility and Attack Surfaces of a Virtualized Configuration

As mentioned above, the characteristics of virtualized environments require an updated approach to managing accessibility and reducing the attack surface of a virtualized configuration. With the introduction of shared resources, hardware-based vulnerabilities need to be addressed differently to mitigate compromise across processes simultaneously executing on the same hardware and across impact categorizations. For example, securing the accessibility of the physical underlay of the shared infrastructure may be better facilitated by managing at the service level versus the port numbers.

Accordingly, the Project 2016-02 drafting team proposed revisions in CIP-007 to manage system security and accessibility. For instance, current CIP-007-6, Requirement R1 focuses on ports and services and the disabling or restricting of those unneeded ports or services. However, in Zero Trust Architecture, for example, accessibility may be gained through a "user to tagged workload" level access control policy instead of an enabled port or service. As a result, the revisions in proposed CIP-007-7, Requirement R1 focus on the security objective of disabling or preventing unneeded routable protocol network accessibility to account for more varied security controls in the future. Proposed changes in CIP-007-7 are discussed in more detail in Section IV.E.7 below.

B. Interactive Remote Access

The Project 2016-02 drafting team considered clarification to the use of Interactive Remote Access based on feedback obtained during implementation of the "Version 5" CIP Reliability Standards. These proposed revisions to CIP-005 and the Interactive Remote Access definition support reliability by clarifying when certain non-routable (serial) Cyber Systems should be subject to the CIP-005 requirements for Interactive Remote Access on the routable portion of the remote access connection. In particular, the drafting team addressed the risk of those Cyber Systems that are serial, non-routable devices but are "reachable" through the availability of Interactive Remote Access. Because these Cyber Systems are not directly connected to a network with a routable protocol, it was unclear if they had an "associated Electronic Security Perimeter" that resulted in External Routable Connectivity upon which Interactive Remote Access depended. Thus, some of the proposed revisions remove those dependencies and clarify that CIP-005 requirements will apply if: (1) a medium or high impact BES Cyber System only has non-routable connectivity (i.e., serial) but is subsequently converted to routable protocol; and (2) a remote user can still gain Interactive Remote Access to the BES Cyber System.

C. CIP Exceptional Circumstances

Within the CIP Reliability Standards, certain requirements include an exception for instances that meet the definition of CIP Exceptional Circumstances,[45] which entities may declare during certain, defined emergencies to temporarily suspend complying with specific CIP

---

[45] The NERC Glossary defines a CIP Exceptional Circumstance as, "[a] situation that involves or threatens to involve one or more of the following, or similar, conditions that impact safety or BES reliability: a risk of injury or death; a natural disaster; civil unrest; an imminent or existing hardware, software, or equipment failure; a Cyber Security Incident requiring emergency assistance; a response by emergency services; the enactment of a mutual assistance agreement; or an impediment of large scale workforce availability."

standards requirements in the interest of supporting reliability. Reliability Standard CIP-003 requires Responsible Entities develop a policy for how to declare and respond to CIP Exceptional Circumstances. Often, these exceptions are attached to requirements that may be more documentation-oriented or compliance-oriented. These exceptions support the reliability of the Bulk Power System by permitting Responsible Entities to focus more on security and reliability than on compliance-related activities in certain discrete circumstances.

During implementation of Version 5, Responsible Entities recognized other requirements that may be appropriate for declaring a CIP Exceptional Circumstance as needed. The Project 2016-02 drafting team reviewed all requirements to determine those that should allow exceptions during CIP Exceptional Circumstances. Based on this review, the following proposed requirements include new exceptions during CIP Exceptional Circumstances or were moved within the requirements:

- CIP-004-8, Requirement R3, Part 3.5;
- CIP-006-7, Requirement R2 (Previously, Parts 2.1 and 2.2 had CIP Exceptional Circumstances. Including the CIP Exceptional Circumstances in the parent requirement now extends its applicability to Part 2.3 as well); and
- CIP-010-5, Requirement R1, Part 1.2.1 (previously was Part 1.5).

D. Technical Feasibility Exceptions

Several of the proposed revisions fall under the category of removing language triggering Technical Feasibility Exceptions and replacing it with “per system capability.” As background, in Order No. 706, FERC approved eight CIP Reliability Standards and, among other things, directed NERC to develop a set of conditions or criteria that a registered entity must follow to obtain a Technical Feasibility Exception from specific requirements in the CIP Reliability

Standards.[46] In response to this directive and subsequent directives on further refinements,[47] NERC developed Appendix 4D of the NERC Rules of Procedure that governs the process for requesting and receiving Technical Feasibility Exceptions. With the transition to the CIP Version 5 Reliability Standards, NERC and the Regional Entities observed a significant decrease in the number of Technical Feasibility Exceptions.[48] This decrease has enabled the Regional Entities to better evaluate the risk and impact of Technical Feasibility Exceptions and gain a more complete understanding of the value of the Technical Feasibility Exceptions process compared to the administrative burden it places on Responsible Entities and Regional Entities. As a result, the Project 2016-02 drafting team took the opportunity to evaluate and eliminate the use of requirement language triggering Technical Feasibility Exceptions.

Instead, the proposed revisions use the term "per system capability" to account for the different types of technology that will be expected to meet the security objective. With the use of this language, Responsible Entities will continue to be responsible for implementing an equally effective method, if necessary and capable, to meet the ultimate security objective for each

The Commission requested further information and clarification regarding certain aspects of the TFE process. On April 21, 2010, NERC submitted its compliance filing in response to the January 21 Order. On October 1, 2010, the Commission issued an order accepting NERC's April 2010 filing as partially compliant and directing further changes to the TFE Procedure. *See* October 1 Order. On December 23, 2010, NERC submitted a compliance filing in response to the Commission's October 1 Order, which the Commission subsequently accepted. *See* April 12 Order; *see also N. Am. Elec. Reliability Corp.*, 144 FERC ¶ 61,180 at PP 14, 17-18 (2013) [hereinafter September 2013 Order]; *see also N. Am. Elec. Reliability Corp.*, Docket No. RR13-3-001 (Jan. 30, 2014) (delegated letter order).

[48] NERC reports on these observations in its Annual Reports on Wide-Area Analysis of Technical Feasibility Exceptions in FERC Dockets Nos. RR10-1-000 and RR13-3-000.

requirement where this language appears. The use of the phrase "per system capability" is further described in Section IV.E regarding certain instances within the proposed requirements.

E. Standards and Definitions

Section IV.E discusses the proposed revisions to each Reliability Standard and NERC Glossary definitions in more detail, with a particular focus on the revisions in the proposed "technical" Reliability Standards CIP-005-8, CIP-007-7, and CIP-010-5.

1. Definitions

There are 18 proposed revised terms used in the NERC *Glossary* and four new proposed terms, which include Cyber System, Management Interface, Shared Cyber Infrastructure, and Virtual Cyber Asset (clean and redline definitions provided in **Exhibit A-12**). In developing these terms, the drafting team focused on keeping the terms more definitional than scoping mechanisms, moving any "requirement-type" language to actual requirements for greater clarity. The following section provides detail around some of the more significant changes within the definitions. Additional explanation of all the proposed revised and new definitions are included in the technical rationale document, **Exhibit E-12** hereto.[49]

Cyber Asset

As mentioned above, the current Cyber Asset definition assumes a one-to-one relationship between software and physical hardware. As such, the drafting team proposed modifications to the Cyber Asset definition to explicitly exclude Shared Cyber Infrastructure because it is a different hardware class on which the other Virtual Cyber Assets of differing impact levels execute. This separation also allows Shared Cyber Infrastructure to be added to

---

[49] Those definitions not described in this section below were more minor or conforming changes, including adding in Shared Cyber Infrastructure, Management Interface, or Virtual Cyber Asset where appropriate; changing "Cyber Asset" to "Cyber System"; revising references to Electronic Security Perimeters; or replacing terms with their acronyms, and can be found in **Exhibit A-12** with further technical rationale provided in **Exhibit E-12**.

applicability based on its unique risks. The revised definition also clarifies that "application containers" (i.e., portable, packaged applications) are considered software of a Cyber Asset (or Virtual Cyber Asset), though they may have some characteristics of a Virtual Cyber Asset (a container can be instantiated with its own internet protocol address, etc.). In addition, the Project 2016-02 drafting team developed the proposed Virtual Cyber Asset definition to distinguish it from the Cyber Asset definition, as described later in this section.

Cyber System

Cyber System is a proposed newly defined term that states: "One or more Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure." This definition groups the three "asset classes" that are subject to the CIP Reliability Standards into one NERC Glossary term for readability so that CIP requirements typically mentioning "Cyber Assets" can now easily refer to Cyber Assets, Virtual Cyber Assets, and Shared Infrastructure in one term.

Electronic Access Control or Monitoring Systems (EACMS)

The proposed revisions to the definition of Electronic Access Control or Monitoring Systems ("EACMS"), shown in blackline, are as follows:

> Cyber ~~Assets~~ **System(s)** that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) **(ESP)** or BES Cyber Systems~~.~~ **(BCS), including those not protected by an ESP used by the responsible entity to convert routable protocol communications to non-routable communications to a BCS** ~~This includes Intermediate Systems~~.

The proposed EACMS definition now includes "Cyber Systems" instead of Cyber Assets to demonstrate that EACMS can also take the form of Virtual Cyber Assets and Shared Cyber Infrastructure in addition to Cyber Assets. The reference to Intermediate System has been removed as the revisions to the definition of Intermediate System now directly reference

EACMS. Finally, the proposed EACMS definition includes language clarifying when a protocol converter (e.g., serial to routable) would be considered an EACMS.

Electronic Access Point

The proposed revisions to the definition of Electronic Access Point, shown in blackline, are as follows:

> ~~**A**~~ **An electronic policy enforcement point or a** Cyber Asset interface on an Electronic ~~**Security Perimeter**~~ **Access Control or Monitoring Systems** that ~~**allows**~~ **controls** routable communication ~~**between**~~ **to and from one or more BES Cyber Systems or their associated Protected** Cyber Assets ~~**outside an Electronic Security Perimeter and Cyber Assets inside an Electronic Security Perimeter**~~.

As network security moves deeper into the infrastructure, it is no longer necessary to prescribe that network security be performed only at a "Cyber Asset interface on an Electronic Security Perimeter" at one point on a network edge. Zero Trust Architecture, for example, highly distributes the network security model and is not perimeter-based. This model is incorporated into the definition through the addition of "electronic policy enforcement point." With the added flexibility in CIP-005 to adopt these models in addition to the traditional perimeter-based model, the proposed modifications to the Electronic Access Point definition allow for the use of electronic policy enforcement points rather than prescribing a specific architecture. The "one or more" and the "associated Protected Cyber Assets" have been added to clarify that Electronic Access Points can control communications to a group and are not required per individual system.

External Routable Connectivity

The proposed revisions to the definition of External Routable Connectivity, shown in blackline, are as follows:

> The ability to access a BES Cyber System ~~**from a Cyber Asset that is outside of its associated**~~ **through its** Electronic Security Perimeter via a bi-directional routable protocol connection.

The proposed modifications to External Routable Connectivity allow for the use of Zero Trust Architecture or other network models that are not strictly perimeter or network-border based by removing the concepts of "inside" or "outside." These concepts are replaced with the language "through its Electronic Security Perimeter." The External Routable Connectivity term is used throughout the CIP Reliability Standards within the Applicable Systems column as a scoping mechanism based on the inherent risk associated with External Routable Connectivity as well as to limit the scope of requirements that would require External Routable Connectivity to function. The Project 2016-02 drafting team maintains this use of External Routable Connectivity, but also clarifies the relationship between External Routable Connectivity and Interactive Remote Access in that a non-routable, serial-only BES Cyber System (thus with no Electronic Security Perimeter) may have Interactive Remote Access through a subsequent internet protocol-to-serial conversion, as further discussed in this section.

Electronic Security Perimeter

The proposed revisions to the definition of Electronic Security Perimeter, shown in blackline, are as follows:

> The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol~~.~~**; or a logical boundary defined by one or more Electronic Access Points**.

In developing additional language to define an Electronic Security Perimeter, the Project 2016-02 drafting team accommodates other security models. The Project 2016-02 drafting team retained the "logical border surrounding a network" concept and added the "logical boundary" language to accommodate other models. The intent behind this is that a border surrounds an object (i.e., a network), but a boundary may not surround or enclose; it is a line that can be crossed, such as a policy enforcement point controlling access to a resource.

Interactive Remote Access (IRA)

The proposed revisions to the definition of Interactive Remote Access, shown in blackline, are as follows:

> User-initiated **electronic** access by a person ~~employing a remote access client or other remote access technology~~ using a **bi-directional** routable protocol**:**~~. Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants.~~
>
> - **To a Cyber System protected by an Electronic Security Perimeter(s) (ESP);**
> - **That is converted by the responsible entity to a non-routable protocol that allows access to a Cyber System; or**
> - **To a Management Interface.**
>
> Interactive ~~r~~**R**emote ~~a~~**A**ccess does not include**:**
>
> - **Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs; or**
> - ~~s~~**S**ystem-to-system process communication~~s~~.

The proposed revisions to Interactive Remote Access address both virtualization concepts and the needed clarifications identified during implementation (as described in Section IV.B in this petition). The proposed definition includes three instances where Interactive Remote Access exists and two exclusions. To address virtualization, the Project 2016-02 drafting team added accessing a Cyber System (thereby incorporating Virtual Cyber Assets and Shared Cyber Infrastructure) or a Management Interface (such as the Shared Cyber Infrastructure "console") as a type of Interactive Remote Access. In addition, the Project 2016-02 drafting team changed references to an Electronic Security Perimeter to reflect it is only one type of Interactive Remote Access instead of all types being defined as going through an Electronic Security Perimeter. Finally, the proposed modifications clarify that conversions of routable protocol to non-routable protocol by the Responsible Entity constitutes Interactive Remote Access to a Cyber System.

The exclusions carry forward constructs that already were not included in the currently enforceable definition of Interactive Remote Access.

Intermediate System

The proposed revisions to the definition of Intermediate System, shown in blackline, are as follows:

> **~~A Cyber Asset~~ One** or **~~collection of Cyber Assets performing access control~~ more Electronic Access Control or Monitoring Systems that are used** to restrict Interactive Remote Access to only authorized users. **~~The Intermediate System must not be located inside the Electronic Security Perimeter.~~**

The proposed modifications to the Intermediate System definition remove requirement language (i.e., where an Intermediate System must reside). The drafting team proposes moving that language to proposed CIP-005-8, Requirement R2, as further discussed in Section IV.E.5. The proposed modifications also update the definition from using "Cyber Asset" to using "EACMS" to reflect the other possible forms (i.e., Virtual Cyber Asset) of an Intermediate System. The proposed revisions also move the clarification of "[t]his includes Intermediate Systems" out of the EACMS definition into the Intermediate System definition.

Management Interface

Management Interface is a new proposed definition and reads as follows:

> **An administrative interface that:**
> - **Controls the processes of initializing, deploying, and configuring Shared Cyber Infrastructure;**
> - **Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or**
> - **Configures an Electronic Access Point.**

In defining Management Interface, the Project 2016-02 drafting team provided a means for requirements to apply to the management plane that is responsible for managing Cyber Systems.

Protected Cyber Asset (PCA)

The proposed revisions to the definition of Protected Cyber Asset, shown in blackline, are as follows:

> One or more Cyber Assets **or Virtual Cyber Assets (VCA) that:** ~~**connected using a routable protocol within or on**~~
>
> - **Are protected by** an Electronic Security Perimeter **(ESP)** ~~**that is**~~ **but are** not part of the highest impact BES Cyber System **(BCS)** ~~**within**~~ **protected by** the same **ESP; or** ~~**Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.**~~
> - **Share CPU resources or memory resources with any part of the BCS, excluding VCA that are being actively remediated in an environment that isolates routable connectivity from BCS;**
>
> **Excluding Transient Cyber Assets.**

The proposed modifications to the Protected Cyber Asset definition ensure certain risks in a virtualized environment were mitigated through the protections applied to a Protected Cyber Asset. The Protected Cyber Asset definition exists to identify other Cyber Assets or Virtual Cyber Assets that must be protected by various CIP requirements due to what they share with a BES Cyber System. With virtualization, the Protected Cyber Asset definition was modified to include “share CPU resources or memory resources with any part of the BCS” to mitigate the risks of hardware-based vulnerabilities (e.g., Spectre, Meltdown, Rowhammer, Zenbleed, etc.) on Shared Cyber Infrastructure. Finally, the proposed modifications account for “remediation Virtual Local Area Network” automation of security controls where a Virtual Cyber Asset may instantiate in a logical network reserved for vulnerability assessment and updates but should not be considered a Protected Cyber Asset while temporarily in this state as its being updated prior to being connected to its production network.

Shared Cyber Infrastructure (SCI)

Shared Cyber Infrastructure is a new proposed definition and reads as follows:

> **One or more programmable electronic devices, including the software that shares the devices' resources, that:**
>
> - **Hosts one or more Virtual Cyber Assets (VCA) included in a BES Cyber Systems (BCS) or their associated Electronic Access Control or Monitoring Systems (EACMS) or Physical Access Control Systems (PACS); and hosts one or more VCAs that are not included in, or associated with, BCS of the same impact categorization; or**
> - **Provides storage resources required for system functionality of one or more Cyber Assets or VCAs included in a BCS or their associated EACMS or PACS; and also for one or more Cyber Assets or VCAs that are not included in, or associated with, BCS of the same impact categorization.**
>
> **SCI does not include the supported VCAs or Cyber Assets with which it shares its resources.**

The proposed term Shared Cyber Infrastructure was defined to separate the underlying hardware from Virtual Cyber Assets in the situation where the shared hardware resources support Virtual Cyber Assets of varying impact levels. This allows security requirements to be targeted to Shared Cyber Infrastructure to address the unique risks of shared hardware. There are many requirements that now include the newly defined term Shared Cyber Infrastructure ("SCI") in the "Applicable Systems" column to maintain security level parity with traditional Cyber Assets.

Virtual Cyber Asset

Virtual Cyber Asset is a new proposed definition and reads as follows:

> **A logical instance of an operating system or firmware, currently executing on a virtual machine hosted on a BES Cyber Asset; Electronic Access Control or Monitoring System; Physical Access Control System; Protected Cyber Asset; or Shared Cyber Infrastructure (SCI).**
>
> **Virtual Cyber Assets (VCAs) do not include:**
>
> - **Logical instances that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems;**

- **<u>Dormant file-based images that contain operating systems or firmware; or</u>**
- **<u>SCI or Cyber Assets that host VCAs.</u>**

<u>Application containers are considered software of VCAs or Cyber Assets.</u>

The proposed definition of Virtual Cyber Asset provides clarity around those virtualized assets that do not have a one-to-one relationship between software and hardware. It also provides clarity on when certain behaviors of virtualized technologies are considered akin to a Cyber Asset within the CIP Reliability Standards.

2. Reliability Standard CIP-002-7

Consistent with the prior Version 5 framework, proposed Reliability Standard CIP-002-7 requires Responsible Entities to identify and categorize their BES Cyber Systems into low, medium, and high impact based on the assets (e.g., Control Centers, Transmission stations and substations, etc.) these BES Cyber Systems support. Attachment 1 to proposed CIP-002-7 includes criteria that categorize BES Cyber Systems based on the adverse impact that loss, compromise, or misuse of those BES Cyber Systems could have on the reliable operation of the BES. This categorization approach is still based on the NIST Risk Management framework, as developed to meet directives in Order No. 706.[50]

The proposed revisions in CIP-002-7 are minor, mostly aligning the standard with updates to the NERC Glossary. In addition to those mostly conforming changes, the proposed revisions incorporate the CIP-002-5.1a interpretation regarding "shared BES Cyber Systems" by clarifying that each "discrete" shared BES Cyber System meets medium impact rating 2.1 in Attachment 1 to CIP-002-7. This is consistent with Section 7.2.3 of the Standard Processes

---

[50] *Mandatory Reliability Standards for Critical Infrastructure Protection*, Order No. 706, 122 FERC ¶ 61,040, *order on clarification*, Order No. 706-A, 123 FERC ¶ 61,174 (2008), *order on clarification*, Order No. 706-B, 126 FERC ¶ 61,229 (2009), *order deny'g request for clarification*, Order No. 706-C, 127 FERC ¶ 61,273 (2009).

Manual (Development of an Interpretation)[51] to incorporate an interpretation into the body of a Reliability Standard once that Reliability Standard is subsequently open for revision in a development project. A clean and redline version of proposed CIP-002-7 is included in **Exhibit A-1**, with additional technical rationale provided in **Exhibit E-1**.

3. Reliability Standard CIP-003-10

Proposed Reliability Standard CIP-003-10 requires Responsible Entities to develop cyber security policies to help establish responsibility and accountability through all levels of an organization. In addition, this standard includes the cyber security requirements applicable to assets containing low impact BES Cyber Systems. The proposed revisions align the requirements with updates to the NERC Glossary and apply low impact requirements to virtualized technologies through new proposed terms such as "Shared Cyber Infrastructure" and "Virtual Cyber Asset." A clean and redline version of proposed CIP-003-10 is included in **Exhibit A-2**, with additional technical rationale provided in **Exhibit E-2**.

4. Reliability Standard CIP-004-8

Proposed Reliability Standard CIP-004-8 minimizes the risk of individuals inappropriately accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management. Proposed Reliability Standard CIP-004-8 includes six requirements: (1) Requirement R1 requires a Responsible Entity to implement a documented security awareness process for high and medium impact BES Cyber Systems that reinforces cyber security practices for certain personnel; (2) Requirement R2 requires Responsible Entities to implement a cyber security training program that includes the applicable requirement parts; (3) Requirement R3 requires a documented personnel risk

---

[51] The NERC Standard Processes Manual is available at https://www.nerc.com/AboutNERC/RulesOfProcedure/Appendix_3A_SPM_Clean_Mar2019.pdf.

assessment program(s); (4) Requirement R4 requires a documented access management program(s) that includes the applicable requirement parts; (5) Requirement R5 requires a documented access revocation program(s) that includes the applicable requirement parts; and (6) Requirement R6 requires an access management program(s) to authorize, verify, and revoke provisioned access to BES Cyber System Information that includes the applicable requirement parts.

The proposed revisions in CIP-004-8 add Shared Cyber Infrastructure as an applicable system to help ensure infrastructure that supports virtualized technologies receives appropriate CIP personnel and training protections. In addition, the proposed revisions clarify applicability to medium impact BES Cyber Systems with External Routable Connectivity and those with Interactive Remote Access. A clean and redline version of proposed CIP-004-8 is included in **Exhibit A-3**, with additional technical rationale provided in **Exhibit E-3**.

5. Reliability Standard CIP-005-8

Proposed Reliability Standard CIP-005-8 includes requirements around controlling electronic access to medium and high impact BES Cyber Systems. The standard requires Responsible Entities to develop an Electronic Security Perimeter that only permits certain communications to medium and high impact BES Cyber Systems. Through revisions to the Electronic Security Perimeter definition and requirements to focus on the security objective of permitting only necessary communication through the Electronic Security Perimeter, the proposed standard allows Responsible Entities to implement security models at a more granular level in addition to network perimeter-based solutions (e.g., firewalls) to control these communications. While the proposed Reliability Standard no longer limits Responsible Entities to using a perimeter-based model, Responsible Entities may continue to meet the security objective of the requirement by deploying such a configuration. However, Responsible Entities may also deploy controls on communications that can be on a per-access or per-session level.

a. Requirement R1

Proposed Requirement R1 of CIP-005-8 requires Responsible Entities to implement one or more documented processes regarding Electronic Security Perimeters. As described below, the proposed revised requirement parts incorporate a security objective approach to accommodate more security models.

The drafting team revised the language "shall reside within" an ESP to "must be protected by an ESP." Through this change, the proposed Requirement R1, Part 1.1 better accommodates architectures without a "perimeter," where the concepts of inside and outside such perimeter do not work. The language, however, still accommodates "traditional" Open Systems Interconnection[52] Layer 3 firewalls in that communications would go "through" the access point in the firewall that establishes the Electronic Security Perimeter.

Proposed Requirement R1, Part 1.2 removes an explicit requirement to use an Electronic Access Point to control communications to applicable systems but replaces it with core security objectives of permitting "only needed routable communications" through the Electronic Security Perimeter and denying all others (excluding time sensitive communications of Protection Systems). This security objective focuses on the "reachability" of applicable systems, permitting Responsible Entities to use Electronic Access Points to control the accessibility of the applicable systems, among other controls. This requirement part incorporates aspects of the previous CIP-005-7, Requirement R1, Part 1.3 into the security objective. In addition, this requirement part

---

[52] The Open Systems Interconnection ("OSI") model is often cited in information security and was developed by the International Organization for Standardization. The OSI model is seven conceptual "layers" that define how communications between systems can occur: 1) physical, 2) data link, 3) network, 4) transport, 5) session, 6) presentation, and 7) application. Wikipedia, *OSI Model*, https://en.wikipedia.org/wiki/OSI_model.

now explicitly requires a Responsible Entity to document the reason for granting access to help ensure only needed communications are permitted.

Proposed Requirement R1, Part 1.3 includes a security objective to protect the configurations of Electronic Security Perimeters and Shared Cyber Infrastructure. To achieve this objective, the requirement part applies to Electronic Access Control or Monitoring Systems that control and create the Electronic Security Perimeter for Applicable Systems in Requirement R1, Part 1.1 and Shared Cyber Infrastructure supporting an Applicable System in Requirement R1, Part 1.1. The intent behind separating this requirement part from the protections in Requirement R1, Part 1.2 is to clarify that entities do not need an Electronic Access Control or Monitoring System for each Electronic Access Control or Monitoring System.

Proposed Requirement R1, Part 1.4 adds "SCI supporting an Applicable System in this Part" to the scope of the requirement part to ensure that controls regarding Dial-up Connectivity are also applicable to Virtual Cyber Assets and Shared Cyber Infrastructure; and "where technically feasible" has been replaced with the "per system capability" language.

The revisions in proposed Requirement R1, Part 1.5 remove the prescriptive application of protections to the Electronic Access Points and now require malicious routable protocol communications detection entering or leaving the Electronic Security Perimeter.

Proposed Requirement R1, Part 1.6 addresses the issue colloquially known as "Super ESPs," where high or medium impact BES Cyber Systems at Control Centers extend a single Electronic Security Perimeter beyond one Physical Security Perimeter. This often applies to virtualized Control Center environments that implement network adjacency to allow workloads to automatically move from one physical location to another to increase BES Cyber System resiliency between primary and backup Control Centers. The security objective is to protect the confidentiality and integrity of the data traversing communication links used to span a single Electronic Security Perimeter between multiple Physical Security Perimeters. This requirement part works in conjunction with the new Applicability Section 4.2.3.3 exemption in the CIP Reliability Standards: proposed Part 1.6 protects the confidentiality and integrity of the data (typically through encryption) between Physical Security Perimeters, while the exemption section covers related Cyber Systems between those encryption points but does not exclude the endpoints performing the encryption. Therefore, those endpoints performing encryption would be covered by the CIP Reliability Standards requirements.

Also, the former CIP-006-6, Requirement R1, Part 1.10 has been removed and incorporated into this new Requirement R1, Part 1.6 requirement part; consolidating the protections of an Electronic Security Perimeter and its components that extend outside of a Physical Security Perimeter within one standard. Communications equipment associated with communications links (e.g., equipment belonging to carriers) is exempted from the CIP Reliability Standards with the Applicability Section 4.2.3.2 exemption. However, that only applies to equipment between discrete Electronic Security Perimeters. In this extended Electronic Security Perimeter situation where a single Electronic Security Perimeter spans multiple sites or Physical Security Perimeters, that exemption does not apply and the potential exists for data to traverse a connection that uses third-party communications equipment that is unprotected *inside* an Electronic Security Perimeter. As a result, there is a need to enforce confidentiality and integrity controls (such as encryption) on the data that traverses Physical Security Perimeters while within the same Electronic Security Perimeter to isolate any protected data from access through the communications equipment. This consolidation also incorporates cabling and non-programmable communication components that are not protected by a Physical Security

Perimeter, intending to protect data moving across the state as well as data traversing cabling that crosses the hall outside of the Physical Security Perimeter.

b. Requirement R2

Proposed Requirement R2 governs protections around remote access management, specifically Interactive Remote Access, used to support and maintain control systems networks. The proposed revisions to Requirement R2 adapt these protections to support virtualized configurations and clarify issues around defining Interactive Remote Access that arose during implementation of the Version 5 CIP Reliability Standards. Similar to proposed Requirement R1, the following revised requirement parts in proposed Requirement R2 incorporate a security objective approach to accommodate more security models:

Proposed Requirement R2, Part 2.1 expands safeguards for remote access to Shared Cyber Infrastructure in addition to high and medium impact BES Cyber Systems. The Project 2016-02 drafting team simplified the requirement part language in conjunction with the clarified terms of Interactive Remote Access and Intermediate System.

The revisions in proposed Requirement R2, Part 2.2 change the applicability to clarify protections should be applied between the Intermediate System and the remote client rather than between the Intermediate System and the BES Cyber System. In addition, proposed Requirement R2, Part 2.2 changed from a technically specific requirement for encryption to an objective-based requirement to protect the confidentiality and integrity of the Interactive Remote Access session.

Proposed Requirement R2, Part 2.3 clarifies that multi-factor authentication should be applied to the Intermediate System through changes to applicable systems.

Proposed Requirement R2, Parts 2.4 and 2.5 are supply chain protections for vendor remote access sessions. There were only acronym changes and the addition of Shared Cyber Infrastructure to applicability for these requirement parts.

Proposed Requirement R2, Parts 2.6 and 2.7 are new requirement parts focusing on reducing the attack surface between an Intermediate System and the BES Cyber System. Proposed Requirement R2, Part 2.6 is intended to prevent a virtualized Intermediate System from sharing central processing units or memory with the BES Cyber System for which it controls access to reduce the risk for a side-channel attack to other Virtual Cyber Assets sharing those resources. Proposed Requirement R2, Part 2.7 requires that routable protocol communications between Intermediate Systems and applicable systems in Part 2.1 must be through an Electronic Security Perimeter. This requirement part replaces the language in the currently enforceable definition of Intermediate System that stated an Intermediate System "must not be located inside" the Electronic Security Perimeter.

c. Requirement R3

Finally, proposed Requirement R3 applicability was updated to extend the protections for vendor-initiated remote connections to Shared Cyber Infrastructure. A clean and redline version of proposed CIP-005-8 is included in **Exhibit A-4**, with additional technical rationale provided in **Exhibit E-4**.

6. Reliability Standard CIP-006-7

Proposed Reliability Standard CIP-006-7 requires a physical security plan to manage physical access to BES Cyber Systems. These requirements are different than the physical security requirements in CIP-014 in that CIP-006 is centered on access to the BES Cyber Systems whereas CIP-014 focuses on physical security of critical infrastructure itself (e.g., security around substations). The proposed revisions apply certain physical protection requirements to virtualization infrastructure where appropriate. A clean and redline version of proposed CIP-006-7 is included in **Exhibit A-5**, with additional technical rationale provided in **Exhibit E-5**.

7. Reliability Standard CIP-007-7

Proposed Reliability Standard CIP-007-7 specifies technical, operational, and procedural requirements to manage system security (e.g., malicious code prevention methods, patch management, etc.). The proposed revisions focus on security objectives rather than specific controls for system security management to accommodate virtualized environments. The revised standard also includes Shared Cyber Infrastructure as an applicable system in all requirement parts of CIP-007-7. The proposed revisions also include a new requirement applicable to Shared Cyber Infrastructure that mitigates vulnerabilities in using the same hardware for different impact categorizations. Finally, the proposed revisions also use "per system capability" instead of "where technically feasible."

Proposed Requirement R1 has an updated table name, "System Hardening" (changed from "Ports and Services"), to reflect the security objective of reducing applicable systems' attack surface. Similarly, proposed Requirement R1, Part 1.1 changes its focus from enabling or restricting ports to the broader focus of disabling or preventing unneeded routable protocol network accessibility. In some instances, a Responsible Entity may be able to disable a service or remove or uninstall software that is providing unneeded network accessibility to the applicable system. In other instances, a Responsible Entity may not be able to disable a service but can prevent access to it in another layer, such as the underlying operating system with a host-based firewall, a policy enforcement point, or other means of filtering traffic. The phrase "per system capability" means that if a Responsible Entity can demonstrate that the applicable system is incapable of performing a required action (e.g., a firmware-based "black box" device with limited configuration capabilities), the requirement is conditional on the ability of the applicable system.

As noted above, proposed Requirement R1, Part 1.3 is a new requirement part applicable to Shared Cyber Infrastructure that supports high or medium impact BES Cyber Systems or their associated Protected Cyber Assets. The intent of proposed Requirement R1, Part 1.3 is to mitigate the risk of exploitation of vulnerabilities of any shared central processing unit resources or memory resources supporting medium or high impact BES Cyber Systems and their associated Protected Cyber Assets. Proposed Requirement R1, Part 1.3 achieves this objective by requiring Responsible Entities to prevent the sharing of these resources, excluding storage resources, with Virtual Cyber Assets that are not, or are not associated with, a medium or high impact BES Cyber System.

The remaining requirements in proposed Reliability Standard CIP-007-7 (Requirements R2, R3, R4, and R5) include minor, conforming changes and the changes listed above (adding Shared Cyber Infrastructure in the Applicable Systems column and replacing "where technically feasible" with "per system capability"). A clean and redline version of proposed CIP-007-7 is included in **Exhibit A-6**, with additional technical rationale provided in **Exhibit E-6**.

8. Reliability Standard CIP-008-7

Proposed Reliability Standard CIP-008-7 specifies incident response requirements to mitigate the risk to the reliable operation of the Bulk Electric System resulting from a Cyber Security Incident. The proposed revisions add Shared Cyber Infrastructure to the applicable systems for incident response requirements. A clean and redline version of proposed CIP-008-7 is included in **Exhibit A-7**, with additional technical rationale provided in **Exhibit E-7**.

9. Reliability Standard CIP-009-7

Proposed Reliability Standard CIP-009-7 specifies recovery plan requirements to recover reliability functions of BES Cyber Systems. The proposed revisions add Shared Cyber Infrastructure to the applicable systems where appropriate. A clean and redline version of proposed CIP-009-7 is included in **Exhibit A-8**, with additional technical rationale provided in **Exhibit E-8**.

10. Reliability Standard CIP-010-5

Proposed Reliability Standard CIP-010-5 governs change management requirements and vulnerability assessment requirements for medium and high impact BES Cyber Systems. The proposed revisions broaden the change management requirements by incorporating the security objective of controlling the implementation of intended changes to software or settings that could weaken certain cyber security controls rather than only permitting a baseline configuration. While Responsible Entities may continue using a baseline configuration to manage change, Responsible Entities may now focus management around those changes that impact the security behavior of certain controls. This accounts for the dynamic nature of virtual machines and other virtualized technologies by permitting authorization of a change for automatic updates that will occur in the future when these virtual machines or application containers instantiate. This contrasts with only looking "backwards" at changes to a baseline as is used for non-virtual machines that run 24 hours a day, seven days a week. In addition, the proposed revisions add Shared Cyber Infrastructure to applicability where appropriate and replace "where technically feasible" with "per system capability."

a. Requirement R1

Like currently enforceable CIP-010-4, the objective of proposed Requirement R1 remains to prevent unauthorized changes to BES Cyber Systems. Recognizing the true security objective behind change management, proposed Requirement R1 focuses on authorizing intended changes that alter security behaviors rather than focusing on listing and documenting changes. In a dynamic environment such as virtualization, where a Virtual Cyber Asset may lie dormant but automatically patched at a future instantiation, the goal of change management is to ensure any changes are authorized prior to that instantiation, not tracking the time and date when the patching occurs for each instantiation with an update to the baseline 30 days later. As a result, the focus of proposed Requirement R1 has changed from documenting the installed software and its open ports on a Cyber Asset or Virtual Cyber Asset at some point post-change to authorizing the changes that will occur when it does instantiate, which provides more security value for virtualized environments. As noted previously, Responsible Entities may continue to use baseline configurations as a valid way to meet Requirement R1.

The Project 2016-02 drafting team replaced the baseline language in proposed Requirement R1, Part 1.1 to focus on the authorization of changes (previously in Requirement R1, Part 1.2). When reviewing the five components that comprised a baseline configuration in the current Part 1.1 (operating system or firmware, commercially available or open source application software intentionally installed, custom software installed, ports, and patches), the Project 2016-02 drafting team determined that the protections around each of these items were already required in the technical controls of CIP-005 and CIP-007. As such, change management requirements in Requirement R1, Part 1.1 needed to not just focus on documenting changes to those controls but rather control the authorization of those changes. To that end, proposed Requirement R1, Part 1.1 requires Responsible Entities to authorize changes that affect Applicable Systems where those changes alter the behavior of one or more cyber security controls, excluding procedural or physical controls, serving one or more requirement parts in

CIP-005 and CIP-007, as defined by the Responsible Entity. With this revision, aspects of current Requirement R1, Parts 1.2 and 1.3, which both relate to using a baseline configuration for change management, are incorporated into the security objective of proposed Requirement R1, Part 1.1.

With the consolidation of current Requirement R1, Parts 1.1 through 1.3 into the security objective of proposed Requirement R1, Part 1.1, proposed Requirement R1, Part 1.2 is a revised current Requirement R1, Part 1.5. The revisions are mostly conforming in that they remove references to baseline configuration and remove the "where technically feasible" language. Instead of "where technically feasible" language, the drafting team determined a CIP Exceptional Circumstance more appropriate to support Responsible Entities' recovering from events or conditions more swiftly.

Proposed Requirement R1, Part 1.3 now maps to the current Requirement R1, Part 1.6, one of the supply chain requirements to verify the integrity of software and the identify of its source. The proposed revisions to Requirement R1, Part 1.3 are mostly conforming, with removal of references to baseline configuration.

Based on the identification of controls in CIP-005 and CIP-007 in proposed Requirement R1, Part 1.1, proposed Requirement R1, Part 1.4 simplifies the current requirement to ensure that altered controls in those standards are not adversely affected. The drafting team also added the language "as part of the changes authorized per Requirement R1, Part 1.1" to indicate that a Responsible Entity should verify that the controls are not adversely affected before closing out those changes.

b. Requirement R2

The modifications in proposed Requirement R2 adjust the scope of configuration monitoring requirements to conform with revisions to Requirement R1 and support the additional Applicable System (SCI supporting high impact BES Cyber Systems and associated EACMS and PCA). To achieve this scope adjustment, proposed Requirement R2, Part 2.1 requires Responsible Entities to implement methods to monitor certain unauthorized changes that affect Applicable Systems. The unauthorized changes subject to monitoring under Requirement R2, Part 2.1 are those changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-007, as defined by the Responsible Entity. Such entity-defined controls must include at least one cyber security control for each of the following seven controls: (1) Configuration on each Applicable System that affects its routable protocol network accessibility; (2) Configuration of CPU or memory sharing of Virtual Cyber Assets on Shared Cyber Infrastructure; (3) Installation, removal, and update of operating system, firmware, software, and cyber security patches; (4) Configuration of malicious code protection methods; (5) Configuration of security event logging or alerting; (6) Configuration of authentication methods; and (7) Changes to the enabled or disabled status of accounts. The Project 2016-02 drafting team added "per system capability" to indicate that an Applicable System may not have one of the seven controls configured on an applicable system (e.g., there may be no sharing of Virtual Cyber Assets on a Shared Cyber Infrastructure), so a Responsible Entity would not be expected to monitor controls it does not have. Proposed Requirement R2, Part 2.1 retains the requirement to document and investigate detected unauthorized changes.

In scoping the controls subject to monitoring, the drafting team focused on a subset of the controls at the center of proposed Requirement R1, Part 1.1. The intent behind this was to focus change management on those controls responsible for maintaining a Cyber System's security posture, such as those supporting systems security management in proposed CIP-007-7. The Project 2016-02 drafting team also determined these controls likely had the capability for automated monitoring.

The Project 2016-02 drafting team used the phrase "that include at least one cyber security control for each of the following" to allow Responsible Entities to monitor a primary security control if they have multiple overlapping controls. The Project 2016-02 drafting team's intent is that having multiple security controls over these categories is a good and beneficial practice where possible, and entities should not be discouraged from having more than one. This allows the Responsible Entity to choose the primary control it monitors for unauthorized changes. The Responsible Entity may of course monitor more than one, but one is required.

Additionally, the Project 2016-02 drafting team added "per system capability" in recognition that not all changes in scope can be monitored on every Cyber System. The intent is not for the 'per system capability' language to exclude manual monitoring methods from the scope of proposed Part 2.1. Rather, the Project 2016-02 drafting team's intent when using the "per system capability" language is to keep the scope of Requirement R2 to those things for which automated solutions are available and more likely to be monitored and alerted for changes. To that end, the word "system" in "per system capability" refers to the Applicable Systems for the requirement, and not the capability of the automated tool used to monitor. As a result, the "per system capability" language does not absolve Responsible Entities of the obligation to implement monitoring methods where automated solutions have not been implemented.

Accordingly, manual methods to accomplish the same results where automated monitoring cannot be done remains a requirement where the Applicable System is capable of producing data related to the list of seven cyber security-related categories to monitor.

c. Requirement R3

Proposed Requirement R3 requires Responsible Entities to implement a process regarding vulnerability assessments of Applicable Systems. Proposed Requirement R3, Parts 3.1 and 3.2 add Shared Cyber Infrastructure as an Applicable System and include conforming changes to reflect the change from only requiring baseline configurations. Proposed Requirement R3, Part 3.3 includes revisions that reflect the dynamic nature of virtualized technologies. As such, the proposed requirement part requires the vulnerability assessment at a point prior to the Virtual Cyber Asset being instantiated, with the "production" connectivity it requires, to perform its function either as a part of a BES Cyber System, as an Electronic Access Control or Monitoring System, or as a Protected Cyber Asset. As it begins to perform those functions of Applicable Systems, it becomes an "Applicable System" at that point, and the Responsible Entity should have already performed the vulnerability assessment. In the case of a remediation Virtual Local Area Network, this may be performed automatically at every instantiation. The proposed change recognizes that Virtual Cyber Assets do not need to be created first in a separate hardware environment and then somehow imported when the vulnerability assessment can safely be performed in a "production environment."

d. Requirement R4

Proposed Requirement R4 requires Responsible Entities to implement a plan to manage Transient Cyber Assets and Removable Media. The proposed revisions within Requirement R4 are mostly conforming and add the term Shared Cyber Infrastructure where appropriate. The proposed revisions within Attachment 1 to Requirement R4 also align language with that in Attachment 1 of proposed CIP-003-10. A clean and redline version of proposed CIP-010-5 is included in **Exhibit A-9**, with additional technical rationale provided in **Exhibit E-9**.

11. Reliability Standard CIP-011-4

Proposed Reliability Standard CIP-011-4 specifies information protection requirements to safeguard BES Cyber System Information. The proposed revisions add information protection requirements to Shared Cyber Infrastructure and apply reuse and disposal requirements at a system versus asset level. Proposed Requirement R1 requires Responsible Entities to implement a documented information protection program(s) that includes the applicable requirement parts. Proposed Requirement R2 requires Responsible Entities to implement documented processes regarding BES Cyber Asset reuse and disposal, consistent with the applicable requirement parts. A clean and redline version of proposed CIP-011-4 is included in **Exhibit A-10**, with additional technical rationale provided in **Exhibit E-10**.

12. Reliability Standard CIP-013-3

Proposed Reliability Standard CIP-013-3 requires Responsible Entities to consider and address cyber security risks from vendor products or services during planning for the procurement of BES Cyber Systems as well as Electronic Access Control or Monitoring Systems and Physical Access Control Systems. Proposed Reliability Standard CIP-013-3 includes three requirements: (1) Requirement R1 requires a Responsible Entity to develop documented supply chain cyber security risk management plan(s) and includes requirement parts detailing the processes to include in the plan; (2) Requirement R2 requires Responsible Entities to implement the plan(s); and (3) Requirement R3 requires review and CIP Senior Manager, or delegate, approval of the plan(s) at least once every 15 calendar months. The proposed revisions extend these supply chain risk management requirements to Shared Cyber Infrastructure. A clean and redline version of proposed CIP-013-3 is included in **Exhibit A-11**, with additional technical rationale provided in **Exhibit E-11**.

F. Other Modifications

To facilitate the proposed changes discussed in Sections IV.A through IV.E supra, there were several other modifications throughout the CIP Reliability Standards that are clarifying or conforming changes but not as substantive as other revisions described in Section IV. For example, the drafting team proposes clarifications of the term "between discrete Electronic Security Perimeters" by modifying the Applicability exemptions section of the CIP Reliability Standards to add Section 4.2.3.3. The proposed section recognizes that the ability to move workloads or virtual machines across different sites for increased resiliency can require different sites to be connected as a flat network without layer 3 Electronic Security Perimeters at each discrete site (e.g., a layer 2 adjacency across the sites). As a result, a "super ESP" is created across the sites and thus an exemption based on having a discrete layer 3 Electronic Security Perimeter at each site no longer works to exclude, for example, the network transport equipment that may belong to carriers, which was the intent behind current Applicability Section 4.2.3.2.

As described above in Section IV.E.5, when extending an Electronic Security Perimeter between geographic locations, the requirement in proposed CIP-005-8 to protect the confidentiality and integrity of the data (typically through encryption) between the relevant Physical Security Perimeters applies. This exemption in proposed Applicability Section 4.2.3.3 then covers the related Cyber Systems "between" those encryption points but does not exclude the endpoints performing the encryption.

There are several other revisions throughout the proposed standards that are administrative in nature, such as use of acronyms, streamlining the Violation Severity Levels, removing functional entities no longer subject to Reliability Standards, and removing the non-enforceable Background and Guidelines and Technical Basis sections to separate technical rationale documents.

In addition, as proposed Reliability Standards CIP-002-7, CIP-006-7, CIP-007-7 and CIP-009-7 have not been modified in several years, there are some more administrative updates within those standards. As such, the proposed Reliability Standards contain a number of minor modifications to align the standard with revisions to other standards or initiatives in other areas. These changes are shown in clean and redline in **Exhibits A-1, A-5, A-6, and A-8** and are summarized below.

First, the proposed modifications would remove Interchange Coordinator or Interchange Authority from the Applicability section of proposed Reliability Standards CIP-002-7, CIP-006-7, CIP-007-7, and CIP-009-7. This revision is consistent with FERC-approved changes to the NERC Compliance Registry under the risk-based registration initiative.[53]

Second, the proposed modifications replace the term "Special Protection Systems" with the term "Remedial Action Schemes," consistent with similar revisions made to other NERC Reliability Standards.[54] This change occurs in the following locations:

- Applicability subsections 4.1.2.2 and 4.2.1.2 in proposed CIP-002-7, CIP-006-7, CIP-007-7, and CIP-009-7;
- Proposed CIP-002-7, Requirement R1;

---

[53] *N. Am. Elec. Reliability Corp.*, 150 FERC ¶ 61,213 (2015) (approving removal of the Purchasing Selling Entity and Interchange Authority/Coordinator from the NERC Compliance Registry).

[54] In Order No. 818, the Commission approved NERC's revised definition of the term "Remedial Action Scheme" and approved certain Reliability Standards in which references to the term "Special Protections Systems" were removed and replaced with the term "Remedial Action Schemes." *Revisions to Emergency Operations Reliability Standards; Revisions to Undervoltage Load Shedding Reliability Standards; Revisions to the Definition of "Remedial Action Scheme" and Related Reliability Standards*, Order No. 818, 153 FERC ¶ 61,228 (2015).

- Proposed CIP-002-7, Attachment 1, medium impact rating criterion 2.9; and
- Proposed CIP-002-7, low impact rating criterion 3.5.

Finally, proposed CIP-002-7, Requirement R2 begins with the word "**Each** Responsible Entity shall:", instead of "~~**The**~~ Responsible Entity shall:", to conform with Requirement R1 language and other requirements in the CIP suite of standards.

G. Enforceability of Proposed Reliability Standards

The proposed Reliability Standards also include measures that support each requirement by clearly identifying what is required and how NERC and the Regional Entities will enforce the requirement. These measures help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.[55] Additionally, the proposed Reliability Standards include VRFs and VSLs. The VRFs and VSLs provide guidance on the way that NERC and the Regional Entities will enforce the requirements of the proposed Reliability Standards. The VRFs and VSLs for the proposed Reliability Standards comport with NERC and Commission guidelines related to their assignment. **Exhibit F** provides a detailed review of the VRFs and VSLs, and the analysis of how the VRFs and VSLs were determined using these guidelines.

As the proposed Reliability Standards incorporate security objectives into requirements, the Compliance Monitoring and Enforcement Program[56] processes and procedures provide effective tools for monitoring and enforcing those security objectives. NERC and the Regional Entities will use existing risk-based compliance monitoring processes to effectively monitor compliance with the new Reliability Standards requirements. As with any new Reliability

[56] NERC, *Rules of Procedure*, Section 400 et. seq.; Appendices 4B and 4C, https://www.nerc.com/AboutNERC/RulesOfProcedure/NERC%20ROP%20effective%2020220825_with%20appendicies.pdf.

Standard, NERC and the Regional Entities expect to provide some training and collaboration on the security objectives to ensure that monitoring staff possess the necessary subject matter expertise to employ professional judgment in assessing compliance, consistent with applicable auditing principles.[57] In addition, NERC and the Regional Entities will consider using stakeholder engagement efforts, such as Small Group Advisory Sessions or entity assist visits, as appropriate, to help ensure both Responsible Entities and monitoring staff are prepared for implementation.

Should a Potential Noncompliance[58] go through enforcement processes for disposition, the existing enforcement processes provide effective means for assessing such findings in a fair and non-preferential manner. For each finding assessed, NERC and the Regional Entities consider the facts and circumstances surrounding each violation and use professional judgment to assess whether security objectives were met, consistent with the FERC-approved Sanction Guidelines.[59] This ensures that enforcement actions bear a reasonable relationship to the seriousness of the violation.[60] In applying such guidelines to requirements with security objectives, NERC and the Regional Entities can follow a repeatable process while ensuring each Responsible Entity is treated fairly based on the unique facts and circumstances of each Potential Noncompliance.

[60] *Id.*

V. EFFECTIVE DATE

NERC respectfully requests that the Commission approve the proposed Reliability Standards and associated definitions to become effective as set forth in the proposed Implementation Plan, provided in **Exhibit B** hereto. The proposed Implementation Plan provides that the proposed Reliability Standards and definitions shall become effective on the later of: (1) April 1, 2026; or (2) the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the Reliability Standards and definitions, or as otherwise provided for by the applicable governmental authority. The proposed implementation timeframe balances the urgency to implement the requirements with the time needed to develop any relevant capabilities.

The proposed Implementation Plan also permits Responsible Entities to elect to comply with the proposed Reliability Standards and associated definitions following Commission approval but prior to their effective date, provided the Responsible Entity notifies its applicable Regional Entities as stated in the Implementation Plan. This option allows Responsible Entities to implement the appropriate controls for virtualized technologies as soon as feasible or continue with configurations currently allowed under the CIP Reliability Standards but update their compliance documentation in a manner appropriate for their schedules. The early adoption dates are limited to three instances to better support Regional Entity tracking of Responsible Entities' availing themselves of this provision in the Implementation Plan:

> <u>Early adoption option 1</u>: First day of the first calendar quarter that is six (6) months after the effective date of the applicable governmental authority's order approving the proposed Reliability Standards and definitions
>
> <u>Early adoption option 2</u>: First day of the first calendar quarter that is twelve (12) months after the effective date of the applicable governmental authority's order approving the proposed Reliability Standards and definitions.

> Early adoption option 3: First day of the first calendar quarter that is eighteen (18) months after the effective date of the applicable governmental authority's order approving the proposed Reliability Standards and definitions.

In addition, the proposed Implementation Plan carries forward the planned and unplanned changes section that has been used in implementation plans associated with previous versions of the CIP Reliability Standards.

VI. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- proposed Reliability Standards, and associated elements included in **Exhibit A**, effective as proposed herein;
- the proposed Implementation Plan included in **Exhibit B**; and
- the retirement of Reliability Standards effective as proposed herein.

Respectfully submitted,

/s/ Marisa Hecht

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A

Proposed Reliability Standards

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-1

Proposed Reliability Standard CIP-002-7
Clean

A. Introduction

1. **Title:** Cyber Security — BES Cyber System Categorization

2. **Number:** CIP-002-7

3. **Purpose:** To identify and categorize BES Cyber Systems (BCS) and their associated BES Cyber Assets (BCA) for the application of cyber security requirements commensurate with the adverse impact that loss, compromise, or misuse of those BCS could have on the reliable operation of the Bulk Electric System (BES). Identification and categorization of BCS support appropriate protection against compromises that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

      4.1.1. **Balancing Authority**

      4.1.2. **Distribution Provider that owns** one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

         4.1.2.1. Each underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) system that:

            4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

            4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

         4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-002-7:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”

B. Requirements and Measures

R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of Parts 1.1 through 1.3: *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

i. Control Centers and backup Control Centers;

ii. Transmission stations and substations;

iii. Generation resources;

iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;

v. RAS that support the reliable operation of the BES; and

vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

1.1. Identify each of the high impact BCS according to Attachment 1, Section 1, if any, at each asset;

1.2. Identify each of the medium impact BCS according to Attachment 1, Section 2, if any, at each asset; and

1.3. Identify each asset that contains a low impact BCS according to Attachment 1, Section 3, if any (a discrete list of low impact BCS is not required).

M1. Acceptable evidence includes, but is not limited to, dated electronic or physical lists required by Requirement R1.

R2. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1 Review the identifications in Requirement R1 and its parts (and update them if there are changes identified) at least once every 15 calendar months, even if it has no identified items in Requirement R1, and

2.2 Have its CIP Senior Manager or delegate approve the identifications required by Requirement R1 at least once every 15 calendar months, even if it has no identified items in Requirement R1.

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has reviewed and updated, where necessary, the identifications required in Requirement R1 and its parts, and has had its CIP Senior Manager or delegate approve the identifications required in Requirement R1 and its parts at least once every 15 calendar months, even if it has none identified in Requirement R1 and its parts, as required by Requirement R2.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-002-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, five percent or fewer BES assets have not been considered according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, 2 or fewer BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BCS, five percent or fewer of identified BCS have not been categorized or have been incorrectly categorized at a lower category; OR For Responsible Entities with a total of 100 or fewer high and medium impact BCS, five or	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than five percent but less than or equal to 10 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than two, but fewer than or equal to four BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BCS, more than five percent but less than or equal to 10 percent of identified BCS have not been categorized or have been incorrectly categorized at a lower category;	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than 10 percent but less than or equal to 15 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than four, but fewer than or equal to six BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high or medium impact BCS, more than 10 percent but less than or equal to 15 percent of identified BCS have not been categorized or have been incorrectly categorized at a lower category;	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than 15 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than six BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BCS, more than 15 percent of identified BCS have not been categorized or have been incorrectly categorized at a lower category; OR For Responsible Entities with a total of 100 or fewer high and medium impact BCS, more

Attachment 1 – Impact Rating Criteria

Impact Rating Criteria

The criteria defined in Attachment 1 do not constitute stand-alone compliance requirements, but are criteria characterizing the level of impact and are referenced by requirements.

1. **High impact rating**

   Each BCS used by and located at any of the following:

   1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.

   1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority: 1) for generation equal to or greater than an aggregate of 3000 MW in a single Interconnection, or 2) for one or more of the assets that meet criterion 2.3, 2.6, or 2.9.

   1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator for one or more of the assets that meet criterion 2.2, 2.4, 2.5, 2.7, 2.8, 2.9, or 2.10.

   1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generator Operator for one or more of the assets that meet criterion 2.1, 2.3, 2.6, or 2.9.

2. **Medium impact rating**

   Each BCS, not included in Section 1 above, associated with any of the following:

   2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BCS that meet this criterion are each discrete shared BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

   2.2. Each BES reactive resource or group of resources at a single location (excluding generation Facilities) with an aggregate maximum Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities). The only BCS that meet this criterion are each discrete shared BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR.

   2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates, and informs the Generator Owner or Generator Operator, as necessary to avoid an Adverse Reliability Impact in the planning horizon of more than one year.

   2.4. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

   2.5. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

2.6. Generation at a single plant location or Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

2.7. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

2.8. Transmission Facilities, including generation interconnection Facilities, providing the generation interconnection required to connect generator output to the Transmission Systems that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the generation Facilities identified by any Generator Owner as a result of its application of Attachment 1, criterion 2.1 or 2.3.

2.9. Each RAS or automated switching System that operates BES Elements, that, if destroyed, degraded, misused, or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed or cause a reduction in one or more IROLs if destroyed, degraded, misused, or otherwise rendered unavailable.

2.10. Each system or group of Elements that performs automatic Load shedding under a common control system, without human operator initiation, of 300 MW or more implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) under a load shedding program that is subject to one or more requirements in a NERC or regional reliability standard.

2.11. Each Control Center or backup Control Center, not already included in high impact rating above, used to perform the functional obligations of the Generator Operator for an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection.

2.12. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator not included in high impact rating, above.

2.13. Each Control Center or backup Control Center, not already included in high impact rating above, used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

3. Low impact rating

BCS not included in Sections 1 or 2 above that are associated with any of the following assets and that meet the applicability qualifications in Section 4 - Applicability, part 4.2 – Facilities, of this standard:

3.1. Control Centers and backup Control Centers.

3.2. Transmission stations and substations.

3.3. Generation resources.

3.4. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements.

3.5. RAS that support the reliable operation of the Bulk Electric System.

3.6. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

Exhibit A-1

Proposed Reliability Standard CIP-002-7
Redline

A. Introduction

1. **Title:** Cyber Security — BES Cyber System Categorization

2. **Number:** CIP-002-~~5.1a~~7

3. **Purpose:** To identify and categorize BES Cyber Systems (BCS) and their associated BES Cyber Assets (BCA) for the application of cyber security requirements commensurate with the adverse impact that loss, compromise, or misuse of those ~~BES Cyber Systems~~BCS could have on the reliable operation of the ~~BES.~~Bulk Electric System (BES). Identification and categorization of ~~BES Cyber Systems~~BCS support appropriate protection against compromises that could lead to misoperation or instability in the BES.

4. **Applicability:**

    4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. **Balancing Authority**

    4.1.2. **Distribution Provider that owns** one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each ~~Special Protection System or~~ Remedial Action Scheme (RAS) where the ~~Special Protection System or Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and

including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

~~**4.1.5. Interchange Coordinator or Interchange Authority**~~

~~4.1.6.~~4.1.5. Reliability Coordinator

~~4.1.7.~~4.1.6. Transmission Operator

~~4.1.8.~~4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. ~~Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme~~Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. **Exemptions:** The following are exempt from Standard CIP-002-~~5.1a~~7:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4.**~~**4.2.3.5.** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~**5.**~~ **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan"

~~1. **24 Months Minimum –** CIP-002-5.1a shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.~~

~~2. In those jurisdictions where no regulatory approval is required CIP-002-5.1a shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~**6. Background:**~~

~~This standard provides "bright-line" criteria for applicable Responsible Entities to categorize their BES Cyber Systems based on the impact of their associated Facilities, systems, and equipment, which, if destroyed, degraded, misused, or otherwise rendered unavailable, would affect the reliable operation of the Bulk Electric System. Several concepts provide the basis for the approach to the standard.~~

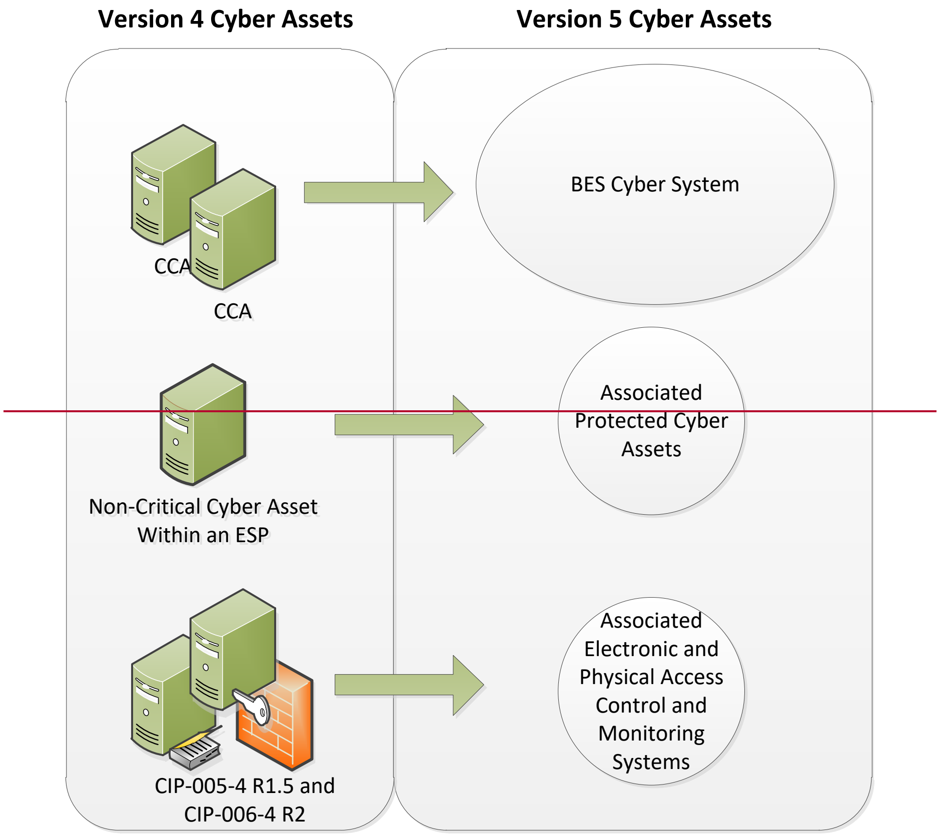
~~Throughout the standards, unless otherwise stated, bulleted items in the requirements are items that are linked with an "or," and numbered items are items that are linked with an "and."~~

5. ~~Many references in the Applicability section and the criteria in Attachment 1 of CIP-002 use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS,~~

~~which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~BES Cyber Systems~~

~~One of the fundamental differences between Versions 4 and 5 of the CIP Cyber Security Standards is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change results from the drafting team's review of the NIST Risk Management Framework and the use of an analogous term "information system" as the target for categorizing and applying security controls.~~



~~In transitioning from Version 4 to Version 5, a BES Cyber System can be viewed simply as a grouping of Critical Cyber Assets (as that term is used in Version 4). The CIP Cyber Security Standards use the "BES Cyber System" term primarily to provide a higher level for referencing the object of a requirement. For example, it becomes possible to apply requirements dealing with recovery and malware protection to a grouping rather than individual Cyber Assets, and it becomes clearer in the requirement that malware protection applies to the system as a whole and may not be necessary for every individual device to comply.~~

~~Another reason for using the term “BES Cyber System” is to provide a convenient level at which a Responsible Entity can organize their documented implementation of the requirements and compliance evidence. Responsible Entities can use the well-developed concept of a *security plan* for each BES Cyber System to document the programs, processes, and plans in place to comply with security requirements.~~

~~It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System. For example, the Responsible Entity might choose to view an entire plant control system as a single BES Cyber System, or it might choose to view certain components of the plant control system as distinct BES Cyber Systems. The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.~~

~~Reliable Operation of the BES~~

~~The scope of the CIP Cyber Security Standards is restricted to BES Cyber Systems that would impact the reliable operation of the BES. In order to identify BES Cyber Systems, Responsible Entities determine whether the BES Cyber Systems perform or support any BES reliability function according to those reliability tasks identified for their reliability function and the corresponding functional entity’s responsibilities as defined in its relationships with other functional entities in the NERC Functional Model. This ensures that the *initial* scope for consideration includes only those BES Cyber Systems and their associated BES Cyber Assets that perform or support the reliable operation of the BES. The definition of BES Cyber Asset provides the basis for this scoping.~~

~~Real-time Operations~~

~~One characteristic of the BES Cyber Asset is a real-time scoping characteristic. The time horizon that is significant for BES Cyber Systems and BES Cyber Assets subject to the application of these Version 5 CIP Cyber Security Standards is defined as that which is material to real-time operations for the reliable operation of the BES. To provide a better defined time horizon than “Real-time,” BES Cyber Assets are those Cyber Assets that, if rendered unavailable, degraded, or misused, would adversely impact the reliable operation of the BES within 15 minutes of the activation or exercise of the compromise. This time window must not include in its consideration the activation of redundant BES Cyber Assets or BES Cyber Systems: from the cyber security standpoint, redundancy does not mitigate cyber security vulnerabilities.~~

~~Categorization Criteria~~

~~The criteria defined in Attachment 1 are used to categorize BES Cyber Systems into impact categories. Requirement 1 only requires the discrete identification of BES~~

~~Cyber Systems for those in the high impact and medium impact categories. All BES Cyber Systems for Facilities not included in Attachment 1 – Impact Rating Criteria, Criteria 1.1 to 1.4 and Criteria 2.1 to 2.11 default to be low impact.~~

~~This general process of categorization of BES Cyber Systems based on impact on the reliable operation of the BES is consistent with risk management approaches for the purpose of application of cyber security requirements in the remainder of the Version 5 CIP Cyber Security Standards.~~

~~Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets that are associated with BES Cyber Systems~~

~~BES Cyber Systems have associated Cyber Assets, which, if compromised, pose a threat to the BES Cyber System by virtue of: (a) their location within the Electronic Security Perimeter (Protected Cyber Assets), or (b) the security control function they perform (Electronic Access Control or Monitoring Systems and Physical Access Control Systems). These Cyber Assets include:~~

> **~~Electronic Access Control or Monitoring Systems (“EACMS”)~~** ~~– Examples include: Electronic Access Points, Intermediate Systems, authentication servers (e.g., RADIUS servers, Active Directory servers, Certificate Authorities), security event monitoring systems, and intrusion detection systems.~~
>
> **~~Physical Access Control Systems (“PACS”)~~**~~– Examples include: authentication servers, card systems, and badge control systems.~~
>
> **~~Protected Cyber Assets (“PCA”)~~** ~~– Examples may include, to the extent they are within the ESP: file servers, ftp servers, time servers, LAN switches, networked printers, digital fault recorders, and emission monitoring systems.~~

B. Requirements and Measures

R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of ~~parts~~Parts 1.1 through 1.3: *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

- **i.** Control Centers and backup Control Centers;
- **ii.** Transmission stations and substations;
- **iii.** Generation resources;
- **iv.** Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;
- **v.** ~~Special Protection Systems~~RAS that support the reliable operation of the ~~Bulk Electric System~~BES; and
- **vi.** For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

1.1. Identify each of the high impact ~~BES Cyber Systems~~BCS according to Attachment 1, Section 1, if any, at each asset;

1.2. Identify each of the medium impact ~~BES Cyber Systems~~BCS according to Attachment 1, Section 2, if any, at each asset; and

1.3. Identify each asset that contains a low impact ~~BES Cyber System~~BCS according to Attachment 1, Section 3, if any (a discrete list of low impact ~~BES Cyber Systems~~BCS is not required).

M1. Acceptable evidence includes, but is not limited to, dated electronic or physical lists required by Requirement R1~~, and Parts 1.1 and 1.2~~.

R2. ~~The~~Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1~~—~~ Review the identifications in Requirement R1 and its parts (and update them if there are changes identified) at least once every 15 calendar months, even if it has no identified items in Requirement R1, and

2.2 Have its CIP Senior Manager or delegate approve the identifications required by Requirement R1 at least once every 15 calendar months, even if it has no identified items in Requirement R1.

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has reviewed and updated, where necessary, the identifications required in Requirement R1 and its parts, and has had its CIP Senior Manager or delegate approve the identifications required in Requirement R1 and its parts at least once every 15 calendar months, even if it has none identified in Requirement R1 and its parts, as required by Requirement R2.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the~~ "Compliance Enforcement Authority ~~("CEA") unless the applicable~~" means NERC or the Regional Entity, or any entity ~~is owned, operated, or controlled~~as otherwise designated by ~~the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC~~ an Applicable Governmental Authority, in their respective roles of monitoring and/or ~~other applicable governmental authority shall serve as the CEA.~~enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and ~~Assessment Processes~~Enforcement Program:

- ~~Compliance Audit~~
- ~~Self-Certification~~
- ~~Spot Checking~~
- ~~Compliance Investigation~~
- ~~Self-Reporting~~
- ~~Complaint~~

~~**1.4. Additional Compliance Information**~~

- ~~None~~

~~2. Table of Compliance Elements~~

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3. Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5.1	9/30/13	Replaced “Devices” with “Systems” in a definition in background section.	Errata
5.1	11/22/13	FERC Order issued approving CIP-002-5.1.	
5.1a	11/02/16	Adopted by the NERC Board of Trustees.	
5.1a	12/14/2016	FERC letter Order approving CIP-002-5.1a. Docket No. RD17-2-000.	
6	5/14/2020	Adopted by the NERC Board of Trustees.	Modified Criterion 2.12.
7	TBD	Virtualization Modifications	

Attachment 1 – Impact Rating Criteria

Impact Rating Criteria

The criteria defined in Attachment 1 do not constitute stand-alone compliance requirements, but are criteria characterizing the level of impact and are referenced by requirements.

1. High ~~Impact Rating (H)~~impact rating

Each ~~BES Cyber System~~BCS used by and located at any of the following:

1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.

1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority: 1) for generation equal to or greater than an aggregate of 3000 MW in a single Interconnection, or 2) for one or more of the assets that meet criterion 2.3, 2.6, or 2.9.

1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator for one or more of the assets that meet criterion 2.2, 2.4, 2.5, 2.7, 2.8, 2.9, or 2.10.

1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generator Operator for one or more of the assets that meet criterion 2.1, 2.3, 2.6, or 2.9.

2. Medium ~~Impact Rating (M)~~impact rating

Each ~~BES Cyber System~~BCS, not included in Section 1 above, associated with any of the following:

2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only ~~BES Cyber Systems~~BCS that meet this criterion are ~~those~~each discrete shared ~~BES Cyber Systems~~BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

2.2. Each BES reactive resource or group of resources at a single location (excluding generation Facilities) with an aggregate maximum Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities). The only ~~BES Cyber Systems~~BCS that meet this criterion are ~~those~~each discrete shared ~~BES Cyber Systems~~BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR.

2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates, and informs the Generator Owner or Generator Operator, as necessary to avoid an Adverse Reliability Impact in the planning horizon of more than one year.

2.4. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2.5. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

2.6. Generation at a single plant location or Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

2.7. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

2.8. Transmission Facilities, including generation interconnection Facilities, providing the generation interconnection required to connect generator output to the Transmission Systems that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the generation Facilities identified by any Generator Owner as a result of its application of Attachment 1, criterion 2.1 or 2.3.

2.9. Each ~~Special Protection System (SPS), Remedial Action Scheme (~~RAS~~),~~ or automated switching System that operates BES Elements, that, if destroyed, degraded, misused, or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed or cause a reduction in one or more IROLs if destroyed, degraded, misused, or otherwise rendered unavailable.

2.10. Each system or group of Elements that performs automatic Load shedding under a common control system, without human operator initiation, of 300 MW or more implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) under a load shedding program that is subject to one or more requirements in a NERC or regional reliability standard.

2.11. Each Control Center or backup Control Center, not already included in ~~High Impact Rating (H)~~high impact rating above, used to perform the functional obligations of the Generator Operator for an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection.

2.12. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator not included in ~~High Impact Rating (H),~~high impact rating, above.

2.13. Each Control Center or backup Control Center, not already included in ~~High Impact Rating (H)~~high impact rating above, used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

3. Low ~~Impact Rating (L)~~impact rating

~~BES Cyber Systems~~BCS not included in Sections 1 or 2 above that are associated with any of the following assets and that meet the applicability qualifications in Section 4 - Applicability, part 4.2 – Facilities, of this standard:

3.1. Control Centers and backup Control Centers.

3.2. Transmission stations and substations.

3.3. Generation resources.

3.4. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements.

3.5. ~~Special Protection Systems~~RAS that support the reliable operation of the Bulk Electric System.

3.6. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

~~Guidelines and Technical Basis~~

~~Section 4 – Scope of Applicability of the CIP Cyber Security Standards~~

~~Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.~~

~~Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.~~

~~Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the qualified set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards. This section is especially significant in CIP-002-5.1a and represents the total scope of Facilities, systems, and equipment to which the criteria in Attachment 1 apply. This is important because it determines the balance of these Facilities, systems, and equipment that are Low Impact once those that qualify under the High and Medium Impact categories are filtered out.~~

~~For the purpose of identifying groups of Facilities, systems, and equipment, whether by location or otherwise, the Responsible Entity identifies assets as described in Requirement R1 of CIP-002-5.1a. This is a process familiar to Responsible Entities that have to comply with versions 1, 2, 3, and 4 of the CIP standards for Critical Assets. As in versions 1, 2, 3, and 4, Responsible Entities may use substations, generation plants, and Control Centers at single site locations as identifiers of these groups of Facilities, systems, and equipment.~~

~~CIP-002-5.1a~~

~~CIP-002-5.1a requires that applicable Responsible Entities categorize their BES Cyber Systems and associated BES Cyber Assets according to the criteria in Attachment 1. A BES Cyber Asset includes in its definition, "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact the reliable operation of the BES."~~

~~The following provides guidance that a Responsible Entity may use to identify the BES Cyber Systems that would be in scope. The concept of BES reliability operating service is useful in providing Responsible Entities with the option of a defined process for scoping those BES Cyber~~

~~Systems that would be subject to CIP-002-5.1a. The concept includes a number of named BES reliability operating services. These named services include:~~

~~Dynamic Response to BES conditions~~
~~Balancing Load and Generation~~
~~Controlling Frequency (Real Power)~~
~~Controlling Voltage (Reactive Power)~~
~~Managing Constraints~~
~~Monitoring & Control~~
~~Restoration of BES~~
~~Situational Awareness~~
~~Inter-Entity Real-Time Coordination and Communication~~

~~Responsibility for the reliable operation of the BES is spread across all Entity Registrations. Each entity registration has its own special contribution to reliable operations and the following discussion helps identify which entity registration, in the context of those functional entities to which these CIP standards apply, performs which reliability operating service, as a process to identify BES Cyber Systems that would be in scope. The following provides guidance for Responsible Entities to determine applicable reliability operations services according to their Function Registration type.~~

~~**Entity Registration**~~	~~**RC**~~	~~**BA**~~	~~**TOP**~~	~~**TO**~~	~~**DP**~~	~~**GOP**~~	~~**GO**~~
~~Dynamic Response~~		~~X~~	~~X~~	~~X~~	~~X~~	~~X~~	~~X~~

~~Controlling Voltage~~			~~X~~	~~X~~	~~X~~		~~X~~
~~Managing Constraints~~	~~X~~		~~X~~			~~X~~	
~~Monitoring and Control~~			~~X~~			~~X~~	
~~Restoration~~			~~X~~			~~X~~	
~~Situation Awareness~~	~~X~~	~~X~~	~~X~~			~~X~~	
~~Inter-Entity coordination~~	~~X~~	~~X~~	~~X~~	~~X~~		~~X~~	~~X~~

~~**Dynamic Response**~~

~~The Dynamic Response Operating Service includes those actions performed by BES Elements or subsystems which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition. The types of dynamic responses that may be considered as potentially having an impact on the BES are:~~

- ~~Spinning reserves (contingency reserves)~~
    - ~~Providing actual reserve generation when called upon (GO,GOP)~~
    - ~~Monitoring that reserves are sufficient (BA)~~
- ~~Governor Response~~
    - ~~Control system used to actuate governor response (GO)~~
- ~~Protection Systems (transmission & generation)~~
    - ~~Lines, buses, transformers, generators (DP, TO, TOP, GO, GOP)~~
    - ~~Zone protection for breaker failure (DP, TO, TOP)~~
    - ~~Breaker protection (DP, TO, TOP)~~
    - ~~Current, frequency, speed, phase (TO,TOP, GO,GOP)~~
- ~~Special Protection Systems or Remedial Action Schemes~~
    - ~~Sensors, relays, and breakers, possibly software (DP, TO, TOP)~~
- ~~Under and Over Frequency relay protection (includes automatic load shedding)~~
    - ~~Sensors, relays & breakers (DP)~~
- ~~Under and Over Voltage relay protection (includes automatic load shedding)~~
    - ~~Sensors, relays & breakers (DP)~~
- ~~Power System Stabilizers (GO)~~

~~Balancing Load and Generation~~

~~The Balancing Load and Generation Operations Service includes activities, actions and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time. Aspects of the Balancing Load and Generation function include, but are not limited to:~~

- ~~Calculation of Area Control Error (ACE)~~
    - ~~Field data sources (real time tie flows, frequency sources, time error, etc) (TO, TOP)~~
    - ~~Software used to perform calculation (BA)~~
- ~~Demand Response~~
    - ~~Ability to identify load change need (BA)~~
    - ~~Ability to implement load changes (TOP,DP)~~
- ~~Manually Initiated Load shedding~~
    - ~~Ability to identify load change need (BA)~~
    - ~~Ability to implement load changes (TOP, DP)~~

- ~~Non-spinning reserve (contingency reserve)~~
  - ~~Know generation status, capability, ramp rate, start time (GO, BA)~~
  - ~~Start units and provide energy (GOP)~~

~~Controlling Frequency (Real Power)~~

~~The Controlling Frequency Operations Service includes activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Frequency function include, but are limited to:~~

- ~~Generation Control (such as AGC)~~
  - ~~ACE, current generator output, ramp rate, unit characteristics (BA, GOP, GO)~~
  - ~~Software to calculate unit adjustments (BA)~~
  - ~~Transmit adjustments to individual units (GOP)~~
  - ~~Unit controls implementing adjustments (GOP)~~
- ~~Regulation (regulating reserves)~~
  - ~~Frequency source, schedule (BA)~~
  - ~~Governor control system (GO)~~

~~Controlling Voltage (Reactive Power)~~

~~The Controlling Voltage Operations Service includes activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Voltage function include, but are not limited to:~~

- ~~Automatic Voltage Regulation (AVR)~~
  - ~~Sensors, stator control system, feedback (GO)~~
- ~~Capacitive resources~~
  - ~~Status, control (manual or auto), feedback (TOP, TO,DP)~~
- ~~Inductive resources (transformer tap changer, or inductors)~~
  - ~~Status, control (manual or auto), feedback (TOP,TO,DP)~~
- ~~Static VAR Compensators (SVC)~~
  - ~~Status, computations, control (manual or auto), feedback (TOP, TO,DP)~~

~~Managing Constraints~~

~~Managing Constraints includes activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES. Aspects of the Managing Constraints include, but are not limited to:~~

- ~~Available Transfer Capability (ATC) (TOP)~~
- ~~Interchange schedules (TOP, RC)~~
- ~~Generation re-dispatch and unit commit (GOP)~~
- ~~Identify and monitor SOL's & IROL's (TOP, RC)~~
- ~~Identify and monitor Flow gates (TOP, RC)~~

~~Monitoring and Control~~

~~Monitoring and Control includes those activities, actions and conditions that provide monitoring and control of BES Elements. An example aspect of the Control and Operation function is:~~

- ~~All methods of operating breakers and switches~~
  - ~~SCADA (TOP, GOP)~~
  - ~~Substation automation (TOP)~~

~~Restoration of BES~~

~~The Restoration of BES Operations Service includes activities, actions and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Aspects of the Restoration of BES function include, but are not limited to:~~

- ~~Restoration including planned cranking path~~
  - ~~Through black start units (TOP, GOP)~~
  - ~~Through tie lines (TOP, GOP)~~
- ~~Off-site power for nuclear facilities. (TOP, TO, BA, RC, DP, GO, GOP)~~
- ~~Coordination (TOP, TO, BA, RC, DP, GO, GOP)~~

~~Situational Awareness~~

~~The Situational Awareness function includes activities, actions and conditions established by policy, directive or standard operating procedure necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions. Aspects of the Situation Awareness function include:~~

- ~~Monitoring and alerting (such as EMS alarms) (TOP, GOP, RC,BA)~~
- ~~Change management (TOP,GOP,RC,BA)~~
- ~~Current Day and Next Day planning (TOP)~~
- ~~Contingency Analysis (RC)~~
- ~~Frequency monitoring (BA, RC)~~

~~Inter-Entity Coordination~~

~~The Inter-Entity coordination and communication function includes activities, actions, and conditions established by policy, directive, or standard operating procedure necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES. Aspects of the Inter-Entity Coordination and Communication function include:~~

- ~~Scheduled interchange (BA,TOP,GOP,RC)~~
- ~~Facility operational data and status (TO, TOP, GO, GOP, RC, BA)~~
- ~~Operational directives (TOP, RC, BA)~~

~~Applicability to Distribution Providers~~

~~It is expected that only Distribution Providers that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. Distribution Providers that do not own or operate any facility that qualifies are not subject to these standards. The qualifications are based on the requirements for registration as a Distribution Provider and on the requirements applicable to Distribution Providers in NERC Standard EOP-005.~~

~~Requirement R1:~~

~~Requirement R1 implements the methodology for the categorization of BES Cyber Systems according to their impact on the BES. Using the traditional risk assessment equation, it reduces the measure of the risk to an impact (consequence) assessment, assuming the vulnerability index of 1 (the Systems are assumed to be vulnerable) and a probability of threat of 1 (100 percent). The criteria in Attachment 1 provide a measure of the impact of the BES assets supported by these BES Cyber Systems.~~

~~Responsible Entities are required to identify and categorize those BES Cyber Systems that have high and medium impact. BES Cyber Systems for BES assets not specified in Attachment 1, Criteria 1.1 – 1.4 and Criteria 2.1 – 2.11 default to low impact.~~

~~Attachment 1~~

~~Overall Application~~

~~In the application of the criteria in Attachment 1, Responsible Entities should note that the approach used is based on the impact of the BES Cyber System as measured by the bright-line criteria defined in Attachment 1.~~

- ~~When the drafting team uses the term "Facilities", there is some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases, the criteria refer to a group of Facilities in a given location that supports the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to consider only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that supports reliable operation of the BES, as the Facilities that are subject to the criteria for categorization of BES Cyber Systems. Generation Facilities are separately discussed in the Generation section below. In CIP-002-5.1a, these groups of Facilities, systems, and equipment are sometimes designated as BES assets. For example, an identified BES asset may be a named substation, generating plant, or Control Center. Responsible Entities have flexibility in how they group Facilities, systems, and equipment at a location.~~
- ~~In certain cases, a BES Cyber System may be categorized by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that result in the categorization. This will avoid inadvertent miscategorization when it no longer meets one of the criteria, but still meets another.~~
- ~~It is recommended that each BES Cyber System should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.~~

~~High Impact Rating (H)~~

~~This category includes those BES Cyber Systems, used by and at Control Centers (and the associated data centers included in the definition of Control Centers), that perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), or Generator Operator (GOP), as defined under the Tasks heading of the applicable Function and the Relationship with Other Entities heading of the functional entity in the NERC Functional Model, and as scoped by the qualification in Attachment 1, Criteria 1.1, 1.2, 1.3 and 1.4. While those entities that have been registered as the above-named functional entities are specifically referenced, it must be noted that there may be agreements where some~~

~~of the functional obligations of a Transmission Operator may be delegated to a Transmission Owner (TO). In these cases, BES Cyber Systems at these TO Control Centers that perform these functional obligations would be subject to categorization as high impact. The criteria notably specifically emphasize functional obligations, not necessarily the RC, BA, TOP, or GOP facilities. One must note that the definition of Control Center specifically refers to reliability tasks for RCs, Bas, TOPs, and GOPs. A TO BES Cyber System in a TO facility that does not perform or does not have an agreement with a TOP to perform any of these functional tasks does not meet the definition of a Control Center. However, if that BES Cyber System operates any of the facilities that meet criteria in the Medium Impact category, that BES Cyber System would be categorized as a Medium Impact BES Cyber System.~~

~~The 3000 MW threshold defined in criterion 1.2 for BA Control Centers provides a sufficient differentiation of the threshold defined for Medium Impact BA Control Centers. An analysis of BA footprints shows that the majority of Bas with significant impact are covered under this criterion.~~

~~Additional thresholds as specified in the criteria apply for this category.~~

~~Medium Impact Rating (M)~~

~~Generation~~

~~The criteria in Attachment 1's medium impact category that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are criteria 2.1, 2.3, 2.6, 2.9, and 2.11. Criterion 2.13 for BA Control Centers is also included here.~~

- ~~Criterion 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002, whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance." In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Bas in all regions.~~

  ~~In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements as proposed by NERC standard MOD-024 and current development efforts in that area.~~

  ~~By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of 1500 MW or more of generation at a single plant for a unit or group of units are adequately protected.~~

~~The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.~~

- ~~In Criterion 2.3, the drafting team sought to ensure that BES Cyber Systems for those generation Facilities that have been designated by the Planning Coordinator or Transmission Planner as necessary to avoid BES Adverse Reliability Impacts in the planning horizon of one year or more are categorized as medium impact. In specifying a planning horizon of one year or more, the intent is to ensure that those are units that are identified as a result of a "long term" reliability planning, i.e that the plans are spanning an operating period of at least 12 months: it does not mean that the operating day for the unit is necessarily beyond one year, but that the period that is being planned for is more than 1 year: it is specifically intended to avoid designating generation that is required to be run to remediate short term emergency reliability issues. These Facilities may be designated as "Reliability Must Run," and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.~~

  ~~If it is determined through System studies that a unit must run in order to preserve the reliability of the BES, such as due to a Category C3 contingency as defined in TPL-003, then BES Cyber Systems for that unit are categorized as medium impact.~~

  ~~The TPL standards require that, where the studies and plans indicate additional actions, that these studies and plans be communicated by the Planning Coordinator or Transmission Planner in writing to the Regional Entity/RRO. Actions necessary for the implementation of these plans by affected parties (generation owners/operators and Reliability Coordinators or other necessary party) are usually formalized in the form of an agreement and/or contract.~~

- ~~Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2,~~ ~~**Establish and Communicate System Operating Limits**~~~~, R5.1.1 and R5.1.3.~~

  ~~IROLs may be based on dynamic System phenomena such as instability or voltage collapse. Derivation of these IROLs and their associated contingencies often considers the effect of generation inertia and AVR response.~~

- ~~Criterion 2.9 categorizes BES Cyber Systems for Special Protection Systems and Remedial Action Schemes as medium impact. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Generator Operators which own BES Cyber Systems for such Systems and schemes designate them as medium impact.~~

- ~~Criterion 2.11 categorizes as medium impact BES Cyber Systems used by and at Control Centers that perform the functional obligations of the Generator Operator for an aggregate generation of 1500 MW or higher in a single interconnection, and that have not already been included in Part 1.~~

- ~~Criterion 2.13 categorizes as medium impact those BA Control Centers that “control” 1500 MW of generation or more in a single interconnection and that have not already been included in Part 1. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.~~

~~Transmission~~

~~The SDT uses the phrases “Transmission Facilities at a single station or substation” and “Transmission stations or substations” to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both “station” and “substation” to refer to the locations where groups of Transmission Facilities exist.~~

- ~~Criteria 2.2, 2.4 through 2.10, and 2.12 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a System to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). Criterion 2.2 includes BES Cyber Systems for those Facilities in Transmission Systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.~~

- ~~Criterion 2.4 includes BES Cyber Systems for any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion in the medium impact category.~~

~~It must be noted that if the collector bus for a generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation in Criterion 2.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility, and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface." This collector bus would not be a facility for a medium impact BES Cyber System because it does not significantly affect the 500kV Transmission grid; it only affects a plant which is below the generation threshold.~~

- ~~Criterion 2.5 includes BES Cyber Systems for facilities at the lower end of BES Transmission with qualifications for inclusion if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for significant impact on the BES, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES. The drafting team:~~

    - ~~Excluded radial facilities that would only provide support for single generation facilities.~~

    - ~~Specified interconnection to at least three transmission stations or substations to ensure that the level of impact would be appropriate.~~

~~The total aggregated weighted value of 3,000 was derived from weighted values related to three connected 345 kV lines and five connected 230 kV lines at a transmission station or substation. The total aggregated weighted value is used to account for the true impact to the BES, irrespective of line kV rating and mix of multiple kV rated lines.~~

~~Additionally, in NERC's document "Integrated Risk Assessment Approach – Refinement to Severity Risk Index", Attachment 1, the report used an average MVA line loading based on kV rating:~~

- ~~230 kV –> 700 MVA~~
- ~~345 kV –> 1,300 MVA~~
- ~~500 kV –> 2,000 MVA~~
- ~~765 kV –> 3,000 MVA~~

~~In the terms of applicable lines and connecting "other Transmission stations or substations" determinations, the following should be considered:~~

- ~~For autotransformers in a station, Responsible Entities have flexibility in determining whether the groups of Facilities are considered a single substation or station location or multiple substations or stations. In most cases, Responsible Entities would probably consider them as Facilities at a single substation or station unless geographically dispersed. In these cases of these transformers being within the "fence" of the substation or station, autotransformers may not count as separate~~

~~connections to other stations. The use of common BES Cyber Systems may negate any rationale for any consideration otherwise. In the case of autotransformers that are geographically dispersed from a station location, the calculation would take into account the connections in and out of each station or substation location.~~

- ~~Multiple-point (or multiple-tap) lines are considered to contribute a single weight value per line and affect the number of connections to other stations. Therefore, a single 230 kV multiple-point line between three Transmission stations or substations would contribute an aggregated weighted value of 700 and connect Transmission Facilities at a single station or substation to two other Transmission stations or substations.~~
- ~~Multiple lines between two Transmission stations or substations are considered to contribute multiple weight values per line, but these multiple lines between the two stations only connect one station to one other station. Therefore, two 345 kV lines between two Transmission stations or substations would contribute an aggregated weighted value of 2600 and connect Transmission Facilities at a single station or substation to one other Transmission station or substation.~~

~~Criterion 2.5's qualification for Transmission Facilities at a Transmission station or substation is based on 2 distinct conditions.~~

1. ~~The first condition is that Transmission Facilities at a single station or substation where that station or substation connect, at voltage levels of 200 kV or higher to three (3) other stations or substations, to three other stations or substations. This qualification is meant to ensure that connections that operate at voltages of 500 kV or higher are included in the count of connections to other stations or substations as well.~~
2. ~~The second qualification is that the aggregate value of all lines entering or leaving the station or substation must exceed 3000. This qualification does not include the consideration of lines operating at lower than 200 kV, or 500 kV or higher, the latter already qualifying as medium impact under criterion 2.4. : there is no value to be assigned to lines at voltages of less than 200 kV or 500 kV or higher in the table of values for the contribution to the aggregate value of 3000.~~

~~The Transmission Facilities at the station or substation must meet both qualifications to be considered as qualified under criterion 2.5.~~

- ~~Criterion 2.6 include BES Cyber Systems for those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2,~~ ~~**Establish and Communicate System Operating Limits**~~~~, R5.1.1 and R5.1.3.~~

- ~~Criterion 2.7 is sourced from the NUC-001 NERC standard, Requirement R9.2.2, for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown." In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.~~

- ~~Criterion 2.8 designates as medium impact those BES Cyber Systems that impact Transmission Facilities necessary to directly support generation that meet the criteria in Criteria 2.1 (generation Facilities with output greater than 1500 MW) and 2.3 (generation Facilities generally designated as "must run" for wide area reliability in the planning horizon). The Responsible Entity can request a formal statement from the Generation owner as to the qualification of generation Facilities connected to their Transmission systems.~~

- ~~Criterion 2.9 designates as medium impact those BES Cyber Systems for those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching Systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these BES Cyber Systems would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.~~

- ~~Criterion 2.10 designates as medium impact those BES Cyber Systems for Systems or Elements that perform automatic Load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of Criterion 2.10, and chose the term "Each" to represent that the criterion applied to a discrete System or Facility. In the drafting of this criterion, the drafting team sought to include only those Systems that did not require human operator initiation, and targeted in particular those underfrequency load shedding (UFLS) Facilities and systems and undervoltage load shedding (UVLS) systems and Elements that would be subject to a regional Load shedding requirement to prevent Adverse Reliability Impact. These include automated UFLS systems or UVLS systems that are capable of Load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as medium impact. The 300 MW threshold has been defined as the aggregate of the highest MW Load value, as defined by the applicable regional Load Shedding standards, for the preceding 12 months to account for seasonal fluctuations.~~

  ~~This particular threshold (300 MW) was provided in CIP, Version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market. In general, similar demand response programs that are not part of the NERC or regional reliability Load shedding programs, but are offered as components of an ancillary services market do not qualify under this criterion.~~

~~The language used in section 4 for UVLS and UFLS and in criterion 2.10 of Attachment 1 is designed to be consistent with requirements set in the PRC standards for UFLS and UVLS.~~

- ~~Criterion 2.12 categorizes as medium impact those BES Cyber Systems used by and at Control Centers and associated data centers performing the functional obligations of a Transmission Operator and that have not already been categorized as high impact.~~
- ~~Criterion 2.13 categorizes as Medium Impact those BA Control Centers that "control" 1500 MW of generation or more in a single Interconnection. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.~~

~~Low Impact Rating (L)~~

~~BES Cyber Systems not categorized in high impact or medium impact default to low impact. Note that low impact BES Cyber Systems do not require discrete identification.~~

~~Restoration Facilities~~

- ~~Several discussions on the CIP Version 5 standards suggest entities owning Blackstart Resources and Cranking Paths might elect to remove those services to avoid higher compliance costs. For example, one Reliability Coordinator reported a 25% reduction of Blackstart Resources as a result of the Version 1 language, and there could be more entities that make this choice under Version 5.~~

  ~~In response, the CIP Version 5 drafting team sought informal input from NERC's Operating and Planning Committees. The committees indicate there has already been a reduction in Blackstart Resources because of increased CIP compliance costs, environmental rules, and other risks; continued inclusion within Version 5 at a category that would very significantly increase compliance costs can result in further reduction of a vulnerable pool.~~

  ~~The drafting team moved from the categorization of restoration assets such as Blackstart Resources and Cranking Paths as medium impact (as was the case in earlier drafts) to categorization of these assets as low impact as a result of these considerations. This will not relieve asset owners of all responsibilities, as would have been the case in CIP-002, Versions 1-4 (since only Cyber Assets with routable connectivity which are essential to restoration assets are included in those versions). Under the low impact categorization, those assets will be protected in the areas of cyber security awareness, physical access control, and electronic access control, and they will have obligations regarding incident response. This represents a net gain to bulk power system reliability, however, since many of those assets do not meet criteria for inclusion under Versions 1-4.~~

~~Weighing the risks to overall BES reliability, the drafting team determined that this re-categorization represents the option that would be the least detrimental to restoration function and, thus, overall BES reliability. Removing Blackstart Resources and Cranking Paths from medium impact promotes overall reliability, as the likely alternative is fewer Blackstart Resources supporting timely restoration when needed.~~

~~BES Cyber Systems for generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan default to low impact. NERC Standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan, as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired.~~

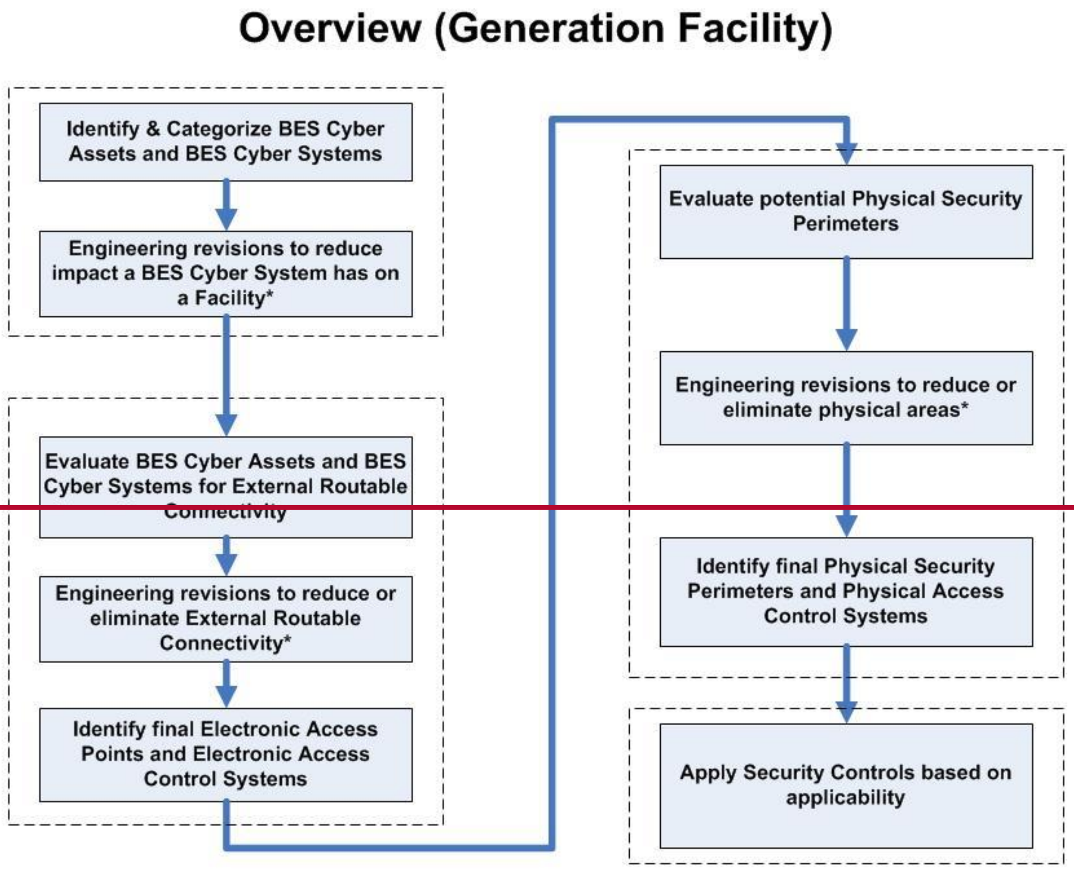
~~Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC Standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."~~

- ~~BES Cyber Systems for Facilities and Elements comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first Interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, default to the category of low impact: however, these systems are explicitly called out to ensure consideration for inclusion in the scope of the version 5 CIP standards. This requirement for inclusion in the scope is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started.~~

  ~~Distribution Providers may note that they may have BES Cyber Systems that must be scoped in if they have Elements listed in the Transmission Operator's Restoration Plan that are components of the Cranking Path.~~

~~Use Case: CIP Process Flow~~

~~The following CIP use case process flow for a generator Operator/Owner was provided by a participant in the development of the Version 5 standards and is provided here as an example of a process used to identify and categorize BES Cyber Systems and BES Cyber Assets; review, develop, and implement strategies to mitigate overall risks; and apply applicable security controls.~~



* - Engineering revisions will need to be reviewed for cost justification, operational\safety requirements, support requirements, and technical limitations.

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~BES Cyber Systems at each site location have varying impact on the reliable operation of the Bulk Electric System. Attachment 1 provides a set of "bright-line" criteria that the Responsible Entity must use to identify these BES Cyber Systems in accordance with the impact on the BES. BES Cyber Systems must be identified and categorized according to their impact so that the appropriate measures can be applied, commensurate with their impact. These impact categories will be the basis for the application of appropriate requirements in CIP-003-CIP-011.~~

~~Rationale for R2:~~

~~The lists required by Requirement R1 are reviewed on a periodic basis to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. The miscategorization or non-categorization of a BES Cyber System can lead to the application of inadequate or non-existent cyber security controls that can lead to compromise or misuse that can affect the real-time operation of the BES. The CIP Senior Manager's approval ensures proper oversight of the process by the appropriate Responsible Entity personnel.~~

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~
~~1~~	~~1/16/06~~	~~R3.2 — Change "Control Center" to "control center."~~	~~3/24/06~~

~~Appendix 1~~

~~**Requirement Number and Text of Requirement**~~
~~CIP-002-5.1, Requirement R1~~ ~~R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3:~~ ~~i. Control Centers and backup Control Centers;~~ ~~ii. Transmission stations and substations;~~ ~~iii. Generation resources;~~ ~~iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;~~ ~~v. Special Protection Systems that support the reliable operation of the Bulk Electric System; and~~ ~~vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.~~ ~~1.1. Identify each of the high impact BES Cyber Systems according to Attachment 1, Section 1, if any, at each asset;~~ ~~1.2. Identify each of the medium impact BES Cyber Systems according to Attachment 1, Section 2, if any, at each asset; and~~ ~~1.3. Identify each asset that contains a low impact BES Cyber System according to Attachment 1, Section 3, if any (a discrete list of low impact BES Cyber Systems is not required).~~ ~~Attachment 1, Criterion 2.1~~ ~~2. Medium Impact Rating (M)~~ ~~Each BES Cyber System, not included in Section 1 above, associated with any of the following:~~ ~~2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BES Cyber Systems that meet this criterion are those shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.~~
~~**Questions**~~
~~Energy Sector Security Consortium, Inc. (EnergySec) submitted a Request for Interpretation (RFI) seeking clarification of Criterion 2.1 of Attachment 1 in Reliability Standard CIP-002-5.1 regarding the use of the phrase "shared BES Cyber Systems."~~ ~~The Interpretation Drafting Team identified the following questions in the RFI:~~

1. ~~Whether the phrase "shared BES Cyber Systems" means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?~~
2. ~~Whether the phrase "shared BES Cyber Systems" refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?~~
3. ~~If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?~~

~~Responses~~

~~Question 1: Whether the phrase "shared BES Cyber Systems," means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?~~

~~The evaluation as to whether a BES Cyber System is shared should be performed individually for each discrete BES Cyber System. In the standard language of CIP-002-5.1, there is no reference to or obligation to group BES Cyber Systems. Requirement R1, part 1.2 states "Identify *each* of the medium impact BES Cyber Systems according to Attachment 1, Section 2…" Further, the preamble of Section 2 of CIP-002-5.1 Attachment 1 states "*Each BES Cyber System*…associated with any of the following [criteria]." (emphasis added)~~

~~Additionally, the Background section of CIP-002-5.1 states that "[i]t is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System." The Background section also provides:~~

> ~~The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.~~

~~Question 2: Whether the phrase "shared BES Cyber Systems" refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?~~

~~The phrase "shared BES Cyber Systems" refers to discrete BES Cyber Systems that are shared by multiple generation units.~~

~~The use of the term "shared" is also clarified in the NERC Frequently Asked Questions (FAQ) document issued by NERC Compliance to support implementation of the CIP Reliability Standards. FAQ #49 provides:~~

> ~~Shared BES Cyber Systems are those that are associated with any combination of units in a single Interconnection, as referenced in CIP-002-5.1, Attachment 1, impact rating~~

~~criteria 2.1 and 2.2. For criterion 2.1 "BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection." For criterion 2.2: "BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR. Also refer to the Lesson Learned for CIP-002-5.1 Requirement R1:~~ **~~Impact Rating of Generation Resource Shared BES Cyber Systems~~** ~~for further information and examples.~~

~~Question 3: If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?~~

~~The phrase applies to each discrete BES Cyber System.~~

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-2

Proposed Reliability Standard CIP-003-10
Clean

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-10

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

      4.1.1. Balancing Authority

      4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

         4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

            4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

            4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

         4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

      4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-10:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;

1.2.6. Vendor electronic remote access security controls; and

1.2.7. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that

include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with mandatory and enforceable Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not address one of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager	The Responsible Entity did not address two of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 16 calendar months but did complete this review in less than or equal to 17 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager within 16 calendar months but did	The Responsible Entity did not address three of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 17 calendar months but did complete this review in less than or equal to 18 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager within 17 calendar months but did	The Responsible Entity did not address four or more of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not have any documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies as required by Requirement R1 within 18 calendar months of the previous review. (Requirement R1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

Version	Date	Action	Change Tracking
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
9	11/16/2022	Adopted by the NERC Board of Trustees.	Revisions to address NERC Board Resolution and the Supply Chain Report
9	3/16/2023	FERC Order issued approving CIP-003-9. Docket No. RD23-3-000.	
9	3/22/2023	Effective Date	April 1, 2026
10	TBD	Virtualization Modifications	

Attachment 1

Required Sections for Cyber Security Plan(s)

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, and (2) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. Between:

- a low impact BCS; or
- An SCI that supports a low impact BCS

and a Cyber System(s) outside the asset containing:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or SCI that supports a low impact BCS; and

iii. not used for time-sensitive communications of Protection Systems.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or SCI that supports a low impact BCS, per system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

6.3 One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s)

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact BCS within the asset; and
  b. The Cyber System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets, the routable protocol communication as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communications are used for time-sensitive communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).
2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process

documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity’s acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
    - steps to preauthorize access;
    - alerts generated by vendor log on;
    - session monitoring;
    - security information management logging alerts;
    - time-of-need session initiation;
    - session recording;
    - system logs; or
    - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
    - disabling vendor electronic remote access user or system accounts;
    - disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
    - disabling communications protocols (such as IP) used for systems which establish and/or maintain vendor electronic remote access;

  - Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
  - administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
  - other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:
   - Anti-malware technologies;
   - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
   - Automated or manual log reviews;
   - alerting; or
   - other operational, procedural, or technical controls.

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-2

Proposed Reliability Standard CIP-003-10
Redline

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-10~~9~~

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-~~9~~10:

4.2.3.1. Cyber ~~Assets~~ Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (~~ESPs~~ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~3.2.3.3.~~4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~3.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan~~ for CIP-003-9.~~."

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact ~~BES Cyber Systems~~BCS, if any:

1.1.1. Personnel and training (CIP~~-~~-004);

1.1.2. Electronic Security Perimeters (CIP~~-~~-005) including Interactive Remote Access;

1.1.3. Physical security of ~~BES Cyber Systems~~BCS (CIP~~-~~-006);

1.1.4. System security management (CIP~~-~~-007);

1.1.5. Incident reporting and response planning (CIP~~-~~-008);

1.1.6. Recovery plans for ~~BES Cyber Systems~~BCS (CIP~~-~~-009);

1.1.7. Configuration change management and vulnerability assessments (CIP~~-~~-010);

1.1.8. Information protection (CIP~~-~~-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP~~-~~-002 containing low impact ~~BES Cyber Systems~~BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;

1.2.6. Vendor electronic remote access security controls; and

1.2.7. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP~~-~~-002 containing low impact ~~BES Cyber Systems~~BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]* ~~*[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*~~

Note: An inventory, list, or discrete identification of low impact ~~BES Cyber Systems~~BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2.~~-~~_Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3.~~-~~_An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4.~~-~~_An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with ~~the NERC~~mandatory and enforceable Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non~~-~~-compliant, it shall keep information related to the non~~-~~-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records~~,~~ and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-~~9~~10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity ~~documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but~~ did not address one of the nine topics required by Requirement R1. (~~R1~~Part1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact ~~BES Cyber Systems~~BCS as required by Requirement R1 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

Version	Date	Action	Change Tracking
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
9	11/16/2022	Adopted by the NERC Board of Trustees.	Revisions to address NERC Board Resolution and the Supply Chain Report
9	3/16/2023	FERC Order issued approving CIP-003-9. Docket No. RD23-3-000.	
9	3/22/2023	Effective Date	April 1, 2026

10	TBD	Modified by Project 2016-02	

Attachment 1

Required Sections for Cyber Security Plan(s)~~ for Assets Containing Low Impact BES Cyber Systems~~

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple~~-~~-impact ~~BES Cyber Systems~~BCS ratings can utilize policies, procedures, and processes for their high or medium impact ~~BES Cyber Systems~~BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. ~~Section 1.~~ Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. ~~Section 2.~~ Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact ~~BES Cyber Systems~~BCS within the asset, and (2) the Cyber Asset(s~~),~~) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. ~~Section 3.~~ Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP~~-~~-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. ~~between~~Between:

- a low impact ~~BES Cyber System(s)~~ BCS; or
- An SCI that supports a low impact BCS

and a Cyber ~~Asset~~System(s) outside the asset containing~~ low impact BES Cyber System(s);~~:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

~~i.~~ii. using a routable protocol when entering or leaving the asset containing the low impact ~~BES Cyber System(s);~~BCS or SCI that supports a low impact BCS; and

~~ii.~~iii. not used for time~~-~~-sensitive ~~protection or control functions between intelligent electronic devices (e.g.,~~ communications ~~using protocol IEC TR-61850-90-5 R-GOOSE).~~of Protection Systems.

3.2 Authenticate all Dial~~-~~-up Connectivity, if any, that provides access to low impact ~~BES Cyber System(s),~~BCS or SCI that supports a low impact BCS, per ~~Cyber Asset~~system capability.

Section 4. ~~**Section 4.**~~ Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E~~-~~-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. ~~Transient Cyber Asset~~ TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact ~~BES Cyber Systems~~BCS, through the use of ~~Transient Cyber Assets~~TCA or Removable Media. The plan(s) shall include:

5.1 For ~~Transient Cyber Asset(s)~~TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on~~-~~-demand manner (per ~~Transient Cyber Asset~~TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For ~~Transient Cyber Asset(s)~~TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting ~~the Transient Cyber Asset to a low impact BES Cyber System (per Transient Cyber Asset~~(per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review of system hardening used by the party; or
- ~~Other~~Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the ~~Transient Cyber Asset.~~TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a ~~BES Cyber System~~BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact ~~BES Cyber System~~BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

6.3 One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s) ~~for Assets Containing Low Impact BES Cyber Systems~~

Section 1. ~~Section 1.~~ Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e~~-~~-mails, memos, or computer~~-~~-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. ~~Section 2.~~ Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact ~~BES Cyber Systems~~BCS within the asset; and
  b. The Cyber ~~Asset~~System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. ~~Section 3.~~ Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets~~ containing low impact BES Cyber Systems, ~~, the routable protocol communication ~~between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset~~as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that ~~communication is~~communications are used for time~~-~~-sensitive ~~protection or control functions between intelligent electronic devices~~communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) ~~between the low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s)~~ or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).

2. Documentation of authentication for Dial~~-~~-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial~~-~~-back modems, modems that must be remotely controlled by the control center or control room, or access control on the ~~BES Cyber System~~BCS).

Section 4. ~~Section 4.~~ Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E~~-~~-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. ~~Section 5.~~ ~~Transient Cyber Asset~~TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

~~1.~~ Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of ~~live operating systems or~~ system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that

2. identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for ~~Transient Cyber Asset(s)~~TCA managed by a party other than the Responsible Entity. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

   Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the ~~Transient Cyber Asset~~TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code~~.~~

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
   - steps to preauthorize access;
   - alerts generated by vendor log on;
   - session monitoring;
   - security information management logging alerts;
   - time-of-need session initiation;
   - session recording;
   - system logs; or
   - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
   - disabling vendor electronic remote access user or system accounts;

- disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
- disabling communications protocols (such as IP) used for systems which establish and/or maintain vendor electronic remote access;
- Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
- administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
- other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:
    - Anti-malware technologies;
    - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
    - Automated or manual log reviews;
    - alerting; or
    - other operational, procedural, or technical controls.

NERC

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-3

Proposed Reliability Standard CIP-004-8
Clean

A. Introduction

1. **Title:** Cyber Security — Personnel & Training
2. **Number:** CIP-004-8
3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting BCS.
4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. **Balancing Authority**

4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. **Generator Operator**

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-8:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R1 – Security Awareness Program			
Part	Applicable Systems	Requirements	Measures
1.1	High impact BCS Medium impact BCS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part.	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-8 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS Medium impact BCS with Interactive Remote Access (IRA) SCI supporting an Applicable System in this Part	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information (BCSI) and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BCS electronic interconnectivity and interoperability with other Cyber Systems, including Transient Cyber Assets (TCA), and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.
2.2	High impact BCS and their associated:	Require completion of the training	Examples of evidence may include, but are

	EACMS SCI supporting an Applicable System in this Part	individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.
5.4	High impact BCS and their associated EACMS SCI supporting an Applicable System in this Part.	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination action; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the Applicable Systems identified in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Prior to provisioning, authorize (unless already authorized according to Part 4.1) based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 6.1.1. Provisioned electronic access to electronic BCSI; and 6.1.2. Provisioned physical access to physical BCSI (except for BCSI at a medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, individual records or lists that include who is authorized, the date of the authorization, and the justification of business need for the provisioned access.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Verify at least once every 15 calendar months that all individuals with provisioned access to BCSI: 6.2.1. have an authorization record; and 6.2.2. still need the provisioned access to perform their current work functions, as determined by the Responsible Entity.	Examples of evidence may include, but are not limited to, the documentation of the review that includes all of the following: • List of authorized individuals; • List of individuals who have been provisioned access; • Verification that provisioned access is appropriate based on need; and • Documented reconciliation actions, if any.
6.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) (except for BCSI at a medium impact BCS without ERC) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-004-8)			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (Part 1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (Requirement R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (Part 1.1)
R2	The Responsible Entity did not include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (Requirement R2) OR The Responsible Entity did not include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct

Version	Date	Action	Change Tracking
			language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-004-6. Docket No. RM15-14-000	
7	8/12/21	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-3
Proposed Reliability Standard CIP-004-8
Redline

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~7~~8

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting ~~BES Cyber Systems~~BCS.

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. **Balancing Authority**

4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. **Generator Operator**

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~7~~8:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3.~~4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5.~~4.2.3.6. Responsible Entities that identify that they have no ~~BES Cyber Systems~~BCS categorized as high impact or medium impact according to the CIP-002~~-5.1a~~ identification and categorization processes.

~~5. **Effective Dates:** See Implementation Plan for CIP-004-7.~~

~~6. **Background:** Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards~~

~~include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~” Columns in Tables:~~

~~6.1.~~4.3. ”: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies. ~~The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1a identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.~~

- ~~**Medium Impact BES Cyber Systems with External Routable Connectivity –** Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS) –** Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~

5. Effective Dates: See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~7~~8 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~Impact BES~~impact BCS Medium impact BCS Shared Cyber ~~Systems~~Infrastructure (SCI) supporting an Applicable System in this Part. ~~Medium Impact BES Cyber Systems~~	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to ~~BES Cyber~~Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. -Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~7~~8 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~7~~8 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~7~~8 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS~~;~~); and ~~2. PACS~~ 2. Physical Access Control Systems (PACS) Medium ~~Impact BES Cyber Systems~~ impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS Medium impact BCS with Interactive Remote Access (IRA) SCI supporting an Applicable System in this Part	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information (BCSI) and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for ~~BES Cyber Systems~~BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a ~~BES Cyber System's~~BCS electronic interconnectivity and interoperability with other Cyber ~~Assets~~Systems, including Transient Cyber Assets~~,~~ (TCA), and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~7~~8 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to ~~applicable Cyber Assets~~Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

3.5	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed, except during CIP Exceptional Circumstances, according to Parts 3.1 ~~to~~through 3.4 within the last seven years.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~7~~8 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; and 4.1.2. Unescorted physical access into a Physical Security Perimeter (PSP) (except for medium impact BCS without ERC).	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated documentation of the process to authorize electronic access, and unescorted physical access in a ~~Physical Security Perimeter.~~PSP.
4.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated:	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or

CIP-004-~~7~~8 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part		- Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).
4.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]*.

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~7~~8 Table R5 – ~~-~~Access Revocation

Part	Applicable Systems	Requirements	Measures
5.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	A process to initiate removal of an individual's ability for unescorted physical access (except for medium impact BCS without ERC) and Interactive Remote Access (IRA) upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.
5.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated:	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts; and authorized unescorted physical access (except for medium impact BCS without ERC) that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible

CIP-004-~~7~~8 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part		Entity determines is not necessary.
5.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.
5.4	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part.	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination action; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the ~~“~~Applicable Systems~~”~~ identified in *CIP-004-~~7~~8 Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-~~7~~8 Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

6.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) (except for BCSI at a medium impact BCS without ERC) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C. ~~C.~~ Compliance

1. **Compliance Monitoring Process:**

1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance.~~ ~~For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

~~2. Table of Compliance Elements~~

Violation Severity Levels

R #	Violation Severity Levels (CIP-004-~~7~~8)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (Part 1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (Requirement R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (Part 1.1)
R2	The Responsible Entity ~~implemented a cyber security training program but failed to~~did not include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-4

Proposed Reliability Standard CIP-005-8
Clean

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-8

3. **Purpose:** To protect BES Cyber Systems (BCS) against compromise by permitting only known and controlled communication to reduce the likelihood of misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-8:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. "Applicable Systems": Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. Effective Date: See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS and their associated PCA Medium impact BCS and their associated PCA	Applicable Systems connected to a network via a routable protocol must be protected by an ESP.	Examples of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Systems connected via a routable protocol within each ESP.
1.2	High impact BCS with ERC and their associated PCA Medium impact BCS with ERC and their associated PCA	Permit only needed routable protocol communications, documenting the reason, and deny all other routable protocol communications, through the ESP; excluding time sensitive communications of Protection Systems.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of system and documented reason, such as: • Electronic Access Point (EAP) configuration; • Network infrastructure configuration (e.g., technical policies, ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); or • SCI configuration or settings (e.g., technical policies, hypervisor, fabric, back-plane, or SAN configuration).

CIP-005-8 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	SCI supporting an Applicable System from Part 1.1. EACMS, and their supporting SCI, that control an ESP for an Applicable System in Part 1.1	Protect ESP and SCI configurations by implementing methods to permit only needed network accessibility to Management Interfaces of Applicable Systems, per system capability.	Examples of evidence may include, but are not limited to, documentation of the methods implemented to permit only needed network accessibility to Management Interfaces, including documented reasons such as: • Logical configuration or settings (e.g., technical Policies, ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • Physically isolated or out-of-band network for dedicated Management Interfaces; or • SCI configuration or settings showing the isolation of the Management Interfaces (e.g., technical policies, hypervisor, fabric back-plane, or SAN configuration).
1.4	High impact BCS and their associated PCA Medium impact BCS and their associated PCA SCI supporting an Applicable System in this Part	Perform authentication when establishing Dial-up Connectivity with Applicable Systems, if any, and per system capability.	Examples of evidence may include, but are not limited to, configuration, settings, or documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.
1.5	High impact BCS Medium impact BCS at Control Centers	Have one or more methods for detecting known or suspected malicious routable protocol communications entering or leaving an ESP.	An example of evidence may include, but is not limited to, documentation that malicious routable protocol communications detection methods (e.g., intrusion detection system, application layer firewall, etc.) are implemented.

CIP-005-8 Table R1 – Electronic Security Perimeter			
Part	Applicable Systems	Requirements	Measures
1.6	High impact BCS and their associated PCA Medium impact BCS at Control Centers and their associated PCA	Protect the data traversing communication links used to span a single ESP between PSPs through the use of: • Confidentiality and integrity controls, or • Physical controls that restrict access to the cabling and other non-programmable communication components in those instances when such cabling and components are located outside of a PSP, Excluding: i. Real-time Assessment and Real-time monitoring data while being transmitted between Control Centers subject to CIP-012; and ii. Time-sensitive communication of Protection Systems.	Examples of evidence may include, but are not limited to, documentation of methods used to protect the confidentiality and integrity of the data, such as: • Configurations or settings used to enforce encryption; or • The physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays).

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, per system capability, in *CIP-005-8 Table R2 – Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R2 – Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated PCA Medium impact BCS and their associated PCA SCI supporting an Applicable System in this Part	Permit Interactive Remote Access (IRA), if any, only through an Intermediate System.	Examples of evidence may include, but are not limited to, network diagrams, architecture documents, configuration, or settings that show all IRA is through an Intermediate System.
2.2	Intermediate System(s) used to access an Applicable System in Part 2.1	Protect the confidentiality and integrity of IRA communications between the initiating Cyber Asset or Virtual Cyber Asset and the Intermediate System.	Examples of evidence may include, but are not limited to, architecture documents, configuration or settings detailing where confidentiality and integrity controls (e.g., encryption) initiate and terminate.
2.3	Intermediate System(s) used to access an Applicable System in Part 2.1	Require multi-factor authentication to the Intermediate System for IRA communications between the initiating Cyber Asset or Virtual Cyber Asset and the Intermediate System.	Example of evidence may include, but are not limited to, architecture documents, configuration or settings detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID;

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.
2.4	High impact BCS and their associated PCA Medium impact BCS and their associated PCA SCI supporting an Applicable System in this Part	Have one or more methods for determining active vendor remote access sessions (including IRA and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access, including IRA and system-to-system remote access, such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g., connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g., netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.
2.5	High impact BCS and their associated PCA	Have one or more method(s) to	Examples of evidence may include,

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium impact BCS and their associated PCA SCI supporting an Applicable System in this Part	disable active vendor remote access (including IRA and system-to-system remote access).	but are not limited to, documentation of the methods(s) used to disable active vendor remote access • (including IRA and system-to-system remote access).
2.6	Intermediate System(s) used to access an Applicable System in Part 2.1	Prevent Intermediate System(s) from sharing CPU resources and memory resources with any part of a high or medium impact BCS or associated PCAs.	Examples of evidence may include, but are not limited to, documentation that includes the following: • Intermediate System architecture; or • Configuration or settings of each Intermediate System and supporting Cyber Systems.
2.7	Intermediate System(s) used to access an Applicable System in Part 2.1	Routable protocol communications from an Intermediate System to a high or medium impact BCS or associated PCAs must be through an ESP.	Examples of evidence may include, but are not limited to, documentation that includes the following: • Network diagrams of Intermediate Systems architecture; or • Configuration, settings, or policy of the EAP which controls routable protocol communications of IRA through the ESP.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts in *CIP-005-8 Table R3 –Vendor Remote Access Management for EACMS, PACS, and SCI*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M3. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and SCI* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and SCI			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	EACMS and PACS associated with high impact BCS. EACMS and PACS associated with medium impact BCS with ERC. SCI supporting an Applicable System in this Part .	Have one or more method(s) to determine authenticated vendor-initiated remote connections.	Examples of evidence may include, but are not limited to, documentation of the methods used to determine authenticated vendor-initiated remote connections, such as: • Methods for accessing logged or monitoring information to determine authenticated vendor-initiated remote connections.
3.2	EACMS and PACS associated with high impact BCS. EACMS and PACS associated with medium impact BCS with ERC. SCI supporting an Applicable System in this Part.	Have one or more method(s) to terminate authenticated vendor-initiated remote connections and control the ability to reconnect.	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to terminate authenticated vendor-initiated remote connections to applicable systems. Examples include terminating an active vendor-initiated shell/process/session or dropping an active vendor-initiated connection in a firewall. Methods to control the ability to reconnect, if necessary, could be: disabling an Active Directory account; disabling a security token; restricting IP addresses from vendor sources in a firewall; or physically disconnecting a network cable to prevent a reconnection.

C. Compliance

1. Compliance Monitoring Process

1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. **Evidence Retention:** The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting known or suspected malicious routable protocol communications entering or leaving the ESP required by Part 1.5. OR The Responsible Entity did not document the reason for permitting communications. (Part 1.2)	The Responsible Entity did not document one or more processes for CIP-005-8 Table R1 – Electronic Security Perimeter. (R1) OR The Responsible Entity did not protect the Applicable Systems connected to the network with routable protocol with an ESP. (Part 1.1) OR The Responsible Entity did not permit only needed communications and deny all other communications, through the ESP; excluding time sensitive communications of Protection Systems. (Part 1.2) OR The Responsible Entity did not protect ESP and SCI configurations by implementing methods to permit only needed network accessibility to Management Interfaces for Applicable

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Systems per system capability. (Part 1.3) OR The Responsible Entity did not perform authentication when establishing Dial-up Connectivity with the Applicable Systems. (Part 1.4) OR The Responsible Entity did not implement a method to protect the data traversing communication links, used to span a single ESP between PSPs, as required by Part 1.6.
R2.	The Responsible Entity does not have documented processes for one or more of the applicable Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable Requirement Parts 2.1 through 2.3. OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including IRA and system-to-system remote access) (Part 2.4); or one or more methods to disable active vendor remote access	The Responsible Entity did not implement processes for three of the applicable Requirement Parts 2.1 through 2.3. OR The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including IRA and system-to-system remote access) (Part 2.4) and one or more methods to disable active vendor remote access

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
			(including IRA and system-to-system remote access) (Part 2.5).	(including IRA and system-to-system remote access) (Part 2.5). OR The Responsible Entity did not prevent Intermediate System(s) from sharing CPU resources or memory resources with any part of a high or medium impact BCS or associated PCAs. (Part 2.6). OR The Responsible Entity did not ensure routable protocol communications from an Intermediate System to high or medium impact BCS or associated PCAs went through an ESP (Part 2.7).
R3.	The Responsible Entity did not document one or more processes for CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and SCI. (Requirement R3)	The Responsible Entity did not have a method to determine authenticated vendor-initiated remote connections for PACS or SCI supporting PACS (Part 3.1). OR	The Responsible Entity did not implement processes for either Part 3.1 or Part 3.2. (Requirement R3) OR The Responsible Entity did not have a method to determine authenticated vendor-initiated	The Responsible Entity did not implement any processes for CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and SCI. (Requirement R3) OR

R #	Violation Severity Levels

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-4
Proposed Reliability Standard CIP-005-8
Redline

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-~~7~~8

3. **Purpose:** To ~~manage electronic access to~~protect BES Cyber Systems (BCS) against compromise by ~~specifying a~~permitting only known and controlled ~~Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to~~communication to reduce the likelihood of misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-~~7~~8:

4.2.3.1. Cyber ~~Assets~~ Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~ Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

~~**4.2.3.2.**~~**4.2.3.3.** Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4.**~~**4.2.3.5.** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no ~~BES Cyber Systems~~BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. “Applicable Systems”: Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Date:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”~~Implementation Plan for Project 2019-03.~~

~~6.~~ ~~**Background:**~~ ~~Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with,~~ ~~*“Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].”*~~ ~~The referenced table requires the applicable items in the procedures for the requirement’s common subject matter.~~

~~The term~~ ~~*documented processes*~~ ~~refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms~~ ~~*program*~~ ~~and~~ ~~*plan*~~ ~~are sometimes used in place of~~ ~~*documented processes*~~ ~~where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as~~ ~~*plans*~~ ~~(i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single trainingprogram could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~"Applicable Systems" Columns in Tables:~~

~~Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicability Systems" column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.~~
- ~~**High Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to high impact BES Cyber Systems with Dial-up Connectivity.~~

- ~~**High Impact BES Cyber Systems with External Routable Connectivity** – Only applies to high impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.~~
- ~~**Medium Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to medium impact BES Cyber Systems with Dial-up Connectivity.~~
- ~~**Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~
- ~~**Electronic Access Points (EAP)** – Applies at Electronic Access Points associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~
- ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~7~~8 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~7~~8 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~7~~8 Table R1 – Electronic Security Perimeter

Part	Applicable Systems	Requirements	Measures
1.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ PCA Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ PCA	~~All applicable Cyber Assets~~Applicable Systems connected to a network via a routable protocol ~~shall reside within a defined~~must be protected by an ESP.	~~An example~~Examples of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber ~~Assets~~Systems connected via a routable protocol within each ESP.
1.2	High impact BCS with ERC and their associated PCA Medium impact BCS with ERC and their associated PCA	Permit only needed routable protocol communications, documenting the reason, and deny all other routable protocol communications, through the ESP; excluding time sensitive communications of Protection Systems.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of system and documented reason, such as: • Electronic Access Point (EAP) configuration; • Network infrastructure configuration (e.g., technical policies, ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); or • SCI configuration or settings (e.g., technical policies, hypervisor, fabric, back-plane, or SAN

CIP-005-~~7~~8 Table R1 – Electronic Security Perimeter

Part	Applicable Systems	Requirements	Measures
			configuration).
1.3	SCI supporting an Applicable System from Part 1.1. EACMS, and their supporting SCI, that control an ESP for an Applicable System in Part 1.1	Protect ESP and SCI configurations by implementing methods to permit only needed network accessibility to Management Interfaces of Applicable Systems, per system capability.	Examples of evidence may include, but are not limited to, documentation of the methods implemented to permit only needed network accessibility to Management Interfaces, including documented reasons such as: • Logical configuration or settings (e.g., technical Policies, ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • Physically isolated or out-of-band network for dedicated Management Interfaces; or • SCI configuration or settings showing the isolation of the Management Interfaces (e.g., technical policies, hypervisor, fabric back-plane, or SAN configuration).
1.4	High impact BCS and their associated PCA Medium impact BCS and their associated PCA SCI supporting an Applicable System in this Part	Perform authentication when establishing Dial-up Connectivity with Applicable Systems, if any, and per system capability.	Examples of evidence may include, but are not limited to, configuration, settings, or documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.
1.5	High impact BCS Medium impact BCS at Control Centers	Have one or more methods for detecting known or suspected malicious routable protocol communications entering or leaving an ESP.	An example of evidence may include, but is not limited to, documentation that malicious routable protocol communications detection methods (e.g., intrusion detection system, application

CIP-005-~~7~~8 Table R1 – Electronic Security Perimeter

Part	Applicable Systems	Requirements	Measures
			layer firewall, etc.) are implemented.
1.~~2~~6	High ~~Impact BES Cyber Systems with External Routable Connectivity~~impact BCS and their associated~~:~~ PCA Medium ~~Impact BES Cyber Systems with External Routable Connectivity~~impact BCS at Control Centers and their associated~~:~~ PCA	~~All External Routable Connectivity must be through an identified Electronic Access Point (EAP).~~Protect the data traversing communication links used to span a single ESP between PSPs through the use of: • Confidentiality and integrity controls, or • Physical controls that restrict access to the cabling and other non-programmable communication components in those instances when such cabling and components are located outside of a PSP, Excluding: i. Real-time Assessment and Real-time monitoring data while being transmitted between Control Centers subject to CIP-012; and ~~i.~~ii. Time-sensitive communication of Protection Systems.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, ~~network diagrams showing all external routable communication paths~~documentation of methods used to protect the confidentiality and integrity of the ~~identified EAPs.~~ data, such as: • Configurations or settings used to enforce encryption; or • The physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays).

~~CIP-005-7 Table R1 – Electronic Security Perimeter~~

~~Part~~	~~Applicable Systems~~	~~Requirements~~	~~Measures~~

~~1.3~~	~~Electronic Access Points for High Impact BES Cyber Systems~~ ~~Electronic Access Points for Medium Impact BES Cyber Systems~~	~~Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.~~	~~An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.~~
~~1.4~~	~~High Impact BES Cyber Systems with Dial-up Connectivity and their associated:~~ - ~~PCA~~ ~~Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated:~~ - ~~PCA~~	~~Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.~~	~~An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.~~
~~1.5~~	~~Electronic Access Points for High Impact BES Cyber Systems~~ ~~Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers~~	~~Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.~~	~~An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.~~

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, ~~where technically feasible~~per system capability, in *CIP-005-~~7~~8 Table R2 – Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-~~7~~8 Table R2 – Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~7~~8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ PCA Medium ~~Impact BES Cyber Systems with External Routable Connectivity~~impact BCS and their associated~~:~~ PCA SCI supporting an Applicable System in this Part	~~For all~~Permit Interactive Remote Access~~,~~ ~~utilize~~ (IRA), if any, only through an Intermediate System~~ such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.~~.	Examples of evidence may include, but are not limited to, network diagrams~~ or~~, architecture documents, configuration, or settings that show all IRA is through an Intermediate System.
2.2	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems with External Routable Connectivity and their associated:~~ ~~PCA~~Intermediate System(s) used to access an Applicable System in Part 2.1	~~For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.~~Protect the confidentiality and integrity of IRA communications between the initiating Cyber Asset or Virtual Cyber Asset and the Intermediate System.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, architecture documents, configuration or settings detailing where confidentiality and integrity controls (e.g., encryption ~~initiates~~) initiate and ~~terminates.~~ terminate.

CIP-005-~~7~~8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems with External Routable Connectivity and their associated:~~ ~~• PCA~~ Intermediate System(s) used to access an Applicable System in Part 2.1	Require multi-factor authentication to the Intermediate System for ~~all~~ ~~Interactive Remote Access sessions~~IRA communications between the initiating Cyber Asset or Virtual Cyber Asset and the Intermediate System.	~~An example~~Example of evidence may include, but ~~is~~are not limited to, architecture documents, configuration or settings detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.
2.4	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ ~~•~~ PCA Medium ~~Impact BES Cyber Systems with External Routable Connectivity~~ impact BCS and their associated~~:~~ ~~•~~ PCA SCI supporting an Applicable System in this Part	Have one or more methods for determining active vendor remote access sessions (including ~~Interactive Remote Access~~IRA and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access, ~~(~~including ~~Interactive Remote Access~~ IRA and system-to-system remote access~~),~~ , such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions;

CIP-005-~~7~~8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
			- Methods for monitoring activity (e.g~~.~~., connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g~~.~~., netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or - Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.
2.5	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ PCA Medium ~~Impact BES Cyber Systems with External Routable Connectivity~~ impact BCS and their associated~~:~~ PCA SCI supporting an Applicable System in this Part	Have one or more method(s) to disable active vendor remote access (including ~~Interactive Remote Access~~IRA and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including ~~Interactive Remote Access~~ IRA and system-to-system remote access~~),~~ ~~such as:~~ - ~~Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or~~ - ~~Methods to disable vendor Interactive Remote Access at~~

Part	Applicable Systems	Requirements	Measures
			~~the applicable Intermediate System.~~).
2.6	Intermediate System(s) used to access an Applicable System in Part 2.1	Prevent Intermediate System(s) from sharing CPU resources and memory resources with any part of a high or medium impact BCS or associated PCAs.	Examples of evidence may include, but are not limited to, documentation that includes the following: • Intermediate System architecture; or • Configuration or settings of each Intermediate System and supporting Cyber Systems.
2.7	Intermediate System(s) used to access an Applicable System in Part 2.1	Routable protocol communications from an Intermediate System to a high or medium impact BCS or associated PCAs must be through an ESP.	Examples of evidence may include, but are not limited to, documentation that includes the following: • Network diagrams of Intermediate Systems architecture; or • Configuration, settings, or policy of the EAP which controls routable protocol communications of IRA through the ESP.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts in *CIP-005-~~7~~8 Table R3 –Vendor Remote Access Management for EACMS, PACS, and ~~PACS~~SCI*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations]*.

M3. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-~~7~~8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and SCI* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~7~~8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and ~~PACS~~SCI

Part	Applicable Systems	Requirements	Measures
3.1	EACMS and PACS associated with ~~High Impact BES Cyber Systems~~ high impact BCS. EACMS and PACS associated with ~~Medium Impact BES Cyber Systems~~medium impact BCS with ~~External Routable Connectivity~~ ERC. SCI supporting an Applicable System in this Part .	Have one or more method(s) to determine authenticated vendor-initiated remote connections.	Examples of evidence may include, but are not limited to, documentation of the methods used to determine authenticated vendor-initiated remote connections, such as: • Methods for accessing logged or monitoring information to determine authenticated vendor-initiated remote connections.
3.2	EACMS and PACS associated with ~~High Impact BES Cyber Systems~~high impact BCS. EACMS and PACS associated with ~~Medium Impact BES Cyber Systems~~medium impact BCS with ~~External Routable Connectivity~~ ERC. SCI supporting an Applicable System in this Part.	Have one or more method(s) to terminate authenticated vendor-initiated remote connections and control the ability to reconnect.	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to terminate authenticated vendor-initiated remote connections to applicable systems. Examples include terminating an active vendor-initiated shell/process/session or dropping an active vendor-initiated connection in a firewall. Methods to control the ability to reconnect, if necessary, could be: disabling an Active Directory account; disabling a security token; restricting IP addresses from vendor sources in a

CIP-005-~~7~~8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and ~~PACS~~SCI

Part	Applicable Systems	Requirements	Measures
			firewall; or physically disconnecting a network cable to prevent a reconnection.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting known or suspected malicious routable protocol communications entering or leaving the ESP required by Part 1.5. OR The Responsible Entity did not document the reason for ~~both inbound and outbound~~permitting communications. (Part 1.~~5)~~2)	The Responsible Entity did not document one or more processes for *CIP-005-~~6~~8 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not ~~have all applicable Cyber Assets~~protect the Applicable Systems connected to ~~a~~the network ~~via a~~with routable protocol ~~within a defined Electronic Security Perimeter (ESP). (~~with an ESP. (Part 1.1) OR ~~External Routable Connectivity through the ESP was not through an identified EAP. (1.2)~~ ~~OR~~ The Responsible Entity did not ~~require inbound and outbound access permissions~~permit only needed communications and deny all other

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				~~access~~communications, through the ESP; excluding time sensitive communications of Protection Systems. (Part 1.2) OR The Responsible Entity did not protect ESP and SCI configurations by ~~default.~~ ~~(~~implementing methods to permit only needed network accessibility to Management Interfaces for Applicable Systems per system capability. (Part 1.3) OR The Responsible Entity did not perform authentication when establishing ~~dial~~Dial-up ~~connectivity with the applicable Cyber Assets, where technically feasible.~~ ~~(~~Connectivity with the Applicable Systems. (Part 1.4) OR The Responsible Entity did not implement a method to protect the data traversing communication links, used to

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				span a single ESP between PSPs, as required by Part 1.6.
R2.	The Responsible Entity does not have documented processes for one or more of the applicable ~~items for~~ Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable ~~items for~~ Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable ~~items for~~ Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including ~~Interactive Remote Access~~IRA and system-to-system remote access) (Part 2.4); or one or more methods to disable active vendor remote access (including ~~Interactive Remote Access~~IRA and system-to-system remote access) (Part 2.5).	The Responsible Entity did not implement processes for three of the applicable ~~items for~~ Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including ~~Interactive Remote Access~~ IRA and system-to-system remote access) (Part 2.4) and one or more methods to disable active vendor remote access (including ~~Interactive Remote Access~~IRA and system-to-system remote access) (Part 2.5). OR The Responsible Entity did not prevent Intermediate System(s) from sharing CPU resources or memory resources with any part of

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
				a high or medium impact BCS or associated PCAs. (Part 2.6). OR The Responsible Entity did not ensure routable protocol communications from an Intermediate System to high or medium impact BCS or associated PCAs went through an ESP (Part 2.7).
R3.	The Responsible Entity did not document one or more processes for *CIP-005-~~7~~8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and ~~PACS.~~ ~~(~~SCI.* (Requirement R3)	The Responsible Entity ~~had method(s) as required by Part 3.1 for EACMS but~~ did not have a method to determine authenticated vendor-initiated remote connections for PACS ~~(~~or SCI supporting PACS (Part 3.1). OR The Responsible Entity ~~had method(s) as required by Part 3.2 for EACMS but~~ did not have a method to terminate authenticated vendor-initiated remote connections for PACS ~~(3.2~~or SCI supporting PACS (Part 3.2).	The Responsible Entity did not implement processes for either Part 3.1 or Part 3.2. (Requirement R3) OR The Responsible Entity ~~had method(s) as required by Part 3.1 for PACS but~~ did not have a method to determine authenticated vendor-initiated remote connections for EACMS ~~(~~or SCI supporting EACMS (Part 3.1). OR The Responsible Entity ~~had method(s) as required by Part 3.2 for PACS but~~ did not	The Responsible Entity did not implement any processes for *CIP-005-~~7~~8 Table R3 – Vendor Remote Access Management for EACMS, PACS, and ~~PACS.~~ ~~(~~SCI.* (Requirement R3) OR The Responsible Entity did not have any methods as required by Parts 3.1 and 3.2 (Requirement R3).

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
			have a method to terminate authenticated vendor-initiated remote connections or control the ability to reconnect for EACMS ~~(~~or SCI supporting EACMS (Part 3.2).

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-5

Proposed Reliability Standard CIP-006-7
Clean

A. Introduction

1. **Title:** Cyber Security — Physical Security of BES Cyber Systems

2. **Number:** CIP-006-7

3. **Purpose:** To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**: All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-006-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between Cyber Systems, providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific Requirement Part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.1	Medium impact BCS without External Routable Connectivity (ERC) Physical Access Control Systems (PACS) associated with: • High impact BCS, or • Medium impact BCS with ERC SCI supporting an Applicable System in this Part	Define operational or procedural controls to restrict physical access.	Examples of evidence may include, but are not limited to, documentation that operational or procedural controls exist.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium impact BCS with ERC and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Protected Cyber Asset (PCA) SCI supporting an Applicable System in this Part	Utilize at least one physical access control to allow unescorted physical access into each applicable PSP to only those individuals who have authorized unescorted physical access.	Examples of evidence may include, but are not limited to, language in the physical security plan that describes each PSP and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.
1.3	High impact BCS and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Utilize two or more different physical access controls (this does not require two completely independent PACS) to collectively allow unescorted physical access into PSPs to only those individuals who have authorized unescorted physical access, per system capability.	Examples of evidence may include, but are not limited to, language in the physical security plan that describes each PSP and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Monitor for unauthorized access through a physical access point into a PSP.	Examples of evidence may include, but are not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a PSP.
1.5	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a PSP to the personnel identified in the Cyber Security Incident response plan within 15 minutes of detection.	Examples of evidence may include, but are not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a PSP and additional evidence that the alarm or alert was issued and communicated as identified in the Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High impact BCS, or • Medium impact BCS with ERC SCI supporting an Applicable System in this Part	Monitor each PACS for unauthorized physical access to a PACS.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	PACS associated with: • High impact BCS, or • Medium impact BCS with ERC SCI supporting an Applicable System in this Part	Issue an alarm or alert in response to detected unauthorized physical access to a PACS to the personnel identified in the Cyber Security Incident response plan within 15 minutes of the detection.	Examples of evidence may include, but are not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to PACS and additional evidence that the alarm or alerts was issued and communicated as identified in the Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.
1.8	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each PSP, with information to identify the individual and date and time of entry.	Examples of evidence may include, but are not limited to, language in the physical security plan that describes logging and recording of physical entry into each PSP and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into each PSP that show the individual and the date and time of entry into each PSP.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Retain physical access logs of entry of individuals with authorized unescorted physical access into each PSP for at least 90 calendar days.	Examples of evidence may include, but are not limited to, dated documentation such as logs of physical access into each PSP that show the date and time of entry into each PSP.

R2. Each Responsible Entity shall implement, except during CIP Exceptional Circumstances, one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-7 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-7 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-7 Table R2 – Visitor Control Program			
Part	Applicable Systems	Requirements	Measures
2.1	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each PSP.	Examples of evidence may include, but are not limited to, language in a visitor control program that requires continuous escorted access of visitors within each PSP and additional evidence to demonstrate that the process was implemented, such as visitor logs.
2.2	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Require manual or automated logging of visitor entry into and exit from each PSP that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor.	Examples of evidence may include, but are not limited to, language in a visitor control program that requires continuous escorted access of visitors within each PSP and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.

CIP-006-7 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High impact BCS and their associated: 1. EACMS; and 2. PCA Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Retain visitor logs for at least 90 calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least 90 calendar days.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-7 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-7 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-7 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	PACS associated with: • High impact BCS, or • Medium impact BCS with ERC Locally mounted hardware or devices at the PSP associated with: • High impact BCS, or • Medium impact BCS with ERC	Maintenance and testing of each PACS and locally mounted hardware or devices at each PSP at least once every 24 calendar months to ensure they function properly.	Examples of evidence may include, but are not limited to, a maintenance and testing program that provides for testing each PACS and locally mounted hardware or devices associated with each applicable each PSP at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. **Compliance Enforcement Authority:** As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Assessment Processes:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (Requirement R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (Part 1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (Part 1.2) OR The Responsible Entity has documented and implemented physical access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (Part 1.3) OR The Responsible Entity does not have a process to monitor

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				for unauthorized access through a physical access point into a PSP. (Part 1.4) OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a PSP or to communicate such alerts within 15 minutes to identified personnel. (Part 1.5) OR The Responsible Entity does not have a process to monitor each PACS for unauthorized physical access to a PACS. (Part 1.6) OR The Responsible Entity does not have a process to alert for unauthorized physical access to PACS or to communicate such alerts within 15 minutes to identified personnel. (Part 1.7) OR The Responsible Entity does not have a process to log

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				authorized physical entry into each PSP with sufficient information to identify the individual and date and time of entry. (Part 1.8) OR The Responsible Entity does not have a process to retain physical access logs for 90 calendar days. (Part 1.9)
R2	N/A	N/A	N/A	The Responsible Entity has failed to include or implement a visitor control program that requires continuous escorted access of visitors within any Physical Security Perimeter. (Part 2.1) OR The Responsible Entity has failed to include or implement a visitor control program that requires logging of the initial entry and last exit dates and times of the visitor, the visitor's name, and the point of contact. (Part 2.2) OR The Responsible Entity failed to include or implement a

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-5

Proposed Reliability Standard CIP-006-7
Redline

A. Introduction

1. **Title:** Cyber Security — Physical Security of BES Cyber Systems

2. **Number:** CIP-006-~~6~~7

3. **Purpose:** To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each ~~Special Protection System (SPS) or~~ Remedial Action Scheme (RAS) where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

~~**4.1.5 Interchange Coordinator or Interchange Authority**~~

~~**4.1.6**~~**4.1.5 Reliability Coordinator**

~~**4.1.7**~~**4.1.6 Transmission Operator**

~~**4.1.8**~~**4.1.7 Transmission Owner**

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~SPS or~~ RAS where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**: All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-006-~~6~~7:

4.2.3.1 Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

~~4.2.3.2~~4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between Cyber Systems, providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3~~4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4~~4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5~~4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002~~-5.1~~ identification and categorization processes.

~~5. Effective Dates:~~

~~See Implementation Plan for CIP-006-6.~~

~~6. Background:~~

~~Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the~~

~~standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~**” Columns in Tables:**~~

4.3. **”:** Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific ~~requirement row~~Requirement Part applies. ~~The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.~~

- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.~~

- ~~**Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.~~
- ~~**Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~
- ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~
- ~~**Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~

5. ~~**Locally mounted hardware or devices at the Physical Security Perimeter** – Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.~~

Effective Dates: See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-~~6~~7 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-~~6~~7 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-~~6~~7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.1	Medium ~~I~~impact ~~BES cyber Systems~~ BCS without External Routable Connectivity (ERC) Physical Access Control Systems (PACS) associated with: • High i~~I~~mpact ~~BES Cyber Systems~~BCS, or • Medium i~~I~~mpact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC SCI supporting an Applicable System in this Part	Define operational or procedural controls to restrict physical access.	~~An example~~Examples of evidence may include, but are not limited to, documentation that operational or procedural controls exist.

CIP-006-~~6~~7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium ~~I~~impact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Protected Cyber Asset (PCA) SCI supporting an Applicable System in this Part	Utilize at least one physical access control to allow unescorted physical access into each applicable ~~Physical Security Perimeter~~PSP to only those individuals who have authorized unescorted physical access.	~~An example~~Examples of evidence may include, but are not limited to, language in the physical security plan that describes each ~~Physical Security Perimeter~~PSP and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.
1.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PCA -SCI supporting an Applicable System in this Part	~~Where technically feasible, utilize~~Utilize two or more different physical access controls (this does not require two completely independent ~~physical access control systems~~PACS) to collectively allow unescorted physical access into ~~Physical Security Perimeters~~PSPs to only those individuals who have authorized unescorted physical access~~.~~ , per system capability.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, language in the physical security plan that describes ~~the Physical Security Perimeters~~each PSP and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-~~6~~7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.4	High ~~I~~impact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; and 2. PCA Medium ~~I~~impact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Monitor for unauthorized access through a physical access point into a ~~Physical Security Perimeter~~ PSP.	Examples ~~An example~~ of evidence may include, but are not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a ~~Physical Security Perimeter~~ PSP.
1.5	High i~~I~~mpact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; and 2. PCA Medium i~~I~~mpact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a ~~Physical Security Perimeter~~ PSP to the personnel identified in the ~~BES~~ Cyber Security Incident response plan within 15 minutes of detection.	Examples ~~An example~~ of evidence may include, but are not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a ~~Physical Security Perimeter~~ PSP and additional evidence that the alarm or alert was issued and communicated as identified in the ~~BES~~ Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.

CIP-006-~~6~~7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.6	Physical Access Control Systems (PACS) associated with: • High i~~I~~mpact ~~BES Cyber Systems~~ BCS, or • Medium i~~I~~mpact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC SCI supporting an Applicable System in this Part	Monitor each ~~Physical Access Control System~~ PACS for unauthorized physical access to a ~~Physical Access Control System~~ PACS.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.
1.7	~~Physical Access Control Systems (~~PACS~~)~~ associated with: • High i~~I~~mpact ~~BES Cyber Systems~~BCS, or • Medium i~~I~~mpact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC SCI supporting an Applicable System in this Part	Issue an alarm or alert in response to detected unauthorized physical access to a ~~Physical Access Control System~~ PACS to the personnel identified in the ~~BES~~ Cyber Security Incident response plan within 15 minutes of the detection.	Examples ~~An example~~ of evidence may include, but are not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to ~~Physical Access Control Systems~~ PACS and additional evidence that the alarm or alerts was issued and communicated as identified in the Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-~~6~~7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.8	High i~~I~~mpact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; and 2. PCA Medium i~~I~~mpact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each ~~Physical Security Perimeter~~PSP, with information to identify the individual and date and time of entry.	Examples ~~An example~~ of evidence may include, but are not limited to, language in the physical security plan that describes logging and recording of physical entry into each PSP ~~Physical Security Perimeter~~ and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into each PSP ~~Physical Security Perimeter~~ that show the individual and the date and time of entry into each PSP ~~Physical Security Perimeter~~.
1.9	High i~~I~~mpact BCS ~~BES Cyber Systems~~ and their associated: 1. EACMS; and 2. PCA Medium i~~I~~mpact BCS ~~BES Cyber Systems~~ with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Retain physical access logs of entry of individuals with authorized unescorted physical access into each PSP ~~Physical Security Perimeter~~ for at least 90 calendar days.	Examples ~~An example~~ of evidence may include, but are not limited to, dated documentation such as logs of physical access into each PSP ~~Physical Security Perimeter~~ that show the date and time of entry into each PSP~~Physical Security Perimeter~~.

~~1.10~~	~~High Impact BES Cyber Systems and their associated:~~ - ~~PCA~~ ~~Medium Impact BES Cyber Systems at Control Centers and their associated:~~ ~~PCA~~	~~Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter.~~ ~~Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following:~~ - ~~encryption of data that transits such cabling and components; or~~ - ~~monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or~~ - ~~an equally effective logical protection.~~	~~An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.~~

R2. Each Responsible Entity shall implement, except during CIP Exceptional Circumstances, one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-~~6~~7 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-~~6~~7 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~6~~7 Table R2 – Visitor Control Program

Part	Applicable Systems	Requirements	Measures
2.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PCA Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each ~~Physical Security Perimeter, except during CIP Exceptional Circumstances.~~PSP.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, language in a visitor control program that requires continuous escorted access of visitors within ~~Physical Security Perimeters~~each PSP and additional evidence to demonstrate that the process was implemented, such as visitor logs.
2.2	High i~~I~~mpact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; and 2. PCA Medium i~~I~~mpact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from each ~~Physical Security Perimeter~~ PSP that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor~~, except during CIP Exceptional Circumstances~~.	Examples ~~An example~~ of evidence may include, but are not limited to, language in a visitor control program that requires continuous escorted access of visitors within each ~~Physical Security Perimeter~~ PSP and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.

	SCI supporting an Applicable System in this Part

Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PCA Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part	Retain visitor logs for at least 90 calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least 90 calendar days.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-~~6~~7 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-~~6~~7 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~6~~7 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	~~Physical Access Control Systems (~~PACS~~)~~ associated with: • High ~~Impact BES Cyber Systems~~impact BCS, or • Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC Locally mounted hardware or devices at the ~~Physical Security Perimeter~~PSP associated with: • High ~~Impact BES Cyber Systems~~impact BCS, or • Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC	Maintenance and testing of each ~~Physical Access Control System~~PACS and locally mounted hardware or devices at ~~the Physical Security Perimeter~~each PSP at least once every 24 calendar months to ensure they function properly.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, a maintenance and testing program that provides for testing each ~~Physical Access Control System~~PACS and locally mounted hardware or devices associated with each applicable ~~Physical Security Perimeter~~each PSP at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. **Compliance Monitoring Process:**

~~1.1.~~ Compliance Enforcement Authority:

~~1.2.~~1.1. As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

~~1.3.~~ Evidence Retention:

1.2. The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

~~1.4.~~ Compliance Monitoring and Assessment Processes:

~~1.5.~~1.3. As defined in the NERC Rules of Procedure, "Compliance ~~Audits~~Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Investigations~~

~~Self-Reporting~~

~~Complaints~~

~~1.6. Additional Compliance Information:~~

~~None~~

~~2. Table of Compliance Elements~~

Violation Severity Levels

R #	Violation Severity Levels (CIP-006-~~6~~7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (Requirement R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (Part 1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (Part 1.2) OR The Responsible Entity has documented and implemented physical access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (Part 1.3) OR

R #	Violation Severity Levels (CIP-006-~~6~~7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				The Responsible Entity does not have a process to monitor for unauthorized access through a physical access point into a ~~Physical Security Perimeter. (~~PSP. (Part 1.4) OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a ~~Physical Security Perimeter~~PSP or to communicate such alerts within 15 minutes to identified personnel. (Part 1.5) OR The Responsible Entity does not have a process to monitor each ~~Physical Access Control System~~PACS for unauthorized physical access to a ~~Physical Access Control Systems. (~~PACS. (Part 1.6) OR The Responsible Entity does not have a process to alert for

- CIP-006-7 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed FERC directives from Order No. 791.
6	1/21/16	FERC order issued approving CIP-006-6. Docket No. RM15-14-000	
7	TBD	Virtualization Modifications	

~~Guidelines and Technical Basis~~

~~Section 4 – Scope of Applicability of the CIP Cyber Security Standards~~

~~Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.~~

~~Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.~~

~~Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.~~

~~General:~~

~~While the focus of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.~~

~~Requirement R1:~~

~~Methods of physical access control include:~~

- ~~Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.~~
- ~~Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.~~
- ~~Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.~~

- ~~Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.~~

~~Methods to monitor physical access include:~~

- ~~Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.~~
- ~~Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.~~

~~Methods to log physical access include:~~

- ~~Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.~~
- ~~Video Recording: Electronic capture of video images of sufficient quality to determine identity.~~
- ~~Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.~~

~~The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, controls for a sole perimeter could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.~~

~~Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.~~

~~The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the~~

~~physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.~~

~~This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.~~

~~The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.~~

~~The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an "an equally effective logical protection" in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.~~

~~The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity's BES Cyber Systems while not requiring controls to be~~

~~implemented on third-party components when entities rely on leased third-party communications.~~

~~In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.~~

~~Requirement R2:~~

~~The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.~~

~~The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.~~

~~Requirement R3:~~

~~This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for Requirement R1:~~

~~Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a Physical Security Perimeter (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.~~

~~Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable~~

~~communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.~~

~~Rationale for Requirement R2:~~

~~To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.~~

~~Rationale for Requirement R3:~~

~~To ensure all Physical Access Control Systems and devices continue to function properly.~~

Exhibit A-6

Proposed Reliability Standard CIP-007-7
Clean

A. Introduction

1. **Title:** Cyber Security — System Security Management

2. **Number:** CIP-007-7

3. **Purpose:** To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002- identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See Project 2016-02 Modifications to CIP Standards Implementation Plan.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R1– System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); 2. Physical Access Control Systems (PACS); and 3. Protected Cyber Asset (PCA) Medium impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Disable or prevent unneeded routable protocol network accessibility on each Applicable System, per system capability.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled network accessible logical ports or network accessible logical services, individually or by group; • Listings of the listening ports, individually or by group, from either configuration files or settings, command output (such as netstat), or network scans of open ports; • Configuration or settings of host-based firewalls or other device level mechanisms that disable or prevent unneeded network accessible logical ports or network accessible logical services; or • Identity or process based access policy or workload configuration demonstrating needed network accessibility.

CIP-007-7 Table R1– System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High impact BCS and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium impact BCS at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. SCI supporting an Applicable System in this Part.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media.	Examples of evidence may include, but are not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.
1.3	SCI supporting either: High impact BCS or their associated PCA. Medium impact BCS or their associated PCA.	Mitigate the risk of CPU or memory vulnerabilities by preventing the sharing of CPU resources and memory resources, excluding storage resources, between VCAs that are, or are associated with, a medium or high impact BCS, and VCAs that are not, or are not associated with, a medium or high impact BCS.	Examples of evidence may include, but are not limited to, documentation of the configuration or settings showing that the CPU and memory cannot be shared, such as: • Virtualization affinity rules; or • Hardware partitioning of physical Cyber Assets.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Cyber Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Cyber Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R2 – Cyber Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	A patch management process for tracking, evaluating, and installing cyber security patches. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for Applicable Systems that are updateable and for which a patching source exists.	Examples of evidence may include, but are not limited to, documentation of a patch management process and documentation or lists of sources that are monitored.
2.2	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	At least once every 35 calendar days, evaluate cyber security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	Examples of evidence may include, but are not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of cyber security patches released by the documented sources at least once every 35 calendar days.
2.3	High impact BES Cyber Systems and their	For applicable patches identified in Part	Examples of evidence may include, but

CIP-007-7 Table R2 – Cyber Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	2.2, within 35 calendar days of the evaluation completion, take one of the following actions: - Apply the applicable patches; - Create a dated mitigation plan; or - Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each cyber security patch and a timeframe to complete these mitigations.	are not limited to: - Records of the installation of the cyber security patch (e.g., exports from automated patch management tools that provide installation date, verification of component software revision, or registry exports that show software has been installed); or - A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the cyber security patch and a timeframe for the completion of these mitigations.
2.4	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	Examples of evidence may include, but are not limited to, records of implementation of mitigations, and any approval records for mitigation plan revisions or extensions.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R3 – Malicious Code Prevention

Part	Applicable Systems	Requirements	Measures
3.1	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Deploy method(s) to deter, detect, or prevent malicious code.	Examples of evidence may include, but are not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).
3.2	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High impact BCS and their associated:	For those methods identified in Part 3.1	Examples of evidence may include, but

CIP-007-7 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	are not limited to, documentation showing the process used for the update of signatures or patterns.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Log security events, per system capability, for identification of, and after-the-fact investigations of, Cyber Security Incidents that include, at a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; and 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the Applicable System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Generate alerts for security events that the Responsible Entity determines necessitates an alert that includes, as a minimum, each of the following types of events, per system capability: 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Retain applicable security event logs identified in Part 4.1 for at least the last 90 consecutive calendar days, per system capability, except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 calendar days or greater.
4.4	High impact BCS and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part.	Review a summarization or sampling of logged security events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, findings from the review (if any), and dated documentation showing the review occurred.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Have a method(s) to enforce authentication of interactive user access, per system capability.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s).	Examples of evidence may include, but are not limited to, a listing of accounts by account types showing the enabled default or generic account types in use.
5.3	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Identify individuals who have authorized access to shared accounts.	Examples of evidence may include, but are not limited to, listing of shared accounts and the individuals who have authorized access to each shared account.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Change known default passwords, per system capability	Examples of evidence may include, but are not limited to: • Records of a procedure that passwords are changed when new devices are in production; or • Documentation in system manuals or other vendor documents showing default vendor passwords were generated pseudo-randomly and are thereby unique to the device.
5.5	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	For password-only authentication for interactive user access, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is, at least, the lesser of eight characters or the maximum length supported by the Applicable Systems; and 5.5.2. Minimum password complexity that is the lesser of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Applicable System.	Examples of evidence may include, but are not limited to: • System-generated reports or screenshots of the system-enforced password parameters, including length and complexity; or • Attestations that include a reference to the documented procedures that were followed.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.6	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	For password-only authentication for interactive user access, either technically or procedurally enforce password changes or an obligation to change the password at least once every 15 calendar months, per system capability.	Examples of evidence may include, but are not limited to: • System-generated reports or screenshots of the system-enforced periodicity of changing passwords; or • Attestations that include a reference to the documented procedures that were followed.
5.7	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Limit the number of unsuccessful authentication attempts or generate alerts after a threshold of unsuccessful authentication attempts, per system capability.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration or settings showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Additional Compliance Information:

None

Violation Severity Levels

R #	Violation Severity Levels (CIP-007-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not document one or more process(es) that included the applicable items in CIP-007-7 Table R1. (Requirement R1)	The Responsible Entity had no methods to protect against unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media. (Part 1.2)	The Responsible Entity had one or more unneeded logical network accessible ports or network accessible services enabled. (Part 1.1) OR The Responsible Entity has not prevented the sharing of the CPU and memory resources between VCAs that are, or are associated with, a Medium or High Impact BCS, and VCAs that are not, or are not associated with a Medium or High Impact BCS. (Part 1.3)	The Responsible Entity neither implemented nor documented one or more process(es) that included the applicable items in CIP-007-6 Table R1. (Requirement R1)
R2	The Responsible Entity did not evaluate the cyber security patches for applicability within 35 calendar days but less than 50 calendar days of the last evaluation for the source or sources identified. (Part 2.2) OR The Responsible Entity did not apply the applicable cyber security patches, create a dated mitigation plan, or revise an existing mitigation plan within 35 calendar days but less than 50 calendar days of the evaluation completion. (Part 2.3)	The Responsible Entity did not include any processes, including the identification of sources, for tracking or evaluating cyber security patches for Applicable Systems. (Part 2.1) OR The Responsible Entity did not evaluate the cyber security patches for applicability within 50 calendar days but less than 65 calendar days of the last evaluation for the source or sources identified. (Part 2.2) OR	The Responsible Entity did not include any processes for installing cyber security patches for Applicable Systems. (Part 2.1) OR The Responsible Entity did not evaluate the cyber security patches for applicability within 65 calendar days of the last evaluation for the source or sources identified. (Part 2.2) OR The Responsible Entity did not apply the applicable cyber security patches, create a dated mitigation plan, or revise	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-7 Table R2. (Requirement R2) OR The Responsible Entity did not include any processes for tracking, evaluating, or installing cyber security patches for applicable Cyber Assets. (Part 2.1) OR The Responsible Entity did not obtain approval by the CIP Senior Manager or delegate. (Part 2.4)

R #	Violation Severity Levels (CIP-007-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
		The Responsible Entity did not apply the applicable cyber security patches, create a dated mitigation plan, or revise an existing mitigation plan within 50 calendar days but less than 65 calendar days of the evaluation completion. (Part 2.3)	an existing mitigation plan within 65 calendar days of the evaluation completion. (Part 2.3)	OR The Responsible Entity did not implement the plan as created or revised within the timeframe specified in the plan. (Part 2.4)
R3	N/A	The Responsible Entity, where signatures or patterns are used, the Responsible Entity did not address testing the signatures or patterns. (Part 3.3)	The Responsible Entity did not mitigate the threat of detected malicious code. (Part 3.2) OR The Responsible Entity, where signatures or patterns are used, the Responsible Entity did not update malicious code protections. (Part 3.3).	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R3. (Requirement R3). OR The Responsible Entity did not deploy method(s) to deter, detect, or prevent malicious code. (Part 3.1)
R4	The Responsible Entity missed one of 15 calendar day interval and completed the review within 22 calendar days of the prior review. (Part 4.4)	The Responsible Entity missed one 15 calendar day interval and completed the review within 30 calendar days of the prior review. (Part 4.4)	The Responsible Entity did not generate alerts for all of the required types of security events described in 4.2.1 through 4.2.2. (Part 4.2) OR The Responsible Entity did not retain applicable security event logs for at least the last 90 consecutive days. (Part 4.3) OR The Responsible Entity missed two or more 15 calendar day intervals. (Part 4.4)	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R4. (Requirement R4) OR The Responsible Entity, per system capability, did not detect and log all of the required types of events described in 4.1.1 through 4.1.3. (Part 4.1)

R #	Violation Severity Levels (CIP-007-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	The Responsible Entity did not technically or procedurally enforce password changes or an obligation to change the password within 15 calendar months but less than or equal to 16 calendar months of the last password change. (Part 5.6)	The Responsible Entity did not technically or procedurally enforce password changes or an obligation to change the password within 16 calendar months but less than or equal to 17 calendar months of the last password change. (Part 5.6)	The Responsible Entity did not include the identification or inventory of all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s). (Part 5.2) OR The Responsible Entity did not include the identification of the individuals with authorized access to shared accounts. (Part 5.3) OR The Responsible Entity did not technically or procedurally enforce one of the two password parameters as described in 5.5.1 and 5.5.2. (Part 5.5) OR The Responsible Entity process(es) for password-only authentication for interactive user access did not technically or procedurally enforce one of the two password parameters as described in 5.5.1 and 5.5.2. (Part 5.5) OR The Responsible Entity did not technically or procedurally	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R5. (Requirement R5) OR The Responsible Entity does not have a method(s) to enforce authentication of interactive user access. (Part 5.1) OR The Responsible Entity does not have a method(s) to enforce authentication of interactive user access. (Part 5.1) OR The Responsible Entity did not, per device capability, change known default passwords. (Part 5.4) OR The Responsible Entity did not technically or procedurally enforce all of the password parameters described in 5.5.1 and 5.5.2. (Part 5.5) OR The Responsible Entity did not technically or procedurally enforce password changes or an obligation to change the

R #	Violation Severity Levels (CIP-007-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
			enforce password changes or an obligation to change the password within 17 calendar months but less than or equal to 18 calendar months of the last password change. (Part 5.6)	password within 18 calendar months of the last password change. (Part 5.6) OR The Responsible Entity neither limited the number of unsuccessful authentication attempts nor generated alerts after a threshold of unsuccessful authentication attempts. (Part 5.7)

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/15/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses

Version	Date	Action	Change Tracking
			remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.

Exhibit A-6

Proposed Reliability Standard CIP-007-7
Redline

A. Introduction

1. **Title:** Cyber Security — System Security Management

2. **Number:** CIP-007-~~6~~7

3. **Purpose:** To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” ~~-~~For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1 Balancing Authority

    4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2 Each ~~Special Protection System (SPS) or~~ Remedial Action Scheme (RAS) where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3 Generator Operator

4.1.4 Generator Owner

~~**4.1.5 Interchange Coordinator or Interchange Authority**~~

~~4.1.6~~4.1.5 Reliability Coordinator

~~4.1.7~~4.1.6 Transmission Operator

~~4.1.8~~4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~SPS or~~ RAS where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~6~~7:

4.2.3.1 Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

~~4.2.3.2~~4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3~~4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4~~4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5~~4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-~~5.1~~ identification and categorization processes.

~~5. Effective Dates:~~

~~See Implementation Plan for CIP-007-6.~~

~~6. Background:~~

~~Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *“Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].”* The referenced table requires the applicable items in the procedures for the requirement’s common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization’s overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~” Columns in Tables:~~

~~5.1.~~4.3. ”: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies.~~ The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.~~

- ~~**Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.~~
- ~~**Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~
- ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~

5. ~~**Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~**Effective Dates:** See Project 2016-02 Modifications to CIP Standards Implementation Plan.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~7 Table R1 – ~~Ports and Services~~System Hardening*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~7 Table R1 – ~~Ports and Services~~System Hardening* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~7 Table R1– ~~Ports and Services~~System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~I~~impact ~~BES Cyber Systems~~ BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); 2. Physical Access Control~~Medium Impact BES Cyber~~ Systems (PACS); and 3. Protected Cyber Asset (PCA) Medium ~~I~~impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA	~~Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.~~Disable or prevent unneeded routable protocol network accessibility on each Applicable System, per system capability.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled network accessible logical ports ~~on all applicable Cyber Assets and Electronic Access Points, individually~~ or ~~by group.~~network accessible logical services, individually or by group; • Listings of the listening ports ~~on the Cyber Assets~~, individually or by group, from either ~~the device~~ configuration files or settings, command output (such as netstat), or network scans of open ports; ~~or~~

CIP-007-~~6~~7 Table R1– ~~Ports and Services~~System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
	SCI supporting an Applicable System in this Part.		• Configuration ~~files~~or settings of host-based firewalls or other device level mechanisms that ~~only allow~~disable or prevent unneeded network accessible logical ports or network accessible logical services; or • Identity or process based access policy or workload configuration demonstrating needed ~~ports and deny all others.~~ network accessibility.

CIP-007-~~6~~7 Table R1– ~~Ports and Services~~System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium ~~I~~impact ~~BES Cyber Systems~~BCS at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. SCI supporting an Applicable System in this Part.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.
1.3	SCI supporting either: High impact BCS or their associated PCA. Medium impact BCS or their associated PCA.	Mitigate the risk of CPU or memory vulnerabilities by preventing the sharing of CPU resources and memory resources, excluding storage resources, between VCAs that are, or are associated with, a medium or high impact BCS, and VCAs that are not, or are not associated with, a medium or high impact BCS.	Examples of evidence may include, but are not limited to, documentation of the configuration or settings showing that the CPU and memory cannot be shared, such as: • Virtualization affinity rules; or • Hardware partitioning of physical Cyber Assets.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~7 Table R2 – Cyber Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~7 Table R2 – Cyber Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~7 Table R2 – Cyber Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~I~~impact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	A patch management process for tracking, evaluating, and installing cyber security patches~~ for applicable Cyber Assets~~. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for ~~applicable Cyber Assets~~Applicable Systems that are updateable and for which a patching source exists.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, documentation of a patch management process and documentation or lists of sources that are monitored~~, whether on an individual BES Cyber System or Cyber Asset basis. ~~.
2.2	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~I~~impact ~~BES Cyber Systems~~ BCS and their associated:	At least once every 35 calendar days, evaluate cyber security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of cyber security~~-related~~ patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~6~~7 Table R2 – Cyber Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.		
2.3	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: - Apply the applicable patches; ~~or~~ - Create a dated mitigation plan; or - Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each cyber security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: - Records of the installation of the cyber security patch (e.g., exports from automated patch management tools that provide installation date, verification of ~~BES Cyber System Component~~component software revision, or registry exports that show software has been installed); or - A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the cyber security patch and a timeframe for the completion of these mitigations.
2.4	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, records of implementation of mitigations, and any approval records for mitigation plan revisions or extensions.

Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration or settings showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigations~~

~~Self-Reporting~~

~~Complaints~~

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Additional Compliance Information:

None

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/15/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order

~~Guidelines and Technical Basis~~

~~Section 4 – Scope of Applicability of the CIP Cyber Security Standards~~

~~Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.~~

~~Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.~~

~~Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.~~

~~Requirement R1:~~

~~Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.~~

~~**1.1.** This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'~~

~~**1.2.** Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.~~

~~The protection of these ports can be accomplished in several ways including, but not limited to:~~

~~Disabling all unneeded physical ports within the Cyber Asset's configuration~~

~~Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization~~

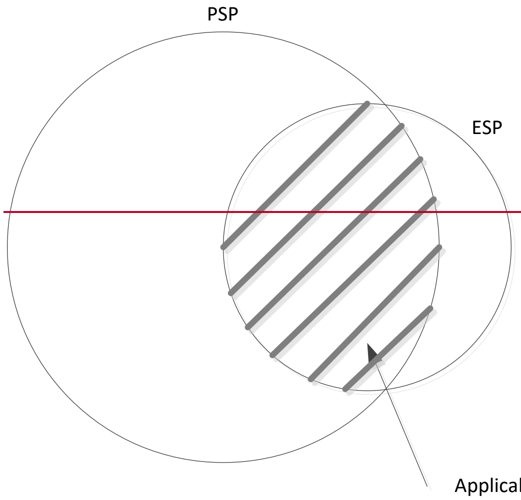
~~Physical port obstruction through removable locks~~

~~The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.~~

~~This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.~~

~~The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:~~

Location of Nonprogrammable Communication Components



Applicability of CIP-007-6 R1, Part 1.2 for Nonprogrammable Communication Components

~~**Requirement R2:**~~

~~The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.~~

~~Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.~~

~~One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.~~

~~**2.1.** The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they~~

~~can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.~~

~~**2.2.** Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.~~

~~When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.~~

~~**2.3.** The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or~~

~~those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.~~

~~**2.4.** The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.~~

~~**Requirement R3:**~~

~~**3.1.** Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.~~

~~**3.2.** When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or~~

~~method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.~~

~~Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement, but do not meet, the additional obligations for transient devices.~~

~~**3.3.** In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.~~

~~**Requirement R4:**~~

~~Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.~~

~~**4.1.** In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.~~

~~Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.~~

~~User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.~~

~~It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.~~

~~**4.2.** Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.~~

~~The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:~~

~~Detected known or potential malware or malicious activity~~

~~Failure of security event logging mechanisms~~

~~Login failures for critical accounts~~

~~Interactive login of system accounts~~

~~Enabling of accounts~~

~~Newly provisioned accounts~~

~~System administration or change tasks by an unauthorized user~~

~~Authentication attempts on certain accounts during non-business hours~~

~~Unauthorized configuration changes~~

~~Insertion of Removable Media in violation of a policy~~

~~**4.3** Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.~~

~~**4.4.** Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-~~

~~time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.~~

~~Requirement R5:~~

~~Account types referenced in this guidance typically include:~~

~~Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.~~

~~Individual user account: An account used by a single user.~~

~~Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.~~

~~System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.~~

~~Application account: A specific system account, with rights granted at the application level often used for access into a Database.~~

~~Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.~~

~~Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.~~

~~Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.~~

~~5.1~~ ~~Reference the Requirement's rationale.~~

~~5.2~~ ~~Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.~~

~~5.3~~ ~~Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.~~

~~5.4.~~ ~~Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.~~

~~The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or~~

~~installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.~~

~~**5.5.** Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.~~

~~Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.~~

~~Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.~~

~~**5.6** Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.~~

~~**5.7** Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.~~

~~Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for Requirement R1:~~

~~The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.~~

~~In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.~~

~~The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).~~

~~Rationale for Requirement R2:~~

~~Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.~~

~~Rationale for Requirement R3:~~

~~Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.~~

~~Rationale for Requirement R4:~~

~~Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.~~

~~Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.~~

~~**Rationale for Requirement R5:**~~

~~To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.~~

~~Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.~~

~~Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.~~

~~Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term "authorized" is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.~~

~~Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.~~

~~For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.~~

~~The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.~~

~~The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.~~

~~The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.~~

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-7

Proposed Reliability Standard CIP-008-7
Clean

A. Introduction

1. **Title:** Cyber Security — Incident Reporting and Response Planning

2. **Number:** CIP-008-7

3. **Purpose:** To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the Bulk Electric System (BES):

   4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3 Generator Operator

   4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-008-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems (BES) categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	Applicable Systems	Requirements	Measures
1.1	High impact BCS and their associated Electronic Access Control and Monitoring Systems (EACMS) Medium impact BCS and their associated EACMS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part	One or more processes to identify, classify, and respond to Cyber Security Incidents.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process(es) to identify, classify, and respond to Cyber Security Incidents.
1.2	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	One or more processes: 1.2.1 That include criteria to evaluate and define attempts to compromise; 1.2.2 To determine if an identified Cyber Security Incident is: • A Reportable Cyber Security Incident; or • An attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the Applicable Systems column for this Part; and 1.2.3 To provide notification per Requirement R4.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents or a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the Applicable Systems column including justification for attempt determination criteria and documented processes for notification.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	The roles and responsibilities of Cyber Security Incident response groups or individuals.	Examples of evidence may include, but are not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.
1.4	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Incident handling procedures for Cyber Security Incidents.	Examples of evidence may include, but are not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing

Part	Applicable Systems	Requirements	Measures
2.1	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations based exercises.
2.2	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident, responding to a Cyber Security Incident that attempted to compromise a system identified in the Applicable Systems column for this Part, or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident response or exercise.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Retain records related to Reportable Cyber Security Incidents and Cyber Security Incidents that attempted to compromise a system identified in the Applicable Systems column for this Part as per the Cyber Security Incident response plan(s) under Requirement R1.	Examples of evidence may include, but are not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents and a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the Applicable Systems column.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication.*

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	Examples of evidence may include, but are not limited to, all of the following: 1. Dated documentation of post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.
3.2	High impact BCS and their associated EACMS	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the	Examples of evidence may include, but are not limited to: 1. Dated and revised Cyber Security Incident response plan with changes

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Responsible Entity determines would impact the ability to execute the plan: 3.2.1. Update the Cyber Security Incident response plan(s); and 3.2.2. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates.	to the roles or responsibilities, responders or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

R4. Each Responsible Entity shall notify the Electricity Information Sharing and Analysis Center (E-ISAC) and, if subject to the jurisdiction of the United States, the United States Cybersecurity & Infrastructure Security Agency (CISA), or their successors, of a Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria from Requirement R1, Part 1.2.1, a system identified in the Applicable Systems column, unless prohibited by law, in accordance with each of the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M4. Evidence must include, but is not limited to, documentation that collectively demonstrates notification of each determined Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise a system identified in the Applicable Systems column according to the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents.*

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents

Part	Applicable Systems	Requirements	Measures
4.1	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Initial notifications and updates shall include the following attributes, at a minimum, to the extent known: 4.1.1 The functional impact; 4.1.2 The attack vector used; and 4.1.3 The level of intrusion that was achieved or attempted.	Examples of evidence may include, but are not limited to, dated documentation of initial notifications and updates to the E-ISAC and CISA, or their successors.
4.2	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	After the Responsible Entity's determination made pursuant to documented process(es) in Requirement R1, Part 1.2, provide initial notification within the following timelines: • One hour after the determination of a Reportable Cyber Security Incident. • By the end of the next calendar day after determination that a Cyber Security Incident was an attempt to compromise a system identified in the Applicable Systems column for this Part.	Examples of evidence may include, but are not limited to, dated documentation of notices to the E-ISAC and CISA, or their successors.

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High impact BCS and their associated EACMS Medium impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	Provide updates, if any, within seven calendar days of determination of new or changed attribute information required in Part 4.1.	Examples of evidence may include, but are not limited to, dated documentation of submissions to the E-ISAC and CISA, or their successors.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority (“CEA”) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-008-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Responsible Entity did not include the roles and responsibilities of Cyber Security Incident response groups or individuals. (Part 1.3) OR The Responsible Entity did not include incident handling procedures for Cyber Security Incidents. (Part 1.4) OR The Responsible Entity's plan did not include one or more processes to provide notification per Requirement R4. (Part 1.2) OR The Responsible Entity's plan did not include one or more processes that include criteria to evaluate and define attempts to compromise. (Part 1.2)	The Responsible Entity did not develop a Cyber Security Incident response plan with one or more processes to identify, classify, and respond to Cyber Security Incidents. (Part 1.1) OR The Responsible Entity's plan did not include one or more processes to identify Reportable Cyber Security Incidents or a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria from Part 1.2.1, a system identified in the Applicable Systems column for Part 1.2. (Part 1.2)
R2	The Responsible Entity did not test the Cyber Security Incident response plan(s) within 15 calendar months, not exceeding 16 calendar months between tests of the plan(s). (Par 2.1)	The Responsible Entity did not test the Cyber Security Incident response plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan(s). (Part 2.1)	The Responsible Entity did not test the Cyber Security Incident response plan(s) within 17 calendar months, not exceeding 18 calendar months between tests of the plan(s). (Part 2.1) OR	The Responsible Entity did not test the Cyber Security Incident response plan(s) within 18 calendar months between tests of the plan(s). (Part 2.1) OR The Responsible Entity did not retain relevant records related

R #	Violation Severity Levels (CIP-008-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
			The Responsible Entity did not document deviations, if any, from the plan during a test or when a Reportable Cyber Security Incident or a Cyber Security Incident that was an attempt to compromise a system identified in the Applicable Systems column for Part 2.2 occurs. (Part 2.2)	to Reportable Cyber Security Incidents or Cyber Security Incidents that were an attempt to compromise a system identified in the Applicable Systems column for Part 2.3. (Part 2.3)
R3	The Responsible Entity did not notify each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within greater than 90 but less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.3)	The Responsible Entity did not update the Cyber Security Incident response plan based on any documented lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.2) OR The Responsible Entity did not notify each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.3) OR The Responsible Entity did not update the Cyber Security	The Responsible Entity neither documented lessons learned nor documented the absence of any lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.1) OR The Responsible Entity did not update the Cyber Security Incident response plan based on any documented lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.2) OR The Responsible Entity did not update the Cyber Security Incident response plan(s) or notified each person or group with a defined role within 90	The Responsible Entity neither documented lessons learned nor documented the absence of any lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Part 3.1.1)

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-008-5.	
5	7/9/14	FERC Letter Order issued approving VRFs and VSLs revisions to certain CIP standards.	CIP-008-5 Requirement R2, VSL table under Severe, changed from 19 to 18 calendar months.
6	2/7/2019	Adopted by the NERC Board of Trustees.	Modified to address directives in FERC Order No. 848

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-7

Proposed Reliability Standard CIP-008-7
Redline

A. Introduction

1. **Title:** Cyber Security — Incident Reporting and Response Planning

2. **Number:** CIP-008-~~6~~7

3. **Purpose:** To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the ~~BES:~~Bulk Electric System (BES):

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Remedial Action Scheme (RAS) where the ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Remedial Action Scheme~~RAS where the ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-008-~~6~~7:

4.2.3.1 Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP.

~~4.2.3.3~~4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4~~4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5~~4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems (BES) categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. ~~5. Effective Dates:~~

~~See Implementation Plan for CIP-008-6.~~

~~6. Background:~~

~~Standard CIP-008 exists as part of a suite of CIP Standards related to cyber security. CIP-002 requires the initial identification and categorization of BES Cyber Systems. CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010, and CIP-011 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization’s overall implementation of its policies, plans and procedures involving a particular subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~” Columns in Tables:~~
”: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies.~~ The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.~~

~~**Medium Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.~~

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-~~6~~7 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-~~6~~7 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-~~6~~7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~Impact BES Cyber Systems~~ impact BCS and their associated~~:~~ Electronic Access Control and Monitoring Systems (EACMS) Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part	One or more processes to identify, classify, and respond to Cyber Security Incidents.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process(es) to identify, classify, and respond to Cyber Security Incidents.
1.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	One or more processes: 1.2.1 That include criteria to evaluate and define attempts to compromise; 1.2.2 To determine if an identified Cyber Security Incident is: • A Reportable Cyber Security Incident; or • An attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the “Applicable Systems” column	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents or a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the “Applicable Systems” column including justification for attempt determination criteria and documented processes for notification.

CIP-008-~~6~~7 Table R1 – Cyber Security Incident Response Plan Specifications

Part	Applicable Systems	Requirements	Measures
		for this Part; and 1.2.3 To provide notification per Requirement R4.	
1.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	The roles and responsibilities of Cyber Security Incident response groups or individuals.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.
1.4	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	Incident handling procedures for Cyber Security Incidents.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-~~6~~7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-~~6~~7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-~~6~~7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	Test each Cyber Security Incident response plan(s) at least once every~~-~~ 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations based exercises.
2.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident, responding to a Cyber Security Incident that attempted to compromise a system identified in the ~~“~~Applicable Systems~~”~~ column for this Part, or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident response or exercise.

CIP-008-~~6~~7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	Retain records related to Reportable Cyber Security Incidents and Cyber Security Incidents that attempted to compromise a system identified in the ~~"~~"Applicable Systems~~"~~" column for this Part as per the Cyber Security Incident response plan(s) under Requirement R1.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents and a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the ~~"~~"Applicable Systems~~"~~" column.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-~~6~~7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-~~6~~7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication.*

CIP-008-~~6~~7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated~~:~~ EACMS SCI supporting an Applicable System in this Part	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, all of the following: 1. Dated documentation of~~-~~ post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or ~~•~~ Training sign-in sheets. •

Examples of evidence may include, but are not limited to, dated documentation of submissions to the E-ISAC and ~~NCCIC.~~CISA, or their successors.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- ~~Compliance Audit~~
- ~~Self-Certification~~
- ~~Spot Checking~~
- ~~Compliance Investigation~~
- ~~Self-Reporting~~
- ~~Complaint~~

~~**1.4. Additional Compliance Information:**~~

~~None~~

~~2. Table of Compliance Elements~~

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-008-~~6~~7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-008-5.	
5	7/9/14	FERC Letter Order issued approving VRFs and VSLs revisions to certain CIP standards.	CIP-008-5 Requirement R2, VSL table under Severe, changed from 19 to 18 calendar months.
6	2/7/2019	Adopted by the NERC Board of Trustees.	Modified to address directives in FERC Order No. 848

Exhibit A-8

Proposed Reliability Standard CIP-009-7
Clean

A. Introduction

1. **Title:** Cyber Security — Recovery Plans for BES Cyber Systems

2. **Number:** CIP-009-7

3. **Purpose:** To recover reliability functions performed by BES Cyber Systems (BCS) by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3 Generator Operator

   4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable Requirement Parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable Requirement Parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium impact BCS and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).
1.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	Examples of evidence may include, but are not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover Applicable System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover Applicable System functionality.
1.4	High impact BCS and their associated:	One or more processes to verify the	Examples of evidence may include, but are

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS Medium impact BCS at Control Centers and their associated: 1. EACMS; and PACS	successful completion of the backup processes in Part 1.3 and to address any backup failures.	not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS and their associated: 1. EACMS; and 2. PACS SCI supporting an Applicable System in this part	One or more processes to preserve data, per system capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	Examples of evidence may include, but are not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable Requirement Parts in *CIP-009-7 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable Requirement Parts in *CIP-009-7 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: - By recovering from an actual incident; - With a paper drill or tabletop exercise; or - With an operational exercise.	Examples of evidence may include, but are not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.
2.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover Applicable System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover Applicable System functionality substitutes for this test.	Examples of evidence may include, but are not limited to, operational logs or test results with criteria for testing the usability (e.g., sample tape load, browsing tape contents) and compatibility with current system configurations (e.g., manual, or automated comparison checkpoints between backup media contents and current configuration).
2.3	High impact BCS	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment.	Examples of evidence may include, but are not limited to, dated documentation of: - An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or

CIP-009-7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
		An actual recovery response may substitute for an operational exercise.	• An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable Requirement Parts in *CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the Applicable Requirement parts in *CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	Examples of evidence may include, but are not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.
3.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a	Examples of evidence may include, but are not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to:

CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
		defined role in the recovery plan of the updates.	• Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information: None

Violation Severity Levels

R #	Violation Severity Levels (CIP-009-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	The Responsible Entity's plan(s) did not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity plan(s) did not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity did not create recovery plan(s) for Applicable Systems. OR The Responsible Entity plan(s) did not address the conditions for activation in Part 1.1. OR The Responsible Entity plan(s) did not address three or more of the requirements in Parts 1.2 through 1.5.
R2	The Responsible Entity did not test the recovery plan(s) according to Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan(s). NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-8

Proposed Reliability Standard CIP-009-7
Redline

A. Introduction

1. **Title:** Cyber Security — Recovery Plans for BES Cyber Systems

2. **Number:** CIP-009-~~6~~7

3. **Purpose:** To recover reliability functions performed by BES Cyber Systems (BCS) by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the Bulk Electric System (BES~~.~~).

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 **Balancing Authority**

4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each ~~Special Protection System or~~ Remedial Action Scheme (RAS) where the ~~Special Protection System or Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 **Generator Operator**

4.1.4 Generator Owner

~~**4.1.5 Interchange Coordinator or Interchange Authority**~~

~~**4.1.6**~~**4.1.5 Reliability Coordinator**

~~**4.1.7**~~**4.1.6 Transmission Operator**

~~**4.1.8**~~**4.1.7 Transmission Owner**

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 ~~Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme~~Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-~~6~~7:

4.2.3.1 Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3**~~**4.2.3.4** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4**~~**4.2.3.5** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~**4.2.3.5**~~**4.2.3.6** Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

~~**5. Effective Dates:**~~

~~See Implementation Plan for CIP-009-6.~~

~~**6. Background:**~~

~~Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident~~

~~response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization’s overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~” Columns in Tables:~~

~~5.1.~~4.3. ”: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies. ~~The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.~~

- ~~**Medium Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems at Control Centers –** Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS) –** Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.~~

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

- ~~**Physical Access Control Systems (PACS) –** Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.~~

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable ~~requirement parts~~Requirement Parts in *CIP-009-~~6~~7 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*.

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable ~~requirement parts~~Requirement Parts in *CIP-009-~~6~~7 Table R1 – Recovery Plan Specifications*.

CIP-009-~~6~~7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).
1.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.

CIP-009-~~6~~7 Table R1 – Recovery Plan Specifications

Part	Applicable Systems	Requirements	Measures
1.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover ~~BES Cyber~~Applicable System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover ~~BES Cyber~~Applicable System functionality.
1.4	High ~~I~~impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium ~~I~~impact ~~BES Cyber Systems~~BCS at Control Centers and their associated: 1. EACMS; and PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	Examples ~~An example~~ of evidence may include, but are not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High i~~I~~mpact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium i~~I~~mpact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS SCI supporting an Applicable System in this part	One or more processes to preserve data, per system ~~Cyber Asset~~ capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	Examples ~~An example~~ of evidence may include, but are not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable ~~requirement parts~~Requirement Parts in *CIP-009-~~6~~7 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable ~~requirement parts~~Requirement Parts in *CIP-009-~~6~~7 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-~~6~~7 Table R2 – Recovery Plan Implementation and Testing

Part	Applicable Systems	Requirements	Measures
2.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: - By recovering from an actual incident; - With a paper drill or tabletop exercise; or - With an operational exercise.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.
2.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS at Control Centers and their associated: 1. EACMS; and	Test a representative sample of information used to recover ~~BES Cyber~~Applicable System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover ~~BES Cyber~~Applicable System functionality substitutes for this test.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, operational logs or test results with criteria for testing the usability (e.g.~~.~~, sample tape load, browsing tape contents) and compatibility with current system configurations (e.g.~~.~~, manual, or automated comparison checkpoints between backup media contents and current configuration).

CIP-009-~~6~~7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
	~~2.~~ PACS ~~3.~~2.		
2.3	High ~~Impact BES Cyber Systems~~impact BCS	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable ~~requirement parts~~Requirement Parts in *CIP-009-~~6~~7 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the ~~applicable requirement~~Applicable Requirement parts in *CIP-009-~~6~~7 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-~~6~~7 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.
3.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact ~~-~~the ability to execute the recovery plan:	~~An example~~Examples of evidence may include, but ~~is~~are not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or

Evidence of plan update distribution including, but not limited to: - Emails; - USPS or other mail service; - Electronic distribution system; or - Training sign-in sheets.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information: None

Violation Severity Levels

R #	Violation Severity Levels (CIP-009-~~6~~7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	The Responsible ~~Entity has developed recovery~~Entity's plan(s~~), but the plan(s) do~~) did not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity ~~has developed recovery~~ plan(s~~), but the plan(s) do~~) did not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity ~~has~~did not ~~created~~create recovery plan(s) for ~~BES Cyber~~Applicable Systems. OR The Responsible Entity ~~has created recovery~~ plan(s) ~~for BES Cyber Systems, but the plan(s) does~~did not address the conditions for activation in Part 1.1. OR The Responsible Entity ~~has created recovery plan(s) for BES Cyber Systems, but the plan(s) does~~plan(s) did not address three or more of the requirements in Parts 1.2 through 1.5.
R2	The Responsible Entity ~~has~~did not ~~tested~~test the recovery plan(s) according to ~~R2~~ Part 2.1 within 15 calendar months, not exceeding 16 calendar months between	The Responsible Entity ~~has~~did not ~~tested~~test the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. ~~Guidelines and Technical Basis~~

~~Section 4 – Scope of Applicability of the CIP Cyber Security Standards~~

~~Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.~~

~~Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.~~

~~Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.~~

~~Requirement R1:~~

~~The following guidelines are available to assist in addressing the required components of a recovery plan:~~

- ~~NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf~~
- ~~National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf~~

~~The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.~~

~~A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants.~~

~~For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.~~

~~For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.~~

~~For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:~~

1. ~~Installation files and media;~~
2. ~~Current backup tapes and any additional documented configuration settings;~~
3. ~~Documented build or restoration procedures; and~~
4. ~~Cross site replication storage.~~

~~For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:~~

- ~~Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.~~
- ~~Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.~~
- ~~Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.~~
- ~~Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.~~

~~The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.~~

~~For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.~~

~~Requirement R2:~~

~~A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.~~

~~A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.~~

~~Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."~~

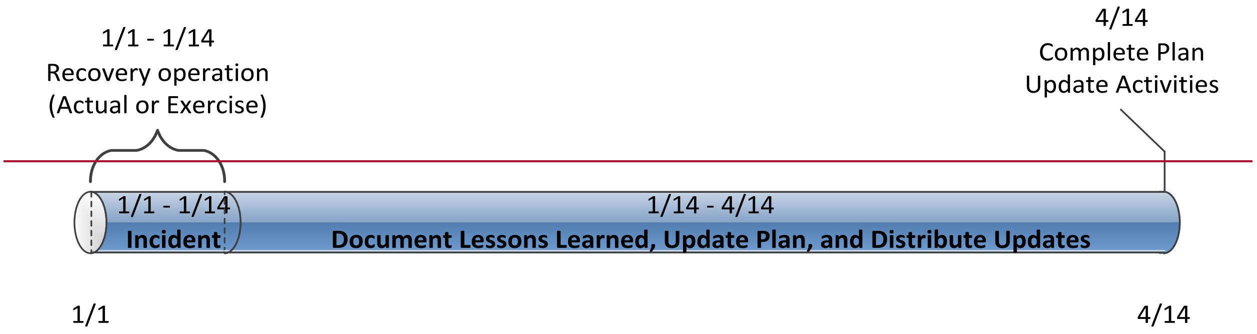
~~The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."~~

~~For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.~~

~~**Requirement R3:**~~

~~This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.~~

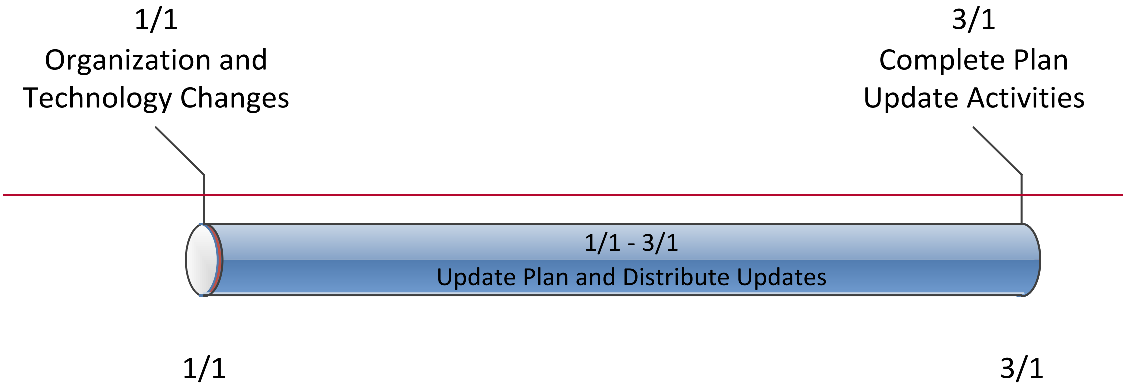
~~The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.~~



~~**Figure 1: CIP-009-6 R3 Timeline**~~

~~The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.~~

~~The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.~~



~~**Figure 2: Timeline for Plan Changes in 3.2**~~

~~When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for Requirement R1:~~

~~Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.~~

~~Rationale for Requirement R2:~~

~~The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.~~

~~Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.~~

~~Rationale for Requirement R3:~~

~~To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.~~

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-9

Proposed Reliability Standard CIP-010-5
Clean

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-010-5

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems (BCS) by specifying configuration change management and vulnerability assessment requirements in support of protecting BCS from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-5:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and

data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Date:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) to manage configuration changes, individually or by group, that collectively include each of the applicable requirement parts in *CIP-010-5 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); 2. Physical Access Control Systems (PACS); and 3. Protected Cyber Asset (PCA) Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Authorize changes that affect Applicable Systems where those changes alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity.	Examples of evidence may include, but are not limited to, one or more documented process(es) that authorize changes that affect Applicable Systems where those changes alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity, such as: • Change records documenting the authorization. • Change records authorizing systems to automate changes to Applicable Systems. Examples of changes that may alter the behavior of one or more cyber security controls may include, but are not limited to: • Installation, removal, or update of operating system, firmware, software, or cyber security patches, including changes to VCA parent images from

CIP-010-5 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
			which Applicable Systems will be instantiated (CIP-007 R1.1, R2) • Configuration changes that affect routable protocol network accessibility (CIP-007 R1.1) • Configuration changes affecting the establishment of, or access control through, an ESP (CIP-005 R1, R2) • Configuration of malicious code prevention methods (CIP-007 R3) • Configuration of security event logging/alerting (CIP-007 R4) • Configuration changes to authentication methods (e.g., a password enforcement policy change, but not users changing their password) (CIP-007 R5) • Configuration changes to CPU/memory sharing of VCAs on SCI (CIP-007 R1.3)
1.2	High impact BCS	1.2.1. Prior to implementing any change from Part 1.1 in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, to ensure that required cyber security controls in CIP-005 and CIP-007 are not	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including the date of the test, or logs from systems that automatically remediate deviations in required cyber security controls in CIP-005 and CIP-007.

CIP-010-5 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
		adversely affected; and 1.2.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	
1.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS and their associated: 1. EACMS; and 2. PACS SCI supporting an Applicable System in this Part. Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	Prior to the installation of operating systems, firmware, software, or software patches and when the method to do so is available to the Responsible Entity from the software source: 1.3.1. Verify the identity of the software source; and 1.3.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed prior to installation or a process which documents the mechanisms in place that would automatically ensure the identity of the software source and integrity of the software.
1.4	High impact BCS and their associated: 1. EACMS;	As a part of the changes authorized per Part 1.1, verify that the behavior(s) of the altered cyber security controls were not	An example of evidence may include, but is not limited to:

CIP-010-5 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	adversely affected.	• System generated evidence of automated verification of required behaviors. • Records from a verification process showing that, as a part of the change process, the required behavior(s) of the altered security controls remain effective, were corrected, or the change was reversed.

R2. Each Responsible Entity shall implement one or more documented process(es) to monitor configuration changes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part.	Methods to monitor, per system capability, at least once every 35 calendar days, for unauthorized changes that affect Applicable Systems, where those changes alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-007, as defined by the Responsible Entity; that include at least one cyber security control for each of the following: 2.1.1. Configuration on each Applicable System that affects its routable protocol network accessibility; 2.1.2. Configuration of CPU or memory sharing of VCAs on SCI; 2.1.3. Installation, removal, and update of operating system, firmware, software, and cyber security patches. 2.1.4. Configuration of malicious code protection methods;	An example of evidence may include, but is not limited to, documented methods to monitor at least once every 35 calendar days. Monitoring system configuration or procedural controls demonstrating monitoring of at least one cyber security control for 2.1.1 through 2.1.7. Examples of evidence may include, but are not limited to, reports generated from automated tools or manual reviews along with records of investigation for any unauthorized changes that were detected. Note: monitoring of VCA parent images from which Applicable Systems will be instantiated is an example of an automated control for 2.1.3.

CIP-010-5 Table R2 – Configuration Monitoring			
Part	Applicable Systems	Requirements	Measures
		2.1.5. Configuration of security event logging or alerting; 2.1.6. Configuration of authentication methods; and 2.1.7. Changes to the enabled or disabled status of accounts. Document and investigate detected unauthorized changes.	

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-5 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High impact BES Cyber Systems. SCI supporting an Applicable System in this Part.	At least once every 36 calendar months, per system capability: 3.2.1 Perform an active vulnerability assessment in a test environment that minimizes differences with the production environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.
3.3	High impact BCS and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part.	Prior to becoming a new Applicable System, perform an active vulnerability assessment of the new Applicable System, except for: • Like replacements or additions with a previously assessed configuration of an existing Applicable System; or • CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to: • The output of tools used to perform the assessment; or • Reports from automated assessment and remediation mechanisms (remediation VLANs, quarantine systems, 802.1x mechanisms that assess and remediate, etc.) that documents the date of the assessment performed prior to becoming a new Applicable System.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.4	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	Examples of evidence may include, but are not limited to: • Reports or logs from automated mechanisms that perform remediation of VCAs at instantiation; or • Documentation listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, associated PCA, and associated SCI, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets (TCA) and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for TCAs and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for TCA and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use TCA(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use TCA(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.		The Responsible Entity's change management process(es) does not include one of the required items listed in 1.2.1 through 1.2.2. (Requirement R1 Part 1.2); OR The Responsible Entity's change management process(es) does not include one of the required items listed in 1.3.1 through 1.3.2. (Part 1.3)	The Responsible Entity change management process(es) did not include authorization for changes as required in Part 1.1. (Part 1.1) OR The Responsible Entity's change management process(es) does not include the two required items listed in 1.2.1 through 1.2.2. (Part 1.2); OR The Responsible Entity's change management process(es) does not include the two required items listed in 1.3.1 through 1.3.2. (Part 1.3) OR The Responsible Entity's change management process(es) does not include verification, as required by Part 1.4. (Part 1.4)	The Responsible Entity neither documented nor implemented any change management process(es) that include required items in Part 1.1 through Part 1.4. (Requirement R1)
R2.	The Responsible Entity did not monitor within 35 calendar days, but less than 70 calendar days as required by Part 2.1.	The Responsible Entity's documented and implemented configuration monitoring process(es) does not include one or two of the required	The Responsible Entity's documented and implemented configuration monitoring process(es) does not include three or four of the required	The Responsible Entity neither documented nor implemented a configuration monitoring process(es); or the process does not include five or more

R #	**Violation Severity Levels**			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
		Parts 2.1.1 through 2.1.7 for Applicable Systems as required in Part 2.1. OR The Responsible Entity did not monitor within 70 calendar days, but less than 105 calendar days as required by Part 2.1.	Parts 2.1.1 through 2.1.7 for Applicable Systems as required in Part 2.1. OR The Responsible Entity did not monitor within 105 calendar days, but less than 140 calendar days as required by Part 2.1.	of the required Parts 2.1.1 through 2.1.7 for Applicable Systems as required in Part 2.1. OR The Responsible Entity did not monitor within 140 calendar days or more as required by Part 2.1. OR The Responsible Entity neither documented nor investigated detected unauthorized changes. (Part 2.1)
R3.	The Responsible Entity performed a vulnerability assessment more than 15 months, but less than 18 months, since the last assessment on one of its Applicable Systems. (Part 3.1) OR The Responsible Entity performed an active vulnerability assessment more than 36 months, but less than 39 months, since the last active assessment on one of its Applicable Systems. (Part 3.2)	The Responsible Entity performed a vulnerability assessment more than 18 months, but less than 21 months, since the last assessment on one of its Applicable Systems. (Part 3.1) OR The Responsible Entity performed an active vulnerability assessment more than 39 months, but less than 42 months, since the last active assessment on one of its Applicable Systems. (Part 3.2)	The Responsible Entity performed a vulnerability assessment more than 21 months, but less than 24 months, since the last assessment on one of its Applicable Systems. (Part 3.1) OR The Responsible Entity performed an active vulnerability assessment more than 42 months, but less than 45 months, since the last active assessment on one of its Applicable Systems. (Part 3.2)	The Responsible Entity did not implement any vulnerability assessment processes for one of its Applicable Systems. (Requirement R3) OR The Responsible Entity performed a vulnerability assessment more than 24 months since the last assessment on one of its applicable BES Cyber Systems. (Part 3.1) OR The Responsible Entity performed an active vulnerability assessment more

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				than 45 months since the last active assessment on one of its applicable BES Cyber Systems. (Part 3.2) OR The Responsible Entity did not perform the active vulnerability assessment of a Cyber System prior to it becoming an Applicable Systems. (Part 3.3) OR The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its Applicable Systems, but has not documented the results of the vulnerability assessments, the action plans to remediate or mitigate vulnerabilities identified in the assessments, the planned date of completion of the action plan, and the execution status of the mitigation plans. - Implementation Plan for Project 2016-02
- CIP-010-5 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-010-3. Docket No. RM15-14-000	
3	07/20/17	Modified to address certain directives in FERC Order No. 829.	Revised
3	08/10/17	Adopted by the NERC Board of Trustees.	
3	10/18/2018	FERC Order approving CIP-010-3. Docket No. RM17-13-000.	
4	08/01/2019	Modified to address directives in FERC Order No. 850.	Revised
4	11/05/2020	Adopted by the NERC Board of Trustees.	
4	3/18/2021	FERC order approving Docket No. RD21-2-000	
4	4/5/2021	Effective Date	10/1/2022
5	TBD	Virtualization Modifications	

Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. TCA(s) Managed by the Responsible Entity.

1.1. TCA Management: Responsible Entities shall manage TCA(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection, or (3) a combination of both (1) and (2) above.

1.2. TCA Authorization: For each individual or group of TCA(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the TCA (per TCA capability):

- Security patching, including manual or managed updates;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of introduction of malicious code (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting;
- Live operating system and software executable only from read only media;
- System hardening; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of TCA(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. TCA(s) Managed by a Party Other than the Responsible Entity.

2.1. Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the TCA (per TCA capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Review of other method(s) to mitigate software vulnerabilities.

2.2. Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of introduction of malicious code (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read only media;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the risk of introduction of malicious code.

2.3. For any method used as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media prior to connecting ; and

3.2.2. Mitigate the threat of detected malicious code.

CIP-010-5 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the TCA(s). This can be included as part of the TCA(s), part of the documentation related to authorization of TCA(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of TCA(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate the risk of software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating system and software executable only from read only media, the use of controls that maintain the state of the operating system and software such that it is in a known state prior to execution, system hardening practices or other method(s) to mitigate the risk of software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, methods to maintain the known good state of the OS and all software, or system hardening practices. If a TCA does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail,

policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that that document a review of the use of live operating system and software executable only from read only media; memoranda, electronic mail, policies, or contracts from parties other than the Responsible Entity that that document a review of the use of controls that maintain the state of the operating system and software such that it is in a known state prior to execution; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for TCA(s) managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, and system hardening by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity’s acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA(s) managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users, either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit A-9

Proposed Reliability Standard CIP-010-5
Redline

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

~~1.~~2. Number: CIP-010-~~4~~5

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems (BCS) by specifying configuration change management and vulnerability assessment requirements in support of protecting ~~BES Cyber Systems~~BCS from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

~~2.~~4. Applicability:

~~2.1.~~4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

~~2.2.~~4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-~~4~~5:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4.**~~**4.2.3.5.** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~**4.2.3.5.**~~**4.2.3.6.** Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

~~**3. Effective Date:** See Implementation Plan for Project 2019-03.~~

~~**4. Background:** Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the~~

~~standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

"Applicable Systems~~" Columns in Tables:~~

4.3. ": Each table has an "Applicable Systems" column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies.~~ The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.~~

- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~
- ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.~~
- ~~**Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~

5. Effective Date: See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) to manage configuration changes, individually or by group, that collectively include each of the applicable requirement parts in *CIP-010-45 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-45 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-45 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
~~**1.1**~~	~~High Impact BES Cyber Systems and their associated:~~ ~~1. EACMS;~~ ~~2.1. PACS; and~~ ~~3.1. PCA~~ ~~Medium Impact BES Cyber Systems and their associated:~~ ~~1. EACMS;~~ ~~2. PACS; and~~ ~~3. PCA~~	~~Develop a baseline configuration, individually or by group, which shall include the following items:~~ ~~1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists;~~ ~~1.1.2. Any commercially available or open-source application software (including version) intentionally installed;~~ ~~1.1.3. Any custom software installed;~~ ~~1.1.4. Any logical network accessible ports; and~~ ~~1.1.5. Any security patches applied.~~	~~Examples of evidence may include, but are not limited to:~~ ~~• A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or~~ ~~• A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.~~
~~**1.2**~~	~~High Impact BES Cyber Systems and their associated:~~ ~~1. EACMS;~~ ~~2. PACS; and~~	~~Authorize and document changes that deviate from the existing baseline configuration.~~	~~Examples of evidence may include, but are not limited to:~~ ~~• A change request record and~~

R2. Each Responsible Entity shall implement one or more documented process(es) to monitor configuration changes that collectively include each of the applicable requirement parts in *CIP-010-~~4~~5 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~4~~5 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~4~~5 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~Impact~~impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part.	~~Monitor~~Methods to monitor, per system capability, at least once every 35 calendar days, for ~~changes to~~ unauthorized changes that affect Applicable Systems, where those changes alter the ~~baseline configuration (as described~~behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in ~~Requirement R1, Part~~ CIP-007, as defined by the Responsible Entity; that include at least one cyber security control for each of the following: 2.1.1~~).~~. Configuration on each Applicable System that affects its routable protocol network accessibility; 2.1.2. Configuration of CPU or memory sharing of VCAs on SCI; 2.1.3. Installation, removal, and update of operating system, firmware, software, and cyber security patches.	An example of evidence may include, but is not limited to, ~~logs from a~~documented methods to monitor at least once every 35 calendar days. Monitoring system ~~that is monitoring the~~ configuration or procedural controls demonstrating monitoring of at least one cyber security control for 2.1.1 through 2.1.7. Examples of evidence may include, but are not limited to, reports generated from automated tools or manual reviews along with records of investigation for any unauthorized changes that were detected. Note: monitoring of VCA parent images from which Applicable Systems will be instantiated is an example of an automated control for 2.1.3.

CIP-010-45 Table R2 – -Configuration Monitoring

Part	Applicable Systems	Requirements	Measures
		2.1.4. Configuration of malicious code protection methods; 2.1.5. Configuration of security event logging or alerting; 2.1.6. Configuration of authentication methods; and 2.1.7. Changes to the enabled or disabled status of accounts. Document and investigate detected unauthorized changes.	

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~3~~5 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~3~~5 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~4~~5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High ~~Impact~~impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~Impact~~impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every -15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~4~~5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High ~~Impact~~impact BES Cyber Systems. SCI supporting an Applicable System in this Part.	~~Where technically feasible, at~~At least once every 36 calendar months, per system capability: ~~2.2.1~~3.2.1 Perform an active vulnerability assessment in a test environment that minimizes differences with the production environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects~~, that models the baseline configuration of the BES Cyber System in a production environment~~; and ~~2.2.2~~3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-45 Table R3 – Vulnerability Assessments

Part	Applicable Systems	Requirements	Measures
3.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PCA SCI supporting an Applicable System in this Part.	Prior to ~~adding~~becoming a new ~~applicable Cyber Asset to a production environment~~Applicable System, perform an active vulnerability assessment of the new ~~Cyber Asset~~Applicable System, except for ~~CIP Exceptional Circumstances and like~~: • Like replacements ~~of the same type of Cyber Asset~~or additions with a ~~baseline~~previously assessed configuration ~~that models~~of an existing ~~baseline configuration of the previous or other existing Cyber Asset.~~Applicable System; or • CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to~~, a document listing~~: • The output of tools used to perform the assessment; or • Reports from automated assessment and remediation mechanisms (remediation VLANs, quarantine systems, 802.1x mechanisms that assess and remediate, etc.) that documents the date of the assessment ~~(~~performed prior to ~~the commissioning of the~~ becoming a new ~~Cyber Asset) and the output of any tools used to perform the assessment.~~ Applicable System.

CIP-010-~~4~~5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.4	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part.	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	~~An example~~Examples of evidence may include, but ~~is~~are not limited to~~, a document~~: • Reports or logs from automated mechanisms that perform remediation of VCAs at instantiation; or • Documentation listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, associated PCA, and associated ~~Protected Cyber Assets~~SCI, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets (TCA) and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for ~~Transient Cyber Assets~~TCAs and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for ~~Transient Cyber Assets~~TCA and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use ~~Transient Cyber Asset~~TCA(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use ~~Transient Cyber Asset~~TCA(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-010-3. Docket No. RM15-14-000	
3	07/20/17	Modified to address certain directives in FERC Order No. 829.	Revised
3	08/10/17	Adopted by the NERC Board of Trustees.	
3	10/18/2018	FERC Order approving CIP-010-3. -Docket No. RM17-13-000.	
4	08/01/2019	Modified to address directives in FERC Order No. 850.	Revised
4	11/05/2020	Adopted by the NERC Board of Trustees.	
4	3/18/2021	FERC order approving Docket No. RD21-2-000	
4	4/5/2021	Effective Date	10/1/2022
5	TBD	Virtualization Modifications	

Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. ~~Transient Cyber Asset~~TCA(s) Managed by the Responsible Entity.

1.1. ~~Transient Cyber Asset~~TCA Management: Responsible Entities shall manage ~~Transient Cyber Asset~~TCA(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection ~~to a BES Cyber System~~, or (3) a combination of both (1) and (2) above.

1.2. ~~Transient Cyber Asset~~TCA Authorization: For each individual or group of ~~Transient Cyber Asset~~TCA(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the ~~Transient Cyber Asset (per Transient Cyber Asset~~TCA (per TCA capability):

- Security patching, including manual or managed updates;
- ~~Live operating system and software executable only from read-only media;~~
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of introduction of malicious code (per ~~Transient Cyber Asset~~TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; ~~or~~
- Live operating system and software executable only from read only media;
- System hardening; or

- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of ~~Transient Cyber Asset~~TCA(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. ~~Transient Cyber Asset~~TCA(s) Managed by a Party Other than the Responsible Entity.

2.1. Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the ~~Transient Cyber Asset (per Transient Cyber Asset~~TCA (per TCA capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- ~~Other~~Review of other method(s) to mitigate software vulnerabilities.

2.2. Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of introduction of malicious code (per ~~Transient Cyber Asset~~TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read~~-~~ only media;
- Review of system hardening used by the party; or
- ~~Other~~Review of other method(s) to mitigate the risk of introduction of malicious code.

2.3. For any method used ~~to mitigate software vulnerabilities or malicious code~~ as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the ~~Transient Cyber Asset~~TCA.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code ~~to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets~~, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media ~~using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets~~prior to connecting ; and

3.2.2. Mitigate the threat of detected malicious code ~~on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets~~.

CIP-010-~~4~~5 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the ~~Transient Cyber Asset~~TCA(s). This can be included as part of the ~~Transient Cyber Asset plan~~TCA(s), part of the documentation related to authorization of ~~Transient Cyber Asset~~TCA(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of ~~Transient Cyber Asset~~TCA(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate the risk of software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating ~~systems~~ system and software executable only from read~~-~~only media, the use of controls that maintain the state of the operating system and software such that it is in a known state prior to execution, system hardening practices or other method(s) to mitigate the risk of software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, methods to maintain the known good state of the OS and all software, or ~~procedures or processes associated with~~ system hardening practices. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that that document a review of the use of live operating system and software executable only from read only media; memoranda, electronic mail, policies, or contracts from parties other than the Responsible Entity that that document a review of the use of controls that maintain the state of the operating system and software such that it is in a known state prior to execution; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for ~~Transient Cyber Asset~~TCA(s) managed by a party other than the Responsible Entity. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, ~~use of live of operating systems or~~and system hardening ~~performed~~ by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for ~~Transient Cyber Asset~~TCA(s) managed by a party other than the Responsible Entity. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the ~~Transient Cyber Asset~~TCA managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users, either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Exhibit A-10

Proposed Reliability Standard CIP-011-4
Clean

A. Introduction

1. **Title:** Cyber Security — Information Protection

2. **Number:** CIP-011-4

3. **Purpose:** To prevent unauthorized access to BES Cyber System Information (BCSI) by specifying information protection requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1 Balancing Authority

    4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3 Generator Operator

    4.1.4 Generator Owner

    4.1.5 Reliability Coordinator

    4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-4:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards” Implementation Plan.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented information protection program(s) for BCSI pertaining to Applicable Systems identified in *CIP-011-4 Table R1 – Information Protection Program* that collectively includes each of the applicable requirement parts in *CIP-011-4 Table R1 – Information Protection Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-4 Table R1 – Information Protection Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-4 Table R1 – Information Protection Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium impact BCS and their associated: 1. EACMS; and 2. PACS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part	Method(s) to identify BCSI.	Examples of evidence may include, but are not limited to, the following: • Documented method(s) to identify BCSI from the entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BCSI as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to identify BCSI; or • Storage locations identified for housing BCSI in the entity's information protection program.
1.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS and their associated:	Method(s) to protect and securely handle BCSI to mitigate risks of compromising confidentiality.	Examples of evidence for on-premise BCSI may include, but are not limited to, the following: • Procedures for protecting and securely handling, which include

CIP-011-4 Table R1 – Information Protection Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS SCI supporting an Applicable System in this Part		topics such as storage, security during transit, and use of BCSI; or • Records indicating that BCSI is handled in a manner consistent with the entity's documented procedure(s). Examples of evidence for off-premise BCSI may include, but are not limited to, the following: • Implementation of electronic technical method(s) to protect electronic BCSI (e.g., data masking, encryption, hashing, tokenization, cipher, electronic key management); or • Implementation of physical technical method(s) to protect physical BCSI (e.g., physical lock and key management, physical badge management, biometrics, alarm system); or • Implementation of administrative method(s) to protect BCSI (e.g., vendor service risk assessments, business agreements).

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-4 Table R2 –Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-4 Table R2 –Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-4 Table R2 –Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part	Methods to prevent the unauthorized retrieval of BCSI from Applicable Systems containing BCSI, prior to their disposal or reuse (except for reuse within other systems identified in the Applicable Systems column).	Examples of evidence may include, but are not limited to, the following: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BCSI such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter (PSP) or other methods used to prevent unauthorized retrieval of BCSI.

B. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-011-4)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Responsible Entity did not implement one or more BCSI protection program(s). (Requirement R1) OR The Responsible Entity did not implement at least one method to identify BCSI. (Part 1.1) OR The Responsible Entity did not implement at least one method to protect and securely handle BCSI. (Part 1.2)	The Responsible Entity neither documented nor implemented one or more BCSI protection program(s). (Requirement R1)
R2	N/A	The Responsible Entity did not include processes for reuse to prevent the unauthorized retrieval of BCSI from an Applicable System. (Part 2.1)	The Responsible Entity did not include disposal processes to prevent the unauthorized retrieval of BCSI from an Applicable System. (Part 2.1)	The Responsible Entity neither documented nor implemented any processes for applicable requirement parts in CIP-011-4 Table R2 –Reuse and Disposal. (Requirement R2)

C. Regional Variances

None.

D. Interpretations

None.

E. Associated Documents

- Implementation Plan for Project 2016-02
- CIP-011-4 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-011-2. Docket No. RM15-14-000	
3	8/12/21	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.
3	12/7/21	FERC Order issued approving CIP-011-3 Docket No. RD21-6-000	“A Responsible Entity may elect to comply with the requirements in CIP-004-7 and CIP-011-3 following their approval by the applicable governmental authority, but prior to their Effective Date. In such a case, the Responsible Entity shall notify the applicable Regional Entities of the date of compliance with the CIP-004-7 and CIP-011-3 Reliability

Version	Date	Action	Change Tracking
			Standards. Responsible Entities must comply with CIP-004-6 and CIP-011-2 until that date.”
3	12/10/21	Effective Date	1/1/2024

Exhibit A-10

Proposed Reliability Standard CIP-011-4
Redline

A. Introduction

1. **Title:** Cyber Security — Information Protection

2. **Number:**~~-~~ CIP-011-~~3~~4

3. **Purpose:**~~-~~ To prevent unauthorized access to BES Cyber System Information (BCSI) by specifying information protection requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

~~3.~~4. **Applicability:**

~~3.1.~~4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

~~3.1.1~~4.1.1 **Balancing Authority**

~~3.1.2~~4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

~~3.1.2.1~~4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

~~3.1.2.1.1~~4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

~~3.1.2.1.2~~4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

~~3.1.2.2~~4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

~~3.1.2.3~~4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

~~3.1.2.4~~4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

~~3.1.3~~4.1.3 **Generator Operator**

~~3.1.4~~4.1.4 **Generator Owner**

~~3.1.5~~4.1.5 **Reliability Coordinator**

~~3.1.6~~4.1.6 **Transmission Operator**

~~3.1.7~~4.1.7 **Transmission Owner**

~~3.2.~~4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

~~3.2.1~~4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

~~3.2.1.1~~4.2.1.1 Each UFLS or UVLS System that:

~~3.2.1.1.1~~4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

~~3.2.1.1.2~~4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

~~3.2.1.2~~4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

~~3.2.1.3~~4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

~~3.2.1.4~~4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

~~3.2.2~~4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers:** All BES Facilities.

~~3.2.3~~4.2.3 **Exemptions:** The following are exempt from Standard CIP-011-~~3~~4:

~~3.2.3.1~~4.2.3.1 Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

~~3.2.3.2~~4.2.3.2 Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3 Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~3.2.3.3~~4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~3.2.3.4~~4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~3.2.3.5~~4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002~~-5.1a~~ identification and categorization processes.

~~**1. Effective Dates:** See Implementation Plan for CIP-011-3.~~

~~**2. Background:** Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and~~

~~implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~” Columns in Tables:~~

~~3.3.~~4.3. ”: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies. ~~The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1a identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards” Implementation Plan.

- B. ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.~~
- ~~**Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.~~

Requirements and Measures

R1. ~~**R1.**~~ Each Responsible Entity shall implement one or more documented information protection program(s) for ~~BES Cyber System Information (~~BCSI~~)~~ pertaining to ~~"~~Applicable Systems~~"~~ identified in *CIP-011-~~3~~4 Table R1 – Information Protection Program* that collectively includes each of the applicable requirement parts in *CIP-011-~~3~~4 Table R1 – Information Protection Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1.~~-~~ Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~3~~4 Table R1 – Information Protection Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~3~~4 Table R1 – Information Protection Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. Electronic Access Control and Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. EACMS; and 2. PACS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part	Method(s) to identify BCSI.	Examples of ~~acceptable~~ evidence may include, but are not limited to, the following: • Documented method(s) to identify BCSI from the entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BCSI as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to identify BCSI; or • Storage locations identified for housing BCSI in the entity's information protection program.
1.2	High ~~I~~impact BCS and their associated:	Method(s) to protect and securely handle BCSI to mitigate risks of compromising confidentiality.	Examples of evidence for on-premise BCSI may include, but are not limited to, the following:

CIP-011-~~3~~4 Table R1 – Information Protection Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS Medium ~~I~~impact BCS and their associated: 1. EACMS; and 2. PACS SCI supporting an Applicable System in this Part		- Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BCSI; or - Records indicating that BCSI is handled in a manner consistent with the entity's documented procedure(s). Examples of evidence for off-premise BCSI may include, but are not limited to, the following: - Implementation of electronic technical method(s) to protect electronic BCSI (e.g., data masking, encryption, hashing, tokenization, cipher, electronic key management); or - Implementation of physical technical method(s) to protect physical BCSI (e.g., physical lock and key management, physical badge management, biometrics, alarm system); or - Implementation of administrative method(s) to protect BCSI (e.g., vendor service risk assessments, business agreements).

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~3~~4 Table R2 –~~ BES Cyber Asset~~ Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2.~~-~~ Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~3~~4 Table R2 –~~ BES Cyber Asset~~ Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~3~~4 Table R2 –~~ BES Cyber Asset~~ Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI supporting an Applicable System in this Part	~~Prior to the release for~~Methods to prevent the unauthorized retrieval of BCSI from Applicable Systems containing BCSI, prior to their disposal or reuse ~~of applicable Cyber Assets that contain BCSI~~ (except for reuse within other systems identified in the ~~“~~"Applicable Systems~~”~~" column~~), the Responsible Entity shall take action to prevent the unauthorized retrieval of BCSI from the Cyber Asset data storage media.~~).	Examples of~~ acceptable~~ evidence may include, but are not limited to, the following: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BCSI such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter (PSP) or other methods used to prevent unauthorized retrieval of BCSI.

B. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-011-~~3~~4)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Responsible Entity ~~documented, but~~ did not~~,~~ implement one or more BCSI protection program(s). ~~(~~ (Requirement R1) OR The Responsible Entity ~~documented but~~ did not implement at least one method to identify BCSI. (Part 1.1) OR The Responsible Entity ~~documented but~~ did not implement at least one method to protect and securely handle BCSI. (Part 1.2)	The Responsible Entity neither documented nor implemented one or more BCSI protection program(s). (Requirement R1)
R2	N/A	The Responsible Entity ~~implemented one or more~~ ~~documented~~did not include processes for reuse to prevent the unauthorized retrieval of BCSI from ~~the BES Cyber Asset~~an Applicable System. (Part 2.1)	The Responsible Entity ~~implemented one or more~~ ~~documented~~did not include disposal processes to prevent the unauthorized retrieval of BCSI from an Applicable System~~the BES Cyber Asset~~. (Part 2.1)	The Responsible Entity ~~has not~~neither documented ~~or~~ nor implemented any processes for applicable requirement parts in CIP-011-4 Table R2 –Reuse and Disposal. (Requirement R2)

- Implementation Plan for Project 2016-02
- CIP-011-4 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-011-2. Docket No. RM15-14-000	
3	8/12/21	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.
3	12/7/21	FERC Order issued approving CIP-011-3 Docket No. RD21-6-000	“A Responsible Entity may elect to comply with the requirements in CIP-004-7 and CIP-011-3 following their approval by the applicable governmental authority, but prior to their Effective Date. In such a case, the Responsible Entity shall notify the applicable Regional Entities of the date of compliance with the CIP-004-7 and CIP-011-3 Reliability

Version	Date	Action	Change Tracking
			Standards. Responsible Entities must comply with CIP-004-6 and CIP-011-2 until that date.”
3	12/10/21	Effective Date	1/1/2024
4	TBD	Virtualization Modifications

Exhibit A-11

Proposed Reliability Standard CIP-013-3
Clean

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-3**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems (BCS).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

        4.1.1. Balancing Authority

        4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

            4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

                4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

                4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

            4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

            4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

        4.1.3. Generator Operator

        4.1.4. Generator Owner

        4.1.5. Reliability Coordinator

        4.1.6. Transmission Operator

        4.1.7. Transmission Owner

    4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in

this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. **Distribution Provider:** One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. **Responsible Entities listed in 4.1 other than Distribution Providers:** All BES Facilities.

4.2.3. **Exemptions:** The following are exempt from Standard CIP-013-3:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002 or any subsequent version of that Reliability Standard.

5. **Effective Date:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI). The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of applicable systems listed in Requirement R1 to identify and assess cyber security risk(s) to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring applicable systems listed in Requirement R1 that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor; and

1.2.6. Coordination of controls for vendor-initiated remote access.

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity's supply chain cyber risk management plan(s) did not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1. OR The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement applicable systems as specified in Part 1.1, and the supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in Requirement R1.
R2.	The Responsible Entity did not implement one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity did not implement the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1, and did not implement the use of process(es) for

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				procuring applicable systems as specified in Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in Requirement R2.
R3.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 16th calendar month since the previous review.	The Responsible Entity exceeded the 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 17th calendar month since the previous review.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 18th calendar month since the previous review.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review.

Exhibit A-11

Proposed Reliability Standard CIP-013-3
Redline

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-~~2~~3**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems~~.~~ (BCS).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in

this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. **Distribution Provider:** One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. **Responsible Entities listed in 4.1 other than Distribution Providers:** All BES Facilities.

4.2.3. **Exemptions:** The following are exempt from Standard CIP-013-~~2~~3:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4.**~~**4.2.3.5.** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~**4.2.3.5.**~~**4.2.3.6.** Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002 or any subsequent version of that Reliability Standard.

5. **Effective Date:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan~~ for Project 2019-03.~~”.

B. Requirements and Measures

R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact ~~BES Cyber Systems~~BCS and their associated Electronic Access Control or Monitoring Systems (EACMS~~) and~~), Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI). The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of ~~BES Cyber Systems and their associated EACMS and PACS~~applicable systems listed in Requirement R1 to identify and assess cyber security risk(s) to the ~~Bulk Electric System~~BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring ~~BES Cyber Systems, and their associated EACMS and PACS,~~applicable systems listed in Requirement R1 that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor~~ for use in the BES Cyber System and their associated EACMS and PACS~~; and

1.2.6. Coordination of controls for vendor-initiated remote access.

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible ~~Entity developed one or more documented~~Entity's supply chain cyber ~~security~~ risk management plan(s) ~~which include the use of process(es) in planning for procurement of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber Systems and their associated EACMS and PACS, as specified in Part 1.2, but the plans do~~did not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible ~~Entity developed one or more documented~~Entity's supply chain cyber security risk management plan(s) ~~which include the use of process(es) in planning for procurement of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber Systems and their associated EACMS and PACS, as specified in Part 1.2, but the plans do~~did not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible ~~Entity developed one or more documented~~Entity's supply chain cyber security risk management plan(s~~), but the plan(s~~) did not include the use of process(es) in planning for procurement of ~~BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES~~applicable systems as specified in Part 1.1~~, or the~~. OR The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring ~~BES Cyber Systems and their associated EACMS and PACS,~~applicable systems as specified in Part 1.2.	The Responsible ~~Entity developed one or more documented~~Entity's supply chain cyber security risk management plan(s~~), but the plan(s~~) did not include the use of process(es) in planning for procurement ~~of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES~~applicable systems as specified in Part 1.1, and the supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring ~~BES Cyber Systems and their associated EACMS and PACS,~~applicable systems as specified in Part 1.2. Project 2016-02 Modifications to CIP Standards | Final Draft

The standard drafting team (SDT) is seeking comment on the following new or modified terms used in the proposed standards. The first column (*NERC Glossary Term*) provides the NERC Glossary term being modified or proposed as a new. The SDT is proposing acronyms to some currently approved and new glossary terms as shown in redline. The second column (*Currently Approved Definition*) provides the currently approved definition and the third column (*CIP SDT Proposed New or Revised)* reflects the proposed modifications to the current definitions in redline and also reflects newly proposed definitions in clean view.

Modified or Newly Proposed Definitions

NERC Glossary Term	Currently Approved Definition	CIP SDT Proposed New or Revised Definition
BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.	A Cyber Asset or Virtual Cyber Asset that, if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the Reliable Operation of the Bulk Electric System (BES). Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
BES Cyber System (BCS) **Update is Acronym only.**	One or more BES Cyber Assets logically grouped by a responsible entity to perform one or more reliability tasks for a functional entity.	
BES Cyber System Information	Information about the BES Cyber System that could be	Information about the BES Cyber System (BCS) that

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
(BCSI)	used to gain unauthorized access or pose a security threat to the BES Cyber System. BES Cyber System Information does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BES Cyber Systems, such as, but not limited to, device names, individual IP addresses without context, ESP names, or policy statements. Examples of BES Cyber System Information may include, but are not limited to, security procedures or security information about BES Cyber Systems, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BES Cyber System	could be used to gain unauthorized access or pose a security threat to the BCS. BES Cyber System Information (BCSI) does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BCS, such as, but not limited to, device names, individual IP addresses without context, Electronic Security Perimeter names, or policy statements. Examples of BCSI may include, but are not limited to, security procedures or security information about BCS, Shared Cyber Infrastructure, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BCS.
CIP Senior Manager	A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC CIP Standards, CIP-002 through CIP-011.	A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC Critical Infrastructure Protection Cyber Security Standards.
Cyber Assets	Programmable electronic devices, including the hardware, software, and data in those devices.	Programmable electronic devices, excluding Shared Cyber Infrastructure, including the hardware, software, and data in those devices. Application containers are considered software of Virtual Cyber Assets (VCAs) or Cyber Assets. VCAs are not considered software or data of Cyber Assets.

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
Cyber Security Incident	A malicious act or suspicious event that: - For a high or medium impact BES Cyber System, compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, or (3) an Electronic Access Control or Monitoring System; or - Disrupts or attempts to disrupt the operation of a BES Cyber System	A malicious act or suspicious event that: • For a high or medium impact BES Cyber System (BCS), compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, (3) an Electronic Access Control or Monitoring Systems; or (4) Shared Cyber Infrastructure; or • Disrupts or attempts to disrupt the operation of a BCS.
Cyber System ***New Definition***		One or more Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure.
Electronic Access Control or Monitoring Systems (EACMS)	Cyber Assets that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems. This includes Intermediate Systems.	Cyber System(s) that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) (ESP) or BES Cyber Systems (BCS), including those not protected by an ESP used by the responsible entity to convert routable protocol communications to non-routable communications to a BCS.
Electronic Access Point (EAP)	A Cyber Asset interface on an Electronic Security Perimeter that allows routable communication between Cyber Assets outside an Electronic Security Perimeter and Cyber Assets inside an Electronic Security Perimeter.	An electronic policy enforcement point or a Cyber Asset interface on an Electronic Access Control or Monitoring Systems that controls routable communication to and from one or more BES Cyber Systems or their associated Protected Cyber Assets.
External Routable Connectivity (ERC)	The ability to access a BES Cyber System from a Cyber Asset that is outside of its associated Electronic Security Perimeter via a bi-directional routable	The ability to access a BES Cyber System through its Electronic Security Perimeter via a bi-directional routable protocol connection.

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
	protocol connection.	
Electronic Security Perimeter (ESP)	The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol.	The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol; or a logical boundary defined by one or more Electronic Access Points.
Interactive Remote Access (IRA)	User-initiated access by a person employing a remote access client or other remote access technology using a routable protocol. Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications.	User-initiated electronic access by a person using a bi-directional routable protocol: • To a Cyber System protected by an Electronic Security Perimeter(s) (ESP); • That is converted by the responsible entity to a non-routable protocol that allows access to a Cyber System; or • To a Management Interface. Interactive Remote Access does not include: • Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs; or • System-to-system process communication.
Intermediate System	A Cyber Asset or collection of Cyber Assets performing access control to restrict Interactive Remote Access to only authorized users. The Intermediate System must not be located inside the Electronic Security Perimeter.	One or more Electronic Access Control or Monitoring Systems that are used to restrict Interactive Remote Access to only authorized users.

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
Management Interface ***New Definition***		An administrative interface that: • Controls the processes of initializing, deploying, and configuring Shared Cyber Infrastructure; • Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or • Configures an Electronic Access Point.
Physical Access Control Systems (PACS)	Cyber Assets that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers	Cyber Systems that control, alert, or log access to the Physical Security Perimeter(s) (PSP), exclusive of locally mounted hardware or devices at the PSP such as motion sensors, electronic lock control mechanisms, and badge readers.
Physical Security Perimeter (PSP)	The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.	The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, Shared Cyber Infrastructure, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.	One or more Cyber Assets or Virtual Cyber Assets (VCA) that: • Are protected by an Electronic Security Perimeter (ESP) but are not part of the highest impact BES Cyber System (BCS) protected by the same ESP; or • Share CPU resources or memory resources with any part of the BCS, excluding VCA that are being

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
		actively remediated in an environment that isolates routable connectivity from BCS; Excluding Transient Cyber Assets.
Removable Media	Storage media that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a Protected Cyber Asset. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.	Storage media that (i) are not Cyber Assets or Shared Cyber Infrastructure (SCI), (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, SCI, a network protected by an Electronic Security Perimeter, or a Protected Cyber Asset.
Reportable Cyber Security Incident	A Cyber Security Incident that compromised or disrupted: - A BES Cyber System that performs one or more reliability tasks of a functional entity; - An Electronic Security Perimeter of a high or medium impact BES Cyber System; or - An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber System	A Cyber Security Incident that compromised or disrupted: • A BES Cyber System (BCS) that performs one or more reliability tasks of a functional entity; • An Electronic Security Perimeter of a high or medium impact BCS; • An Electronic Access Control or Monitoring Systems of a high or medium impact BCS; or • Shared Cyber Infrastructure supporting a BCS.
Shared Cyber Infrastructure (SCI) ***New Definition***		One or more programmable electronic devices, including the software that shares the devices' resources, that: • Hosts one or more Virtual Cyber Assets (VCA)

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
		included in a BES Cyber Systems (BCS) or their associated Electronic Access Control or Monitoring Systems (EACMS) or Physical Access Control Systems (PACS); and hosts one or more VCAs that are not included in, or associated with, BCS of the same impact categorization; or • Provides storage resources required for system functionality of one or more Cyber Assets or VCAs included in a BCS or their associated EACMS or PACS; and also for one or more Cyber Assets or VCAs that are not included in, or associated with, BCS of the same impact categorization. SCI does not include the supported VCAs or Cyber Assets with which it shares its resources.
Transient Cyber Asset (TCA)	A Cyber Asset that is: 1. capable of transmitting or transferring executable code, 2. not included in a BES Cyber System, 3. not a Protected Cyber Asset (PCA) associated with high or medium impact BES Cyber Systems, and 4. directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth communication) for 30 consecutive calendar days or less to a: • BES Cyber Asset,	A Cyber Asset or Virtual Cyber Asset (VCA) that is: 1. Capable of transmitting or transferring executable code; 2. Not included in a BES Cyber System (BCS); 3. Not a Protected Cyber Asset (PCA) associated with high or medium impact BCS; and 4. Connected for 30 consecutive calendar days or less: • On a network protected by an Electronic Security Perimeter containing high or medium impact BCS; or

Modified or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised Definition**
	• network within an Electronic Security Perimeter (ESP) containing high or medium impact BES Cyber Systems, or • PCA associated with high or medium impact BES Cyber Systems. Examples of Transient Cyber Assets include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.	• Directly (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth communication) to a: ▪ BES Cyber Asset; ▪ Shared Cyber Infrastructure; or ▪ PCA associated with high or medium impact BCS. Virtual machines hosted on a physical Transient Cyber Asset (TCA) are treated as software on that physical TCA. Examples of TCAs include, but are not limited to, Cyber Assets or VCAs used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Virtual Cyber Asset (VCA) ***New Definition***		A logical instance of an operating system or firmware, currently executing on a virtual machine hosted on a BES Cyber Asset; Electronic Access Control or Monitoring System; Physical Access Control System; Protected Cyber Asset; or Shared Cyber Infrastructure (SCI). Virtual Cyber Assets (VCAs) do not include: • Logical instances that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems; • Dormant file-based images that contain operating

Project 2016-02 Modifications to CIP Standards | Final Draft

The standard drafting team (SDT) is seeking comment on the following new or modified terms used in the proposed standards. The first column (*NERC Glossary Term*) provides the NERC Glossary term being modified or proposed as a new. The SDT is proposing acronyms to some currently approved and new glossary terms as shown in redline. The second column (*Currently Approved Definition*) provides the currently approved definition and the third column (*CIP SDT Proposed New or Revised)* reflects the proposed modifications to the current definitions in redline and also reflects newly proposed definitions in clean view.

Modified or Newly Proposed Definitions

NERC Glossary Term	Currently Approved Definition	CIP SDT Proposed New or Revised Definition REDLINE TO Currently Approved
BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.	A Cyber Asset or Virtual Cyber Asset that, if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the ~~reliable operation~~Reliable Operation of the Bulk Electric System~~.~~ (BES). Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
BES Cyber System (BCS) **Update is Acronym only.**	One or more BES Cyber Assets logically grouped by a responsible entity to perform one or more reliability tasks for a functional entity.	
BES Cyber System Information	Information about the BES Cyber System that could be	Information about the BES Cyber System (BCS) that

Implementation Plan

Project 2016-02 Modifications to CIP Standards

Applicable Standard(s)

- Reliability Standard CIP-002-7 – Cyber Security – BES Cyber System Categorization
- Reliability Standard CIP-003-10 – Cyber Security – Security Management Controls
- Reliability Standard CIP-004-8 – Cyber Security – Personnel & Training
- Reliability Standard CIP-005-8 – Cyber Security – BES Cyber System Logical Isolation
- Reliability Standard CIP-006-7 – Cyber Security – Physical Security of BES Cyber Systems
- Reliability Standard CIP-007-7 – Cyber Security – System Security Management
- Reliability Standard CIP-008-7 – Cyber Security – Incident Reporting and Response Planning
- Reliability Standard CIP-009-7 – Cyber Security – Recovery Plans for BES Cyber Systems
- Reliability Standard CIP-010-5 – Cyber Security – Change Management and Vulnerability Assessments
- Reliability Standard CIP-011-4 – Cyber Security – Information Protection
- Reliability Standard CIP-013-3 – Cyber Security – Supply Chain Risk Management
- Proposed new or modified terms listed in the "CIP Definitions Project 2016-02 Modifications to CIP Standards Final Draft".

  These standards and Definitions of Terms used in the versions listed above of the CIP Cyber Security Standards are posted for ballot by NERC concurrently with this Implementation Plan.

  These standards and new and modified terms used in the standards above will be referenced as the "Revised CIP Standards and Definitions" within the Implementation Plan.

Requested Retirement(s)

- Reliability Standard CIP-002-5.1a – Cyber Security – BES Cyber System Categorization
- Reliability Standard CIP-003-9 – Cyber Security – Security Management Controls
- Reliability Standard CIP-004-7 – Cyber Security – Personnel & Training
- Reliability Standard CIP-005-7 – Cyber Security – Electronic Security Perimeter(s)
- Reliability Standard CIP-006-6 – Cyber Security – Physical Security of BES Cyber Systems
- Reliability Standard CIP-007-6 – Cyber Security – System Security Management
- Reliability Standard CIP-008-6 – Cyber Security – Incident Reporting and Response Planning

- Reliability Standard CIP-009-6 – Cyber Security – Recovery Plans for BES Cyber Systems
- Reliability Standard CIP-010-4 – Cyber Security – Configuration Change Management and Vulnerability Assessments
- Reliability Standard CIP-011-3 – Cyber Security – Information Protection
- Reliability Standard CIP-013-2 – Cyber Security – Supply Chain Risk Management

These standards and definitions used in the versions listed above will be referenced as the “Requested CIP Retired Standards” within the Implementation Plan.

Prerequisite Standard(s) or Definitions

These standard(s) or definitions must be approved before the Applicable Standard(s) become effective:

- BES Cyber Asset (BCA)
- BES Cyber System (BCS)
- BES Cyber System Information (BCSI)
- CIP Senior Manager
- Cyber Assets
- Cyber Security Incident
- Cyber System
- Electronic Access Control or Monitoring Systems (EACMS)
- Electronic Access Point (EAP)
- External Routable Connectivity (ERC)
- Electronic Security Perimeter (ESP)
- Interactive Remote Access (IRA)
- Intermediate System
- Management Interface
- Physical Access Control Systems (PACS)
- Physical Security Perimeter (PSP)
- Protected Cyber Asset (PCA)
- Removable Media
- Reportable Cyber Security Incident
- Shared Cyber Infrastructure (SCI)
- Transient Cyber Asset (TCA)
- Virtual Cyber Asset (VCA)

Applicable Entities

- Balancing Authority
- Distribution Provider[1]
- Generator Operator
- Generator Owner
- Reliability Coordinator
- Transmission Operator
- Transmission Owner

General Considerations

The intent of the Initial Performance of Periodic Requirements section is for Responsible Entities to remain on the same time interval of the prior versions of the standards for their performance of the requirements under the new versions. The intent of the Compliance Dates for Early Adoption of Revised CIP Standards and Definitions section is to permit Responsible Entities the option to comply with the Revised CIP Standards and Definitions prior to the Effective Date. While the Revised CIP Standards and Definitions are designed to be backwards compatible with perimeter-based security, some Responsible Entities may elect to comply early to leverage different security options associated with zero trust architecture.

Effective Date and Phased-in Compliance Dates

The Effective Dates for the Revised CIP Standards and Definitions are provided below. As noted in the General Considerations section above, the standard drafting team determined to clarify initial performance of periodic requirements and permit Responsible Entities to comply with the Revised CIP Standards and Definitions prior to the effective date. These provisions are also provided below.

Revised CIP Standards and Definitions

Where approval by an applicable governmental authority is required, the Revised CIP Standards and Definitions shall become effective on the later of: (1) April 1, 2026; or (2) the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority’s order approving the Revised CIP Standards and Definitions, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Revised CIP Standards and Definitions shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the Revised CIP Standards and Definitions are adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

---

[1] See Applicability section of Revised CIP Standards and Definitions for additional information on Distribution Providers subject to the standards.

Initial Performance of Periodic Requirements

Responsible Entities shall initially comply with the periodic requirements in the Revised CIP Standards and Definitions within the periodic timeframes of their last performance under the Requested CIP Retired Standards.

Compliance Dates for Early Adoption of Revised CIP Standards and Definitions

A Responsible Entity may elect to comply with the Revised CIP Standards and Definitions following their approval by the applicable governmental authority, but prior to the Effective Date. In such a case, the Responsible Entity shall select one of the following Early Adoption Dates and shall notify the applicable Regional Entities of their selected Early Adoption Date within fifteen (15) calendar days after their selected Early Adoption Date:

Early Adoption Date
Option 1: First day of the first calendar quarter that is six (6) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions
Option 2: First day of the first calendar quarter that is twelve (12) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions
Option 3: First day of the first calendar quarter that is eighteen (18) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions

Responsible Entities must comply with applicable Requested CIP Retired Standards until their selected Early Adoption Date. All Responsible Entities, regardless of whether or not they selected an Early Adoption Date, must comply with the Revised CIP Standards and Definitions by the Effective Date.

Planned or Unplanned Changes

Planned Changes

Planned changes refer to any changes of the electric system or BES Cyber System which were planned and implemented by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2.

For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-7, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change, and must, therefore, be in compliance with the CIP Cyber Security Standards upon the commissioning of the modernized transmission substation.

For planned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the CIP Cyber Security Standards on the update of the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan.

Unplanned Changes

Unplanned changes refer to any changes of the electric system or BES Cyber System which were not planned by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2.

For example, consider the scenario where a particular BES Cyber System at a transmission substation does not meet the criteria in CIP-002-7, Attachment 1, then, later, an action is performed outside of that particular transmission substation; such as, a transmission line is constructed or retired, a generation plant is modified, changing its rated output, and that unchanged BES Cyber System may become a medium impact BES Cyber System based on the CIP-002-7, Attachment 1, criteria.

For unplanned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the CIP Cyber Security Standards, according to the following timelines, following the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan.

Scenario of Unplanned Changes After the Effective Date	Compliance Implementation
New high impact BES Cyber System	12 months
New medium impact BES Cyber System	12 months
Newly categorized high impact BES Cyber System from medium impact BES Cyber System	12 months for requirement not applicable to Medium impact BES Cyber Systems
Newly categorized medium impact BES Cyber System	12 months
Responsible Entity identifies its first high impact or medium impact BES Cyber System (i.e., the Responsible Entity previously had no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes)	24 months

Retirement Date

Requested CIP Retired Standards

The Requested CIP Retired Standards shall be retired immediately prior to the effective date of the Revised CIP Standards and Definitions in the particular jurisdiction in which the Revised CIP Standards and Definitions are becoming effective.

Exhibit C

Order No. 672 Criteria

EXHIBIT C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standards have met or exceeded the criteria.

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]

The proposed Reliability Standards would advance the reliability of the Bulk-Power System ("BPS") through the use of security objectives that help transform the CIP Reliability Standards into a framework that can support cyber security of the grid now and into the future. The proposed CIP Reliability Standards and associated definitions improve upon the currently effective cyber security CIP Reliability Standards by facilitating the use of security models enabled through virtualized technologies while also permitting Responsible Entities with more "traditional" architecture to continue with their current configurations. The proposed standards do so by leveraging "security objectives" to focus requirements on the essential elements a

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, 114 FERC ¶ 61,104, *order on reh'g*, Order No. 672-A, 114 FERC ¶ 61,328 (2006) [hereinafter Order No. 672].

[2] *See* Order No. 672, *supra* note 1, at P 321 ("The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.").

See Order No. 672, *supra* note 1, at P 324 ("The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.").

Responsible Entity must meet to support reliability. Additionally, the use of security objectives helps to set up the framework to adapt to newer technologies and innovative security models as they become part of Responsible Entities' choices to support their systems.

The proposed Reliability Standards are designed to achieve a specific reliability goal (i.e., protect against Bulk Electric System ("BES") Cyber Systems' impact to the Bulk Electric System if rendered unavailable, degraded, or misused), and contain technically sound means to achieve that goal through requirements based on good cyber security practices and security objectives.

2. Proposed Reliability Standards must be applicable only to users, owners, and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]

The proposed Reliability Standards are clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. The proposed Reliability Standards apply to Balancing Authorities, certain Distribution Providers, Generator Operators, Generator Owners, Reliability Coordinators, Transmission Operators, and Transmission Owners. The proposed Reliability Standards clearly articulate the actions that such entities must take to comply with the standards.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment, as discussed further in **Exhibit F**. The assignment of the severity level for each VSL

---

[3] *See* Order No. 672, *supra* note 1, at P 322 ("The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.").

See Order No. 672, *supra* note 1, at P 325 ("The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.").

[4] *See* Order No. 672, *supra* note 1, at P 326 ("The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.").

is consistent with the corresponding requirement, and the VSLs should ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standards include clear and understandable consequences in accordance with Order No. 672.

4. A proposed Reliability Standard must identify clear and objective criteria or measures for compliance, so that it can be enforced in a consistent and non-preferential manner.[5]

The proposed Reliability Standards contain measures that support each requirement by clearly identifying what is required and how the requirement will be enforced. These measures help provide clarity regarding how the requirements would be enforced and help ensure that the requirements would be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently, but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]

The proposed Reliability Standards achieve their reliability goals effectively and efficiently in accordance with Order No. 672. Through the use of security objectives in the proposed Reliability Standards, the proposed requirements alert Responsible Entities to their obligations but also permit Responsible Entities to choose various security models that best fit their organization's configurations while meeting the objective of the requirement.

6. Proposed Reliability Standards cannot be "lowest common denominator," i.e., cannot reflect a compromise that does not adequately protect Bulk-Power System reliability.

---

[5] *See* Order No. 672, *supra* note 1, at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

[6] *See* Order No. 672, *supra* note 1, at P 328 ("The proposed Reliability Standard does not necessarily have to reflect the optimal method, or 'best practice,' for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.").

Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]

The proposed Reliability Standards do not reflect a "lowest common denominator" approach. The proposed Reliability Standards would further advance the reliable operation of the Bulk-Power System by focusing Responsible Entities on the underlying goal of the requirement rather than a prescribed topology or the "lowest common denominator" topology.

7. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]

The proposed Reliability Standards would apply consistently throughout North America and do not favor one geographic area or regional model. The proposed Reliability Standards would provide sufficient flexibility to accommodate regional/geographic variations, including climate, generation type, market issues, state rules, and other considerations.

---

[7] *See* Order No. 672, *supra* note 1, at P 329 ("The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice—the so-called 'lowest common denominator'—if such practice does not adequately protect Bulk-Power System reliability. Although the Commission will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.").

See Order No. 672, *supra* note 1, at P 330 ("A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a 'lowest common denominator' Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.").

[8] *See* Order No. 672, *supra* note 1, at P 331 ("A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.").

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

The proposed Reliability Standards would have no undue negative effect on competition and would not unreasonably restrict the available transmission capacity or limit the use of the BPS in a preferential manner. The proposed standards would require the same performance from each of the applicable entities.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The proposed implementation plan for the proposed Reliability Standards is just and reasonable and appropriately balances the urgency in the need to implement the standards against the reasonableness of the time allowed for those who must comply to develop necessary procedures or other relevant capability. The proposed implementation plan is discussed in detail in the main petition and is attached as **Exhibit B.**

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standards were developed in accordance with NERC's Commission-approved processes for developing and approving Reliability Standards. **Exhibit G**

---

[9] *See* Order No. 672, *supra* note 1, at P 332 ("As directed by section 215 of the FPA, the Commission itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.").

[10] *See* Order No. 672, *supra* note 1, at P 333 ("In considering whether a proposed Reliability Standard is just and reasonable, the Commission will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.").

[11] *See* Order No. 672, *supra* note 1, at P 334 ("Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's

includes a summary of the Reliability Standards development proceedings, and details the processes followed to develop the proposed Reliability Standards. These processes included, among other things, comment periods, pre-ballot review periods, and balloting periods. Additionally, meetings of the standard drafting team were properly noticed and open to the public.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing public interests regarding the request for approval of these proposed Reliability Standards. No comments were received that indicated that the proposed Reliability Standards conflict with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standards are just and reasonable were identified.

Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by the Commission.").

[12] *See* Order No. 672, *supra* note 1, at P 335 ("Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.").

[13] *See* Order No. 672, *supra* note 1, at P 323 ("In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.").

Virtualization and Future Technologies: The Case for Change White Paper

Virtualization and Future Technologies

Project 2016-02 Standards Drafting Team: The Case for Change

April 2019

Table of Contents

Executive Summary

What the interconnected power grid does for Bulk Electric System (BES) reliability, virtualization does for the computing infrastructure supporting vital control systems. Individual utilities interconnected their power systems to form a power grid to share spare capacity for meeting demand peaks and surviving contingencies such as generating unit and transmission line outages. Virtualization connects processors, networks, and storage into ‘computing grids’ that allow our vital systems and applications to meet peak demands and survive outages of individual components.

This is accomplished by abstracting servers, networks, and storage into virtual or logical resources that can be independent of specific underlying hardware such as individual processors, circuits, and disks. A control system and its underlying operating system become a virtual machine and can move to any available hardware. This greatly increases reliability and resiliency of our control systems that support BES reliability.

Virtualization technologies also allow enhanced cyber security controls and the ability to move access controls from the edge of our networks to much deeper inside of them. This is analogous to having generation close to load centers to reduce the susceptibility to outages. These newer security controls allow us to provide tighter security by moving access controls from an outer perimeter closer to the actual code performing reliability tasks.

Virtualization and advanced technology are challenging the way we characterize the Critical Infrastructure Protection (CIP) standards’ objectives and how we develop technical requirements. Use of virtualization and advanced technology can provide benefits for implementing both operational and security enhancements to a system. The goal is to require technology-enforced controls as alternatives to the current prescriptive requirements like those requiring a physically structured architecture, without forcing the use of the new technology. The existing standards with their prescriptive language limit the ability to take full advantage of the new technologies. The Project 2016-02 Modifications to CIP Standards Standard Drafting Team (SDT) is drafting new requirements to support virtualization capabilities. This leaves Responsible Entities with the option to maintain a non-virtualized environment and use backward compatibility to preserve current CIP investments and security postures.

This white paper represents the views of the SDT and presents a sampling of virtualization concepts. It explains, in the SDT’s opinion, how the use of these concepts is inhibited by some of the CIP standards’ definitions and requirements. It also introduces the SDT’s ideas on how to address these issues while maintaining compatibility with current state. The goal is to allow for the use of these technologies and newer security controls by removing prescribed “how’s” and replacing them with clear “what’s” that would allow both current state and these enhanced features.

Introduction

Note: The Project 2016-02 SDT developed this white paper to explain the need to change the cyber security CIP Reliability Standards. This white paper has not been approved or endorsed by NERC and is solely the views of the Project 2016-02 SDT.

In the history of the CIP standards, industry has seen many versions and changes. Some have been straightforward and almost self-explanatory. Others, complex and time-consuming to implement. Still others have been foundational, like the 'do-over' change from Versions 1 – 3 to Version 5. Not surprisingly, the prospect of another set of fairly major changes, this time involving virtualization sparks a great deal of industry concern. It raises valid questions about the timing and the drivers of those changes, and whether or not they are truly necessary. The white paper is designed to provide detailed answers to those questions from the viewpoint of the SDT. This introductory section provides a short, high level introduction to the white paper discussion on what brought about the SDT's focus on future revisions to the CIP standards to address virtualization.

Recognizing the continuing growth in technology innovation, many entities in the Electricity Sector have implemented virtualization as part of their CIP programs. Many of these same entities, however, have implemented this new technology without taking full advantage of virtualization's advanced capabilities. There are a number of reasons for this from the constraints of the current CIP architecture to the ongoing ambiguity around how new virtualization technology applies to CIP compliance. Some of those who are implementing virtualization are experiencing a great deal of uncertainty and difficulty around developing implementation strategies that will support compliance and achieve greater reliability and security.

These issues began coming to light following the NERC "Virtualization Summit" in 2015. Ultimately, the Version 5 Transition Advisory Group (V5TAG) heard about the industry concerns and determined that the issues around the standards and virtualization would be best addressed by a drafting team. The Project 2016-02 SDT was assigned the task to address the technological innovation in virtualization within the CIP standards.

The SDT's purpose of incorporating the virtualization concept into the CIP standards is not to merely augment the current standards. The SDT's intent is to better position the CIP standards to be applicable to any future technological innovation. Leveraging the abstraction that virtualization provides will allow the industry to more readily adopt new technology and increase security posture. This paper presents the SDT's case for change to the NERC CIP standards that is needed to allow for the innovative security techniques and new concepts brought about by virtualization.

As virtualization has progressed, many of these types of issues cannot be addressed with Implementation Guidance. Documenting a possible way to implement a requirement is of great value, but Implementation Guidance cannot, for example, change current requirements so they do not prescribe a perimeter-based model, or allow remediation VLANs. It also cannot add new requirements that are needed for issues like management plane isolation or handling shared infrastructure. These new concepts and techniques require changes to the standards to make them viable and to clarify how they should be secured.

Chapter 1: Virtualization Benefits

The most basic concepts of CIP are essentially unchanged from the Urgent Action 1200 standard in 2003. The primary focus of those standards was the "critical cyber asset"; an "electronic device" such as a server, workstation, or relay as a physical object. It had an operating system, always on and performing its function, and communicating with other components over routable protocols. It was protected by traditional firewalls at the network edge looking at source and destination protocol addresses and ports as the only mechanism by which to make network access control decisions.

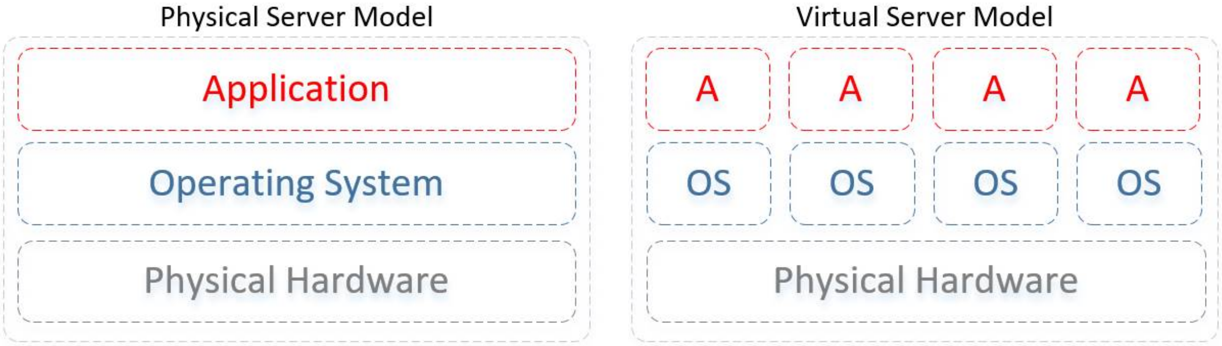

Figure 1

Today, virtualization has changed this scenario. With virtualization, physical devices are no longer the primary units of organization. An entire control system infrastructure can be virtualized (such as "software defined data centers") and only exist as logical constructs. An EMS database server may never exist as a discrete physical object. With containers (operating system emulation), there may not be a concrete tie between application logic and an operating system. Virtual machines can be created and destroyed dynamically and are neither always on, nor tied to specific hardware. Workloads may mirror their information for reliability purposes across great distances without using routable protocols. With micro-segmentation, network access control lists are now much more granular than IP addresses at a perimeter. They are enhanced by policy-based control templates enforcing access at a "user to workload" level throughout the system infrastructure. Electronic access control may no longer be based solely on routable protocol addresses or found only at an ESP boundary.

Benefits of Virtualization

Virtualization technologies bring many reliability benefits to BES Cyber Systems (BCS).

- Increased uptime, very fast recovery capability and flexible architecture that can instantly adapt to changing workloads.
- Virtualization allows for racks of CPUs, memory and disks to be tied together with high speed mesh networks and viewed simply as raw computing resources.
- If the workload on a particular virtual server is nearing capacity, the infrastructure orchestration system can create and configure an additional server on the fly, bring it online to help with the peak workload, and then destroy it when it is no longer needed.

- If a physical machine runs out of resources, the workload can be moved to another physical machine dynamically based upon relative load. When a virtual server or workstation is not in use, it is similar to a physical server that is powered off.
- This flexible and dynamic architecture also allows improved security controls such as those provided by micro-segmentation.
- Users can be granted access to specific workloads that can be placed dynamically throughout the infrastructure with managed access to provided services.

More secure, more reliable, cost effective technology solutions

New and innovative security capabilities continue to evolve to address current threats, particularly in virtualized environments. These capabilities can increase the security of hosted BES Cyber Systems. For example, *distributed firewalls* based on software defined access policies can enforce access controls at a much deeper level within the infrastructure to help prevent an attacker's lateral movement through the network. *Privileged introspection* allows security service such as anti-malware, to operate in a tamper-proof way outside of the instances they protect. *Zero trust models* allow communication to be protected end to end between individual processes across cyber assets without having to trust that devices in the path (such as all firewalls and switches) are configured correctly to protect the data. We'll consider each of these and other examples in more detail to show the benefits and the case for change in the CIP standards.

Chapter 2: Virtualization challenges in the NERC CIP Standards

Virtualization brings benefits to reliability and resiliency of our BES Cyber Systems. It also brings challenges with determining how some of the newer concepts fit within the framework of the NERC CIP standards. Some of these newer techniques and concepts are:

- Identification of Virtual Cyber Assets
- Distributed Firewalls vs. Perimeter models
- Zero Trust models
- Virtualized Firewall Interfaces
- Virtual Storage challenges
- Management Plane Isolation
- Privileged Introspection
- Remediation VLANs

Each of these topics will be covered in detail in the following sections.

Identification of Virtual Cyber Assets

One of the issues requiring change within the CIP standards is the need to clarify the treatment of virtual machines (VMs) under today's definitions. The foundational term Cyber Asset is defined as "Programmable electronic devices, including the hardware, software, and data in those devices." This definition, since it includes the hardware, does not fit with virtualized environments. A literal use of this foundational definition would mean a server hardware platform may be a BES Cyber System, the hypervisor software could be the "operating system", and all the virtual machines running on the hardware are applications or simply data. The CIP-007 requirements, most of which are aimed at an operating system instance, would not be applied to these virtual machines since they aren't hardware. This is referred to in the Figure 2 as the "Physical System w/Software Model."

To require that VM operating systems be classified correctly, the tie between a virtual machine and the hardware needs to be clarified. The standards and their associated definitions need to clearly support the "VM as a CA Model" (Virtual Machine as a Cyber Asset) as pictured in Figure 2. Here it is clear that the physical server hardware and the hypervisor are in scope and each VM is subject to requirements such as CIP-007.

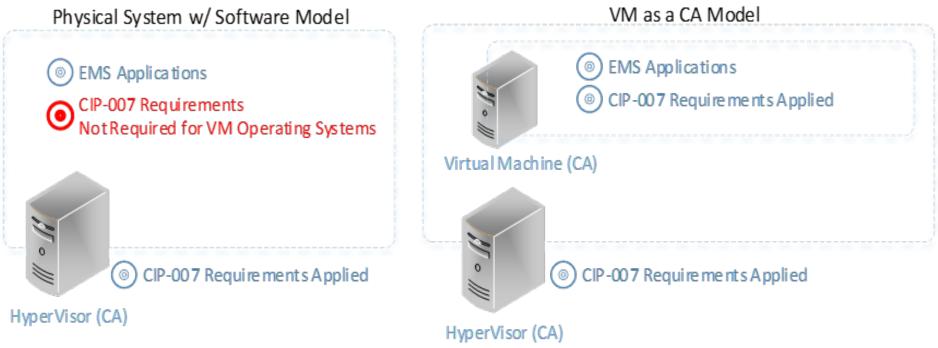

Figure 2

The Cyber Asset definition assumes a 1:1 relationship between a BES Cyber Asset and its hardware. Virtualization, however, breaks that concept because in some cases hundreds of virtual BES Cyber Assets can share a pool of hardware resources (compute, network, and storage). The outdated concepts need to be changed to recognize the one-to-many relationships that are now possible between a BES Cyber Asset, an instance of an operating system supporting applications, and the underlying hardware so it is clear how each is to be treated. There are three different types of asset classes involved in today's BES Cyber Systems:

- Self-contained devices that are composed of dedicated hardware, some form of operating system or firmware, and the application code. This is the traditional definition of a Cyber Asset and applies to things such as digital relays, RTUs, physical operator workstations and dedicated physical servers.
- Virtual "cyber assets" composed of an operating system and applications or containers minus any dedicated hardware. These types of assets are logical or virtual constructs by nature and exist only in memory or files. They can, however, appear from a network perspective the same as any other host.
- Shared Infrastructure consists of the hardware resource pools (compute, network, storage) and is shared by virtual cyber assets and can host numerous virtual cyber assets, networks, or storage locations.

The current CIP standards only recognize the first class and changes are needed to properly address the other two. This will allow BES Cyber Systems, which can be composed of all three asset classes, to be properly identified and classified and the proper requirements applied to each one.

Distributed Firewalls vs. Perimeter Models

Distributed firewalls based on software defined access policies can enforce access controls deeply within the infrastructure to help prevent an attacker's lateral movement through the network. The CIP standards (CIP-005) today require a perimeter-based model as shown in the left side of Figure 3. It has an Electronic Security Perimeter (ESP) as a logical border around a group of cyber assets, and defined interfaces (on a firewall for example) as an Electronic Access Point (EAP). This perimeter model is a prescriptive topology, and for many scenarios is still a valid way to perform network security. What may be prescribed, however, for a small network of similar cyber assets may not be ideal for a large network of virtualized BES Cyber Assets.

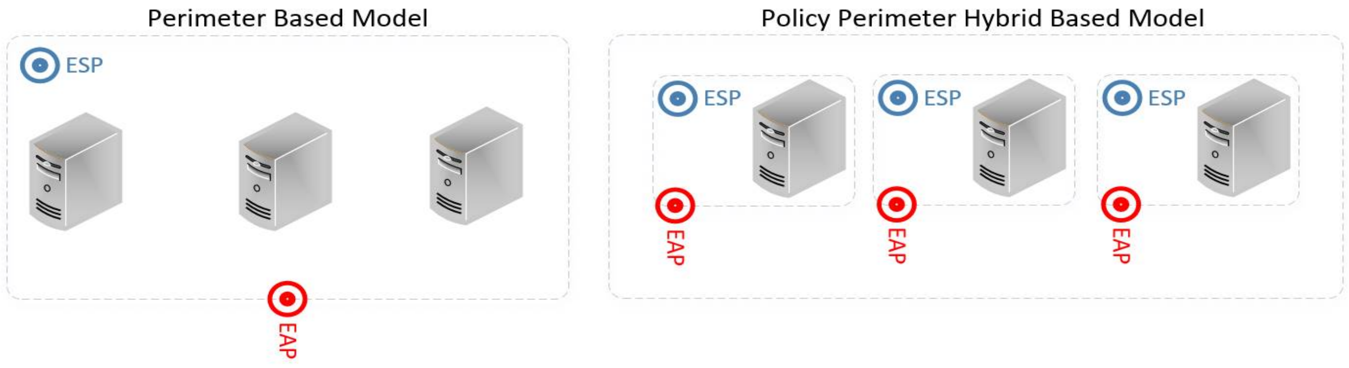

Figure 3

The issue is that network access is permitted or denied at the outer EAP "gate." Even if access is only needed to a single cyber asset inside the perimeter and a strict rule is instituted at the EAP "gate" to allow someone access to that single cyber asset, that control is implemented only at the gate. Once inside the perimeter, there are no network level access controls that would prevent hopping ("pivoting") from that cyber asset to all other cyber assets inside the perimeter. Attackers today depend upon this; if they can get a foothold on a single cyber asset inside a perimeter they can work over time to move laterally within the environment from there.

Virtualized environments, especially those of cloud providers that support tenants from various customers, had to be designed to implement new, more granular security techniques to not only mitigate this threat but to also keep customer's workloads totally isolated from one another. These new techniques are philosophically simple – every cyber asset is inside its own "perimeter" and the EAP "gates" are specific to each virtual cyber asset. This is shown on the right side of Figure 3 in the "Policy Perimeter Hybrid Based Model." In this model, network access is controlled at an individual cyber asset level and access to a single cyber asset gives you no additional access to any other cyber asset. An attacker's ability to move laterally or pivot in this environment is greatly reduced. These techniques are also configured at a *network access policy* level and the infrastructure dynamically implements it at various levels throughout the entire infrastructure. Even as these cyber assets move dynamically within the infrastructure, these access controls move with them. All of this, however, precludes the ability of administrators to provide a "list" of potentially hundreds or thousands of ESPs, EAPs, or the discrete rules per EAP. This is because it is all dynamically generated by the infrastructure to control access in accordance with a higher-level access policy.

These same techniques can be used to mitigate the same risks within virtualized CIP environments. The problem is that CIP requires the perimeter model with EAP "gates" as the only prescribed way to implement network level security. The SDT is planning to change the CIP standards and definitions in a way that does not *preclude* the perimeter based model, but also does not t *prescribe* that model as the only way. For example, the language in CIP-005 R1.2 "All External Routable Connectivity must be through an identified Electronic Access Point (EAP)." This creates an issue since historically this is a physical interface on a physical device. More current, virtualized architectures distribute the policy enforcement tasks to multiple devices and each of them validates that the network communications passing through it are permitted. The current standards do not align with these architectures because there is no single interface identified that is responsible for policy enforcement.

Identifying non-routable EAPs and the OSI Model

Related to the ESP issue, today's CIP Standards are limited to prescriptive topologies even as potentially more secure, reliable and cost-effective solutions are available. ESP's are defined today by the access provided at the network layer (OSI Layer 3) and are therefore limited to making access decisions based on routable protocol addresses. This method does not support security evaluation or compliance via security solutions at any of the other layers of the OSI model. This presents two issues:

- There may be network access into and out of the perimeter at different layers other than by a purely routable protocol that allow for things like high speed replication of data. This will be discussed further in the "Multi-Site Data Center Extensions (Super ESP)" section below.
- Virtualized environments have much more context and can enforce network access control at more granular levels in much better ways. These include by user, process, or certificate and are not limited to only a source/destination IP address of a routable protocol.

In many environments today, the perimeter model is sufficient and routable protocol addresses are all an entity has to make access control decisions. However, the standards should not prescribe this as the only way and should allow entities to use these more granular controls that may operate at other layers.

Zero Trust Models

The zero trust network model is a new and different way of thinking about network security. In most cases it can be implemented within the security model that an entity currently has deployed.

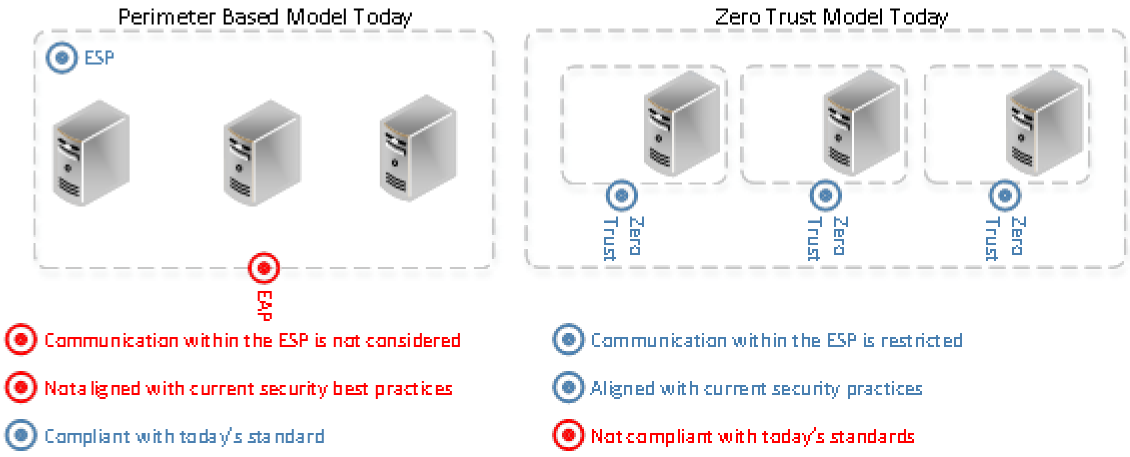

Figure 4

Most entities have a perimeter model deployed, which is what the current ESP model requires as in Figure 4. Traditionally, this consists of a firewall (or firewalls), with a single path into the network (EAP). This model protects the BES Cyber System indirectly, by protecting the network topology. This access point is protected by rules and policies that tell the firewall what kind of traffic to pass and what kind of traffic to stop. This model can be loosely compared to a gated community, where the fence is the firewall, and the gate and security guard are the access control.

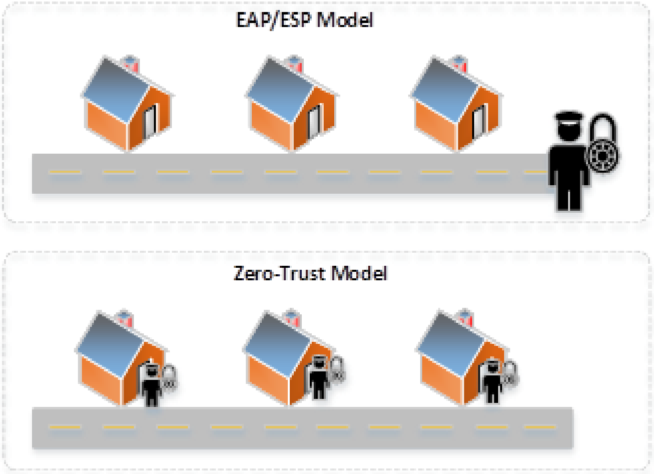

Figure 5

The overarching problem with this model is that if attackers should get past the firewalls and through the gate, they would have free rein throughout the network and could pose a serious threat to other BES Cyber Systems within the ESP.

A zero trust model brings the protection directly to the cyber asset or even to the process level. Using network policies, whitelisting, certificates, and other technologies, the ability of an intruder to move around is severely restricted. A zero trust model usually starts with simple items like restricting network traffic to the device except that which is necessary for it to perform its job function. It also restricts what logins can access the device. Finally, it introduces more complex ideas such as digitally signed executables, restrictions on what time a process can be started, and end to end encrypted traffic, even within the local network. This model protects the BES Cyber System directly by protecting the workloads, the devices and the topology. Unfortunately, this model is very difficult to describe using the current language constructs of the CIP requirements.

Referring to the gated community analogy in Figure 5, this would put a fence in every yard, a lock on every door and an alarm system in every house. This effectively isolates the intruder to the public areas of the neighborhood.

Virtualized Firewall Interfaces ('Firewall on a Stick')

As the use of network segmentation grows and firewalls are used to control traffic flows between the network segments, firewalls need higher densities of interfaces. To obtain these higher densities, products today rely on fewer physical ports and instead use virtualized network interfaces to emulate many physical interfaces. Some modern firewalls are service modules (a "firewall on a stick") installed in a switch or router where virtual interfaces are the only option to route traffic to and from the firewall as shown in Figure 6.

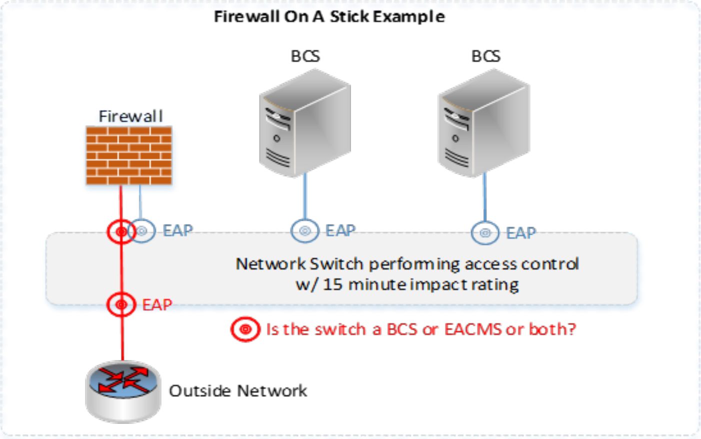

Figure 6

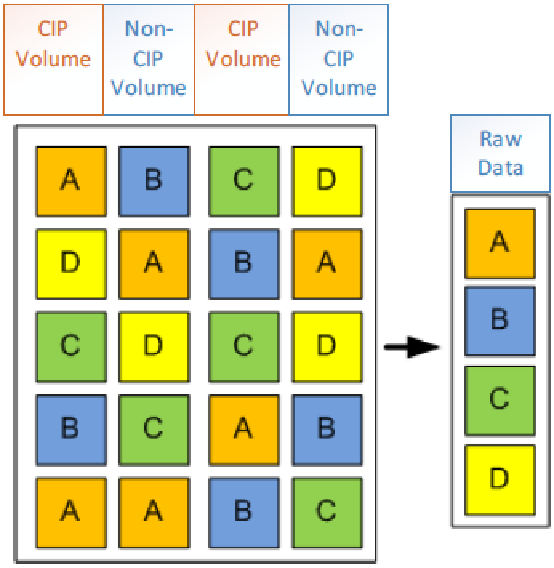
The CIP standards are ambiguous on how to properly identify these assets. If this were simply a network switch allowing two BES Cyber Systems to communicate with each other with a 15 minute impact if the switch is unavailable, then the switch itself is part of a BES Cyber System. In this example, the entity wanted to increase security of the communications between these two systems. To accomplish this, it put each BCS on its own network segment so it can filter all traffic between these two systems through a firewall. A "firewall on a stick" is installed in the switch and the ports on the switch are divided into virtual networks so the traffic between different segments is directed to the firewall and controlled. Since the firewall either has no physical interface or may use its few physical interfaces for redundancy, the outside network must connect to the same switch and that port is configured to the "outside" interface of the firewall. All communications to and from the outside network and between the two BCS are all controlled via the firewall. The entity has increased the security of these systems, but it is now undecided on how to identify the cyber assets in this scenario. As one example, are all the network switch ports now EAPs on an EACMS, or is this switch still just a part of the BCS? As access control is pushed deeper into networks as in this example, the current paradigms are ambiguous. The answer may lie in identifying new asset classes and developing new objective requirements that do not include prescriptive network topology assumptions. Trunks and sub-interfaces are common network technologies to aggregate data streams and better utilize limited physical interfaces[1].

---

[1] Trunking is the use of a single link to aggregate multiple data streams. This technology is widely used in networking and telecommunications. Sub-interfaces allow for multiple LAN segments to share a common physical interface.

Virtual Storage Challenges

As we move to virtual storage, there are issues with some of today's CIP concepts. For example, the CIP-011-2, requirement R2 restricts unauthorized access to BES Cyber System Information on systems meant for reuse outside of the CIP environment or systems meant for disposal. This causes a challenge for virtualized infrastructure. Today, when disposing of a physical medium or high impact BES Cyber Asset, access to BCSI can be restricted by sanitizing or destroying the media associated with the physical asset. If storage media is provided from a Storage Area Network (SAN) or Network Attached Storage (NAS) array, there may be no easy way to identify the specific drives where the data might have been stored. Additionally, there is no significant benefit to pulling drives from an array to sanitize or destroy them if there is another way to manage this media.



Deduplication Example

Figure 7

To extend this challenge further, many SAN and NAS environments can de-duplicate and move data to various storage tiers within the array to optimize access times and reduce latency. This process analyzes the data in small enough chunks to create single instances of data that are used within multiple volumes that may be assigned to any number of devices. The chunks with the highest access rates are then placed on fast storage media because the data is constantly referenced. This effectively causes data re-use if storage media is shared between CIP and Non-CIP assets even when the information contained within these de-duplicated chunks is not readily retrievable individually.

That was one example. The CIP standards were built on a paradigm of disk storage being physical disks dedicated to a Cyber Asset. Updates to the standards are needed to reflect the realities of virtual storage technologies that are in use today.

Management Plane Isolation

Because virtualized servers, networks, switches, firewalls, and storage are logical constructs, controlling access and communications to the management plane of these systems is imperative. Access to the management plane (interface/console/etc.) allows a user to create, modify, or delete these objects or entire infrastructures from one place, or move objects from one zone or network to another. Administrative level or "management plane" access to the hypervisors is therefore absolutely critical to the security and reliability of the hosted systems. These types of access must be brought into the scope of CIP standards if hosting BES Cyber Systems and will require changes to the CIP standards.

Another challenge of the perimeter model is it can drive less secure topologies in order to provide clear adherence to the perimeter model. In Figure 8 below on the right is the desired separation between the management plane of a virtualized environment and the production or "data plane". The management port of the BCA is connected to a switch on the management network. The production network switch is connected to the network interface on the BCA. This creates two different network paths to the BCA: one for normal production traffic and a separate network path with separate access controls for administrative or management plane access. It is unclear, however, if the BCA has now created two ESP's with two EAPs, and whether or not it is now an EACMS. It is not functioning as an EACMS, but from the topology it appears as one. The prescriptive CIP model may create a temptation to place the management interface into the production ESP as in the picture on the left. This is very clear from a CIP standard adherence perspective but is the less secure choice.

Figure 8

Privileged Introspection

Privileged introspection allows security services, such as malware detection, to be performed outside of the operating system and applications it is protecting in a tamper-proof way. Previously, malware that could gain elevated privileges on a cyber asset could then disable security services such as anti-virus solutions running on the same OS. Virtualized environments, however, can allow privileged introspection where anti-virus or application whitelisting services run as part of the hypervisor; outside of the operating system they are protecting so malware with elevated privileges inside the OS cannot reach them. Another benefit of privileged introspection is it allows integration with distributed firewalls because it can inspect network traffic entering or leaving virtual machines and make decisions with vastly more context. For example, these firewalls can control access not simply at a network address level (IP source/destination) but down to the level of a process with a particular certificate.

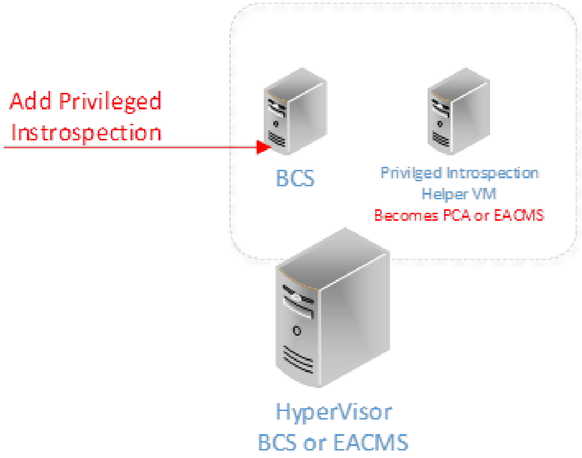


Figure 9

Even though the current CIP-007 R3 is already written at a security objective level and can work with privileged introspection, there can still be CIP standards issues brought into play. If this functionality uses "helper VMs", it is not clear how to identify and classify these under the current CIP standards. Since the status of malware detection is now outside the VM's, it requires grouping the VM's protected by privileged introspection into a particular BES Cyber System.

Remediation VLANs

As another example of the need for change in the CIP standards brought about by new virtualization technologies, CIP-010 R3.3 states, "Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset..." This is a valid requirement that cyber assets be in a CIP compliant state before being added to a production CIP environment. The issue is that this is written with the idea that an entity's new cyber asset is a separate physical asset it can configure in a compliant state prior to it being placed in a "production environment" and connected to a production network.

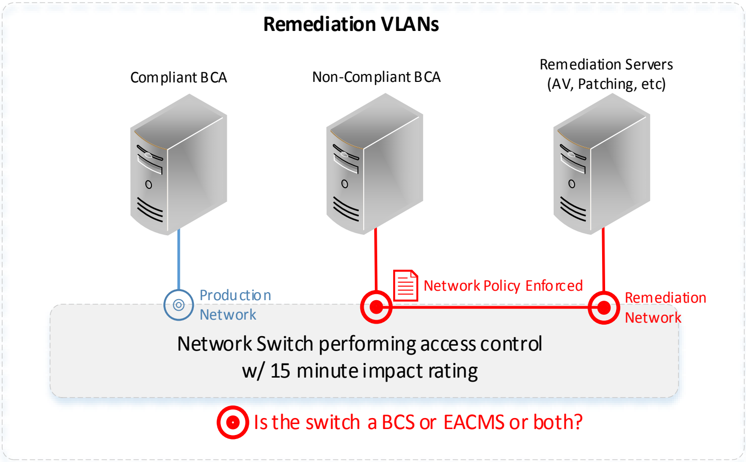

Figure 10

Virtualized environments, however, allow for a concept known as remediation VLANs. When a new cyber asset, such as a server or operator workstation is instantiated from an image, it is already "in" a production environment. However, it is brought up in a remediation VLAN where its network visibility is restricted to those services (patching, anti-virus updates, etc.) that it needs to assess vulnerabilities, update itself, and become compliant. Only after it is fully compliant with policy, can it be moved to a production VLAN where it has the full network visibility. Should this virtual machine become non-compliant with the network policy, it is moved back to the remediation VLAN to be made compliant again. This is an advanced security control, beyond what CIP-010 envisions, where real time checks are performed to ensure a cyber asset is compliant with security policy. The way the CIP standards are currently written, however, could preclude such advanced controls since this Remediation VLAN must be either part of an ESP or a separate ESP in order to host BCAs per CIP-005-5 R1. Requirements such as those in CIP-005 and CIP-010 need to be modified to allow for these more advanced features and controls.

Multi-Site Data Center Extensions (Super ESP)

There are technology solutions now that support very high levels of resiliency, so much so that virtual machines can be seamlessly moved from physical infrastructure at one data center across great distances to physical infrastructure at another data center. For example, control center functions could move easily and seamlessly from a primary control center to a backup control center across town or across the state. For this to work, an entity would use tunneling protocols that make the two data center networks appear as one local network ("layer 2 adjacency"). You've "stretched" a LAN across a WAN. The issue with CIP is that it assumes a LAN at each site with a defined ESP and access control at a point on that ESP at each site, with all the WAN communications equipment in between these ESPs exempted from scope. In

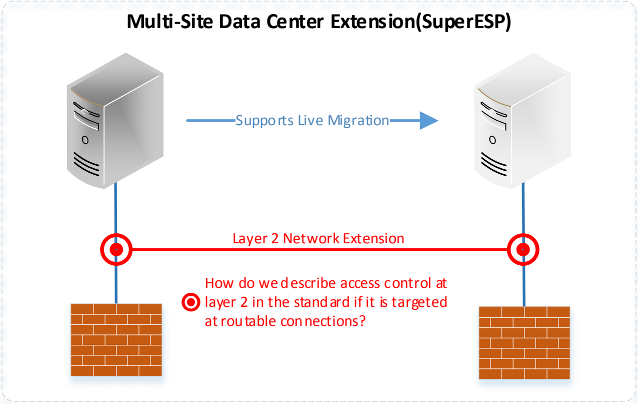

Figure 11

this situation, however, we have a single “local network” stretched between different sites creating at one level a “Super ESP”. Complicating the issue is that underneath this logical network extension, the data may actually ride in encrypted tunnels created at a routable protocol layer. At that layer, firewalls on an ESP can’t really provide any security, but that is prescriptively where the CIP standards say it must be done.

Chapter 3: Future Concept Example

Previously the proposed solution to address these issues with virtualization was a full embrace of the cyber system concept (retiring device level terms like Cyber Asset and BES Cyber Asset) and writing the technical requirements (e.g. CIP-005, CIP-007, CIP-010) at a more objective level. However, through industry feedback several important issues came to light:

- Eliminating the BES Cyber Asset definition and moving to the BES Cyber System as the sole foundational object with no further granularity would cause a complete overhaul and “do-over” of entities’ CIP-002 processes with insufficient benefit for the effort required.
- Requiring grouping systems by function exclusively conflicts with a number of different ways the industry has used the systems grouping flexibility; for example to group all Cyber Assets of a like operating system for patching purposes.
- Stating security objectives in requirements must be at a level where they are clearly measurable.

With these issues in mind, the future concept is to leave the foundational definitions largely unmodified. A “Cyber Asset” would remain as-is and be inclusive of the hardware as it is today. However, including the hardware for virtual cyber assets does not work, even though it needs to be protected the same as a discrete physical cyber asset. To resolve this the SDT will create a separate definition to capture virtual cyber assets so that they can be added to the applicability of the appropriate requirements. The hardware that provides compute, network, and storage resources would become its own new term to capture shared infrastructure and allow requirements to be written for risks unique to that environment. BES Cyber Systems would remain as-is and allow for all the various ways entities have used that concept to date.

The direction remains to establish objective level requirements but these need to be written at the appropriate level. For example, if CIP-005 R1 were written as “Mitigate the risk of unauthorized network access”, it is certainly an objective but is too high level to be measurable. No one would be able to state when, or to what degree this objective had been accomplished. If CIP-005 R1 were written as “Only allow known valid layer 3 IP addresses into or out of the network and implement this only at a Cyber Asset interface located only at the network edge”, it would be a prescribed topology and a prescriptive “how.” This should be avoided as it precludes much of the newer technologies presented in this paper. The latter is essentially the CIP-005 R1 of today and is one of the primary requirements that needs to change to remove this prescriptive topology and “how’s”.

An example of an alternative objective requirement that clearly describes a measurable “what” but avoids prescriptive “how’s” for CIP-005 R1 could conceptually be:

> *Deny all access to and from the networks on which high and medium impact BES Cyber Systems and their associated PCAs are connected and only allow network communication that has documented access permissions including the reason for granting access.*

This is a much clearer objective to accomplish but it avoids telling the entity how or where they must implement it or how their network must be architected. As for backward compatibility, an entity could still define an ESP with designated EAPs and provide firewall configurations as they do today. However, an entity using the advanced virtualization techniques from earlier in this paper, or future techniques to control network access that have not yet been contemplated can still show they meet this same objective.

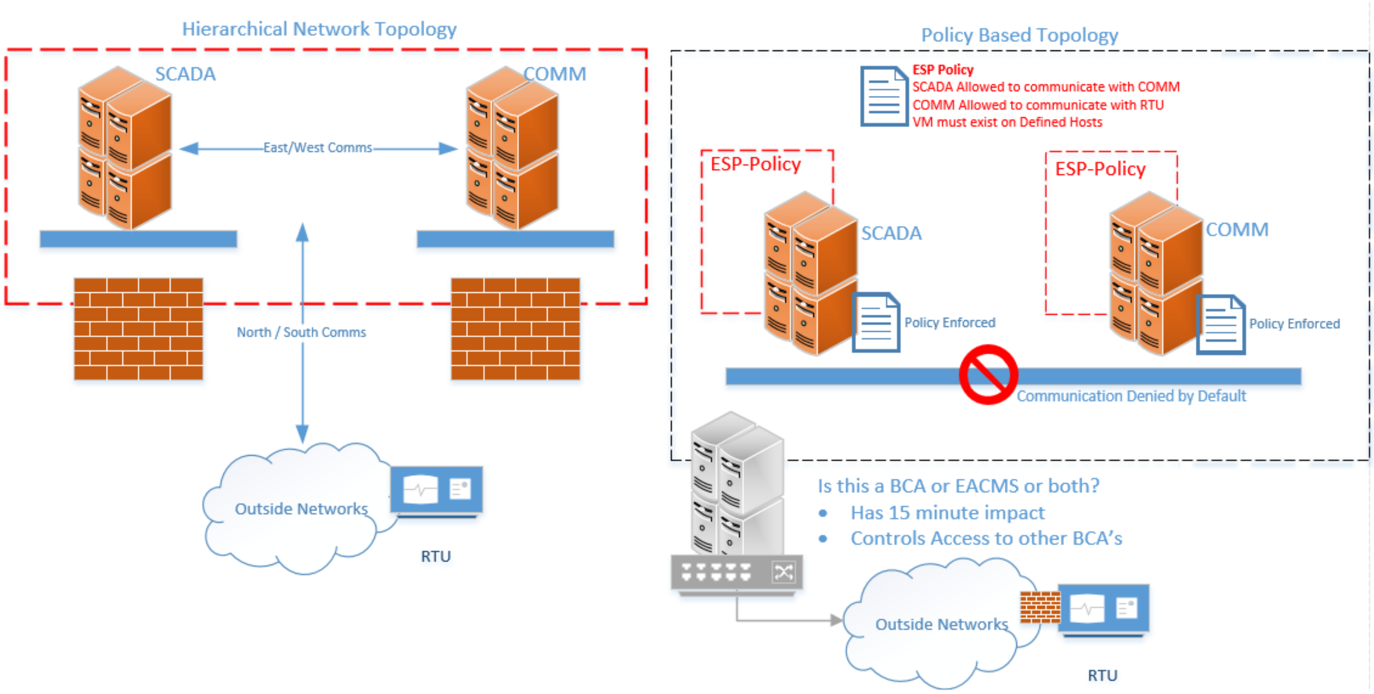

Figure 12

As shown in Figure 12, the current state ESP/EAP model on the left continues to be a valid architecture and topology with which to meet the objective. It is prescribed under the current requirements, but is not the ONLY way to accomplish the objective. On the right is a policy-based model in a fully virtualized system which can also accomplish the same objective once it is no longer prohibited by the requirement language. It has no distinct EAP; no distinct 'point' or 'interface' where the access controls are implemented. This is because the access policy is implemented throughout the infrastructure and the controls move with the virtual workloads. Access control is applied at a deeper level, closer to the functions that require protection and the policy allows no communication to occur that isn't explicitly allowed. The objective stated in the requirement can be met in either scenario.

For the asset classification, nothing changes for the architecture on the left. For the virtualized architecture on the right, the concept is to clarify that the systems in orange are virtual cyber assets, but without including the hardware. They exist as a virtual entity and need much of the same protection as a physical cyber asset. The systems depicted in grey are the Shared Infrastructure, a new asset class that hosts virtual cyber assets. Having these additional asset classes would allow the CIP standards to require protection appropriate to each class, whether a discrete physical system, a virtual cyber asset, or shared infrastructure hosting many virtual BES Cyber Systems.

Chapter 4: Conclusion

This paper has stepped through the benefits of virtualization in terms of increased reliability and resiliency for BES Cyber Systems. It also discusses how virtualization provides newer techniques for securing access to those systems, such as distributed firewalls and zero trust models. It has highlighted some of the issues created by several of these concepts and the required topologies contained within today's CIP requirements. Many of these issues revolve around the proper classification of cyber assets in virtualized environments and having asset classes whereby requirements can be properly scoped. Several other issues revolve around the prescriptive "how" of today's CIP-005 ESP/EAP model, the CIP-010 data requirements in a virtual storage world, or how CIP-011's requirements need minor changes to allow for technologies such as remediation VLAN's.

The CIP standards require some changes to:

- Address risks unique to virtualized environments such as the sharing of hardware resources and management plane access.
- Provide clarity around how to identify and categorize the various types of cyber assets in a virtualized infrastructure and scope requirements appropriately.
- Allow entities to fully implement newer security techniques in these environments that can provide higher levels of access control that are easier to manage, and don't require purchasing extra hardware to show compliance with prescribed topologies.

Many of these issues can be addressed as shown in the CIP-005 R1 example concept, where the prescriptive 'how' has been removed and replaced with a clearly stated security objective – one that fully allows for current state but also allows these newer techniques. Developing technology-agnostic security objectives can not only solve the issues presented by today's virtualization technologies, but also help address future issues brought about by technologies that aren't even contemplated today.

Technical Rationale for Reliability Standard CIP-002-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-002-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-002-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a SDT. The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Attachment 1 – Impact Rating Criteria

Change Rationale:

In the medium impact rating criterion 2.1 referencing shared BCS for commissioned generation, the SDT has proposed a change to incorporate an earlier approved Request For Interpretation (RFI). The RFI was submitted seeking clarification of Criterion 2.1 of Attachment 1 regarding the use of the phrase "shared BES Cyber Systems." The resulting approved interpretation was introduced as Appendix 1 in CIP-002-5.1a.

The SDT incorporated the interpretation into CIP-002-7 Attachment 1 criterion 2.1 by modifying it to reference "each discrete shared BCS" and removed the RFI appendix from the standard.

Former Background Section from Reliability Standard CIP-002-5.1a

The **Background** section has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

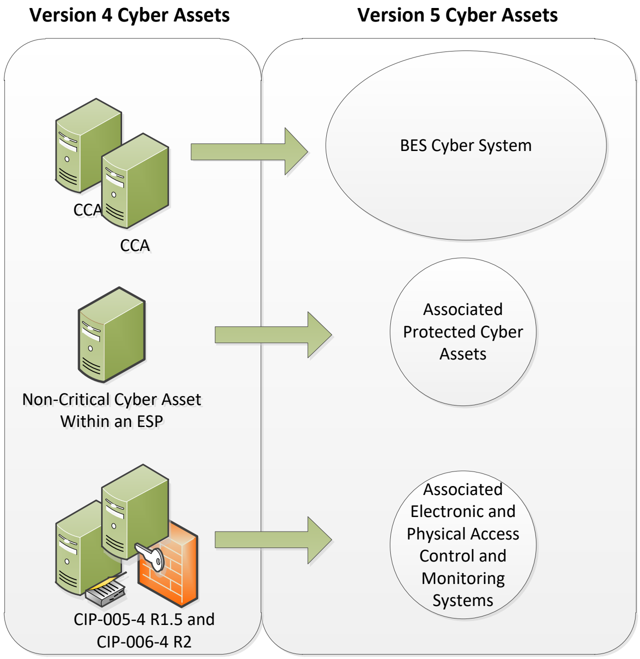
This standard provides "bright-line" criteria for applicable Responsible Entities to categorize their Bulk Electric System (BES) Cyber Systems based on the impact of their associated Facilities, systems, and equipment, which, if destroyed, degraded, misused, or otherwise rendered unavailable, would affect the reliable operation of the BES. Several concepts provide the basis for the approach to the standard.

Throughout the standards, unless otherwise stated, bulleted items in the requirements are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section and the criteria in Attachment 1 of CIP-002 use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

BES Cyber Systems

One of the fundamental differences between Versions 4 and 5 of the CIP Cyber Security Standards is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change results from the drafting team's review of the NIST Risk Management Framework and the use of an analogous term "information system" as the target for categorizing and applying security controls.



In transitioning from Version 4 to Version 5, a BES Cyber System can be viewed simply as a grouping of Critical Cyber Assets (as that term is used in Version 4). The CIP Cyber Security Standards use the "BES Cyber System" term primarily

to provide a higher level for referencing the object of a requirement. For example, it becomes possible to apply requirements dealing with recovery and malware protection to a grouping rather than individual Cyber Assets, and it becomes clearer in the requirement that malware protection applies to the system as a whole and may not be necessary for every individual device to comply.

Another reason for using the term “BES Cyber System” is to provide a convenient level at which a Responsible Entity can organize their documented implementation of the requirements and compliance evidence. Responsible Entities can use the well-developed concept of a *security plan* for each BES Cyber System to document the programs, processes, and plans in place to comply with security requirements.

It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System. For example, the Responsible Entity might choose to view an entire plant control system as a single BES Cyber System, or it might choose to view certain components of the plant control system as distinct BES Cyber Systems. The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.

Reliable Operation of the BES

The scope of the CIP Cyber Security Standards is restricted to BES Cyber Systems that would impact the reliable operation of the BES. In order to identify BES Cyber Systems, Responsible Entities determine whether the BES Cyber Systems perform or support any BES reliability function according to those reliability tasks identified for their reliability function and the corresponding functional entity’s responsibilities as defined in its relationships with other functional entities in the NERC Functional Model. This ensures that the *initial* scope for consideration includes only those BES Cyber Systems and their associated BES Cyber Assets that perform or support the reliable operation of the BES. The definition of BES Cyber Asset provides the basis for this scoping.

Real-time Operations

One characteristic of the BES Cyber Asset is a real-time scoping characteristic. The time horizon that is significant for BES Cyber Systems and BES Cyber Assets subject to the application of these Version 5 CIP Cyber Security Standards is defined as that which is material to real-time operations for the reliable operation of the BES. To provide a better defined time horizon than “Real-time,” BES Cyber Assets are those Cyber Assets that, if rendered unavailable, degraded, or misused, would adversely impact the reliable operation of the BES within 15 minutes of the activation or exercise of the compromise. This time window must not include in its consideration the activation of redundant BES Cyber Assets or BES Cyber Systems: from the cyber security standpoint, redundancy does not mitigate cyber security vulnerabilities.

Categorization Criteria

The criteria defined in Attachment 1 are used to categorize BES Cyber Systems into impact categories. Requirement 1 only requires the discrete identification of BES Cyber Systems for those in the high impact and medium impact categories. All BES Cyber Systems for Facilities not included in Attachment 1 – Impact Rating Criteria, Criteria 1.1 to 1.4, and Criteria 2.1 to 2.11 default to be low impact.

This general process of categorization of BES Cyber Systems based on impact on the reliable operation of the BES is consistent with risk management approaches for the purpose of application of cyber security requirements in the remainder of the Version 5 CIP Cyber Security Standards.

Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets that are associated with BES Cyber Systems

BES Cyber Systems have associated Cyber Assets, which, if compromised, pose a threat to the BES Cyber System by virtue of: (a) their location within the Electronic Security Perimeter (Protected Cyber Assets), or (b) the security control function they perform (Electronic Access Control or Monitoring Systems and Physical Access Control Systems). These Cyber Assets include:

Electronic Access Control or Monitoring Systems ("EACMS")

Examples include Electronic Access Points, Intermediate Systems, authentication servers (e.g., RADIUS servers, Active Directory servers, Certificate Authorities), security event monitoring systems, and intrusion detection systems.

Physical Access Control Systems ("PACS")

Examples include authentication servers, card systems, and badge control systems.

Protected Cyber Assets ("PCA")

Examples may include, to the extent they are within the ESP file servers, ftp servers, time servers, LAN switches, networked printers, digital fault recorders, and emission monitoring systems.

Technical Rationale for Reliability Standard CIP-002-5.1a

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from the CIP-002-5.1a standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the qualified set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards. This section is especially significant in CIP-002-5.1a and represents the total scope of Facilities, systems, and equipment to which the criteria in Attachment 1 apply. This is important because it determines the balance of these Facilities, systems, and equipment that are Low Impact once those that qualify under the High and Medium Impact categories are filtered out.

For the purpose of identifying groups of Facilities, systems, and equipment, whether by location or otherwise, the Responsible Entity identifies assets as described in Requirement R1 of CIP-002-5.1a. This is a process familiar to Responsible Entities that have to comply with versions 1, 2, 3, and 4 of the CIP standards for Critical Assets. As in versions 1, 2, 3, and 4, Responsible Entities may use substations, generation plants, and Control Centers at single site locations as identifiers of these groups of Facilities, systems, and equipment.

CIP-002-5.1a

CIP-002-5.1a requires that applicable Responsible Entities categorize their BES Cyber Systems and associated BES Cyber Assets according to the criteria in Attachment 1. A BES Cyber Asset includes in its definition, "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact the reliable operation of the BES."

The following provides guidance that a Responsible Entity may use to identify the BES Cyber Systems that would be in scope. The concept of BES reliability operating service is useful in providing Responsible Entities with the option of a defined process for scoping those BES Cyber Systems that would be subject to CIP-002-5.1a. The concept includes a number of named BES reliability operating services. These named services include:

- Dynamic Response to BES conditions
- Balancing Load and Generation
- Controlling Frequency (Real Power)
- Controlling Voltage (Reactive Power)
- Managing Constraints

- Monitoring & Control
- Restoration of BES
- Situational Awareness
- Inter-Entity Real-Time Coordination and Communication

Responsibility for the reliable operation of the BES is spread across all Entity Registrations. Each entity registration has its own special contribution to reliable operations and the following discussion helps identify which entity registration, in the context of those functional entities to which these CIP standards apply, performs which reliability operating service, as a process to identify BES Cyber Systems that would be in scope. The following provides guidance for Responsible Entities to determine applicable reliability operations services according to their Function Registration type.

Entity Registration	RC	BA	TOP	TO	DP	GOP	GO
Dynamic Response		X	X	X	X	X	X
Balancing Load & Generation	X	X	X	X	X	X	X
Controlling Frequency		X				X	X
Controlling Voltage			X	X	X		X
Managing Constraints	X		X			X	
Monitoring and Control			X			X	
Restoration			X			X	
Situation Awareness	X	X	X			X	
Inter-Entity coordination	X	X	X	X		X	X

Dynamic Response

The Dynamic Response Operating Service includes those actions performed by BES Elements or subsystems which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition. The types of dynamic responses that may be considered as potentially having an impact on the BES are:

- Spinning reserves (contingency reserves)
  - Providing actual reserve generation when called upon (GO,GOP)
  - Monitoring that reserves are sufficient (BA)
- Governor Response
  - Control system used to actuate governor response (GO)
    - Protection Systems (transmission & generation)
  - Lines, buses, transformers, generators (DP, TO, TOP, GO, GOP)
  - Zone protection for breaker failure (DP, TO, TOP)
  - Breaker protection (DP, TO, TOP)
  - Current, frequency, speed, phase (TO,TOP, GO,GOP)

        - Special Protection Systems or Remedial Action Schemes
    - Sensors, relays, and breakers, possibly software (DP, TO, TOP)
        - Under and Over Frequency relay protection (includes automatic load shedding)
    - Sensors, relays & breakers (DP)
        - Under and Over Voltage relay protection (includes automatic load shedding)
    - Sensors, relays & breakers (DP)
        - Power System Stabilizers (GO)

Balancing Load and Generation

The Balancing Load and Generation Operations Service includes activities, actions, and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time. Aspects of the Balancing Load and Generation function include, but are not limited to:

- Calculation of Area Control Error (ACE)
    - Field data sources (real time tie flows, frequency sources, time error, etc.) (TO, TOP)
    - Software used to perform calculation (BA)
- Demand Response
    - Ability to identify load change need (BA)
    - Ability to implement load changes (TOP,DP)
- Manually Initiated Load shedding
    - Ability to identify load change need (BA)
    - Ability to implement load changes (TOP, DP)
- Non-spinning reserve (contingency reserve)
    - Know generation status, capability, ramp rate, start time (GO, BA)
    - Start units and provide energy (GOP)

Controlling Frequency (Real Power)

The Controlling Frequency Operations Service includes activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Frequency function include, but are limited to:

- Generation Control (such as AGC)
    - ACE, current generator output, ramp rate, unit characteristics (BA, GOP, GO)
    - Software to calculate unit adjustments (BA)
    - Transmit adjustments to individual units (GOP)
    - Unit controls implementing adjustments (GOP)
- Regulation (regulating reserves)
    - Frequency source, schedule (BA)
    - Governor control system (GO)

Controlling Voltage (Reactive Power)

The Controlling Voltage Operations Service includes activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Voltage function include, but are not limited to:

- Automatic Voltage Regulation (AVR)
    - Sensors, stator control system, feedback (GO)
- Capacitive resources
    - Status, control (manual or auto), feedback (TOP, TO,DP)
- Inductive resources (transformer tap changer, or inductors)
    - Status, control (manual or auto), feedback (TOP,TO,DP)
- Static VAR Compensators (SVC)
    - Status, computations, control (manual or auto), feedback (TOP, TO,DP)

Managing Constraints

Managing Constraints includes activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES. Aspects of the Managing Constraints include, but are not limited to:

- Available Transfer Capability (ATC) (TOP)
- Interchange schedules (TOP, RC)
- Generation re-dispatch and unit commit (GOP)
- Identify and monitor SOL's & IROL's (TOP, RC)
- Identify and monitor Flow gates (TOP, RC)

Monitoring and Control

Monitoring and Control includes those activities, actions and conditions that provide monitoring and control of BES Elements. An example aspect of the Control and Operation function is:

- All methods of operating breakers and switches
    - SCADA (TOP, GOP)
    - Substation automation (TOP)

Restoration of BES

The Restoration of BES Operations Service includes activities, actions, and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Aspects of the Restoration of BES function include, but are not limited to:

- Restoration including planned cranking path
    - Through black start units (TOP, GOP)
    - Through tie lines (TOP, GOP)
- Off-site power for nuclear facilities. (TOP, TO, BA, RC, DP, GO, GOP)
- Coordination (TOP, TO, BA, RC, DP, GO, GOP)

Situational Awareness

The Situational Awareness function includes activities, actions and conditions established by policy, directive, or standard operating procedure necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions. Aspects of the Situation Awareness function include:

- Monitoring and alerting (such as EMS alarms) (TOP, GOP, RC,BA)
- Change management (TOP,GOP,RC,BA)
- Current Day and Next Day planning (TOP)
- Contingency Analysis (RC)
- Frequency monitoring (BA, RC)

Inter-Entity Coordination

The Inter-Entity coordination and communication function includes activities, actions, and conditions established by policy, directive, or standard operating procedure necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES. Aspects of the Inter-Entity Coordination and Communication function include:

- Scheduled interchange (BA,TOP,GOP,RC)
- Facility operational data and status (TO, TOP, GO, GOP, RC, BA)
- Operational directives (TOP, RC, BA)

Applicability to Distribution Providers

It is expected that only Distribution Providers that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. Distribution Providers that do not own or operate any facility that qualifies are not subject to these standards. The qualifications are based on the requirements for registration as a Distribution Provider and on the requirements applicable to Distribution Providers in NERC Standard EOP-005.

Requirement R1:

Requirement R1 implements the methodology for the categorization of BES Cyber Systems according to their impact on the BES. Using the traditional risk assessment equation, it reduces the measure of the risk to an impact (consequence) assessment, assuming the vulnerability index of 1 (the Systems are assumed to be vulnerable) and a probability of threat of 1 (100 percent). The criteria in Attachment 1 provide a measure of the impact of the BES assets supported by these BES Cyber Systems.

Responsible Entities are required to identify and categorize those BES Cyber Systems that have high and medium impact. BES Cyber Systems for BES assets not specified in Attachment 1, Criteria 1.1 – 1.4 and Criteria 2.1 – 2.11 default to low impact.

Attachment 1

Overall Application

In the application of the criteria in Attachment 1, Responsible Entities should note that the approach used is based on the impact of the BES Cyber System as measured by the bright-line criteria defined in Attachment 1.

- When the drafting team uses the term “Facilities”, there is some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as “A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.).” In most cases, the criteria refer to a group of Facilities in a given location that supports

the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to consider only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that supports reliable operation of the BES, as the Facilities that are subject to the criteria for categorization of BES Cyber Systems. Generation Facilities are separately discussed in the Generation section below. In CIP-002-5.1a, these groups of Facilities, systems, and equipment are sometimes designated as BES assets. For example, an identified BES asset may be a named substation, generating plant, or Control Center. Responsible Entities have flexibility in how they group Facilities, systems, and equipment at a location.

- In certain cases, a BES Cyber System may be categorized by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that result in the categorization. This will avoid inadvertent miscategorization when it no longer meets one of the criteria, but still meets another.
- It is recommended that each BES Cyber System should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

High Impact Rating (H)

This category includes those BES Cyber Systems, used by and at Control Centers (and the associated data centers included in the definition of Control Centers), that perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), or Generator Operator (GOP), as defined under the Tasks heading of the applicable Function and the Relationship with Other Entities heading of the functional entity in the NERC Functional Model, and as scoped by the qualification in Attachment 1, Criteria 1.1, 1.2, 1.3 and 1.4. While those entities that have been registered as the above-named functional entities are specifically referenced, it must be noted that there may be agreements where some of the functional obligations of a Transmission Operator may be delegated to a Transmission Owner (TO). In these cases, BES Cyber Systems at these TO Control Centers that perform these functional obligations would be subject to categorization as high impact. The criteria notably specifically emphasize functional obligations, not necessarily the RC, BA, TOP, or GOP facilities. One must note that the definition of Control Center specifically refers to reliability tasks for RCs, Bas, TOPs, and GOPs. A TO BES Cyber System in a TO facility that does not perform or does not have an agreement with a TOP to perform any of these functional tasks does not meet the definition of a Control Center. However, if that BES Cyber System operates any of the facilities that meet criteria in the Medium Impact category, that BES Cyber System would be categorized as a Medium Impact BES Cyber System.

The 3000 MW threshold defined in criterion 1.2 for BA Control Centers provides a sufficient differentiation of the threshold defined for Medium Impact BA Control Centers. An analysis of BA footprints shows that the majority of Bas with significant impact are covered under this criterion.

Additional thresholds as specified in the criteria apply for this category.

Medium Impact Rating (M)

Generation

The criteria in Attachment 1’s medium impact category that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are criteria 2.1, 2.3, 2.6, 2.9, and 2.11. Criterion 2.13 for BA Control Centers is also included here.

- Criterion 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002, whose purpose is “to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance.” In particular, it requires that “as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency.” The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Bas in all regions.

In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements as proposed by NERC standard MOD-024 and current development efforts in that area.

By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of 1500 MW or more of generation at a single plant for a unit or group of units are adequately protected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities’ qualification against these bright-lines, the highest value was used.

- In Criterion 2.3, the drafting team sought to ensure that BES Cyber Systems for those generation Facilities that have been designated by the Planning Coordinator or Transmission Planner as necessary to avoid BES Adverse Reliability Impacts in the planning horizon of one year or more are categorized as medium impact. In specifying a planning horizon of one year or more, the intent is to ensure that those are units that are identified as a result of a “long term” reliability planning, i.e. that the plans are spanning an operating period of at least 12 months: it does not mean that the operating day for the unit is necessarily beyond one year, but that the period that is being planned for is more than 1 year: it is specifically intended to avoid designating generation that is required to be run to remediate short term emergency reliability issues. These Facilities may be designated as “Reliability Must Run,” and this designation is distinct from those generation Facilities designated as “must run” for market stabilization purposes. Because the use of the term “must run” creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  If it is determined through System studies that a unit must run in order to preserve the reliability of the BES, such as due to a Category C3 contingency as defined in TPL-003, then BES Cyber Systems for that unit are categorized as medium impact.

  The TPL standards require that, where the studies and plans indicate additional actions, that these studies and plans be communicated by the Planning Coordinator or Transmission Planner in writing to the Regional Entity/RRO. Actions necessary for the implementation of these plans by affected parties (generation owners/operators and Reliability Coordinators or other necessary party) are usually formalized in the form of an agreement and/or contract.

- Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.

  IROLs may be based on dynamic System phenomena such as instability or voltage collapse. Derivation of these IROLs and their associated contingencies often considers the effect of generation inertia and AVR response.

- Criterion 2.9 categorizes BES Cyber Systems for Special Protection Systems and Remedial Action Schemes as medium impact. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Generator Operators which own BES Cyber Systems for such Systems and schemes designate them as medium impact.
- Criterion 2.11 categorizes as medium impact BES Cyber Systems used by and at Control Centers that perform the functional obligations of the Generator Operator for an aggregate generation of 1500 MW or higher in a single interconnection, and that have not already been included in Part 1.
- Criterion 2.13 categorizes as medium impact those BA Control Centers that "control" 1500 MW of generation or more in a single interconnection and that have not already been included in Part 1. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.

Transmission

The SDT uses the phrases "Transmission Facilities at a single station or substation" and "Transmission stations or substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e., fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

- Criteria 2.2, 2.4 through 2.10, and 2.12 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a System to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). Criterion 2.2 includes BES Cyber Systems for those Facilities in Transmission Systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.
- Criterion 2.4 includes BES Cyber Systems for any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion in the medium impact category.

  It must be noted that if the collector bus for a generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation in Criterion 2.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility, and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface." This collector bus would not be a facility for a medium impact BES Cyber System because it does not significantly affect the 500kV Transmission grid; it only affects a plant which is below the generation threshold.
- Criterion 2.5 includes BES Cyber Systems for facilities at the lower end of BES Transmission with qualifications for inclusion if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for significant impact on the BES, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES. The drafting team:
  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least three transmission stations or substations to ensure that the level of impact would be appropriate.

The total aggregated weighted value of 3,000 was derived from weighted values related to three connected 345 kV lines and five connected 230 kV lines at a transmission station or substation. The total aggregated weighted value is used to account for the true impact to the BES, irrespective of line kV rating and mix of multiple kV rated lines.

Additionally, in NERC's document "Integrated Risk Assessment Approach – Refinement to Severity Risk Index", Attachment 1, the report used an average MVA line loading based on kV rating:

- 230 kV –> 700 MVA
- 345 kV –> 1,300 MVA
- 500 kV –> 2,000 MVA
- 765 kV –> 3,000 MVA

In the terms of applicable lines and connecting "other Transmission stations or substations" determinations, the following should be considered:

- For autotransformers in a station, Responsible Entities have flexibility in determining whether the groups of Facilities are considered a single substation or station location or multiple substations or stations. In most cases, Responsible Entities would probably consider them as Facilities at a single substation or station unless geographically dispersed. In these cases of these transformers being within the "fence" of the substation or station, autotransformers may not count as separate connections to other stations. The use of common BES Cyber Systems may negate any rationale for any consideration otherwise. In the case of autotransformers that are geographically dispersed from a station location, the calculation would consider the connections in and out of each station or substation location.
- Multiple-point (or multiple-tap) lines are considered to contribute a single weight value per line and affect the number of connections to other stations. Therefore, a single 230 kV multiple-point line between three Transmission stations or substations would contribute an aggregated weighted value of 700 and connect Transmission Facilities at a single station or substation to two other Transmission stations or substations.
- Multiple lines between two Transmission stations or substations are considered to contribute multiple weight values per line, but these multiple lines between the two stations only connect one station to one other station. Therefore, two 345 kV lines between two Transmission stations or substations would contribute an aggregated weighted value of 2600 and connect Transmission Facilities at a single station or substation to one other Transmission station or substation.

Criterion 2.5's qualification for Transmission Facilities at a Transmission station or substation is based on 2 distinct conditions.

1. The first condition is that Transmission Facilities at a single station or substation where that station or substation connect, at voltage levels of 200 kV or higher to three (3) other stations or substations, to three other stations or substations. This qualification is meant to ensure that connections that operate at voltages of 500 kV or higher are included in the count of connections to other stations or substations as well.
2. The second qualification is that the aggregate value of all lines entering or leaving the station or substation must exceed 3000. This qualification does not include the consideration of lines operating at lower than 200 kV, or 500 kV or higher, the latter already qualifying as medium impact under criterion 2.4. : there is no value to be assigned to lines at voltages of less than 200 kV or 500 kV or higher in the table of values for the contribution to the aggregate value of 3000.

The Transmission Facilities at the station or substation must meet both qualifications to be considered as qualified under criterion 2.5.

- Criterion 2.6 include BES Cyber Systems for those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.
- Criterion 2.7 is sourced from the NUC-001 NERC standard, Requirement R9.2.2, for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIRs are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown." In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.
- Criterion 2.8 designates as medium impact those BES Cyber Systems that impact Transmission Facilities necessary to directly support generation that meet the criteria in Criteria 2.1 (generation Facilities with output greater than 1500 MW) and 2.3 (generation Facilities generally designated as "must run" for wide area reliability in the planning horizon). The Responsible Entity can request a formal statement from the Generation owner as to the qualification of generation Facilities connected to their Transmission systems.
- Criterion 2.9 designates as medium impact those BES Cyber Systems for those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching Systems installed to ensure BES operation within IROLs. The degradation, compromise, or unavailability of these BES Cyber Systems would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.
- Criterion 2.10 designates as medium impact those BES Cyber Systems for Systems or Elements that perform automatic Load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of Criterion 2.10, and chose the term "Each" to represent that the criterion applied to a discrete System or Facility. In the drafting of this criterion, the drafting team sought to include only those Systems that did not require human operator initiation, and targeted in particular those underfrequency load shedding (UFLS) Facilities and systems and undervoltage load shedding (UVLS) systems and Elements that would be subject to a regional Load shedding requirement to prevent Adverse Reliability Impact. These include automated UFLS systems or UVLS systems that are capable of Load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as medium impact. The 300 MW threshold has been defined as the aggregate of the highest MW Load value, as defined by the applicable regional Load Shedding standards, for the preceding 12 months to account for seasonal fluctuations.

  This particular threshold (300 MW) was provided in CIP, Version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES and hence requires a lower threshold. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

  In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market. In general, similar demand response programs that are not part of the NERC or regional reliability Load shedding programs, but are offered as components of an ancillary services market do not qualify under this criterion.

The language used in section 4 for UVLS and UFLS and in criterion 2.10 of Attachment 1 is designed to be consistent with requirements set in the PRC standards for UFLS and UVLS.

- Criterion 2.12 categorizes as medium impact those BES Cyber Systems used by and at Control Centers and associated data centers performing the functional obligations of a Transmission Operator and that have not already been categorized as high impact.
- Criterion 2.13 categorizes as Medium Impact those BA Control Centers that “control” 1500 MW of generation or more in a single Interconnection. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.

Low Impact Rating (L)

BES Cyber Systems not categorized in high impact or medium impact default to low impact. Note that low impact BES Cyber Systems do not require discrete identification.

Restoration Facilities

- Several discussions on the CIP Version 5 standards suggest entities owning Blackstart Resources and Cranking Paths might elect to remove those services to avoid higher compliance costs. For example, one Reliability Coordinator reported a 25% reduction of Blackstart Resources as a result of the Version 1 language, and there could be more entities that make this choice under Version 5.

  In response, the CIP Version 5 drafting team sought informal input from NERC’s Operating and Planning Committees. The committees indicate there has already been a reduction in Blackstart Resources because of increased CIP compliance costs, environmental rules, and other risks; continued inclusion within Version 5 at a category that would very significantly increase compliance costs can result in further reduction of a vulnerable pool.

  The drafting team moved from the categorization of restoration assets such as Blackstart Resources and Cranking Paths as medium impact (as was the case in earlier drafts) to categorization of these assets as low impact as a result of these considerations. This will not relieve asset owners of all responsibilities, as would have been the case in CIP-002, Versions 1-4 (since only Cyber Assets with routable connectivity which are essential to restoration assets are included in those versions). Under the low impact categorization, those assets will be protected in the areas of cyber security awareness, physical access control, and electronic access control, and they will have obligations regarding incident response. This represents a net gain to bulk power system reliability, however, since many of those assets do not meet criteria for inclusion under Versions 1-4.

  Weighing the risks to overall BES reliability, the drafting team determined that this re-categorization represents the option that would be the least detrimental to restoration function and, thus, overall BES reliability. Removing Blackstart Resources and Cranking Paths from medium impact promotes overall reliability, as the likely alternative is fewer Blackstart Resources supporting timely restoration when needed.

  BES Cyber Systems for generation resources that have been designated as Blackstart Resources in the Transmission Operator’s restoration plan default to low impact. NERC Standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan, as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator’s restoration plan. The glossary term Blackstart Capability Plan has been retired.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC Standard EOP-005-2 to “provide the entities identified in

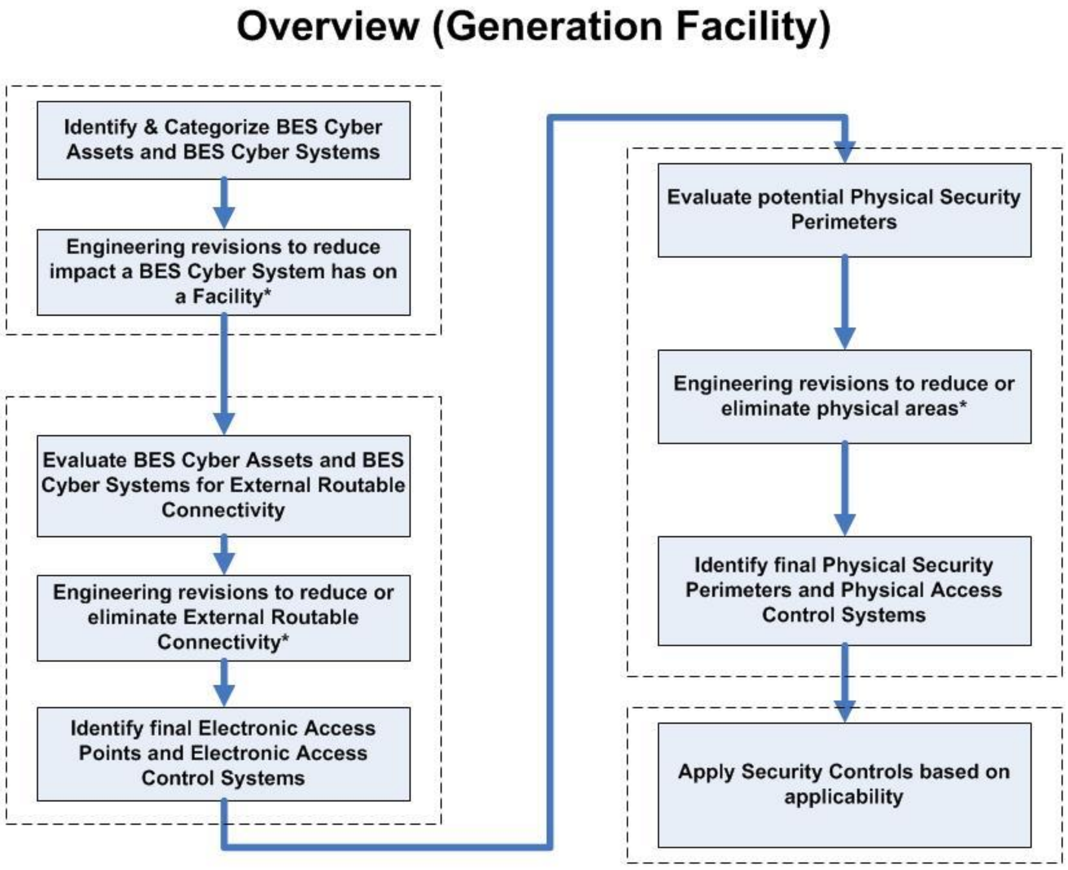
its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan.”

- BES Cyber Systems for Facilities and Elements comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first Interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator’s restoration plan, default to the category of low impact: however, these systems are explicitly called out to ensure consideration for inclusion in the scope of the version 5 CIP standards. This requirement for inclusion in the scope is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started.

  Distribution Providers may note that they may have BES Cyber Systems that must be scoped in if they have Elements listed in the Transmission Operator’s Restoration Plan that are components of the Cranking Path.

Use Case: CIP Process Flow

The following CIP use case process flow for a generator Operator/Owner was provided by a participant in the development of the Version 5 standards and is provided here as an example of a process used to identify and categorize BES Cyber Systems and BES Cyber Assets; review, develop, and implement strategies to mitigate overall risks; and apply applicable security controls.



* - Engineering revisions will need to be reviewed for cost justification, operational\safety requirements, support requirements, and technical limitations.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

BES Cyber Systems at each site location have varying impact on the reliable operation of the BES. Attachment 1 provides a set of "bright-line" criteria that the Responsible Entity must use to identify these BES Cyber Systems in accordance with the impact on the BES. BES Cyber Systems must be identified and categorized according to their impact so that the appropriate measures can be applied, commensurate with their impact. These impact categories will be the basis for the application of appropriate requirements in CIP-003-CIP-011.

Rationale for R2:

The lists required by Requirement R1 are reviewed on a periodic basis to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. The miscategorization or non-categorization of a BES Cyber System can lead to the application of inadequate or non-existent cyber security controls that can lead to compromise or misuse that can affect the real-time operation of the BES. The CIP Senior Manager's approval ensures proper oversight of the process by the appropriate Responsible Entity personnel.

Appendix 1

Requirement Number and Text of Requirement

<u>CIP-002-5.1, Requirement R1</u>

R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3:

- i. Control Centers and backup Control Centers;
- ii. Transmission stations and substations;
- iii. Generation resources;
- iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;
- v. Special Protection Systems that support the reliable operation of the Bulk Electric System; and
- vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

1.1. Identify each of the high impact BES Cyber Systems according to Attachment 1, Section 1, if any, at each asset;

1.2. Identify each of the medium impact BES Cyber Systems according to Attachment 1, Section 2, if any, at each asset; and

1.3. Identify each asset that contains a low impact BES Cyber System according to Attachment 1, Section 3, if any (a discrete list of low impact BES Cyber Systems is not required).

<u>Attachment 1, Criterion 2.1</u>

2. Medium Impact Rating (M)

Each BES Cyber System, not included in Section 1 above, associated with any of the following:

2.1 Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BES Cyber Systems that meet this criterion are those shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

Questions

Energy Sector Security Consortium, Inc. (EnergySec) submitted a Request for Interpretation (RFI) seeking clarification of Criterion 2.1 of Attachment 1 in Reliability Standard CIP-002-5.1 regarding the use of the phrase “shared BES Cyber Systems.”

The Interpretation Drafting Team identified the following questions in the RFI:

1. Whether the phrase “shared BES Cyber Systems” means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?
2. Whether the phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?
3. If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?

Responses

Question 1: Whether the phrase “shared BES Cyber Systems,” means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?

The evaluation as to whether a BES Cyber System is shared should be performed individually for each discrete BES Cyber System. In the standard language of CIP-002-5.1, there is no reference to or obligation to group BES Cyber Systems. Requirement R1, part 1.2 states “Identify *each* of the medium impact BES Cyber Systems according to Attachment 1, Section 2…” Further, the preamble of Section 2 of CIP-002-5.1 Attachment 1 states “*Each BES Cyber System*…associated with any of the following [criteria].” (emphasis added)

Additionally, the Background section of CIP-002-5.1 states that “[i]t is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System.” The Background section also provides:

> The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.

Question 2: Whether the phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?

The phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple generation units.

The use of the term “shared” is also clarified in the NERC Frequently Asked Questions (FAQ) document issued by NERC Compliance to support implementation of the CIP Reliability Standards. FAQ #49 provides:

> Shared BES Cyber Systems are those that are associated with any combination of units in a single Interconnection, as referenced in CIP-002-5.1, Attachment 1, impact rating criteria 2.1 and 2.2. For criterion 2.1 “BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.” For criterion 2.2: “BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR. Also refer to the Lesson Learned for CIP-002-5.1 Requirement R1: **Impact Rating of Generation Resource Shared BES Cyber Systems** for further information and examples.

Question 3: If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?

The phrase applies to each discrete BES Cyber System.

Technical Rationale for Reliability Standard CIP-003-10

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-003-10. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-003-10 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document stated, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale." document for reference when reading the technical rationale that follows.

Requirement R1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-10 to shorten applicability statements within the body of CIP standards with "BCS" as the defined acronym for "BES Cyber System".

Requirement R2

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-10 to align security management control requirements with the virtualization changes.

To ensure SCI supporting low impact BCS is afforded equal security controls as the BCS, the SDT added "SCI that supports a low impact BCS". Where shared infrastructure is serving only low impact BCS it would not meet the 2nd component of the first bullet in the SCI definition and therefore would not qualify as SCI; However, in this scenario the shared infrastructure becomes a component of the low impact BCS and would remain subject to the Requirements within R2.

Attachment 1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-10 to shorten applicability statements within the body of CIP standards with "BCS" as the defined acronym for "BES Cyber System".

To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs), the SDT adjusted the language to refer to communications that are between a low impact BCS and a system(s) outside the asset containing low impact BCS, instead of discrete Cyber Assets outside the assets containing low impact BCS. The use of the term system(s) no longer restricts this section to physical Cyber Assets, thereby permitting VCAs as part of the BCS grouping under the modified definition.

Attachment 1 Section 2

Rationale

To ensure virtual infrastructure providing electronic access controls for the low impact BCS is afforded equal physical security controls as the physical Cyber Assets that provide electronic access controls for the low impact BCS, the SDT modified this section to include the Virtual Cyber Asset (VCA) where only Cyber Assets had previously been listed.

Attachment 1 Section 3 Part 3.1

Rationale

Part 3.1(i)

To ensure an asset containing a low impact BCS or an SCI supporting a low impact BCS is afforded equal electronic access controls as the low impact BCS, the SDT added "SCI that supports a low impact BCS and a Cyber System(s) outside the asset containing the low impact BES Cyber System (BCS); or the SCI that supports a low impact BCS"".

To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs), the SDT adjusted the language to refer to communications that are between a low impact BCS and a Cyber System(s) outside the asset containing low impact BCS, instead of discrete Cyber Assets outside the assets containing low impact BCS. The use of the term Cyber System(s) no longer restricts this section to physical Cyber Assets, thereby permitting VCAs as part of the BCS grouping under the modified definition.

Part 3.1(ii) To ensure only necessary inbound and outbound electronic access is permitted for SCI that supports a low impact BCS just as is required for access control to the low impact BCS, the SDT adjusted the language to include communications that are between SCI that supports any part of a low impact BCS and a system(s) outside the asset(s) containing the SCI that supports any part of a low impact BCS.

Part 3.1 (iii) The SDT replaced the undefined 'intelligent electronic devices' with the defined term 'Protection Systems'.

Attachment 1 Section 3 Part 3.2

Rationale

To ensure SCI supporting low impact BCS are afforded equal electronic access controls for Dial-up Connectivity, the SDT added "or SCI that supports a low impact BCS". To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs), the ‘per Cyber Asset capability’ was changed to ‘per system capability’.

Attachment 1 Section 5 Part 5.2

Rationale

The final bullet of Attachment 1 Section 5 Part 5.2.1 was preceded with the language “Review of” to make the requirement for other methods parallel to the five options listed above it.

Attachment 1 Section 5 Part 5.3

Rationale

To enable for virtualization technologies and capabilities the SDT added, “or VCA” in Attachment 1 Section 5 Parts 5.3.1.

To ensure SCI supporting a low impact BCS are afforded equal protections from malicious code when using Removable Media, the SDT added “SCI that supports a low impact BCS” to the low impact BCS in Attachment 1 Section 5 Parts 5.3.1 & 5.3.2.

Attachment 2

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-10 to shorten applicability statements within the body of CIP standards with “BCS” as the defined acronym for “BES Cyber System”. Additional changes were to align the Attachment 2 Measures with the modifications to the Attachment 1 requirement language.

Technical Rationale for Reliability Standard CIP-003-9

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-003-9 standard to preserve any historical references. No modifications have been made.

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-003-9. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-003-9 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2020-03 – Supply Chain Low Impact Revisions Standards Drafting Team (SDT) intent in drafting changes to the requirement.

Background

In its final report[1] accepted by the NERC Board in May 2019, NERC documented the results of the evaluation of supply chain risks associated with certain categories of assets not currently subject to the Supply Chain Standards and recommended actions to address those risks. NERC staff recommended further study to determine whether new information supports modifying the standards to include low impact Bulk Electric System (BES) Cyber Systems with external connectivity by issuing a request for data or information pursuant to Section 1600 of the NERC Rules of Procedure.

The Board approved the formal issuance of this data request on August 15, 2019. NERC collected the data from August 19 through October 3, 2019. A final report, *Supply Chain Risk Assessment*, was published in December 2019. The report recommended the modification of the Supply Chain Standards to include low impact BES Cyber Systems with remote electronic access connectivity. Further, industry feedback was received regarding this recommendation at the February 2020 NERC Board meeting through Member Representatives Committee (MRC) Policy Input.

After considering policy input, the NERC Board adopted a resolution[2] to initiate a project to modify Reliability Standard CIP-003-8 to include policies for low impact BES Cyber Systems to: (1) detect known or suspected malicious communications for both inbound and outbound communications; (2) determine when active vendor remote access sessions are initiated; and (3) disable active vendor remote access when necessary.

Foreword Regarding Section 3 and Section 6

When developing the standards language for this SAR, the SDT considered many variables and inputs to draft clear, concise, and meaningful requirements. The SDT considered the scope and variety of entity sizes, functions, organizations, systems and configurations, entity business processes, remote access, local electronic access, remote access architectures and technologies, and data path and communications protocols. The SDT discussed systems used for electronic access, remote vs local electronic access, vendor access accounts and privileges, and optimal time frames for establishing, identifying, determining, and disabling or terminating vendor electronic access.

---

[1] Supply Chain Risk Assessment Report (nerc.com)

[2] FINAL_Minutes_BOT_Open_Meeting_February_2020.pdf (nerc.com)

The SDT reviewed industry comments and draft language suggestions, existing standards, and discussed and deliberated the options and their potential impacts and interpretative values to industry. The SDT recognized that some entities may use the same process, system and/or technology (for vendor electronic access) that is used by entity personnel, or cases where entities use separate processes, systems, or technologies to manage vendor electronic access. The SDT also discussed systems and Cyber Assets owned by vendors but authorized for use on entity networks, vs systems and Cyber Assets owned by entities but used by vendors for electronic remote access. Because of the variety, the SDT focused on allowing entities to identify their particular risks related to remote vendor electronic access and define processes and plans to define and implement security controls to address those risks.

In reviewing the industry comments, the SDT identified, discussed and considered additional terms for clarification, and came to the following conclusions:

1. Electronic remote access: considered remote access as definition and/or remote access vs electronic remote access - as well as onsite vs off-premises remote access. The use of electronic remote access clarifies the remote access using a method (non-physical) which matches existing electronic remote access in other CIP standards.
2. Interactive Remote Access: avoided the existing NERC Glossary of Terms definition in order to prevent applying high and medium impact requirements upon low impact assets and systems.
3. Active: avoided using this term due to potential unintended consequences. The use of “active” may add further requirements upon entities to define, track and document when “active” occurs vs when it does not.
4. Read-only: avoided using this term due to potential unintended consequences. The use of “read-only” may add further requirements upon entities to define and document systems and processes which are read-only from read-write, and where and when read-only access occurs.
5. Vendor: CIP-013 Supplemental Material[3] addresses the term vendor in context with applicable high and medium BES Cyber Systems. The SDT avoided defining the term vendor specifically within the low impact standards to avoid conflicts for entities with high, medium, and low impact systems.

The language developed gives entities the flexibility to define processes to identify and manage vendor electronic remote access for their specific policies, processes, systems, configurations, organizations, operations, and BES Facilities. The language allows entities to define how and where vendor electronic remote access occurs and the ideal methods and timeframes to authorize, establish, and disable vendor electronic remote access.

The SDT agreed to retain Section 3 of CIP-003-9 Requirement R2, Attachment 1 and established Section 6 to specifically address low impact vendor electronic remote access, as well as malicious inbound and outbound data communications which may be sourced from or transmitted to vendors. Based on the SAR, the SDT did not include dial-up from Section 3.2.

The language requires an entity to develop and implement a process or processes for identifying vendor electronic remote access, having a method or methods for disabling vendor electronic remote access, as well as methods to detect known or suspicious vendor inbound and outbound malicious communications.

Entities may choose to define systems, applications and/or configurations used by vendors, accounts and privileges, network data communication paths or physical processes for establishing and disabling vendor electronic remote communications. Section 6 provides the flexibility to meet many types of vendor electronic remote access configurations while managing vendor electronic remote access risks.

---

[3] CIP-013 Technical Rationale

Rationale Section 6 of Attachment 1 (Requirement R2)

Requirement R2 mandates that entities develop and implement one or more cyber security plan(s) to meet specific security objectives for assets containing low impact BES Cyber System(s). In February 2020, the NERC Board approved the initiation of a project to modify Reliability Standard CIP-003-8 to include policies for low impact BES Cyber Systems to: (1) detect known or suspected malicious communications for both inbound and outbound communications; (2) determine vendor electronic remote access is initiated; and (3) disable vendor electronic remote access when necessary.

As published in the December 2019 NERC Report: Supply Chain Risk Assessment – Analysis of Data Collected under the NERC Rules of Procedure Section 1600 Data Request, of the 87% of section 1600 data request respondents with low impact BES Cyber Systems approximately 66% have external connectivity which often results in the allowance of vendor electronic remote access. As our grid has grown more complex, the use of external parties to support and maintain low impact BES Cyber Systems, equipment and facilities is expected. However, the prevalence of external connectivity across low-impact BES systems could pose a significant impact to the reliability of the grid through the potential of a common supply chain vulnerability. To address this vulnerability, the originating FERC Order[4], and the resulting NERC Board resolution[5], the proposed Attachment 1 Section 6, as it relates to the existing Requirement R2, mandates that applicable entities develop, document, and implement a process to mitigate the risks associated with malicious communications and vendor electronic remote access.

Attachment 1 Section 6 Part 6.1 – Determining vendor electronic remote access

The objective of Attachment 1 Section 6.1 is for entities to determine vendor electronic remote access to their low impact BES Asset(s) and/or BES Cyber Systems. Such visibility increases an entity's ability to detect, respond, and resolve issues that may originate with, or be tied to, a particular vendor's electronic remote access. The obligation in Section 6.1 requires that entities have one or more methods for determining vendor electronic remote access.

Attachment 1 Section 6 Part 6.2 – Disabling vendor electronic remote access

The objective of Attachment 1 Section 6.2 is for entities to have the ability to disable vendor electronic remote access for any basis the entity may choose and to prevent security events and propagation of potential malicious communications which may degrade or have adverse effects upon the entity's assets containing low impact BES Cyber Systems. The obligation in Section 6.2 requires that entities have a method to disable vendor electronic remote access, which in turn supports the security objective to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

Attachment 1 Section 6 Part 6.3 – Detecting known or suspected malicious communications for both inbound and outbound communications

The objective of Attachment 1 Section 6.3 is for entities to have the ability to detect known or suspected malicious communications from vendors, such that the entity may respond to and remediate any resulting adverse impacts.

This sub section is scoped to focus only on vendors' communications per the NERC Board resolution and the supply chain report. The obligation in Section 6.3 requires that entities must establish a method(s) to detect known or suspected malicious communications from vendors and the systems used by vendors to communicate with assets containing low impact BES Cyber Systems.

---

[4] Order No. 829, Revised Critical Infrastructure Protection Reliability Standards, 156 FERC ¶ 61,050 (2016).

[5] Resolution-Supply Chain Recommendations - Board Approved - February 6, 2020 (LINK)

Current obligations in CIP-003-8 Requirement R2 that govern direct electronic communications with low impact BES Cyber Systems are not as robust as those in CIP-005-6 that govern high impact medium impact BES Cyber Systems. Security controls such as use of Intermediate Systems and multi-factor authentication provide additional security protection from malicious communication and overall access controls for high and medium impact BES Cyber Systems. In addition to Intermediate Systems and multi-factor authentication, high and medium impact BES Cyber Systems at Control Centers have requirements to detect malicious communications at the Electronic Access Points of those systems. These security measures are not required at low impact BES Cyber Systems.

In keeping with the NERC stated risk-based model, there may be a scenario where a vendor directly communicates with a low impact BES Cyber System. In the event that this connection may be compromised, the inclusion of security requirements to detect malicious communications under CIP-003-9 Attachment 1 Section 6 would provide entities visibility and opportunity in detecting and mitigating risks posed by vendor communications.

Former Background from Reliability Standard CIP-003-8

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background
Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term policy refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of policies also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term documented processes refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms program and plan are sometimes used in place of documented processes where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as plans (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term program may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms program and plan do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high, medium, and low impact BES Cyber Systems. For example, a single cyber security awareness program could meet the requirements across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within Regional Reliability Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

Technical Rationale for Reliability Standard CIP-003-8

This section contains a “cut and paste” of the former Guidelines and Technical Basis (GTB) as-is of from CIP-003-8 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

In developing policies in compliance with Requirement R1, the number of policies and their content should be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering the required topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-8, Requirement R1.

If a Responsible Entity has any high or medium impact BES Cyber Systems, the one or more cyber security policies must cover the nine subject matter areas required by CIP-003-8, Requirement R1, Part 1.1. If a Responsible Entity has identified from CIP-002 any assets containing low impact BES Cyber Systems, the one or more cyber security policies must cover the six subject matter areas required by Requirement R1, Part 1.2.

Responsible Entities that have multiple-impact rated BES Cyber Systems are not required to create separate cyber security policies for high, medium, or low impact BES Cyber Systems. The Responsible Entities have the flexibility to develop policies that cover all three impact ratings.

Implementation of the cyber security policy is not specifically included in CIP-003-8, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-003 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements in NERC cyber security Reliability Standards, but to develop a holistic cyber security policy appropriate for its organization. Elements of a policy that extend beyond the scope of NERC's cyber security Reliability Standards will not be considered candidates for potential violations although they will help demonstrate the organization's internal culture of compliance and posture towards cyber security.

For Part 1.1, the Responsible Entity may consider the following for each of the required topics in its one or more cyber security policies for medium and high impact BES Cyber Systems, if any:

1.1.1 Personnel and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

For Part 1.2, the Responsible Entity may consider the following for each of the required topics in its one or more cyber security policies for assets containing low impact BES Cyber Systems, if any:

1.2.1 Cyber security awareness

- Method(s) for delivery of security awareness
- Identification of groups to receive cyber security awareness

1.2.2 Physical security controls

- Acceptable approach(es) for selection of physical security control(s)

1.2.3 Electronic access controls

- Acceptable approach(es) for selection of electronic access control(s)

1.2.4 Cyber Security Incident response

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.2.5 Transient Cyber Assets and Removable Media Malicious Code Risk Mitigation

- Acceptable use of Transient Cyber Asset(s) and Removable Media

- Method(s) to mitigate the risk of the introduction of malicious code to low impact BES Cyber Systems from Transient Cyber Assets and Removable Media
- Method(s) to request Transient Cyber Asset and Removable Media

1.2.6 Declaring and responding to CIP Exceptional Circumstances

- Process(es) to declare a CIP Exceptional Circumstance
- Process(es) to respond to a declared CIP Exceptional Circumstance

Requirements relating to exceptions to a Responsible Entity's security policies were removed because it is a general management issue that is not within the scope of a reliability requirement. It is an internal policy requirement and not a reliability requirement. However, Responsible Entities are encouraged to continue this practice as a component of their cyber security policies.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

The intent of Requirement R2 is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that address the security objective for the protection of low impact BES Cyber Systems. The required protections are designed to be part of a program that covers the low impact BES Cyber Systems collectively at an asset level (based on the list of assets containing low impact BES Cyber Systems identified in CIP-002), but not at an individual device or system level.

Requirement R2, Attachment 1

As noted, Attachment 1 contains the sections that must be included in the cyber security plan(s). The intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose, if desired, to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems rather than maintain two separate programs. The purpose of the cyber security plan(s) in Requirement R2 is for Responsible Entities to use the cyber security plan(s) as a means of documenting their approaches to meeting the subject matter areas. The cyber security plan(s) can be used to reference other policies and procedures that demonstrate "how" the Responsible Entity is meeting each of the subject matter areas, or Responsible Entities can develop comprehensive cyber security plan(s) that contain all of the detailed implementation content solely within the cyber security plan itself. To meet the obligation for the cyber security plan, the expectation is that the cyber security plan contains or references sufficient details to address the implementation of each of the required subject matters areas.

Guidance for each of the subject matter areas of Attachment 1 is provided below.

Requirement R2, Attachment 1, Section 1 – Cyber Security Awareness

The intent of the cyber security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. The entity has the discretion to determine the topics to be addressed and the manner in which it will communicate these topics. As evidence of compliance, the Responsible Entity should be able to produce the awareness material that was delivered according to the delivery method(s) (e.g., posters, emails, or topics at staff meetings, etc.). The standard drafting team does not intend for Responsible Entities to be required to maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be included in the program. Appropriate physical security topics (e.g., tailgating awareness and protection of badges for physical security, or "If you see something, say something" campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2, Attachment 1, Section 2 – Physical Security Controls

The Responsible Entity must document and implement methods to control physical access to (1) the asset or the locations of low impact BES Cyber Systems within the asset, and (2) Cyber Assets that implement the electronic access control(s) specified by the Responsible Entity in Attachment 1, Section 3.1, if any. If these Cyber Assets implementing the electronic access controls are located within the same asset as the low impact BES Cyber Asset(s) and inherit the same physical access controls and the same need as outlined in Section 2, this may be noted by the Responsible Entity in either its policies or cyber security plan(s) to avoid duplicate documentation of the same controls.

The Responsible Entity has the flexibility to select the methods used to meet the objective of controlling physical access to (1) the asset(s) containing low impact BES Cyber System(s) or the low impact BES Cyber Systems themselves and (2) the electronic access control Cyber Assets specified by the Responsible Entity, if any. The Responsible Entity may use one or a combination of physical access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may use perimeter controls (e.g., fences with locked gates, guards, or site access policies, etc.) or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses.

The security objective is to control the physical access based on need as determined by the Responsible Entity. The need for physical access can be documented at the policy level. The standard drafting team did not intend to obligate an entity to specify a need for each physical access or authorization of an individual for physical access.

Monitoring as a physical security control can be used as a complement or an alternative to physical access control. Examples of monitoring controls include, but are not limited to: (1) alarm systems to detect motion or entry into a controlled area, or (2) human observation of a controlled area. Monitoring does not necessarily require logging and maintaining logs but could include monitoring that physical access has occurred or been attempted (e.g., door alarm, or human observation, etc.). The standard drafting team's intent is that the monitoring does not need to be per low impact BES Cyber System but should be at the appropriate level to meet the security objective of controlling physical access.

User authorization programs and lists of authorized users for physical access are not required although they are an option to meet the security objective.

Requirement R2, Attachment 1, Section 3 – Electronic Access Controls

Section 3 requires the establishment of electronic access controls for assets containing low impact BES Cyber Systems when there is routable protocol communication or Dial-up Connectivity between Cyber Asset(s) outside of the asset containing the low impact BES Cyber System(s) and the low impact BES Cyber System(s) within such asset. The establishment of electronic access controls is intended to reduce the risks associated with uncontrolled communication using routable protocols or Dial-up Connectivity.

When implementing Attachment 1, Section 3.1, Responsible Entities should note that electronic access controls to permit only necessary inbound and outbound electronic access are required for communications when those communications meet all three of the criteria identified in Attachment 1, Section 3.1. The Responsible Entity should evaluate the communications and when all three criteria are met, the Responsible Entity must document and implement electronic access control(s).

When identifying electronic access controls, Responsible Entities are provided flexibility in the selection of the electronic access controls that meet their operational needs while meeting the security objective of allowing only necessary inbound and outbound electronic access to low impact BES Cyber Systems that use routable protocols between a low impact BES Cyber System(s) and Cyber Asset(s) outside the asset.

In essence, the intent is for Responsible Entities to determine whether there is communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset or Dial-up Connectivity to the low impact BES Cyber System(s). Where such communication is present, Responsible Entities should document and implement electronic access control(s). Where routable protocol communication for time-sensitive protection or control functions between intelligent electronic devices that meets the exclusion language is present, Responsible Entities should document that communication, but are not required to establish any specific electronic access controls.

The inputs to this requirement are the assets identified in CIP-002 as containing low impact BES Cyber System(s); therefore, the determination of routable protocol communications or Dial-up Connectivity is an attribute of the asset. However, it is not intended for communication that provides no access to or from the low impact BES Cyber System(s), but happens to be located at the asset with the low impact BES Cyber System(s), to be evaluated for electronic access controls.

Electronic Access Control Exclusion

In order to avoid future technology issues, the obligations for electronic access controls exclude communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions, such as IEC TR-61850-90-5 R-GOOSE messaging. Time-sensitive in this context generally means functions that would be negatively impacted by the latency introduced in the communications by the required electronic access controls. This time-sensitivity exclusion does not apply to SCADA communications which typically operate on scan rates of 2 seconds or greater. While technically time-sensitive, SCADA communications over routable protocols can withstand the delay introduced by electronic access controls. Examples of excluded time-sensitive communications are those communications which may necessitate the tripping of a breaker within a few cycles. A Responsible Entity using this technology is not expected to implement the electronic access controls noted herein. This exception was included so as not to inhibit the functionality of the time-sensitive characteristics related to this technology and not to preclude the use of such time-sensitive reliability enhancing functions if they use a routable protocol in the future.

Considerations for Determining Routable Protocol Communications

To determine whether electronic access controls need to be implemented, the Responsible Entity has to determine whether there is communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset.

When determining whether a routable protocol is entering or leaving the asset containing the low impact BES Cyber System(s), Responsible Entities have flexibility in identifying an approach. One approach is for Responsible Entities to identify an “electronic boundary” associated with the asset containing low impact BES Cyber System(s). This is not an Electronic Security Perimeter *per se*, but a demarcation that demonstrates the routable protocol communication entering or leaving the asset between a low impact BES Cyber System and Cyber Asset(s) outside the asset to then have electronic access controls implemented. This electronic boundary may vary by asset type (Control Center, substation, generation resource) and the specific configuration of the asset. If this approach is used, the intent is for the Responsible Entity to define the electronic boundary such that the low impact BES Cyber System(s) located at the asset are contained within the “electronic boundary.” This is strictly for determining which routable protocol communications and networks are internal or inside or local to the asset and which are external to or outside the asset.

Alternatively, the Responsible Entity may find the concepts of what is inside and outside to be intuitively obvious for a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s) communicating to a low impact BES Cyber System(s) inside the asset. This may be the case when a low impact BES Cyber System(s) is communicating with a Cyber Asset many miles away and a clear and unambiguous demarcation exists. In this case, a Responsible Entity may decide not to identify an “electronic boundary,” but rather to simply leverage the unambiguous asset demarcation to ensure that the electronic access controls are placed between the low impact BES Cyber System(s) and the Cyber Asset(s) outside the asset.

Determining Electronic Access Controls

Once a Responsible Entity has determined that there is routable communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s), the intent is for the Responsible Entity to document and implement its chosen electronic access control(s). The control(s) are intended to allow only “necessary” inbound and outbound electronic access as determined by the Responsible Entity. However the Responsible Entity chooses to document the inbound and outbound access permissions and the need, the intent is that the Responsible Entity is able to explain the reasons for the electronic access permitted. The reasoning for “necessary” inbound and outbound electronic access controls may be documented within the Responsible Entity’s cyber security plan(s), within a comment on an access control list, a database, spreadsheet or other policies or procedures associated with the electronic access controls.

Concept Diagrams

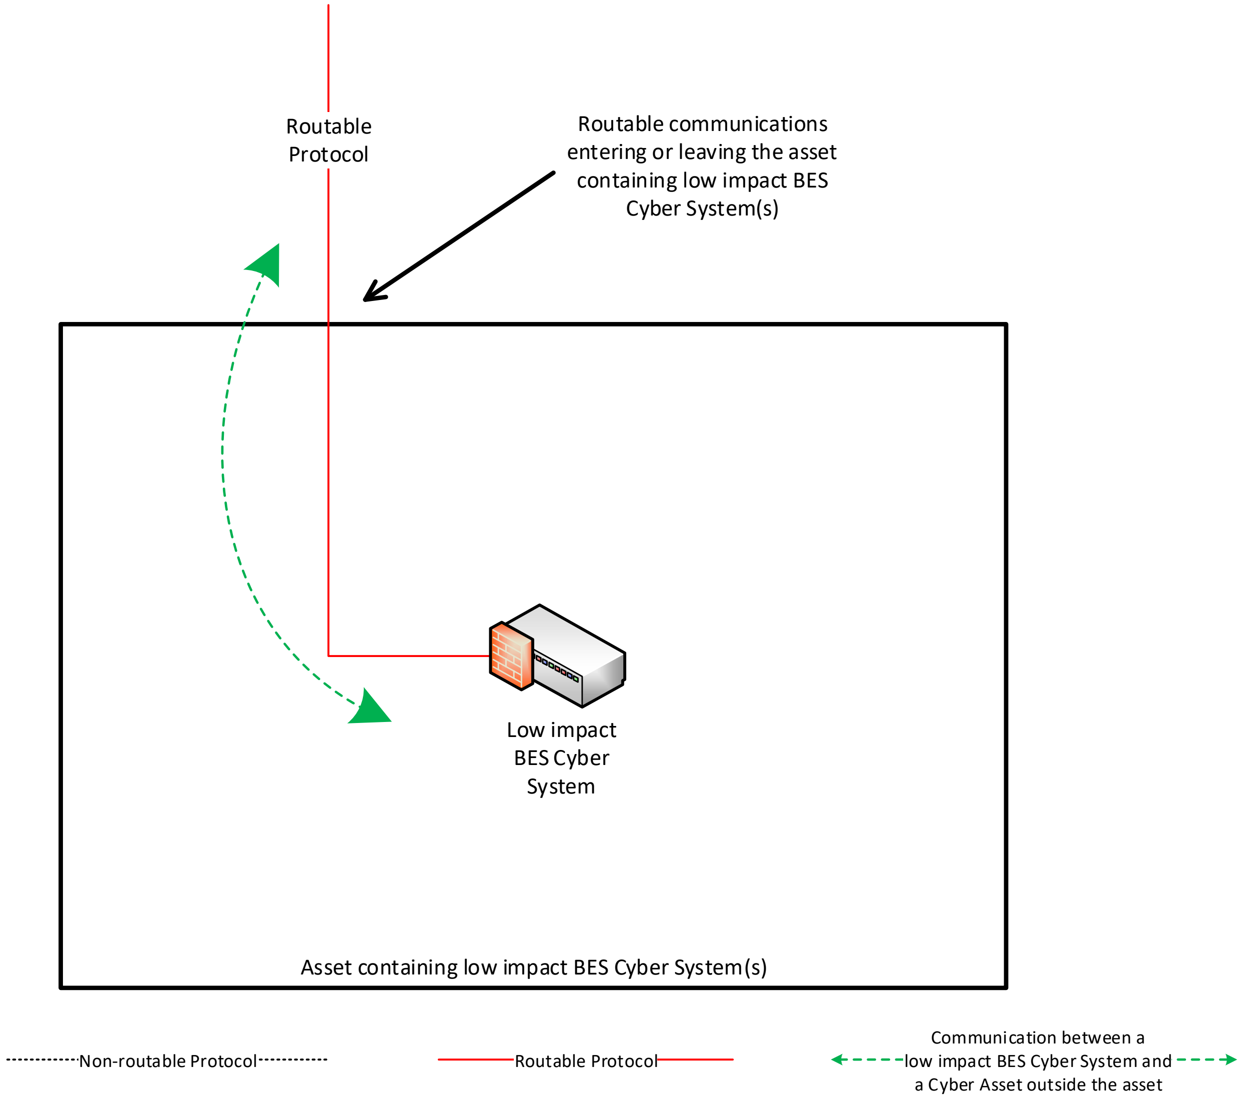
The diagrams on the following pages are provided as examples to illustrate various electronic access controls at a conceptual level. Regardless of the concepts or configurations chosen by the Responsible Entity, the intent is to achieve the security objective of permitting only necessary inbound and outbound electronic access for communication between low impact BES Cyber Systems and Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) using a routable protocol when entering or leaving the asset.

NOTE:

- This is not an exhaustive list of applicable concepts.
- The same legend is used in each diagram; however, the diagram may not contain all of the articles represented in the legend.

Reference Model 1 – Host-based Inbound & Outbound Access Permissions

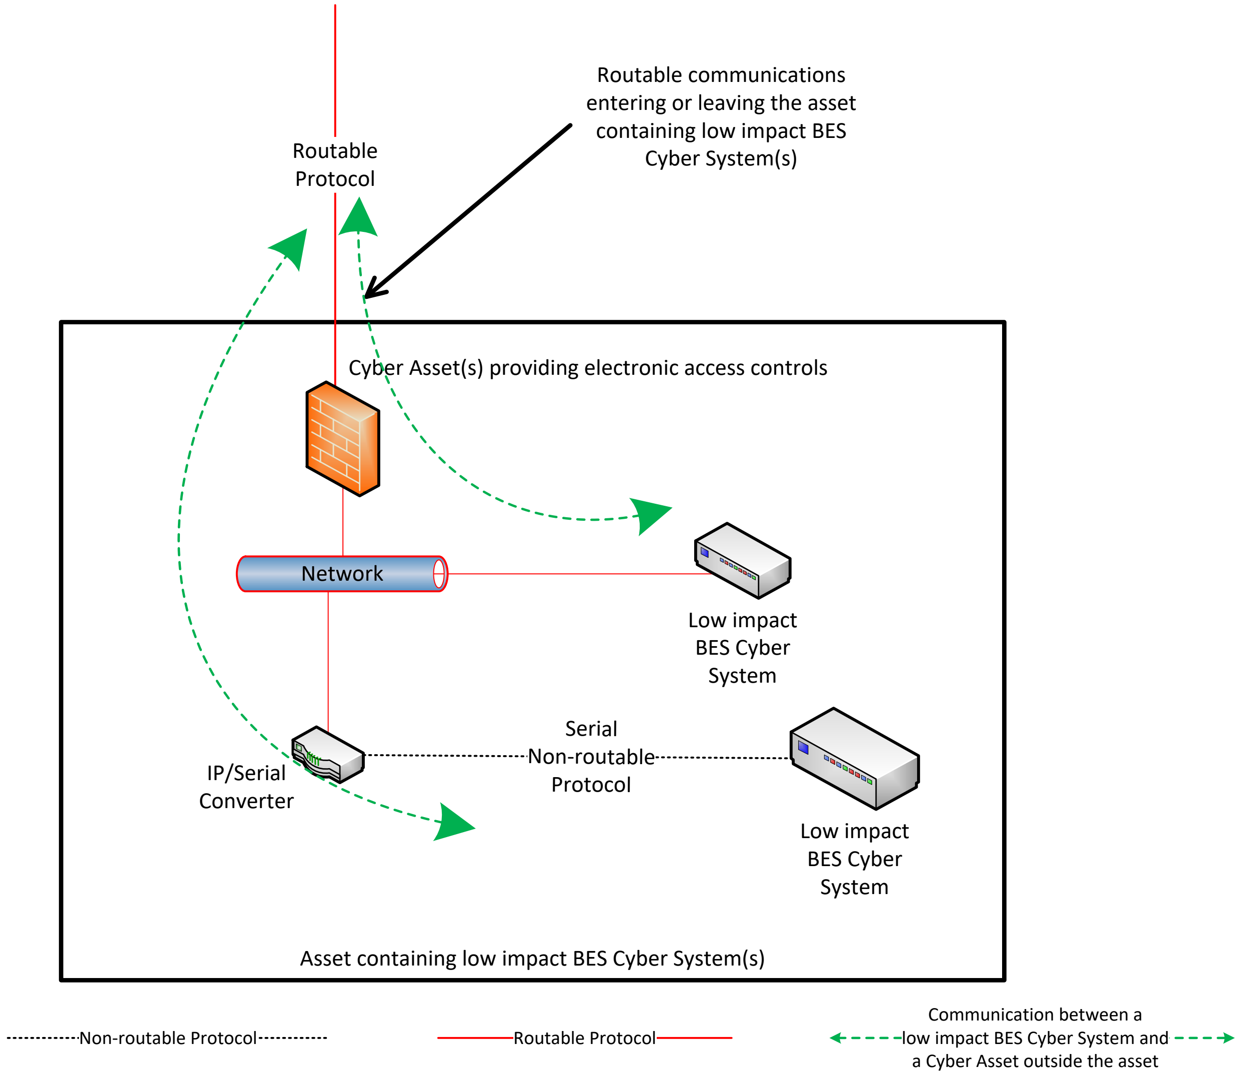
The Responsible Entity may choose to utilize a host-based firewall technology on the low impact BES Cyber System(s) itself that manages the inbound and outbound electronic access permissions so that only necessary inbound and outbound electronic access is allowed between the low impact BES Cyber System(s) and the Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s). When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 1

Reference Model 2 – Network-based Inbound & Outbound Access Permissions

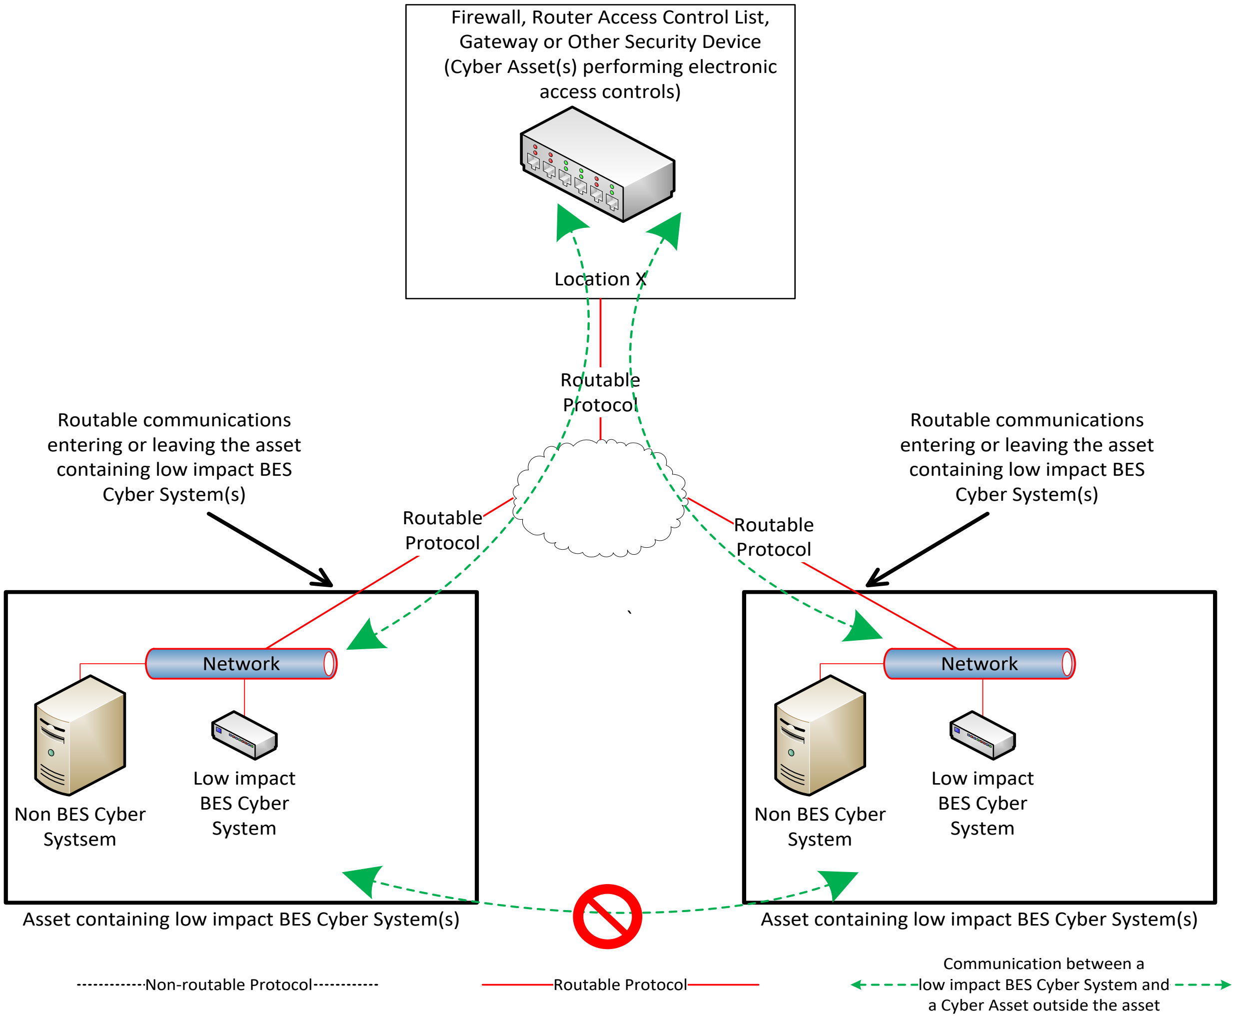
The Responsible Entity may choose to use a security device that permits only necessary inbound and outbound electronic access to the low impact BES Cyber System(s) within the asset containing the low impact BES Cyber System(s). In this example, two low impact BES Cyber Systems are accessed using the routable protocol that is entering or leaving the asset containing the low impact BES Cyber System(s). The IP/Serial converter is continuing the same communications session from the Cyber Asset(s) that are outside the asset to the low impact BES Cyber System(s). The security device provides the electronic access controls to permit only necessary inbound and outbound routable protocol access to the low impact BES Cyber System(s). When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 2

Reference Model 3 – Centralized Network-based Inbound & Outbound Access Permissions

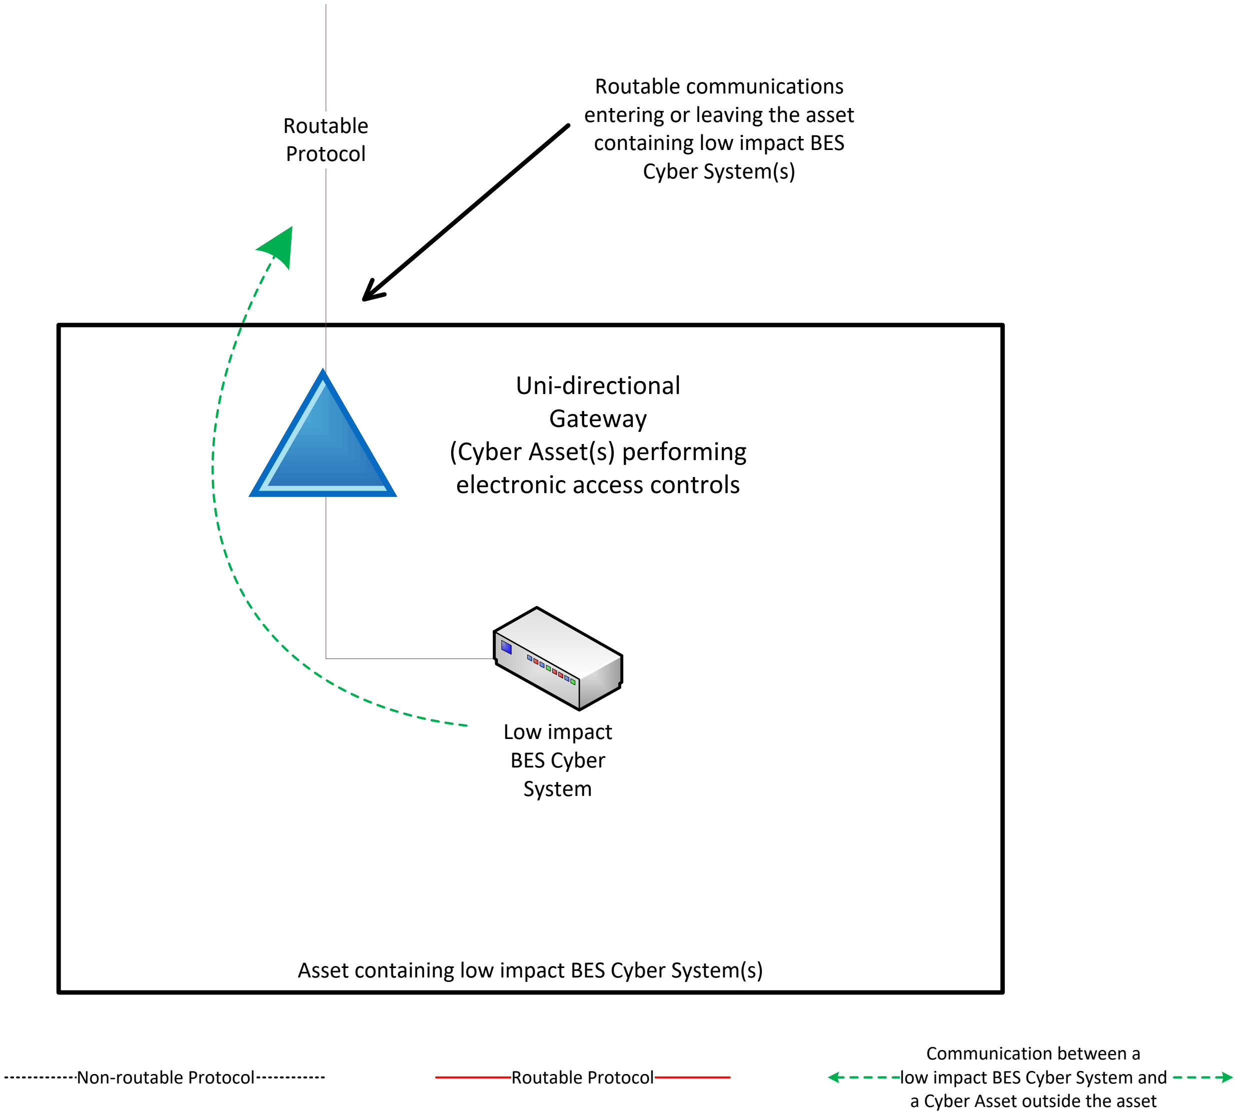
The Responsible Entity may choose to utilize a security device at a centralized location that may or may not be at another asset containing low impact BES Cyber System(s). The electronic access control(s) do not necessarily have to reside inside the asset containing the low impact BES Cyber System(s). A security device is in place at "Location X" to act as the electronic access control and permit only necessary inbound and outbound routable protocol access between the low impact BES Cyber System(s) and the Cyber Asset(s) outside each asset containing low impact BES Cyber System(s). Care should be taken that electronic access to or between each asset is through the Cyber Asset(s) determined by the Responsible Entity to be performing electronic access controls at the centralized location. When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 3

Reference Model 4 – Uni-directional Gateway

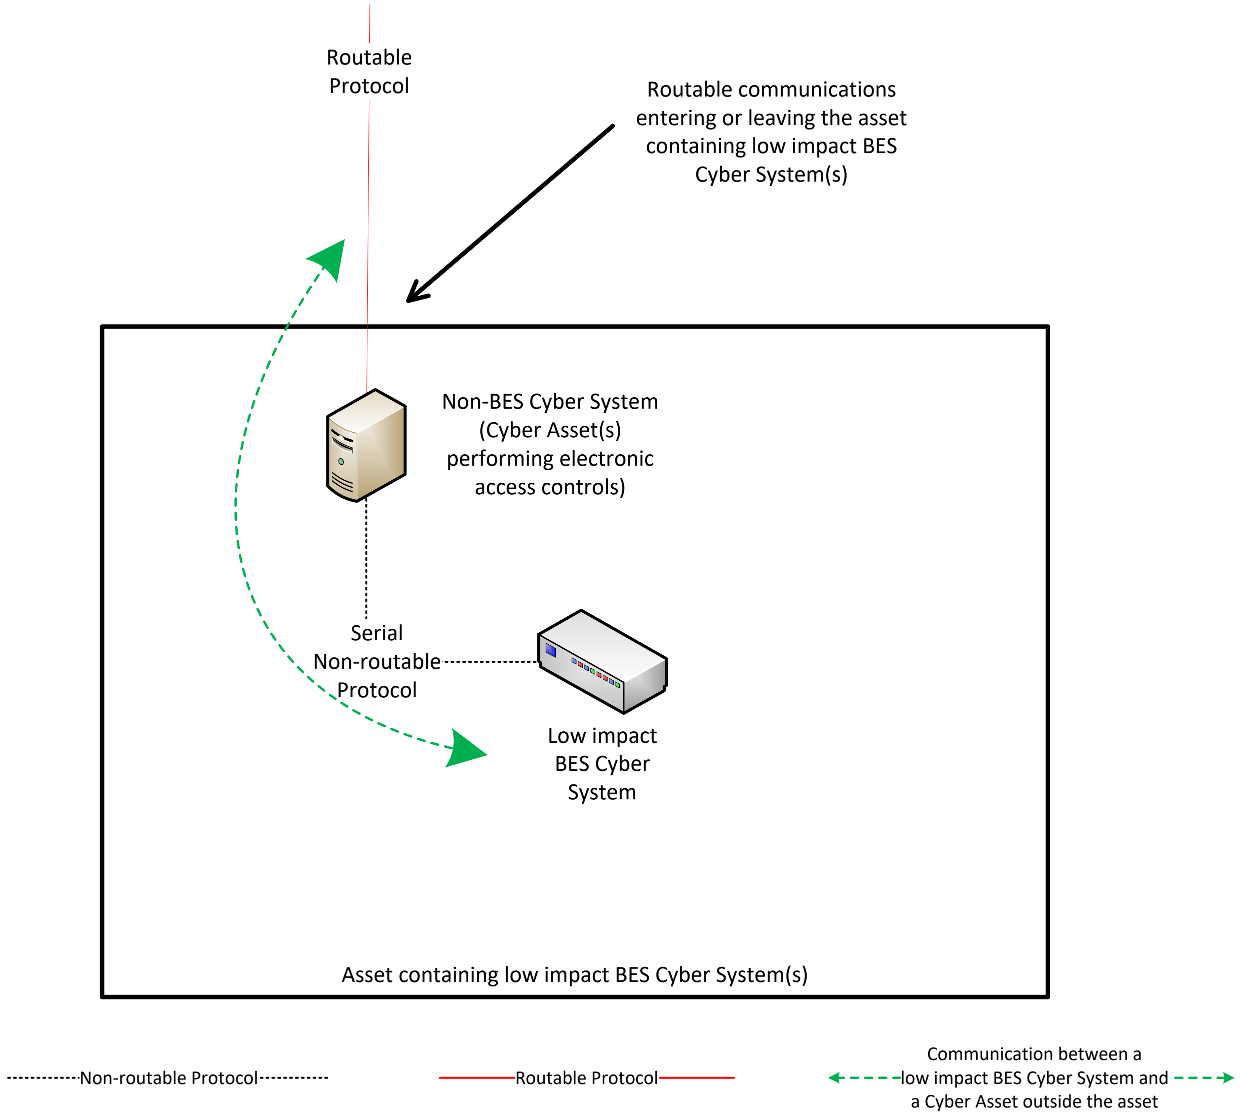
The Responsible Entity may choose to utilize a uni-directional gateway as the electronic access control. The low impact BES Cyber System(s) is not accessible (data cannot flow into the low impact BES Cyber System) using the routable protocol entering the asset due to the implementation of a “one-way” (uni-directional) path for data to flow. The uni-directional gateway is configured to permit only the necessary outbound communications using the routable protocol communication leaving the asset.



Reference Model 4

Reference Model 5 – User Authentication

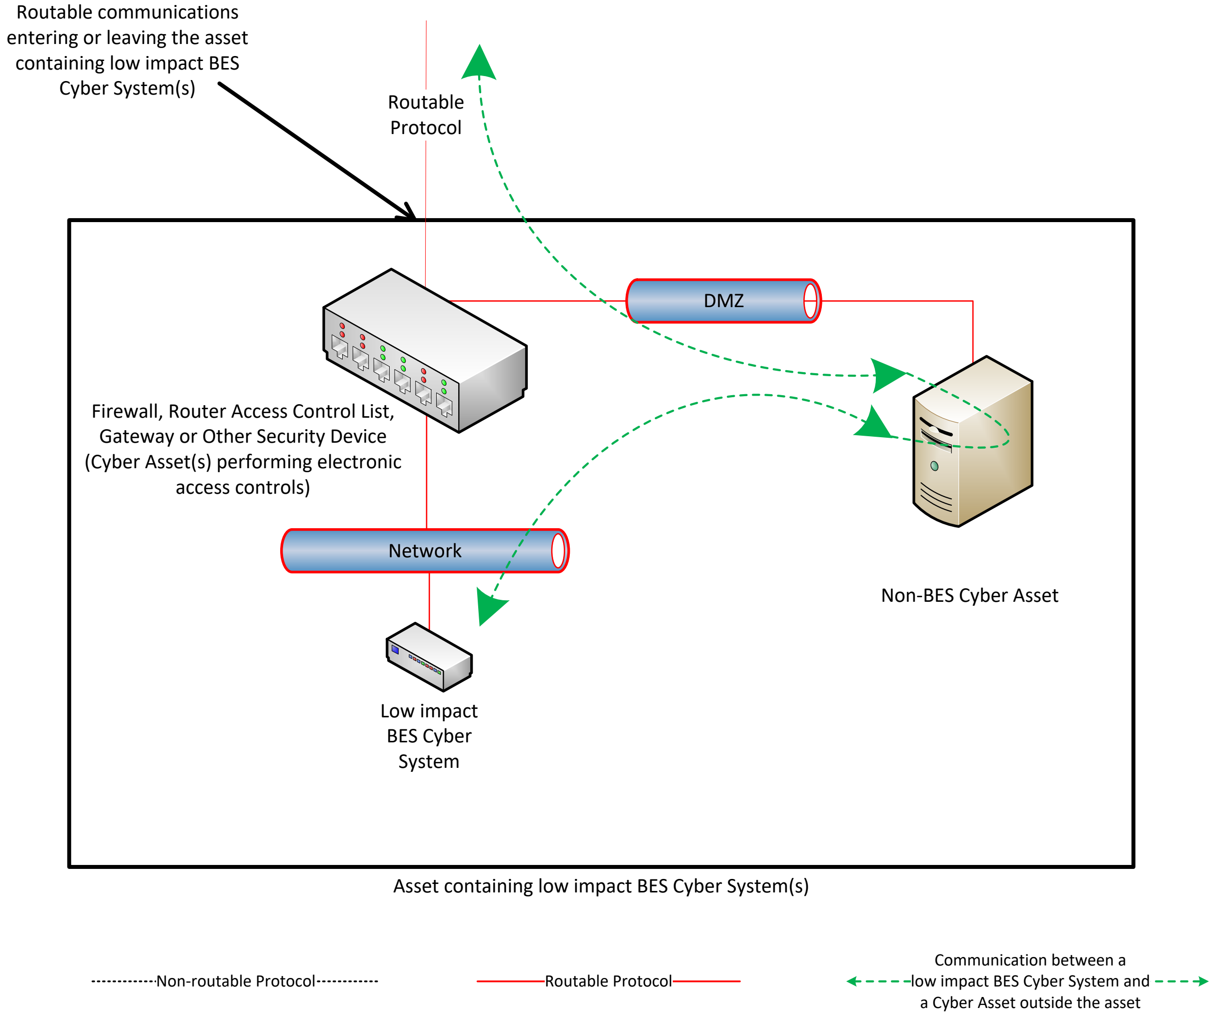
This reference model demonstrates that Responsible Entities have flexibility in choosing electronic access controls so long as the security objective of the requirement is met. The Responsible Entity may choose to utilize a non-BES Cyber Asset located at the asset containing the low impact BES Cyber System that requires authentication for communication from the Cyber Asset(s) outside the asset. This non-BES Cyber System performing the authentication permits only authenticated communication to connect to the low impact BES Cyber System(s), meeting the first half of the security objective to permit only necessary inbound electronic access. Additionally, the non-BES Cyber System performing authentication is configured such that it permits only necessary outbound communication meeting the second half of the security objective. Often, the outbound communications would be controlled in this network architecture by permitting no communication to be initiated from the low impact BES Cyber System. This configuration may be beneficial when the only communication to a device is for user-initiated interactive access.



Reference Model 5

Reference Model 6 – Indirect Access

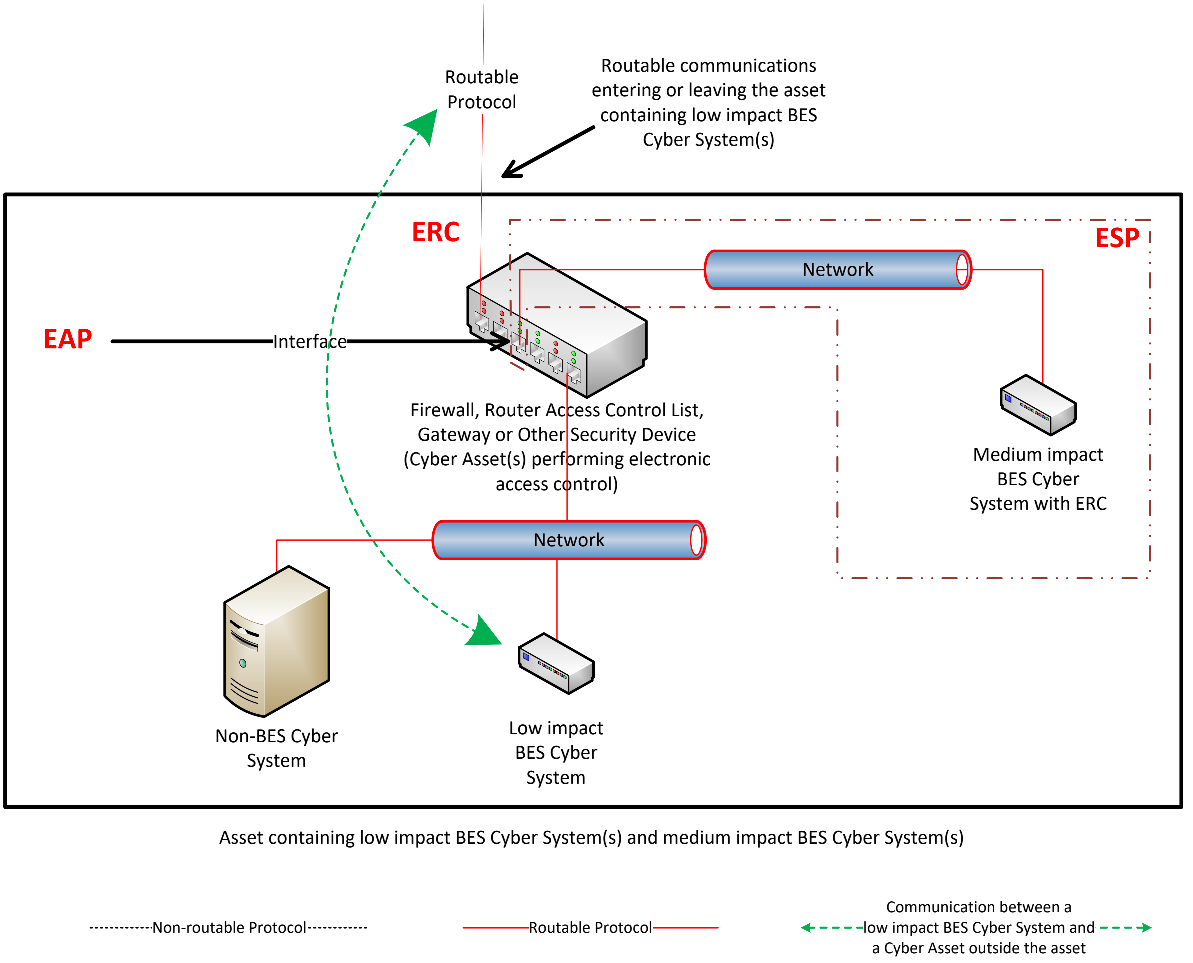
In implementing its electronic access controls, the Responsible Entity may identify that it has indirect access between the low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System through a non-BES Cyber Asset located within the asset. This indirect access meets the criteria of having communication between the low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System. In this reference model, it is intended that the Responsible Entity implement electronic access controls that permit only necessary inbound and outbound electronic access to the low impact BES Cyber System. Consistent with the other reference models provided, the electronic access in this reference model is controlled using the security device that is restricting the communication that is entering or leaving the asset.



Reference Model 6

Reference Model 7 – Electronic Access Controls at assets containing low impact BES Cyber Systems and ERC

In this reference model, there is both a routable protocol entering and leaving the asset containing the low impact BES Cyber System(s) that is used by Cyber Asset(s) outside the asset and External Routable Connectivity because there is at least one medium impact BES Cyber System and one low impact BES Cyber System within the asset using the routable protocol communications. The Responsible Entity may choose to leverage an interface on the medium impact Electronic Access Control or Monitoring Systems (EACMS) to provide electronic access controls for purposes of CIP-003. The EACMS is therefore performing multiple functions – as a medium impact EACMS and as implementing electronic access controls for an asset containing low impact BES Cyber Systems.



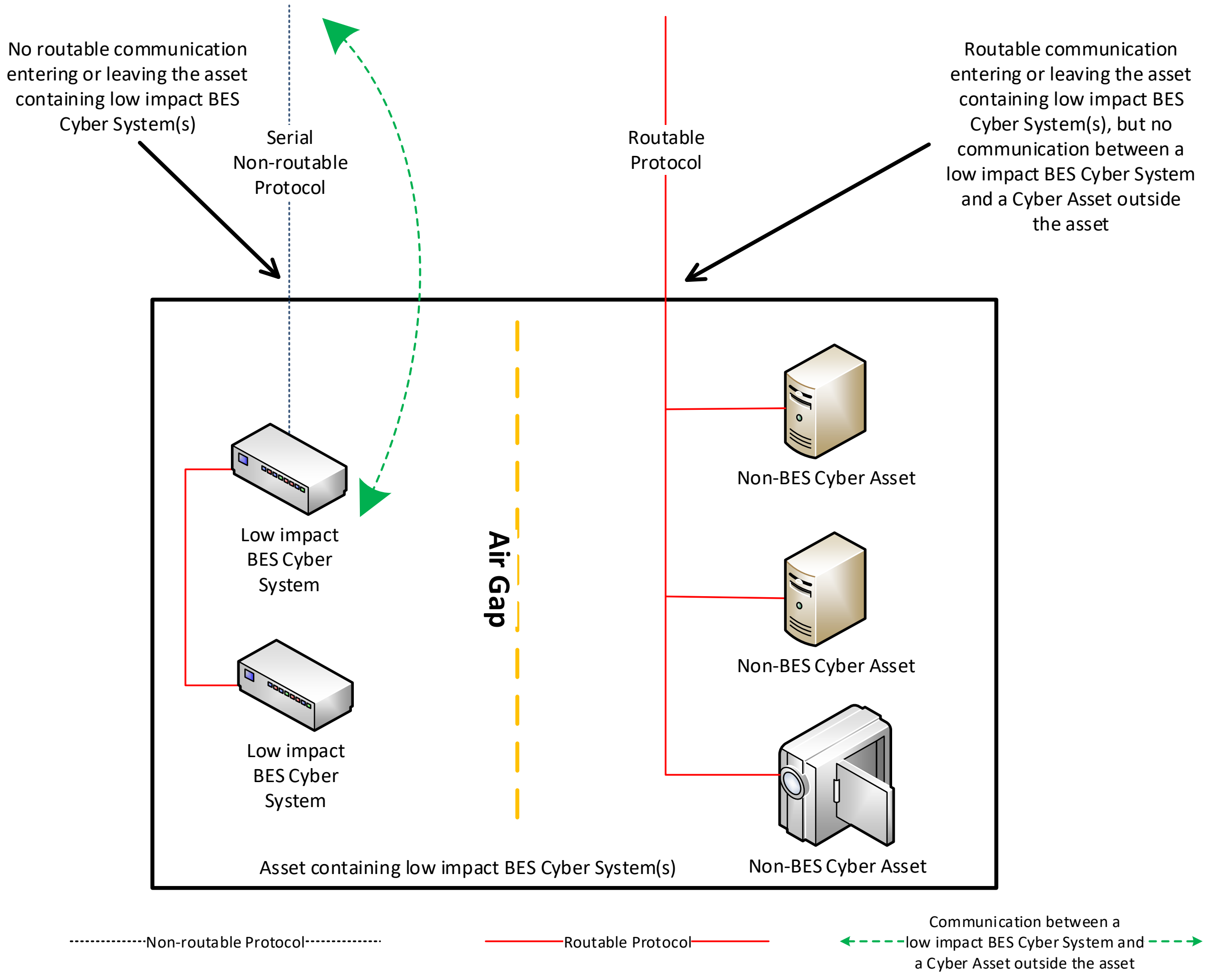
Reference Model 7

Reference Model 8 – Physical Isolation and Serial Non-routable Communications – No Electronic Access Controls Required

In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. This reference model demonstrates three concepts:

1) The physical isolation of the low impact BES Cyber System(s) from the routable protocol communication entering or leaving the asset containing the low impact BES Cyber System(s), commonly referred to as an 'air gap', mitigates the need to implement the required electronic access controls;
2) The communication to the low impact BES Cyber System from a Cyber Asset outside the asset containing the low impact BES Cyber System(s) using only a serial non-routable protocol where such communication is entering or leaving the asset mitigates the need to implement the required electronic access controls.
3) The routable protocol communication between the low impact BES Cyber System(s) and other Cyber Asset(s), such as the second low impact BES Cyber System depicted, may exist without needing to implement the required electronic access controls so long as the routable protocol communications never leaves the asset containing the low impact BES Cyber System(s).

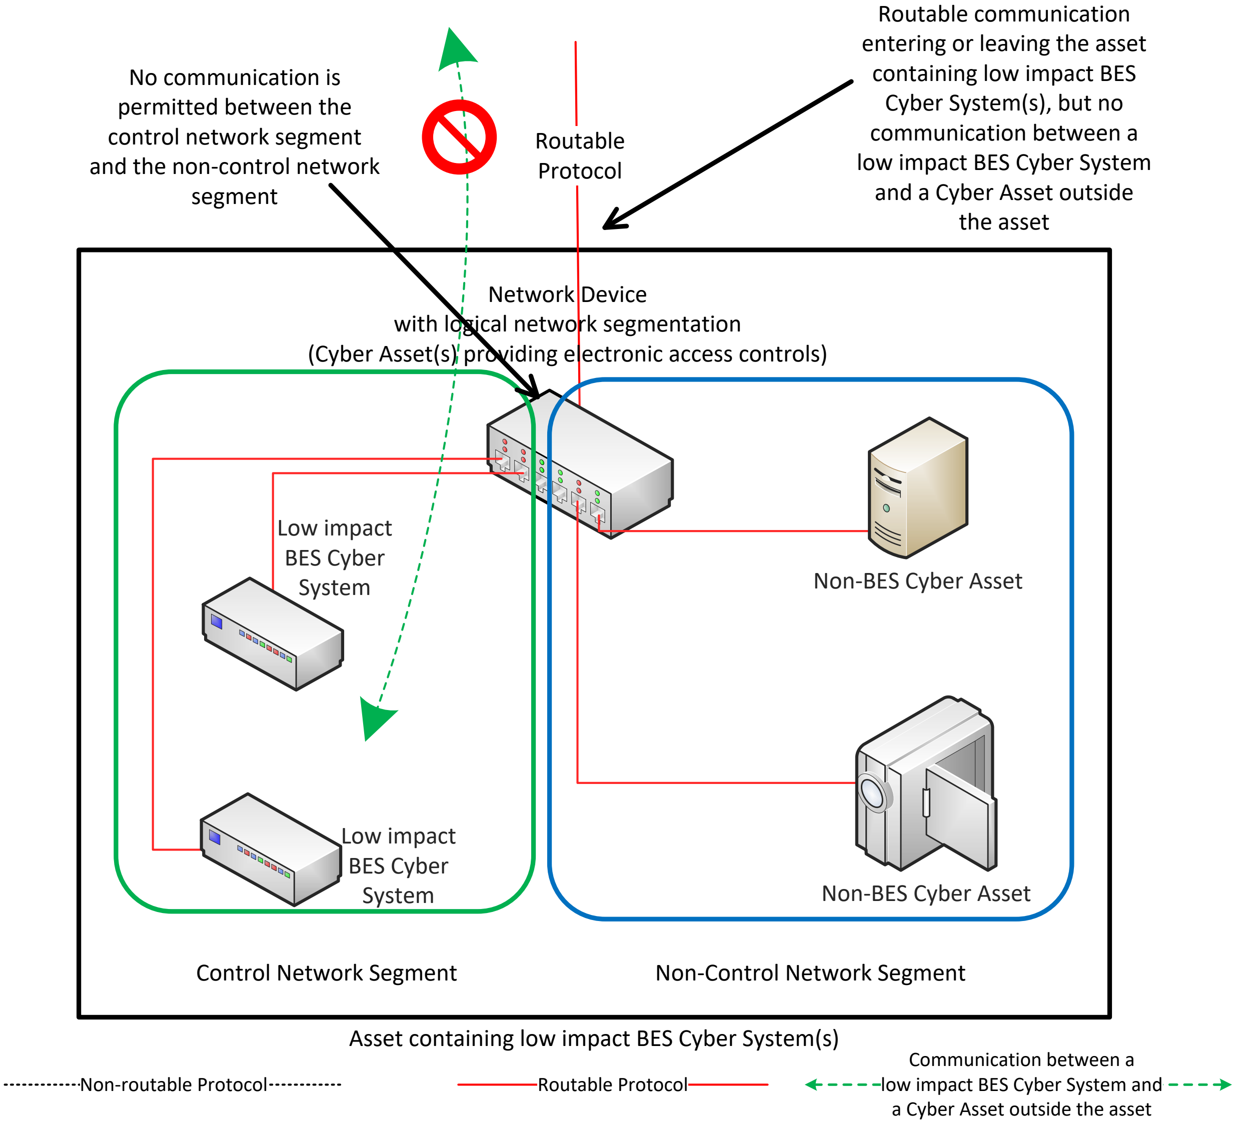
Section 1.



Reference Model 8

Reference Model 9 – Logical Isolation - No Electronic Access Controls Required

In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. The Responsible Entity has logically isolated the low impact BES Cyber System(s) from the routable protocol communication entering or leaving the asset containing low impact BES Cyber System(s). The logical network segmentation in this reference model permits no communication between a low impact BES Cyber System and a Cyber Asset outside the asset. Additionally, no indirect access exists because those non-BES Cyber Assets that are able to communicate outside the asset are strictly prohibited from communicating to the low impact BES Cyber System(s). The low impact BES Cyber System(s) is on an isolated network segment with logical controls preventing routable protocol communication into or out of the network containing the low impact BES Cyber System(s) and these communications never leave the asset using a routable protocol.



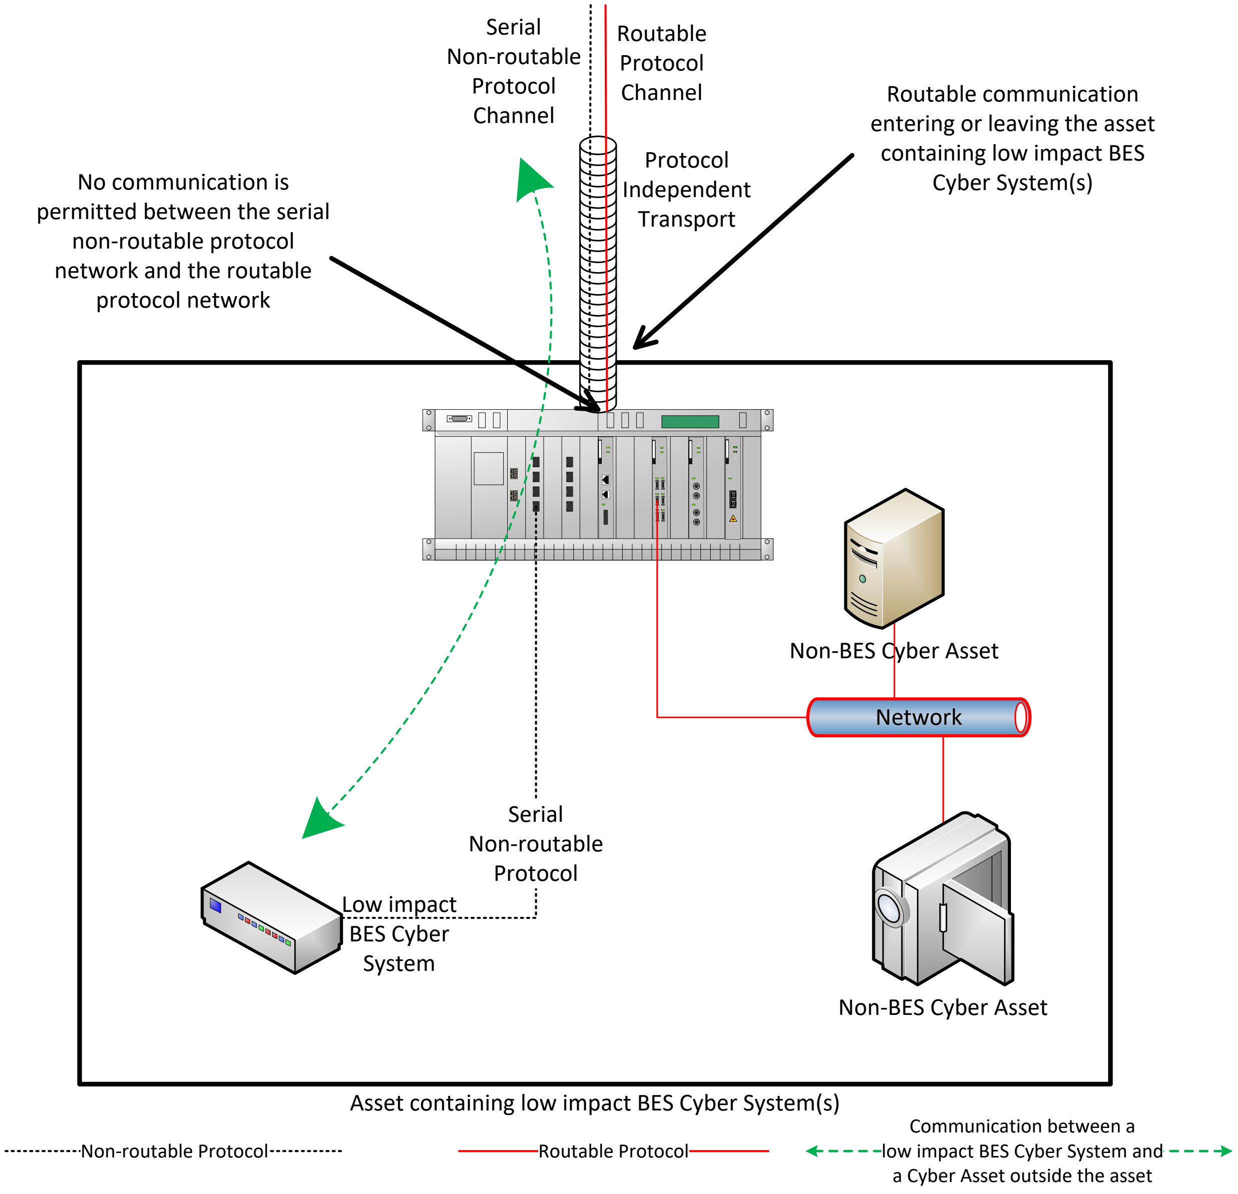
No communication is permitted between the control network segment and the non-control network segment

Routable communication entering or leaving the asset containing low impact BES Cyber System(s), but no communication between a low impact BES Cyber System and a Cyber Asset outside the asset

Reference Model 9

Reference Model 10 - Serial Non-routable Communications Traversing an Isolated Channel on a Non-routable Transport Network – No Electronic Access Controls Required

In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. This reference model depicts communication between a low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System over a serial non-routable protocol which is transported across a wide-area network using a protocol independent transport that may carry routable and non-routable communication such as a Time-Division Multiplexing (TDM) network, a Synchronous Optical Network (SONET), or a Multiprotocol Label Switching (MPLS) network. While there is routable protocol communication entering or leaving the asset containing low impact BES Cyber Systems(s) and there is communication between a low impact BES Cyber System and a Cyber Asset outside the asset, the communication between the low impact BES Cyber System and the Cyber Asset outside the asset is not using the routable protocol communication. This model is related to Reference Model 9 in that it relies on logical isolation to prohibit the communication between a low impact BES Cyber System and a Cyber Asset outside the asset from using a routable protocol.



Reference Model 10

Dial-up Connectivity

Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Insufficient Access Controls

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has Dial-up Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset that has a default password. There is no practical access control in this instance.
- A low impact BES Cyber System has a wireless card on a public carrier that allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.
- Dual-homing or multiple-network interface cards without disabling IP forwarding in the non-BES Cyber Asset within the DMZ to provide separation between the low impact BES Cyber System(s) and the external network would not meet the intent of “controlling” inbound and outbound electronic access assuming there was no other host-based firewall or other security devices on the non-BES Cyber Asset.

Requirement R2, Attachment 1, Section 4 – Cyber Security Incident Response

The entity should have one or more documented Cyber Security Incident response plan(s) that include each of the topics listed in Section 4. If, in the normal course of business, suspicious activities are noted at an asset containing low impact BES Cyber System(s), the intent is for the entity to implement a Cyber Security Incident response plan that will guide the entity in responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Entities are provided the flexibility to develop their Attachment 1, Section 4 Cyber Security Incident response plan(s) by asset or group of assets. The plans do not need to be on a per asset site or per low impact BES Cyber System basis. Entities can choose to use a single enterprise-wide plan to fulfill the obligations for low impact BES Cyber Systems.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but rather is an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as do other forms of tabletop exercises or drills. NERC-led exercises such as GridEx participation would also count as an exercise provided the entity’s response plan is followed. The intent of the requirement is for entities to keep the Cyber Security Incident response plan(s) current, which includes updating the plan(s), if needed, within 180 days following a test or an actual incident.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, “A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System.” The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

Requirement R2, Attachment 1, Section 5 – Transient Cyber Assets and Removable Media Malicious Code Risk Mitigation

Most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, and therefore Transient Cyber Assets and Removable Media are needed to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. Transient Cyber Assets and Removable Media are a potential means for cyber-attack. To protect the BES Cyber Assets and BES Cyber Systems, CIP-003 Requirement R2, Attachment 1, Section 5 requires Responsible Entities to document and implement a plan for how they will mitigate the risk of malicious code introduction to low impact BES Cyber Systems from Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code to the BES Cyber Asset(s) or BES Cyber System(s). Note: Cyber Assets connected to a BES Cyber System for less than 30 days due to an unplanned removal, such as premature failure, are not intended to be identified as Transient Cyber Assets. Removable Media subject to this requirement include, among others, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Equipment used for BES Cyber System maintenance; or
- Equipment used for BES Cyber System configuration.

To meet the objective of mitigating risks associated with the introduction of malicious code at low impact BES Cyber Systems, Section 5 specifies the capabilities and possible security methods available to Responsible Entities based upon asset type and ownership.

With the list of options provided in Attachment 1, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset or BES Cyber Asset.

Malicious Code Risk Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in Section 5 in Attachment 1 to address the risks posed by malicious code when connecting Transient Cyber Assets and Removable Media to BES Cyber Systems. Mitigation is intended to mean that entities reduce security risks presented by connecting the Transient Cyber Asset or Removable Media. When determining the method(s) to mitigate the introduction of malicious code, it is not intended for entities to perform and document a formal risk assessment associated with the introduction of malicious code.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R2, Attachment 1, Section 5.1 - Transient Cyber Asset(s) Managed by the Responsible Entity

For Transient Cyber Assets and Removable Media that are connected to both low impact and medium/high impact BES Cyber Systems, entities must be aware of the differing levels of requirements and manage these assets under the program that matches the highest impact level to which they will connect.

Section 5.1: Entities are to document and implement their plan(s) to mitigate malicious code through the use of one or more of the protective measures listed, based on the capability of the Transient Cyber Asset.

The Responsible Entity has the flexibility to apply the selected method(s) to meet the objective of mitigating the introductions of malicious code either in an on-going or in an on-demand manner. An example of managing a device in an on-going manner is having the antivirus solution for the device managed as part of an end-point security solution with current signature or pattern updates, regularly scheduled systems scans, etc. In contrast, for devices that are used infrequently and the signatures or patterns are not kept current, the entity may manage those devices in an on-demand manner by requiring an update to the signatures or patterns and a scan of the device before the device is connected to ensure that it is free of malicious code.

Selecting management in an on-going or on-demand manner is not intended to imply that the control has to be verified at every single connection. For example, if the device is managed in an on-demand manner, but will be used to perform maintenance on several BES Cyber Asset(s), the Responsible Entity may choose to document that the Transient Cyber Asset has been updated before being connected as a Transient Cyber Asset for the first use of that maintenance work. The intent is not to require a log documenting each connection of a Transient Cyber Asset to a BES Cyber Asset.

The following is additional discussion of the methods to mitigate the introduction of malicious code.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to update the signatures or patterns and scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the risk that malicious software could execute on the Transient Cyber Asset and impact the BES Cyber Asset or BES Cyber System.
- When using methods other than those listed, entities need to document how the other method(s) meet the objective of mitigating the risk of the introduction of malicious code.

If malicious code is discovered on the Transient Cyber Asset, it must be mitigated prior to connection to a BES Cyber System to prevent the malicious code from being introduced into the BES Cyber System. An entity may choose to not connect the Transient Cyber Asset to a BES Cyber System to prevent the malicious code from being introduced into the BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Requirement R2, Attachment 1, Section 5.2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

Section 5 also recognizes the lack of direct control over Transient Cyber Assets that are managed by parties other than the Responsible Entity. This lack of control, however, does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to mitigate the introduction of malicious code to low impact BES Cyber System(s) from Transient Cyber Assets it does not manage. Section 5 requires entities to review the other party's security practices with respect to Transient Cyber Assets to help meet the objective of the requirement. The use of "prior to connecting the Transient Cyber Assets" is intended to ensure that the Responsible Entity conducts the review before the first connection of the Transient Cyber Asset to help meet the objective to mitigate the introduction of malicious code. The SDT does not intend for the Responsible Entity to conduct a review for every single connection of that Transient Cyber Asset once the Responsible Entity has established the Transient Cyber Asset is meeting the security objective. The intent is to not require a log documenting each connection of a Transient Cyber Asset to a BES Cyber Asset.

To facilitate these controls, Responsible Entities may execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014.[6] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities may consider the "General Cybersecurity

---

[6] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 5.2.1: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This method intends to reduce the attack surface on the Transient Cyber Asset and reduce the avenues by which malicious software could be introduced.

Section 5.2.2: The intent of this section is to ensure that after conducting the selected review from Section 5.2.1, if there are deficiencies identified, actions mitigating the risk of the introduction of malicious code to low impact BES Cyber Systems must be completed prior to connecting the device(s) to an applicable system.

Requirement R2, Attachment 1, Section 5.3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 5.3: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The SDT does not intend to obligate a Responsible Entity to conduct a review for every single connection of Removable Media, but rather to implement its plan(s) in a manner that protects all BES Cyber Systems where Removable Media may be used. The intent is to not require a log documenting each connection of Removable Media to a BES Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 5.3.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System.

Requirement R3:

The intent of CIP-003-8, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Reliability Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-8, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity significant flexibility to adapt this requirement to its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up-to-date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

One or more security policies enable effective implementation of the requirements of the cyber security Reliability Standards. The purpose of policies is to provide a management and governance foundation for all requirements that apply to a Responsible Entity’s BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements.

Annual review and approval of the cyber security policies ensures that the policies are kept-up-to-date and periodically reaffirms management’s commitment to the protection of its BES Cyber Systems.

Rationale for Requirement R2:

In response to FERC Order No. 791, Requirement R2 requires entities to develop and implement cyber security plans to meet specific security control objectives for assets containing low impact BES Cyber System(s). The cyber security plan(s) covers five subject matter areas: (1) cyber security awareness; (2) physical security controls; (3) electronic access controls; (4) Cyber Security Incident response; and (5) Transient Cyber Asset and Removable Media Malicious Code Risk Mitigation. This plan(s), along with the cyber security policies required under Requirement R1, Part 1.2, provides a framework for operational, procedural, and technical safeguards for low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the BES, Attachment 1 provides Responsible Entities flexibility on how to apply the security controls to meet the security objectives. Additionally, because many Responsible Entities have multiple-impact rated BES Cyber Systems, nothing in the requirement prohibits entities from using their high and medium impact BES Cyber System policies, procedures, and processes to implement security controls required for low impact BES Cyber Systems, as detailed in Requirement R2, Attachment 1.

Responsible Entities will use their identified assets containing low impact BES Cyber System(s) (developed pursuant to CIP-002) to substantiate the sites or locations associated with low impact BES Cyber System(s). However, there is no requirement or compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber System(s) and their associated cyber assets or to maintain a list of authorized users.

Rationale for Modifications to Sections 2 and 3 of Attachment 1 (Requirement R2):
Requirement R2 mandates that entities develop and implement one or more cyber security plan(s) to meet specific security objectives for assets containing low impact BES Cyber System(s). In Paragraph 73 of FERC Order No. 822, the Commission directed NERC to modify "…the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6…to provide needed clarity to the definition and eliminate ambiguity surrounding the term 'direct' as it is used in the proposed definition…within one year of the effective date of this Final Rule."

The revisions to Section 3 incorporate select language from the LERC definition into Attachment 1 and focus the requirement on implementing electronic access controls for asset(s) containing low impact BES Cyber System(s). This change requires the Responsible Entity to permit only necessary inbound and outbound electronic access when using a routable protocol entering or leaving the asset between low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber system(s). When this communication is present, Responsible Entities are required to implement electronic access controls unless that communication meets the following exclusion language (previously in the definition of LERC) contained in romanette (iii): "not used for time-sensitive protection or control functions between intelligent electronic devices (e.g. communications using protocol IEC TR-61850-90-5 R-GOOSE)".

The revisions to Section 2 of Attachment 1 complement the revisions to Section 3; consequently, the requirement now mandates the Responsible Entity control physical access to "the Cyber Asset(s), as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any." The focus on electronic access controls rather than on the Low Impact BES Cyber System Electronic Access Points (LEAPs) eliminates the need for LEAPs.

Given these revisions to Sections 2 and 3, the NERC Glossary terms: Low Impact External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) will be retired.

Rationale for Section 5 of Attachment 1 (Requirement R2):
Requirement R2 mandates that entities develop and implement one or more cyber security plan(s) to meet specific security objectives for assets containing low impact BES Cyber System(s). In Paragraph 32 of FERC Order No. 822, the Commission directed NERC to "…provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability." Transient devices are potential vehicles for introducing malicious code into low impact BES Cyber Systems. Section 5 of Attachment 1 is intended to mitigate the risk of malware propagation to the BES through low impact BES Cyber Systems by requiring entities to develop and implement one or more plan(s) to address the risk. The cyber security plan(s) along with the cyber security policies required under Requirement R1, Part 1.2, provide a framework for operational, procedural, and technical safeguards for low impact BES Cyber Systems.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the Glossary of Terms used in NERC Reliability Standards so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has “the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards” which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP Senior Manager to be a “corporate officer or equivalent” would be extremely difficult to interpret and enforce on a consistent basis.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for “clear lines of authority and ownership for security matters.” With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

Technical Rationale for Reliability Standard CIP-004-8

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-004-8. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-004-8 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the issues identified by the V5TAG was virtualization. The V5TAG Transfer document states, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale." Document for reference when reading the technical rationale that follows.

Requirement R1-R6

General Considerations

For Requirements R2 through R6, the Project 2016-02 SDT added a new type of 'Applicable System' called '**Medium impact BCS with IRA**'. As the SDT is addressing IRA to a non-routable BCA/BCS through scenarios such as IP-to-serial conversion, IRA is no longer dependent on ERC and "associated ESPs". Therefore, CIP-004 requirements for provisioning and deprovisioning IRA for personnel can no longer be limited to only medium impact BCS with ERC.

However, several of the Requirement Parts cover both physical and electronic access and the "with ERC" has been used as a scoping filter so that, for example, you don't have to deprovision physical access within 24 hours at a remote site that has no ERC and changes for physical security may require a site visit. To account for this situation, several of the Requirement Parts now include a "(except for Medium impact BCS without ERC)" exclusion on the physical access portions of the language.

Note that by adding this to Requirement 2, Part 2.1 it does not mean that all personnel who would ONLY need IRA (i.e., vendors with occasional remote access needs) would need training on all content listed. R2 states the training program is "appropriate to individual roles, functions, or responsibilities".

The Project 2016-02 SDT also made conforming changes to Reliability Standard CIP-004-8 to align personnel and training requirements with the virtualization changes.

To enable CIP-004-8 for virtualization, the SDT added "Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part" within the Applicable Systems column of each of the Parts for Requirement R1 – Requirement R6.

Additionally, where the term BES Cyber System (BCS) was used in the requirement language, it is replaced with "Applicable Systems" to align the requirement language of each Requirement Part with the updated applicability for each Requirement Part.

Requirement R3 Part 3.5

Summary of Changes:

A CIP Exceptional Circumstance was added as an exception to "Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 through 3.4 within the last seven years" such that individuals granted authorized electronic access and authorized unescorted physical access have undergone the personnel risk assessment processes.

Change Rationale:

The SDT determined Responsible Entities cannot require personnel risk assessments for first responders prior to granting them authorized unescorted physical access during certain conditions that qualify as CIP Exceptional Circumstances.

Former Background Section from Reliability Standard CIP-004-7

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of documented processes where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as plans (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.

The following conventions are used in the “Applicable Systems” column as described. High Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

Technical Rationale for Reliability Standard CIP-004-7

General Considerations for Requirement R1

None

Rationale for Requirement R1

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Requirement R2

General Considerations for Requirement R2

None

Rationale for Requirement R2

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table Requirement R2.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets (TCA) and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, TCA and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3

General Considerations for Requirement R3

None

Rationale for Requirement R3

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new personnel risk assessment (PRA). Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4

General Considerations for Requirement R4

None

Rationale for Requirement R4

Authorization for electronic and unescorted physical access must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5

General Considerations for Requirement R5

None

Rationale for Requirement R5

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked.

The initial revocation required in Requirement R5 Part 5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement R5 Part 5.5 specified that passwords for shared account are to be changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the Bulk Electric System. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Requirement R6

General Considerations for Requirement R6

None

Rationale for Requirement R6

Requirement R6 requires Responsible Entities to implement a BES Cyber System Information (BCSI) access management program to ensure that provisioned access to BCSI is authorized, verified, and promptly revoked. Authorization ensures only individuals who have a need are authorized for provisioned access to BCSI. Prompt revocation of terminated individuals’ ability to access BCSI helps prevent inappropriate disclosure or use of BCSI. Periodic verification ensures that what is currently provisioned is authorized and still required, and allows the Responsible Entity the opportunity to correct any errors in provisioning.

The change to "provisioned access" instead of "designated storage locations" enables the use of third-party solutions (e.g., cloud services) for BCSI. The concept of "designated storage locations" is too prescriptive and limiting for entities that want to implement file-level rights and permissions (i.e., policy based credentials or encryption keys that follow the file and the provisioned individual), which provide BCSI access controls regardless of storage location. The concept of provisioned access provides the needed flexibility for entities to use other technologies and approaches instead of or in addition to storage locations as a way to meet the access management requirements for BCSI, especially that which is stored in third-party cloud solutions or is protected at the information/file level no matter where it is located.

According to Requirement R6, Part 6.1, the Responsible Entity must authorize individuals to be given provisioned access to BCSI. First, the Responsible Entity determines who needs the ability to obtain and use BCSI for performing legitimate work functions. Next, a person empowered by the Responsible Entity to do so authorizes—gives permission or approval for—those individuals to be given provisioned access to BCSI. Only then would the Responsible Entity provision access to BCSI as authorized.

Provisioned access is to be considered the result of specific actions taken to provide an individual the means to access BCSI (e.g., physical keys or access cards, user accounts and associated rights and privileges, encryption keys, etc.). In the context of this requirement, an individual is considered to have been provisioned access if they concurrently have the means to both obtain and use the BCSI. To illustrate, an individual who can obtain encrypted BCSI but does not have the encryption keys to be able to use the BCSI has not been provisioned access to the BCSI.

For BCSI in physical format, physical access is provisioned to a physical storage location designated for BCSI and for which access can be provisioned, such as a lockable file cabinet. For BCSI in electronic format, electronic access is provisioned to an electronic system or its contents, or to individual files. Provisioned physical access alone to a physical location housing hardware that contains electronic BCSI is not considered to be provisioned access to the electronic BCSI. Take, for instance, storing BCSI with a cloud service provider. In this case, the cloud service provider's personnel with physical access to the data center is not, by itself, considered provisioned access to the electronic BCSI stored on servers in that data center, as the personnel would also need to be provisioned electronic access to the servers or system. In scenarios like this, the Responsible Entity should implement appropriate information protection controls to help prevent unauthorized access to BCSI per its information protection program, as required in CIP-011-X. The subparts in Requirement R6, Part 6.1 were written to reinforce this concept and clarify access management requirements.

The periodic verification required by Requirement R6 Part 6.2 is to ensure that only authorized individuals have been provisioned access to BCSI and that what is provisioned is what each individual currently needs to perform work functions. For example, by performing the verification, the Responsible Entity might identify individuals who have changed jobs and no longer have a need for provisioned access to BCSI, and would therefore revoke provisioned access.

For Requirement R6 Part 6.3, removal of an individual's ability to use provisioned access to BCSI is considered to mean a process with the result that electronic access to electronic BCSI and physical access to physical BCSI is no longer possible from that point in time onwards using the means the individual had been given to obtain and use BCSI in those circumstances. Either what was specifically provisioned to give an individual access to BCSI (e.g., keys, local user or database accounts and associated privileges, etc.) is taken away, deleted, disabled, revoked, etc. (also known as “deprovisioning”), or some primary access is removed which prevents the individual from using the specifically provisioned means. Requirement R6 Part 6.3 acknowledges that where removing unescorted physical access and Interactive Remote Access, such as is required in Requirement R5 Part 5.1, prevents any further access to BCSI by the individual after termination, then this would constitute removal of an individual’s ability to use provisioned access to BCSI. Access can only be revoked or removed where access has been provisioned. The intent is not to have to retrieve individual pieces of BCSI (e.g., documents) that might be in someone’s possession (although you should if you can, but the individual cannot un-see what they have already seen).

Where no specific mechanisms are available or feasible for provisioning access to BCSI, these requirements are not applicable. For example, there is no available or feasible mechanism to provision access in instances when an individual is merely given, views, or might see BCSI, such as when the individual is handed a piece of paper during a meeting or sees a whiteboard in a conference room. Likewise, these requirements are not applicable where provisioned electronic or physical access is not specifically intended to provide an individual the means to obtain and use BCSI. There will likely be no specific provisioning of access to BCSI on workstations, laptops, flash drives, portable equipment, offices, vehicles, etc., especially when BCSI is only temporarily or incidentally located or stored there. Another example is the provisioning of access to a substation, the intent of which is to enable an individual to gain access to the substation to perform substation-related work tasks, not to access BCSI that may be located there. However, BCSI in these locations and situations still needs to be protected against unauthorized access per the Responsible Entity’s information protection program as required by CIP-011-X.

The change to “provisioned access” to BCSI is backwards compatible with the previous “designated storage locations” concept. Entities have likely designated only those storage locations to which access can be provisioned, rather than any location where BCSI might be found. Both concepts intend to exclude those locations where BCSI is temporarily stored, as explained in the previous paragraph. Provisioned access, like designated storage locations, maintains the scope to a finite and discrete object that is manageable and auditable, rather than trying to manage access to individual pieces of information. The removal of the term “designated storage location” does not preclude an entity from defining storage locations for the entity’s access management program for authorization, verification, and revocation of access to BCSI.

Technical Rationale for Reliability Standard CIP-004-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-004-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

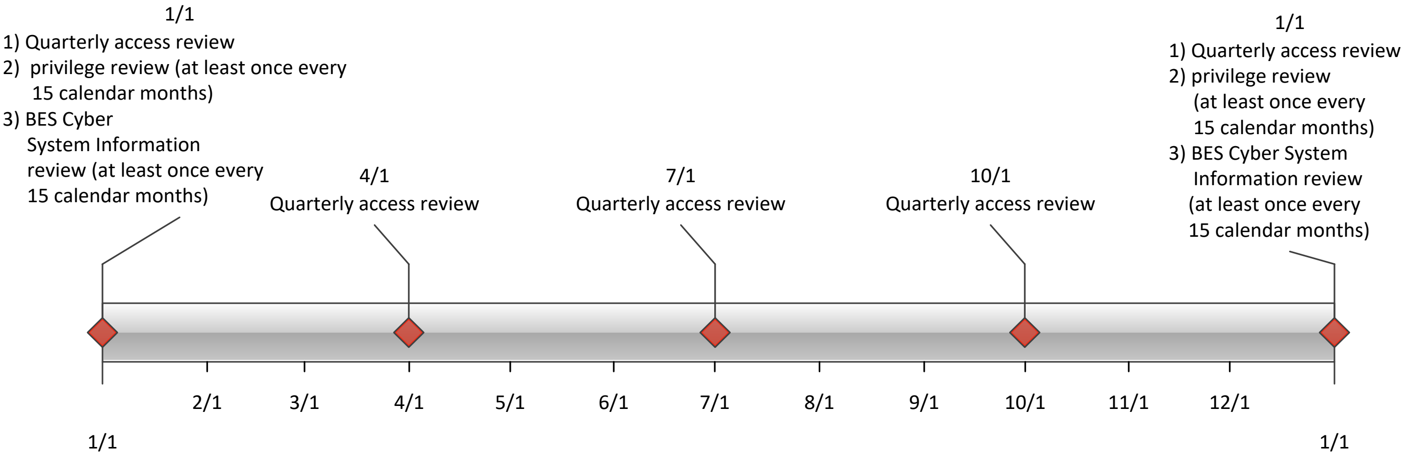
A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.



Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing “immediate” revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

Technical Rationale for Reliability Standard CIP-005-8

Introduction

This document is the technical rationale and justification for Reliability Standard CIP-005. It includes the rationale for changes in the current proposed version (CIP-005-8) as well as previous versions of the standard. The intent of this document is to provide stakeholders and the ERO Enterprise with an understanding of the revisions and the technical concepts of the Reliability Standard as well as the rationale for such revisions, both the currently proposed and historical revisions from previous versions and SDTs.

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-005-8. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-005-8 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition Advisory Group (V5TAG), which consisted of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005-8 and the definitions of Cyber Asset and Electronic Access Point (EAP) that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

Summary

The Project 2016-02 Standard Drafting Team (SDT) proposal accommodates for increasing use of virtualization and other technology innovation. The SDT's purpose of incorporating the virtualization concept into the CIP standards is not to merely augment the current standards, but also to better position the CIP standards to be applicable to additional future technological innovation while, to the extent possible, maintaining backwards compatibility.

CIP-005-8 remains a standard concerned with controlling communications to and from BES Cyber Systems (BCS) by establishing an Electronic Security Perimeter (ESP) with increased security controls for Interactive Remote Access (IRA) and vendor remote access. However, virtualization is enabling models for network security, such as "Zero Trust", that are not network perimeter based. Therefore, in CIP-005-8 the ESP focuses on being a security model rather than a network topology-based perimeter as the only option. Securing the communications to and from BCS is the security objective, but the standard no longer prescribes "where", as in where on a network, the controls must be implemented. Innovations such as Zero Trust models are moving access control from network borders to a session level orientation and eliminating the implicit trust within a local network. Network perimeter-based ESP and EAP implementations remain a valid option and are one method for allowing only necessary communications to the Cyber Systems within the ESP.

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in “CIP Definitions and Exemptions Technical Rationale” document for reference when reading the technical rationale that follows.

Requirement R1 General Considerations

ESP Redefined

For backwards compatibility purposes, network border-based ESPs and EAPs remain a valid option for controlling the communications to and from BCS. However, virtualization technologies and models such as Zero Trust present equally effective methods that are not network border-based solutions. A Zero Trust model can implement more granular controls throughout a network on a per-access or per-session level.

Shared infrastructure and “Mixed Trust” Risks

For virtualized environments where SCI is used, a risk of side channel attacks exists. Virtualization allows disparate workloads of what could be differing impact to execute on the same CPUs and share the same memory (i.e., RAM). In this case the lower impact systems would become high water marked with the higher impact system through the PCA definition. This would in turn affect what requires protection by any associated ESPs. The risks associated with this scenario is mitigated in CIP-005-8 by either:

- Declaring the VCAs that share CPU or memory or are within the same ESP with a BCS as associated PCAs which will require they meet the security requirements (high water marking) that include ‘associated PCAs’; or
- Configuring the virtualization infrastructure to place VCAs of differing impact or trust levels into differing CPU and memory pools and configuring affinity controls to these pools such that hypervisors do not allow workloads in these differing pools to simultaneously exist or execute on the same hypervisor.

Assets with Multiple Classifications (PCA, EACMS, Intermediate System, SCI, etc.)

The definitions created to categorize Cyber Assets have historically included overlap. The definition of PCA was revised to include VCAs that share CPU or memory with a BCS. Additional definitions such as SCI and VCA will add to the possibility of additional instances of assets or systems meeting multiple definitions, such as SCI that are also EACMS.

These definitions are used in both the Applicable Systems column as well as within the requirement language. The fact that one asset or system may meet multiple definitions and therefor have multiple classifications does not pose a significant challenge as long as the Responsible Entity ensures that all requirements that pertain to ANY of the classifications are applied. In other words, if an asset or system meets both the SCI and the EACMS definition, requirements that apply to either categorization are applicable.

Firewall/Router on a Stick

A “firewall on a stick” or “router on a stick” is a reference to a networking design scenario by which a firewall or router has one single physical connection to a switch, but has access to multiple networks and broadcast domains by utilizing logical interfaces in combination with VLANs (Virtual Local Area Networks).

Devices on different VLANs are not able to communicate by default, so the primary purpose of this design is to allow for inter-VLAN routing enabling communication between devices which reside on different VLANs by way of the firewall or router.

As all traffic between these VLANs passes through the firewall or router it is uniquely positioned to restrict access and log traffic flows between devices on different VLANs facilitating compliance and the enforcement of security requirements.

This design allows an entity additional flexibility with respect to the creation of multiple Electronic Security Perimeters while minimizing the cost and number of physical networking devices required to provide proper levels of protection and isolation to each of the created Electronic Security Perimeters.

An entity may select this design to enable further isolation of distinct applications and systems from each other based on the assessed risk that they pose to the BES or to enhance their ability to control access to these systems.

Careful attention should be given to the isolation and access control of management interfaces that support this design as they have the potential to impact multiple Electronic Security Perimeters.

SDWAN

Software-Defined Wide Area Networks (SDWANs) are comprised of an underlay network and an overlay network.

The underlay network is what we traditionally refer to as our Wide Area Networks and is constructed with various telecommunications provider circuits and technologies, including Serial, MPLS, LTE, Cable Modem, DSL, etc.

The overlay network is a virtual network layer created upon the underlay network, generally via encrypted tunnels or other similar mechanisms. An overlay network may utilize one or more underlay networks via load balancing or network policies. The policies governing the overlay network may dictate parameters such as what traffic is permitted, what underlay to utilize based on the application type, what should be utilized as the primary path, and various other parameters.

SDWAN enables the construction of secured and isolated network paths with enhanced management and monitoring capabilities in addition to enabling additional services to and from the SDWAN such as VPN connectivity, firewall services, traffic inspection, and shared gateways.

This technology provides an increased level of control over Wide Area Networks while enhancing visibility, security, and redundancy, all while offering the potential to reduce the costs associated with providing connectivity between an entity's locations and assets.

Figure 1 depicts a typical SD-WAN where encrypted tunnels protect traffic between sites A to C as well as sites B to C.

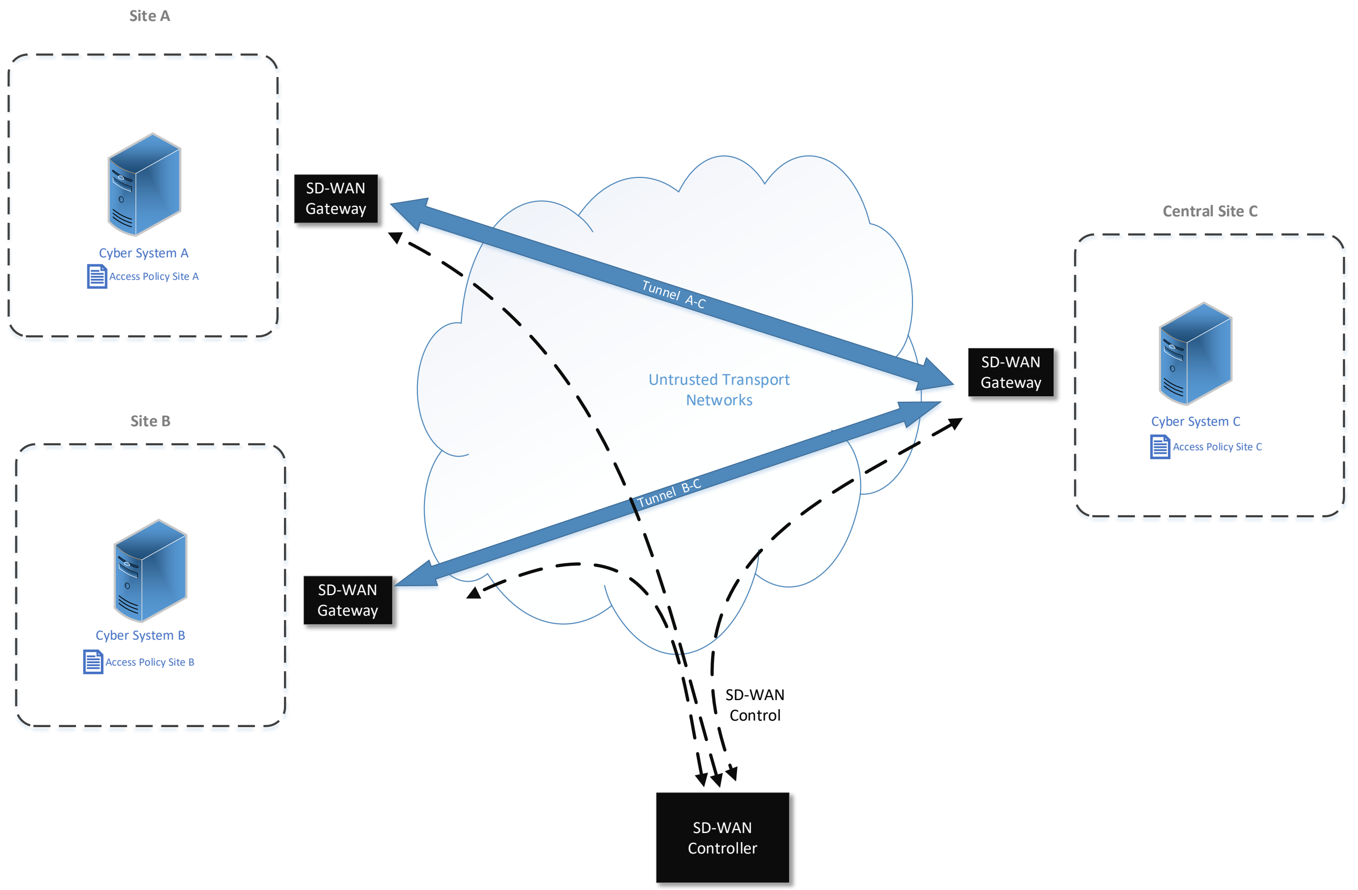

Figure 2 Typical SD-WAN

VXLAN

VXLAN is similar in concept to SDWAN in that it is a form of a Software Defined Network, but in the case of VXLAN the focus is on networks within the Datacenter as opposed to SDWAN which focuses on networks between Datacenters and other facilities.

VXLAN also utilizes the underlay and overlay terminology that we are familiar with given our review of SDWAN. The primary distinction is that VXLAN itself is the name of the overlay protocol utilized in this design and is the most common protocol used for overlay networks within a Datacenter.

The goal of VXLAN is to enhance the ability to segment network resources while also easing the burden of managing, automating, and orchestrating this segmentation by creating a virtual network that is agnostic of the physical network components supporting it.

The VXLAN protocol encapsulates Layer 2 Ethernet frames within Layer 3 UDP packets between devices comprising the design and allows for upwards of 16 million network segments to be created versus the traditional limit of 4094 VLANs. These network segments are identified with a VNI (VXLAN Network Identifier) which is synonymous with VLAN ID.

The components of the design that are capable of encapsulating and de-encapsulating the VXLAN protocol are referred to as VTEPs (VXLAN Tunnel Endpoints) and are commonly network switches or virtual machine hypervisors.

Physical devices and servers rely on switches to act as their VTEP whereas a virtual machine, hosted on VMWare ESX in this example, relies on the hypervisor as its' VTEP.

Figure 3 depicts a typical VXLAN where access control policies are implemented in the IP fabric.

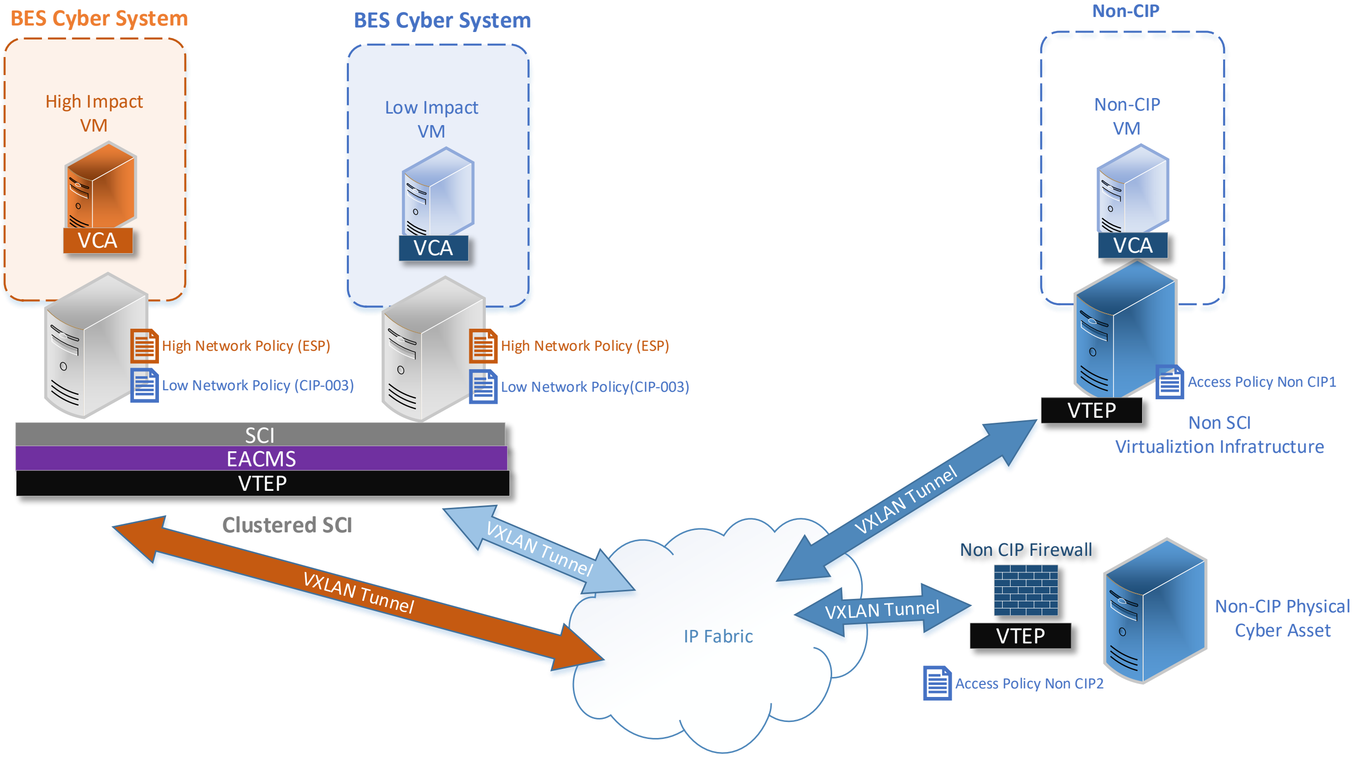

Figure 4 Typical VXLAN

VXLAN facilitates increasing the level of network segmentation within and between an entities Datacenters, while also enhancing their ability to automate and orchestrate the deployment of network resources. With this increased network segmentation an entity is granted more granular control over the flow of traffic and is given more opportunities to inspect that traffic to ensure appropriate levels of access control and protection.

Requirement R1

Rationale

Requirement R1 requires implementation of an ESP for BCS permitting only necessary communication through the ESP. However, there are other network security models available (such as zero trust) that can accomplish this security objective by controlling communications end-to-end at a more granular level than a network perimeter-based model. The definitions (ESP and EAP) and the changes to R1 allow entities the flexibility to implement different models that meet the security objective, or retain their current perimeter-based implementation.

Requirement R1 Part 1.1:

Rationale

This Requirement Part requires all high and medium impact BCS and their associated PCAs to be protected by an ESP. In recognition of non-perimeter based models, the language changed from “shall reside within” to “must be protected by”. Note, a PCA can now be defined by two different attributes of what they share with a BCS – not only network location, but also the sharing of CPU and memory from the underlying hypervisor(s) for VCAs. In the instance

that a VCA becomes an ‘associated PCA’ from its sharing of CPU or memory with a high or medium impact BCS, that associated PCA must also be protected by an ESP.

Note that this Requirement Part applies to all high and medium impact BCS without regard to external connectivity from the local network to other networks. This allows for the identification of PCAs and the scope of TCA connectivity even on isolated networks.

Requirement R1 Part 1.2:

Rationale

This Requirement Part changed to a security objective, rather than prescribing ERC must be controlled at an EAP. Virtualization technologies introduce additional methods to isolate systems. This requirement part no longer prescribes one method of controlling communications to Applicable Systems, and opens it up for alternative solutions.

This allows for other models such as zero trust architectures. Such models are not based on controlling communications at a Cyber Asset interface located on a network boundary. Communications can be authorized by software defined policy enforcement points throughout the infrastructure. In this model, network security is less topology-based and more policy-based (configurations and settings) and can be used to granularly protect communication at an individual system or even process or resource level.

While pure zero-trust architectures are an emerging model, the objective-based requirement also allows for hybrid models of various combinations of network border-based and zero trust architectures. As technology changes, this requirement and broadened ESP definition are flexible in how the objective is met.

The intent of “through the ESP” is to better incorporate future Zero Trust implementations where there is no “logical border surrounding a network” but instead Policy Enforcement Points at the accessed resource itself or as close to it as possible. In these instances that are designed to be perimeter-less, the concepts of “inside” and “outside” begin to fail and the SDT is removing those now to be better prepared for future technologies. The SDT asserts that even in traditional Layer 3 firewalls that define an ESP, the communications between systems that are encapsulated in packets go “through” the perimeter (ESP) in order to reach their destination.

The core security objective, of permitting only needed communications and denying all others by no longer prescribing this must be implemented at a Cyber Asset interface on a network border (an EAP), is retained. The intent of this Requirement Part is to control the ‘reachability’ of the Applicable Systems; filtering network communications *before* they reach the Applicable Systems and their OS, not as part of it. This is not to discourage the use of integrated host-based firewalls to further filter network traffic to a host.

Note that the requirement now explicitly includes “the reason for granting access”. Previously, this had been an implied part of the requirement based on the Measures.

The SDT had considered adding “physical isolation” to the Measure, but did not do so as the applicability explicitly includes ERC. Additionally, within the Measures, the SDT uses examples of VLAN and VXLAN configurations as evidence. These configurations could be used as methods to “Permit only needed routable protocol communications”, despite not being OSI layer routable protocols in and of themselves.

Time-sensitive communications between Protection Systems (i.e., digital relays) that use routable communication protocols are excluded. Time-sensitive in this context generally means functions that would be negatively impacted by the latency introduced in the communications by inserting an ESP and its controls. This time-sensitivity exclusion does not apply to SCADA communications which typically operate on scan rates of 2 seconds or greater. While technically time-sensitive, SCADA communications over routable protocols can withstand the delay introduced by electronic access controls. Examples of excluded time-sensitive communications are those communications which may necessitate the tripping of a breaker within a few cycles (sub-second response times) to protect BES assets. The SDT intent is a Responsible Entity using this technology is not expected to implement the electronic access controls in a situation where it would prohibit the proper function in the proper timeframe.

Requirement R1 Part 1.3:

Rationale

It is important to note that Requirement Part 1.2 is scoped to the Applicable Systems protected by (inside) the ESP while Requirement Part 1.3 is scoped to protect the Management Interface of the Cyber Assets creating and controlling the ESP and thus not protected by the ESP itself. These different scopes show the need for separate Requirements Parts. In addition, the separation into different Requirement Parts prevents a recursive requirement. Otherwise, each EACMS would require an EACMS creating an impossibility to implement.

The objective of this new Requirement Part is to protect ESP configurations and SCI configurations. The intent is preventing unauthorized changes to these important configurations by controlling what can connect to administrative interfaces for SCI and certain EACMS.

This can be done by permitting only needed communications to the Management Interfaces, denying all other communications, of the systems that are providing protection of BCS; namely SCI that is supporting an Applicable System from Part 1.1 (SCI isolates systems of different impact levels from each other) and certain EACMS that are controlling an ESP. This Requirement Part only applies to SCI and EACMS controlling an ESP, and not to the BCS itself).

These are vital controls performing the isolation/segmentation between systems of differing impact levels, and warrant protection of the Management Interface that could be used to compromise them.

Certain EACMS that can control access to an ESP are subject to this requirement. This includes those EACMS such as a firewall that is controlling an ESP, a centralized station administering firewalls controlling ESPs as well as a network switch configured with VLANs to isolate and segment traffic. These certain EACMS will need to have their Management Interfaces protected. The SDT intended to exclude EACMS not associated with control and ESP such as domain controllers that provide only authentication services. The SDT is aware of possible implementations where an authentication server is used to provide real-time control of ESP access on a per user basis. In these situations, the authentication server does fall within scope of an EACMS that controls access to an ESP.

The ‘per system capability’ is included in this Part in recognition that some Management Interfaces, such as “ILO” interfaces, may do inbound but not outbound traffic controls.

Requirement R1 Part 1.4:

Rationale

The SDT included “SCI supporting an Applicable System in this Part” to the scope of the requirement part to ensure that controls regarding Dial-up Connectivity are also applicable to VCAs and SCI; and ‘technical feasibility’ has been replaced with the ‘per system capability’.

Additionally, in order to maintain a decipherable Applicable Systems column, the SDT replaced the scoping phrase “with Dial-Up Connectivity” from the Applicable Systems column, with a reference to “if any” in the Requirement Language.

Requirement R1 Part 1.5:

Rationale

Known or suspected malicious communication detection is specific to routable protocol based traffic that enters or leaves the required ESP. Products available to implement this malicious communication detection are usually based on IP traffic (as defined in RFC 791 and upon which TCP and UDP reside). The SDT intended to exclude other data center communications protocols currently in use such as Fibre Channel, where it would not be possible to meet this requirement.

The requirement applicability was changed to the ESP instead of EAPs; lifting it to an objective level and keeping it from being a prescriptive ‘where’ that forces certain architecture. These protections at the ESP level do not preclude entities from accomplishing the security objective by implementing controls at the EAP level, but offer entities the flexibility to implement other methods at the ESP level.

The SDT considered adding SCI to the Applicable Systems; however, chose not to do so as this functionally may be provided by SCI, thus resulting in a recursive requirement issue. Note that the Management Interfaces of SCI are protected by Requirement R1.3. Entities may wish to implement malicious communications detection on these Management Interfaces of SCI.

Requirement R1 Part 1.6:

Rationale

Requirement R1 Part 1.6 was written to address the issue of “Super ESPs” with high or medium impact BCS at Control Centers that extend a single ESP beyond one PSP. This often applies to virtualized Control Center environments that implement network adjacency to allow workloads to automatically move from one physical location to another to increase BCS resiliency between primary and backup Control Centers.

The security objective is to protect the confidentiality and integrity of the data traversing communication links used to span a single ESP between multiple PSPs. This is especially important when portions of the transport are not within the Registered Entity’s control. Many encryption methods (such as IPSec and TLS) can fulfil this objective; however, some encryption methods fall short of providing both confidentiality and integrity controls.

This Requirement Part works in conjunction with the new 4.2.3.3 exemption in the CIP standards that exempts the Cyber Systems associated with such communication links since the data is required to be protected per this requirement. Also, the former CIP-006-6, Requirement R1, Part 1.10 has been removed and incorporated into this new 1.6 requirement part; consolidating the protections of an ESP and its components that extend outside of a PSP within one standard.

Communications equipment associated with communications links (e.g., equipment belonging to carriers) is exempted from the CIP standards with the 4.2.3.2 exemption. However that only applies to equipment between discrete ESPs. In this extended ESP situation where a single ESP spans multiple sites or PSPs, that exemption does not apply and the potential exists for data to traverse a connection that uses third-party communications equipment that is unprotected inside an ESP; hence the need to enforce confidentiality and integrity controls (such as encryption) on the data that traverses PSPs while within the same ESP to isolate any protected data from access through the communications equipment.

This consolidation also incorporates cabling and non-programmable communication components that are not PSP-protected, intending to protect data moving across the state as well as data traversing cabling that crosses the hall outside of the PSP. Note: the language specifically exempts the data that falls under CIP-012 Requirements in order to avoid the potential for double jeopardy as well as the time-sensitive protection or control functions as described in CIP-005-8 Requirement R1 Part 1.1 above.

The SDT had considered adding SCI to the Applicable Systems; however, chose not to do so as this functionality may be provided by SCI, thus resulting in a “hall of mirrors” issue.

Requirement R2:

General Considerations for Requirement R2.

External Routable Connectivity (ERC) and Interactive Remote Access (IRA)

The ERC and IRA definitions have been updated in order to:

1. Incorporate new models such as Zero Trust where a security perimeter is not necessarily a network perimeter and ESPs become very granular based on policies that can be established at “people to resource” levels rather than IP address levels.
2. Recognize those Cyber Systems that are of an increased risk due to their “reachability” via ERC and that have IRA available to them even if they are serial-only, non-routable devices.
3. Continue to limit scope of Requirement Parts to BCS with ERC and not those that have connectivity such as non-routable serial leased circuits.

The V5TAG transfer document in the SDT’s scope includes the issue of a BES Cyber Asset (BCA) that only uses non-routable protocols over a serial port. These BCAs are not connected to a network with a routable protocol themselves and therefore can be considered to not be within an ESP and thus not have ERC. However, these BCAs can have interactive user access using those serial connections. The SDT’s intent is to clarify that IRA can occur to a device with only a serial, non-routable connection through IP-to-serial conversions and be subject to CIP-005-8 Requirement R2. For example, the intent is to clearly cover situations where a serial-only, non-routable BCA, such as a digital relay in a substation, has its serial communication from a ‘console port’ converted to IP or other routable protocols thus allowing IRA from users outside the substation to use a routable protocol to interact with the serial device and to require the CIP-005-8 Requirement R2 protection for that IRA.

Due to the inclusion of serial based connections into the revised definition of IRA, other CIP requirements (i.e., CIP-004) have been revised to conform. Entities should review serial/IP converters that are currently being used for remote access.

The SDT removed the requirement-style language “The Intermediate System must not be located inside the Electronic Security Perimeter” from the Intermediate System definition in favor of a clarified objective in CIP-005-8 Requirement R2 that all IRA must be *through* an Intermediate System. Requirement R2 Part 2.6 was added to objectively address the location of the Intermediate System.

See the “*CIP Definitions and Exemptions Technical Rationale*” document for further explanation of the changes to the R2 related definitions.

Requirement R2 Part 2.1:

Rationale

Applicable Systems was updated to include SCI to ensure the same safeguards for remote access methods exist for SCI supporting an Applicable System within the Part as they do for the high and medium impact BCS and associated PCA hosted on that SCI. Backwards compatibility is retained for entities that do not use SCI. Please note that there may be situations where an Intermediate System is implemented as a VCA on SCI. The SDT intends that applicability for SCI is to ensure that the objectives of Requirement R1.3 are met such that the Management Interfaces of SCI are appropriately protected. VCAs are not considered part of SCI and therefore could be used to access a Management Interface of SCI.

The requirement language was simplified, and definitions for IRA and Intermediate System have been updated. Please note that the definition of IRA was changed to include serial communications that are converted to/from routable protocols by the Responsible Entity. This change maintains backwards compatibility except where serial connectivity and routable protocol conversion is being used for IRA.

Requirement R2 Part 2.2:

Rationale

The “Applicable Systems” scope was changed to “Intermediate Systems used to access Applicable Systems in Part 2.1”. This clarifies this requirement is associated with the IRA communications between an Intermediate System and the remote clients, as opposed to between the Intermediate System and the BCS. This is important so that it does not require encryption through the ESP to the BCS which would hinder monitoring and inspection.

The requirement was changed from a specific technical-based requirement for encryption to an objective-based requirement to protect confidentiality and integrity of the IRA session between the Intermediate System and the remote client (with encryption as a primary example). The proposed language accounts for the possibility that other equally effective methods could be developed and deployed. This objective also keeps methods from being used that are merely obfuscation methods (XOR, ROT13, etc.) or deprecated encryption methods (DES with 56-bit keys) that no longer meet the objective to protect the confidentiality and integrity of the IRA session.

The changed requirement is backwards compatible except where deprecated encryption methods are in use.

Requirement R2 Part 2.3:

Rationale

Applicable Systems was changed to “Intermediate Systems used to access Applicable Systems of Part 2.1”. This clarifies this requirement is associated with the Intermediate System itself, and where the requirement for multifactor authentication should be applied (multi-factor authentication to the Intermediate System).

Note that the wording of the requirement was updated to specially apply to IRA communications between the initiating Cyber Asset or Virtual Cyber Asset and the Intermediate System. This was previously implied.

Requirement R2 Part 2.4 – 2.5:

Rationale

The applicability and requirements have not changed.

Requirement R2 Part 2.6:

Rationale

This is a new requirement that applies to Intermediate Systems. The intent of this new requirement is to further protect the BCS from the Intermediate System by reducing the attack surface between the two. It is important to note that a virtualized Intermediate System (VCA) hosted in such a way that it can share CPU and share memory with a BCS will also meet the definition of PCA and become an ‘associated PCA’ of the BCS. CIP-005 R1.1 requires that PCA to be within an ESP, in conflict with this requirement. This is by design, and thus a VCA performing the function of an Intermediate System must not share CPU or memory with the BCS it is controlling access for. This is due to the access granted to the less trusted side of the Intermediate System and the risk for side-channel attacks to other VCAs sharing the same CPU and memory. Entities must therefore use affinity rules or some other means to keep Intermediate System VCAs from sharing the same CPU and memory as a BCS or its associated PCAs.

Figure 5 depicts an Intermediate System VCA where an affinity ruleset prevents the sharing of CPU or the sharing of memory with a BES System by ensuring these systems run on different on the hypervisor.

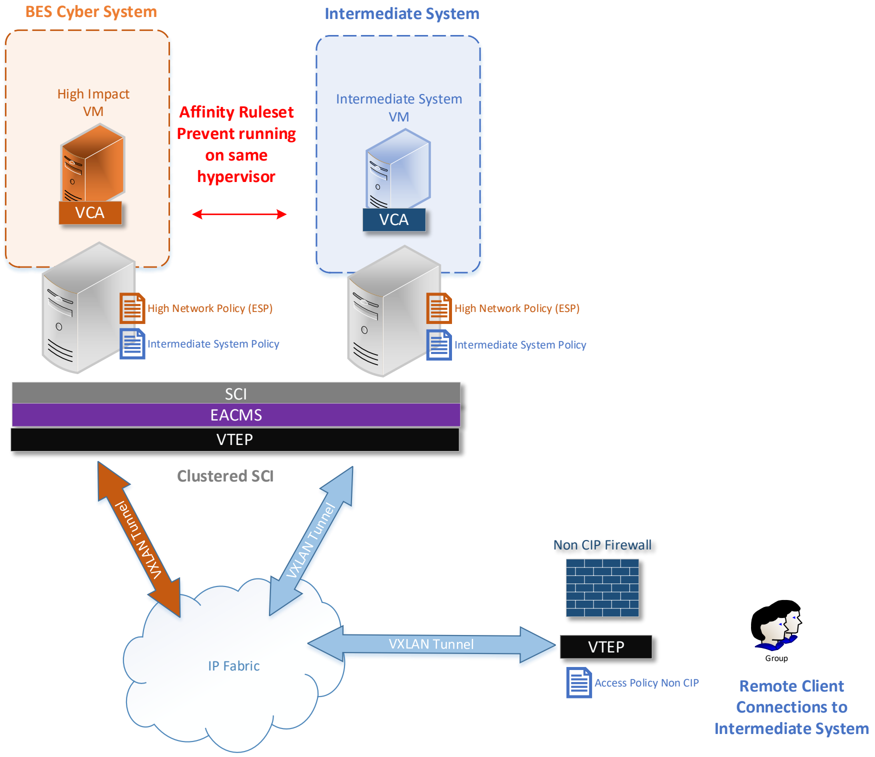

Figure 6 Affinity Rules - Intermediate System does not share CPU or share memory with BES Cyber Systems

Requirement R2 Part 2.7:

Rationale

This is a new requirement that applies to Intermediate Systems. The intent of this new requirement is to further protect the BCS from the Intermediate System by reducing the attack surface between the two. Intermediate Systems have an externally accessible interface that may be used by external parties such as vendors or entity support staff using IRA across an Internet connection to support a remote site. Since Intermediate Systems by nature provide IRA from a less-trusted network and are accessible from yet-to-be authenticated users (in order to authenticate them), a degree of separation from the higher-trust systems they are protecting is necessary in case the Intermediate System is compromised. Previously, this risk was addressed within the glossary definition of Intermediate System ("…must not be located inside the ESP") instead of within an actual requirement. The SDT removed this from the definition and included a security objective in CIP-005-8 Requirement R2 Part 2.7 to require that routable protocol communications between Intermediate Systems and Applicable Systems of Part 2.1 must be through an ESP.

It is important to note that the SDT does not intend to prescribe architecture to the point of what Cyber Asset or Virtual Cyber Asset a function may reside. For example, some "security appliances" that have firewall/EAP capability also have separate functionality within them that can perform part of the Intermediate System function. Historically this definition has stated "must not be located inside" which allowed for "outside or ON" the ESP. The SDT does not want to preclude architectures where at least some portion of the Intermediate System functionality may execute on the EAP.

Figure 7 depicts an Intermediate System running on non SCI infrastructure. Network connections from the Intermediate System to the BES Cyber Systems must pass through the ESP protecting those systems. In this case, access control policies, implemented on SCI are used to control network connections.

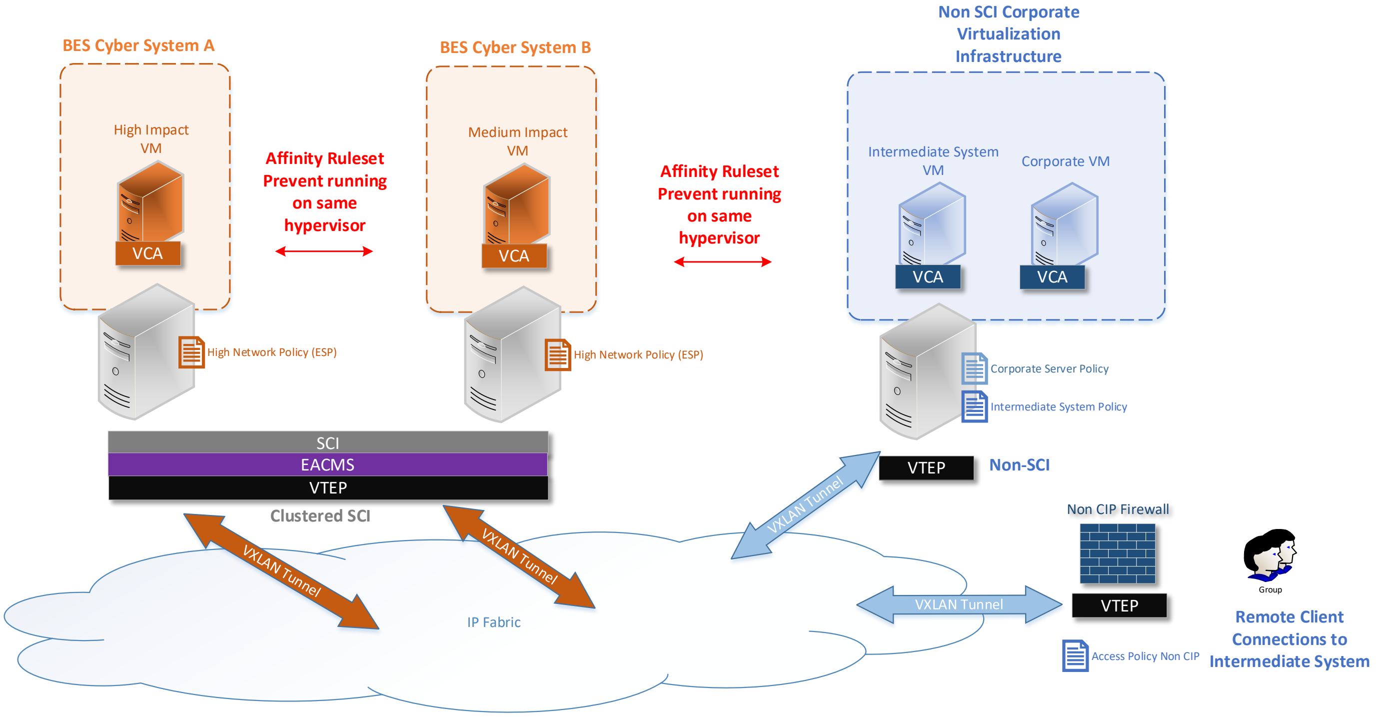

Figure 8 Intermediate System must connect through the Electronic Security Perimeter protecting the BES Cyber Systems

Requirement R3

Rationale

The Applicable Systems section of CIP-005-8 Requirement R3 was updated to include SCI to ensure the same safeguards for vendor-initiated remote connections exist for the applicable SCI. Backwards compatibility is retained for entities that do not currently use SCI.

Background Section from Reliability Standard CIP-005-7

The section 6. Background has been retired. removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BCS and require a minimum level of organizational, operational and procedural controls to mitigate risk to BCS.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BCS. For example, a single training program could meet the requirements for training personnel across multiple BCS.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicability Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.
- **High Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to high impact BES Cyber Systems with Dial-up Connectivity.
- **High Impact BES Cyber Systems with External Routable Connectivity** – Only applies to high impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to medium impact BES Cyber Systems with Dial-up Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Electronic Access Points (EAP)** – Applies at Electronic Access Points associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

Technical Rationale for Reliability Standard CIP-005-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-005-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-005-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in this Section that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Furthermore, Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of Bulk Electric System (BES) Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Updates to this document now include the Project 2019-03 – Cyber Security Supply Chain Risks Standard Drafting Team's (SDT's) intent in drafting changes to the requirements.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850 on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards to address Electronic Access Control or Monitoring Systems (EACMS), specifically those system that provide electronic access control or monitoring to high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-005-7 to require Responsible Entities to meet the directives set forth in the Commission's Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

Additionally, the Project 2019-03 SDT removed Interchange Coordinator or Interchange Authority as that registration has been retired.

New and Modified Terms Used in NERC Reliability Standards

CIP-005-7 uses the following definition(s), which are cited below for reference when reading the technical rational that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1

General Considerations for Requirement R1

The ESP serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network-based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R1

CIP-005-5, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP. However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, then each Cyber Asset of the low impact BES Cyber System are "Associated Protected Cyber Assets" of the high impact BES Cyber System and must meet all the requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero-day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communication to that known range. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rouge connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R2

General Considerations for Requirement R2

Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources should only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords.

But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Requirement R3

Requirement Part 3.1 and Part 3.2 Vendor Remote Access Management for EACMS and PACS

The 2019-03 SDT added Requirement R3 to contain the requirements for all types of vendor remote access management for EACMS and PACS (i.e., system to system, user to system). EACMS were added based on FERC order 850 paragraph 5 where FERC ordered NERC to create a drafting team to add these devices. EACMS were added based on the risks FERC noted in paragraph 4, where a Department of Homeland Security Industrial Control System-Cyber Emergency Response Team (DHS ICS-CERT) said firewalls (normally defined as an EACMS) is the “first line of defense within an Industry Control System (ICS) network environment”. The compromise of those devices that control access management could provide an outsider the “keys to the front door” of the ESP where BES Cyber Systems reside. An intruder holding the “keys to the front door” could use those “keys” to enter the ESP or modify the access controls to allow others to bypass authorization.

In Requirement R3 Part 3.1 and Part 3.2, the word "connection" is the mechanism for a user or a system to interact with an EAMCS or PACS for the purpose of authenticating.

In Requirement R3 Part 3.1 and Part 3.2, the word "authenticate" is the mechanism for the EACMS or PACS to identify the user or device. This permits the EACMS or PACS to first perform its function to authenticate the user or device that is connecting, which in turn permits the entity to delineate or differentiate vendor-initiated connections from other remote access connections. This new proposed language is not prescriptive as to how authentication must occur to permit administrative and technical methods.

In Requirement R3 Part 3.2, the word "control" provides the entity flexibility to allow the vendor to reconnect under a specific set of conditions, established by the entity, where the reconnection is necessary to support critical operations of the entity. If the entity determines that they do not want to allow or does not need to allow a reconnection they can employ means to stop any reconnection.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability

Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Since remotely compromised PACS still require physical presence to exploit BES Cyber Systems, the SDT conducted extensive dialogue and considerations for the addition of PACS. The SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warranted their inclusion as an applicable Cyber Asset. Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. addresses the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks*"[1].

NERC's final report on "*Cyber Security Supply Chain Risks*", states on page 4, "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." PACS are intended to manage physical threats to BES Cyber Systems, thus protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks*" that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical accesses or monitoring controls that have not been compromised in order to gain access." While a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it could demonstrate a threat Actor's intention to gain fully unauthorized electronic access.

While other Reliability Standards mitigate certain security risks relating to PACS none address supply chain risk. Based on this analysis the SDT included PACS within the applicable section of both Requirement Parts 3.1 and 3.2.

An additional aspect of the NERC Supply Chain Report, the SDT considered was the risk associated with the access control vs. access monitoring functions of both EACMS and PACS. While both types of systems, under the current definitions, have various functional activities they perform, the NERC Supply Chain Report pointed to the increased risk of the access control function beyond the access monitoring function. The SDT considered limiting the scope of the requirements to only those access control functions, however chose to stay with the currently approved definition of both EACMS and PACS. The SDT concluded staying with approved definitions would introduce less confusion. Additionally, an attempt to change the EACMS and PACS definition was outside the 2019-03 SAR.

Entities may or may not allow remote access into any of its systems, (BES Cyber Systems, EACMS or PACS), however if remote access is allowed, options to determine remote access connection(s) and capability to disable remote access connection(s) is required.

Technical Rational for Reliability Standard CIP-005-6

This section contains an as-is "cut and paste" of the former Guidelines and Technical Basis (GTB) from Reliability Standard CIP-005-6 Technical Rationale to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Furthermore, Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-5, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP. However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an “Associated Protected Cyber Asset” of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP.

Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually ‘command and control’ hosts on the Internet, or compromised ‘jump hosts’ within the Responsible Entity’s other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT’s intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity’s address space. The SDT’s intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and ‘deny by default’ type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run between two Cyber Assets. Without a clear ‘perimeter type’ security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions (“TFEs”) rather than increased security.

As for dial-up connectivity, the Standard Drafting Team’s intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
E*xplicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.*

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale for R2:

Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords.

But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)

This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Change Rationale: (Part 2.4 and 2.5)
Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. This scope covers all remote access sessions with vendors. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement. The objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

Technical Rationale for Reliability Standard CIP-006-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-006-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-006-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-006-7 to shorten applicability statements within the body of CIP standards by replacing some terms with the defined acronym for that term:

"BCS" has replaced "BES Cyber System".

"ERC" has replaced "External Routable Connectivity".

"PSP" has replaced "Physical Security Perimeter".

"PACS" has replaced "Physical Access Control Systems".

Requirement R1

Rationale

The SDT made conforming changes to Applicable Systems for virtualization such that protections must be afforded to SCI for relevant Requirement Parts.

<u>Applicable Systems</u>:
Requirement R1 Part 1.1-1.9: the SDT added "SCI supporting an Applicable System in this Part.

<u>Per System Capability vs Technical Feasibility</u>:
Requirement R1 Part 1.3: The SDT chose to remove the reliance on a Technical Feasibility Exception in favor of the updated term "per system capability."

<u>Consolidation</u>:
Requirement R1 Part 1.10: The SDT deleted Requirement R1 Part 1.10 from CIP-006-7 because requirements to protect the data traversing communication links used to span a single ESP between PSPs is incorporated into CIP-005-8 Requirement R1 Part 1.6.

Requirement R2

Rationale

The SDT has include the CIP Exceptional Circumstances within the main R2 requirement text so that it applies to all requirement parts.

The SDT made conforming changes to Applicable Systems for virtualization such that protections must be afforded to SCI for relevant Requirement Parts.

<u>Applicable Systems</u>:
Requirement R2 Part 2.1-2.3: the SDT added "SCI supporting an Applicable System in this Part"

Former Background Section from Reliability Standard CIP-006-6

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rationale for Reliability Standard CIP-006-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-006-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the PSP.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A logbook or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more PSPs, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, controls for a sole perimeter could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System, but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where these cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.

The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.

The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an “an equally effective logical protection” in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.

The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity’s BES Cyber Systems while not requiring controls to be implemented on third-party components when entities rely on leased third-party communications.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the PSP to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the PSP. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a PSP (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any PSPs protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

Technical Rationale for Reliability Standard CIP-007-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-007-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for CIP-007-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The V5TAG, which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale.pdf" for reference when reading the technical rationale that follows.

General Considerations

Requirement R1

General Considerations for Requirement R1

Shared Cyber Infrastructure (SCI) is mutually exclusive from BES Cyber System (BCS) by definition. To clarify treatment of virtualization concepts in CIP-007-7, the SDT added “SCI supporting an Applicable System in this Part”. This approach keeps the SCI applicability parallel to each existing variant of Applicable Systems in the same Requirement Part (i.e., Medium impact BCS vs. Medium impact BCS with External Routable Connectivity (ERC) vs. Medium impact BCS at Control Centers etc.)

Change Rationale Requirement R1:

The SDT has changed the name of the R1 table to “System Hardening” to clearly reflect the security objective of the entries in the table, which is to reduce a systems’ attack surface. The parts of this requirement do this by:

- limiting network access to only needed routable protocol network accessibility (i.e., logical ports or services),
- limiting access to physical I/O ports (i.e., USB, network, console ports) to only what is necessary, and
- limiting the shared hardware (CPU and memory resources) attack surface between certain groups of VCAs on SCI.

As R1 is broader than only ports and services, the table name was changed to reflect this. The SDT notes that this is merely a label on the Requirement Parts table, linking it to the main Requirement 1 language above it, and does not change or imply any other Requirements or Requirement Parts.

The SDT chose to include “SCI supporting an Applicable System in this Part” language in the Applicable Systems column of the requirement to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the Virtual Cyber Assets (VCA) used in applicable BCS, EACMS, PACS or PCA.

Change Rationale Requirement R1 Part 1.1: Requirement R1 Part 1.1 requires “disable or prevent unneeded routable protocol network accessibility on each Applicable System, per system capability”. The SDT updated the Requirement Part language to state a security objective concerning “*routable protocol network accessibility*” as opposed to “ports and services”. As this is a new phrase, the intent of this phrase with some examples and rationale for this change is as follows.

> ***Routable protocol network accessibility*** - The objective of this phrase in the Requirement Part is to reduce the attack surface on an applicable system by preventing any unnecessary accessibility to the system over a network using routable protocols. “Accessibility” as used in R1.1 is at the routable protocol network level and does not include physical access, logon to the physical console, code on TCA/RM, etc. Port numbers (TCP/UDP) are at times the best way to track this accessibility, at other times documenting enabled services is better. For example, reducing network accessibility in the physical underlay of SCI between hypervisors or on fabric-based networks may be best performed at a *services* level; turning off or disabling virtualization services that are not needed, rather than documenting the often proprietary and dynamic port numbers which may be of little value. However, in the overlay where an entity may be hosting a database server VCA, it may be easier to show that network accessibility on that VCA is limited to SQL server and remote admin enabled port numbers. In Zero Trust Architectures (ZTA), it may be neither ports or services, but instead a “user to tagged workload” level access control policy where accessibility is described and protected at a more granular, yet higher level than a port #, enforced at a Policy Enforcement Point (PEP) on the applicable system. The SDT has moved to this objective language to avoid prescribing only one way to perform and document network accessibility in all these various scenarios and implementations. In addition, it is limited to routable protocol network accessibility such that non routable network communications (e.g., SAN over Fiber Channel) do not fall within scope of the Requirement Part. The objective is to know the ways a system

can be accessed from the network via routable protocols and have no unnecessary attack surface from that perspective.

In this Requirement Part, the SDT used the verbs "Disable or prevent". In some cases, the entity may be able to disable a service or remove/uninstall software that is providing unneeded network accessibility to the applicable system. In other cases, the entity may not be able to disable a service, but can prevent access to it in another layer, such as the underlying OS with a host-based firewall, a PEP, or other means of filtering traffic. In instances where the entity can do neither (e.g., a firmware-based 'black box' device with limited configuration capabilities), the SDT chose to add 'per system capability' to make the requirement conditional on the ability of the applicable system to meet it, if the entity can show that it is incapable.

The SDT also added the clarifier "on each Applicable System" to indicate that the intent of this requirement is for an entity to perform the configuration actions ***on*** each Applicable System, hardening the system from its routable protocol network peers rather than having a single method such as an EAP network firewall rule that would disable such accessibility for a group of Applicable Systems on a network. In other words, merely filtering a port/service on a firewall at an ESP network boundary (CIP-005 R1 controls) does not meet the intent of CIP-007 R1.

Change Rationale Requirement R1 Part 1.3:

Requirement R1 Part 1.3 is a new requirement intended to apply security controls in Shared Cyber Infrastructure scenarios to mitigate the risk of hardware-based vulnerabilities between groups of Applicable Systems of differing impact categorizations. This requirement addresses these vulnerabilities at the CPU and memory level (e.g., Downfall, Inception, Spectre, Meltdown, Rowhammer) that could allow for compromise across processes simultaneously executing on the same shared hardware. Virtualization technology typically has "affinity" controls that can be used to tag VCAs by their impact category and then configure affinity rules such that hypervisors do not instantiate or move VCAs of differing trust levels to the same CPU or memory resources at the same time. Note the requirement excludes shared storage resources, although included in the definition of SCI. The SDT intent is it is allowable to have logical disks attached to systems of differing impact categorization stored in the same SAN for example, and since these storage solutions have internal CPU and memory, which is not the intended object of this requirement.

Note that the SCI definition covers *only* those portions of entity's virtualization infrastructure that support systems of differing impact levels. As VCAs that share the same CPU or memory with any part of the highest rated BCS are "Associated PCAs", this requirement is only needed to cover instances where different impact categorizations are supported and the entity wishes to keep other VCAs from becoming "associated PCAs', thus maintaining the separation by impact category. This may occur when part of the same SCI supports different BCS and the entity does not wish to high watermark all the BCS together, but instead employ affinity rules to prevent VCAs that are high or medium impact from being instantiated or moved to CPU and memory resources where other VCAs are executing.

For example, this requirement would apply where the same SCI supports both a high impact BCS on one part of a virtualization cluster and a low impact BCS on a different part of the virtualization cluster. The proper use of host affinity controls would not require the low impact BCS to be considered an "associated PCA" of the high as long as:

1. the low impact BCS is not in the ESP of the high impact BCS, and
2. controls are in place to prevent the SCI from executing these BCS on the same CPU and memory resources.

As an example, if an entity has a substation intelligent electronic device (IED) management system that is used as an EACMS for medium and low impact BCS in a single VCA, it is an associated EACMS of the medium impact BCS and protected as such. It can therefore execute on hypervisors with other medium or high impact BCS. If it is implemented as two separate VCAs, one for medium impact IEDs and another for low impact IEDs, then the low impact one cannot execute on the same hypervisor as the medium impact one, unless it is categorized as an "associated PCA" of the medium BCS as well. If the entity wishes to have it remain as low impact those two VCAs sharing the same CPU or memory resources would not meet this requirement. In situations where high or medium impact VCAs are allowed to execute on the same CPU or memory resources with VCA's of other impact levels and those other VCA's are inadvertent PCAs, this requirement is a single place for that violation rather than every requirement that has PCA in the scope.

Requirement R2

Change Rationale Requirement R2:

The SDT chose to include the "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA(s) used in applicable BCS, EACMS, PACS or PCA.

The SDT made conforming changes where necessary with Requirement R2 to remove reliance on the Cyber Asset term, choosing to reference the Applicable Systems instead.

Additionally, the SDT chose to insert the word "cyber" as a clarifier to security patches for consistency with the term used in R2.1.

Backward Compatibility

CIP-007-7 Requirement R2 retains backward compatibility for entities that do not utilize SCI.

The SDT intends that entities take full advantage of their virtualization infrastructure in order to ease the overhead associated with patch management. While many of the entity's existing processes will remain the same, (such as those associated with tracking the source of cyber security patches, evaluation of the applicability of available patches and mitigation plans for those applicable patches that cannot be installed) new or modified processes around the installation of patches can be used (for example, parent images, remediation VLANs, etc.).

Parent Images

One of the interesting nuances of virtualization is the concept of parent/child relationships.

Some VCAs utilize a "parent image" type methodology where a specific VCA (operating system and software) is merely a child instance of a parent image. In such cases, the application of cyber security patches to the parent image applies those changes to any children instantiated from that image. As there may be many dynamic child instances, the administrative overhead associated with patching of those child instances can be greatly reduced. The intent is that entities would track and document the R2 cyber security patching requirements at the parent image level rather than attempting to track and document patching for each individual VCA instantiated from the parent image.

Dormant Instances

There are times when a VCA may not be in use and, as a virtual instance, may be shut down to free its resources since it can be easily instantiated when needed. Thus, VCAs are unlike physical Cyber Assets that are up and running continuously and can receive applicable patches, software updates, configuration updates, etc.

Leveraging the built-in virtualization features allows idle resources to be reassigned to tasks at hand without incurring additional overhead of tracking which dormant virtual instances require patching. Dormant virtual instances are just files with the saved state of the VCA. Dormant instances are not VCAs themselves nor Applicable Systems until they become active instances again.

Where a dormant virtual instance is also the child instance of a parent image, the application of security patches to the parent image will also make the same changes automatically when needed to any out of date dormant child virtual instances when they are restarted.

In most cases, a dormant virtual child instance is made active again on a remediation type network where any missing security patches (compared to the parent image) are automatically applied before it is placed back into active service.

Saved Images

Similar to dormant child images, saved child images or snapshots may be also used as functional backups for CIP-009 purposes in order to provide fast restoration and better availability. If an active VCA becomes corrupted, a saved image can be made active where the application of any missing security patches (compared to the parent image) can be automatically applied, through remediation, before being placed back into active service. However, the SDT's intent is that VCA images that are used for backup purposes would not be subject to patching, as the backup may be needed to recover from a failed patch or if later discovered that a patch has negatively affected functionality.

Requirement R3

Change Rationale Requirement R3:

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCA.

Requirement R4

Change Rationale Requirement R4:

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCA.

Change Rationale Requirement R4 Part 4.1:

The SDT determined the entire structure of the "at the BCS level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability)" language could be simplified to "per system capability" since the Applicable Systems column clarifies what systems are included.

Additionally, the SDT chose to insert the word "security" as a clarifier to which events are to be logged.

Change Rationale Requirement R4 Part 4.2:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the "Cyber Asset" term, as well as the ambiguity that would have existed if the term "BES Cyber System" were left in place while the Applicability Column included SCI.

Change Rationale Requirement R4 Part 4.3:

The SDT clarified the retaining of applicable "security" event logs, as that is what is identified in Part 4.1.

The SDT also chose to remove the reliance on a TFE from Part 4.3 in favor of the updated term "per system capability". The SDT contends that the term still requires an entity to document the limit to the system's capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

Requirement R5

Change Rationale Requirement R5:

The SDT chose to include “SCI supporting an Applicable System in this Part” language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCAs.

Change Rationale Requirement R5 Parts 5.1, and 5.6 – 5.7:

The SDT chose to remove the reliance on TFE in favor of the updated term “per system capability”. The SDT contends that the term still requires an entity to document the limit to the system’s capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

Change Rationale Requirement R5 Part 5.4:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the “Cyber Asset” term, replacing it with a per “system” capability.

Change Rationale Requirement R5 Part 5.5:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the “Cyber Asset” term, replacing it with a reference to the Applicable Systems.

Former Background Section from Reliability Standard CIP-007-6

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicability Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rationale for Reliability Standard CIP-007-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-007-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

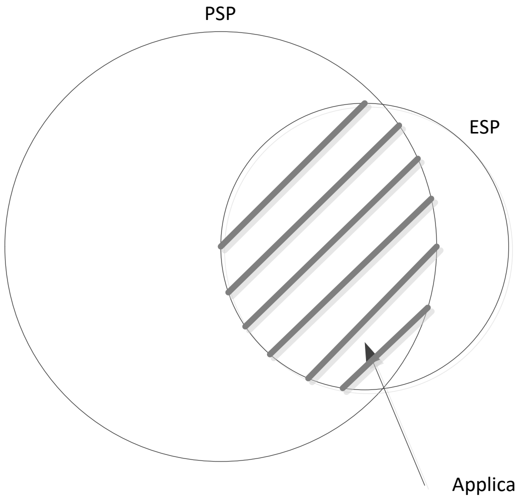
- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:

Location of Nonprogrammable Communication Components



Applicability of CIP-007-6 R1, Part 1.2 for Nonprogrammable Communication Components

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media (“transient devices”) in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement, but do not meet, the additional obligations for transient devices.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System’s ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a ‘false positive’ could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of Removable Media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC’s reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity’s control (i.e. as part of the telecommunication carrier’s network).

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

Technical Rationale for Reliability Standard CIP-008-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-008-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-008-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1 – Requirement R4

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-008-6 to align incident reporting and response planning requirements with the virtualization changes and protections for Shared Cyber Infrastructure (SCI) by adding "SCI supporting an Applicable System in this Part" to each of the Parts in Applicable Systems for Requirement R1 – Requirement R4.

Requirement R4

Rationale

The Project 2016-02 SDT made updates to reflect the change from the National Cybersecurity and Communications integration Center (NCCIC) to its successor organization Cybersecurity & Infrastructure Security Agency (CISA), and deleted the historical footnote in favor of deference to the Requirement language, which already states "or their successors".

Former Background Section from Reliability Standard CIP-008-6

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-008 exists as part of a suite of CIP Standards related to cyber security. CIP-002 requires the initial identification and categorization of BES Cyber Systems. CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010, and CIP-011 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a particular subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST")

Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.

High Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.

Medium Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.

Technical Rationale for Reliability Standard CIP-008-6

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-008-6. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. It also contains information on the Standard Drafting Team's (SDT's) intent in drafting the requirements. This Technical Rationale and Justification for CIP-008-6 is not a Reliability Standard and should not be considered mandatory and enforceable.

On July 19, 2018, the Federal Energy Regulatory Commission (FERC or Commission) issued Order No. 848. In this Order FERC directed the North American Electric Reliability Corporation (NERC) to "develop and submit modifications to the Reliability Standards to require the reporting of Cyber Security Incidents that compromise, or attempt to compromise, a responsible entity's Electronic Security Perimeter (ESP) or associated Electronic Access and Control or Monitoring System (EACMS)." (Order 848, Paragraph 1)

In response to the directive in Order No. 848, the Project 2018-02 SDT drafted Reliability Standard CIP-008-6 to require Responsible Entities to implement methods augmenting the mandatory reporting of Cyber Security Incidents to include: "(1) responsible entities must report Cyber Security Incidents that compromise, or attempt to compromise, a responsible entity's ESP; (2) required information in Cyber Security Incident reports should include certain minimum information to improve the quality of reporting and allow for ease of comparison by ensuring that each report included specified fields of information; (3) filing deadlines for Cyber Security Incident reports should be established once a compromise or disruption to reliable BES operation, or an attempted compromise or disruption, is identified by a responsible entity; and (4) Cyber Security Incident reports should continue to be sent to the Electricity Information Sharing and Analysis Center (E-ISAC), rather than the Commission, but the reports should also be sent to the Department of Homeland Security (DHS) Industrial Control System Cyber Emergency Response Team (ICS-CERT)." (Order 848, Paragraph 3)[1]

New and Modified Terms Used in NERC Reliability Standards

CIP-006-6 uses the following definition(s), which are cited below for reference when reading the technical rationale that follows.

Proposed Modified Terms:

Cyber Security Incident

A malicious act or suspicious event that:

- *For a high or medium impact BES Cyber System, compromises, or attempts to compromise the, (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, or (3) an Electronic Access Control or Monitoring System; or*
- *Disrupts, or attempts to disrupt, the operation of a BES Cyber System.*

In response to FERC Order 848, Paragraph 1, the SDT modified the Cyber Security Incident definition to include Electronic Access Control or Monitoring Systems (EACMS) associated with high or medium impact BES Cyber Systems, in response to the Order.

The addition of high and medium impact BES Cyber Systems considers the potential unintended consequences with the use of the existing definition in CIP-003-7. It also provides clarity that only low impact BES Cyber Systems are

---

[1] The National Cybersecurity and Communications Integration Center (NCCIC) is the successor organization of the Industrial Control Systems Cyber Emergency Response Team (ICS-CERT). In 2017, NCCIC realigned its organizational structure and integrated like functions previously performed independently by the ICS-CERT and the United States Computer Emergency Readiness Team (US-CERT).

included within the definition. ESP or EACMs that may be defined by an entity for low impact BES Cyber Systems are not part of the definition.

An attempt to disrupt the operation of a BES Cyber System is meant to include, among other things, a compromise of a single BES Cyber Asset within a BES Cyber System. For example, malware discovered on a BES Cyber Asset is an attempt to disrupt the operation of that BES Cyber System.

Reportable Cyber Security Incident

A Cyber Security Incident that compromised or disrupted:

- *A BES Cyber System that performs one or more reliability tasks of a functional entity;*
- *An Electronic Security Perimeter of a high or medium impact BES Cyber System; or*
- *An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber Systems.*

The Reportable Cyber Security Incident definition was modified to comply with FERC Order 848. In response to Paragraph 54 of the Order, the SDT modified the definition to include incidents that compromised or disrupted an ESP or an EACMS. The team also added the qualifying clause for “A BES Cyber System that performs one or more reliability tasks of a functional entity” to clarify what was compromised or disrupted, thus not extending the scope to Protected Cyber Assets (PCAs). In response to comments, the SDT left the entire definition of BES Cyber system in Reportable Cyber Security Incident to provide clarity.

It is also important to understand the relationship between the two definitions, the requirement language, and how they work in concert to classify events and conditions at varied levels of significance as the Registered Entity executes its process and applies its defined criteria to determine if reporting is required.

Electronic Access Control or Monitoring Systems (EACMS)

The drafting team spent significant time discussing this topic among its members, through industry outreach, and with FERC staff. The team believes by not specifically referencing the five functions in Order 848, we have reduced complexity and made compliance with the Standard achievable. The drafting team asserts that the five functions are equivalent to the current definition of EACMS in the NERC Glossary of Terms. If entities have questions about application of the EACMS definition, the drafting team advises entities to discuss those questions directly with NERC.

Requirements R1, R2, and R3

General Considerations for Requirement R1, Requirement R2, and Requirement R3

FERC Order 848, Paragraph 1, directs modifications to Reliability Standards to require reporting of incidents that compromise, or attempt to compromise a responsible entity’s ESP or associated EACMS. The intent of the SDT was to minimize the changes within CIP-008 and address the required modifications. To do this, the SDT added “and their associated EACMS” to the “Applicable Systems” column for Requirements R1, R2, and R3.

To add clarity to “attempts to compromise,” the drafting team created Part 1.2.1 to require entities to establish and document their process to include criteria to evaluate and define attempts to compromise. This requirement maps to Requirement 4 Part 4.2, which requires entities to use that entity-defined process for determining which incidents entities must report.

The use of the language describing Cyber Security Incident(s) as being “an attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the ‘Applicable Systems’” column for the Part is meant to clarify which Cyber Assets are in scope for attempts to compromise reporting by entities. This language is used throughout the standard.

Moving Parts of Requirement R1 to Requirement R4

To minimize the changes to Requirement R1, the SDT created Requirement R4 and consolidated all the CIP-008-6 reporting requirements. The SDT deleted Requirement R1 Part 1.2 reporting requirements from CIP-008-5, and moved them to Requirement R4 for this purpose.

Inclusion of “Successor Organizations” throughout the Requirement Parts

The SDT recognizes that organizations are constantly evolving to meet emerging needs, and may re-organize or change their names over time. The ICS-CERT has completed its name change to the National Cybersecurity and Communications Integration Center (NCCIC) Industrial Control Systems. The E-ISAC previously re-branded its name and may again in the future. By following Requirement R4 references to E-ISAC and NCCIC with “or their successors” the SDT is ensuring that Requirement R4 can be implemented even if the names of E-ISAC and NCCIC change or a different agency takes over their current roles.

Requirement R4

General Considerations for Requirement R4

Requirement R4 is a new requirement focused on mandatory reporting of Reportable Cyber Security Incidents and includes attempts to compromise systems in the “Applicable Systems” column. Previously, CIP-008-5 defined reporting requirements for Reportable Cyber Security Requirements (Requirement R1 Part 1.2) only.

Required Reportable Incident Attributes

Requirement R4.1 specifies that initial notifications and updates must include three attributes: 1) functional impact, 2) attack vector used, and 3) level of intrusion achieved or attempted. These attributes are taken directly from the Order. (FERC Order No. 848, paragraph 89).

The SDT understands that some or all of these attributes may be unknown at time of initial notification. To account for this scenario the SDT included “to the extent known” in the requirement language. There is an expectation that update reporting will be done as new information is determined or unknown attributes become known by the entity. There could be cases, due to operational need, that all the attributes may never be known, if this case presents itself that information should be reported.

Methods for Submitting Notifications

Requirement R4 Part 4.2 allows responsible entities to submit notification using any method supported by E-ISAC and NCCIC. The SDT did not prescribe a particular reporting method or format to allow responsible entities’ personnel to focus on incident response itself and not the method or format of reporting. It is important to note the report must contain the three attributes required in Requirement R4 Part 4.1 as they are known, regardless of reporting method or format.

Notification Timing

Requirement R4 Part 4.2 specifies two timelines for initial notification submission; one hour for Reportable Cyber Security Incidents; and end of next calendar day for attempts to compromise systems in the “Applicable Systems” column. Paragraph 3 of FERC Order No 848 directly states that reporting deadlines must be established. Paragraph 89 further states that “timelines that are commensurate with the adverse impact to the BES that loss, compromise, or misuse of those BES Cyber Systems could have on the reliable operation of the BES.”

- *Reportable Cyber Security Incidents* – The SDT wrote Requirement R4 Part R4.2 to use a one hour deadline for reporting of these events because incidents in this category include successful compromise of ESP(s), EACMS, or BES Cyber System(s). One hour is referenced directly in FERC Order No 848 paragraph 89 and is also the current reporting requirement in CIP-008-5.
- *Cyber Security Incident that was an attempt to compromise one or more systems identified in the “Applicable Systems” column* - Due to the lower severity of these unsuccessful attempts at compromising ESP(s), EACMS, or BES Cyber System(s), the SDT proposed a longer reporting timeframe. The intent behind

> the decision to add "By the end of the next calendar day" (11:59 pm local time) was to give responsible entities additional time to gather facts prior to notifications for the less severe attempts to compromise Applicable Systems. It is important to note that compliance timing begins with the entity's determination that attempt to compromise meets the process they defined in Requirement R1 Part 1.2.1.

The SDT understands initial notification may not have all the details when first submitted. It is expected, however, that information that has been determined is reported within the notification deadlines. Additionally, it is important to note the wording in Requirement R4 Part 4.2. The "compliance clock" for the report timing begins when the Responsible Entity executes its process from Requirement R1 Part 1.2.1 and a determination has been made that the type of incident which has occurred qualifies as reportable.

Technical rationale taken from the Guidelines and Technical Basis (GTB) CIP-008-5 Requirement 1 provides additional justification for the SDT to maintain the one hour timeframe for Reportable Cyber Security Incidents.

> *"The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report."*

In 2007, the Electricity Information Sharing and Analysis Center (E-ISAC) was known as the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). Its voluntary procedures required the reporting of a cyber-incident within one hour of an incident. CIP-008-1 required entities to report to the ES-ISAC.

In FERC Order No. 706[2] (July 18, 2008), the Commission concluded that the one-hour reporting limit was reasonable [P 663]. The Commission further stated that it was leaving the details to NERC, but it wanted the reporting timeframe to run from the "**discovery**" of the incident by the entity, and not the actual **"occurrence"** of the incident [P 664].

CIP-008-2 and CIP-008-3 were silent regarding the required timeframe for reporting, but it was specifically addressed in CIP-008-5. In the October 26, 2012, redlined version of CIP-008-5, the proposed language for initial notification originally specified "one hour from **identification**" of an incident. This aligned with the Commission's decision in Order No. 706, for the clock to start with the discovery of an incident. However, the Standard Drafting Team changed "one hour from identification" to "one hour from the **determination** of a Reportable Cyber Security Incident". This language was subsequently approved and incorporated into CIP-008-5.

These changes, from "occurrence" to "discovery" to "determination," provide the additional time needed for the entity to apply its specifically created process(es) for determining whether a Cyber Security Incident rises to the level of required reporting. This determination timeframe may include a preliminary investigation of the incident which will provide useful information to other entities to help defend against similar attacks.

Notification Updates

Requirement R4 Part 4.3 requires that Responsible Entities submit updates for the required attributes upon determination of new or changed attribute information, if any. The SDT added this language to provide entities sufficient time to determine attribute information, which may be unknown at the time of initial notification, and which may change as more information is gathered. The intent of Requirement R4 Part 4.3 is to provide a method for Responsible Entities to report new information over time as their investigations progress. NOTE: The SDT does not

---

[2] 2008, Federal Energy Regulatory Commission, Mandatory Reliability Standards for Critical Infrastructure Protection, Order No. 706.

intend updates specified in Requirement R4. Part 4.3 to expose responsible entities to potential violations if, for example, initial and updated notification on the same attribute have different information. This is expected since knowledge of attributes may change as investigations proceed. Rather, the intent of Requirement R4 Part 4.3 is to have a mechanism to report incident information to E-ISAC and NCCIC (and thereby industry) upon determination of each required attribute.

The intent is that the entity report what is known and document the reason not all attributes could become known and ultimately be reported in conditions where, e.g. a Cyber Asset was restored completely, removing all forensic evidence in order to restore operations, which caused the entity to conclude its investigation without having a complete knowledge of the three required attributes.

The SDT asserts that nothing included in the new reporting Requirement R4, precludes the entity from continuing to provide any voluntary sharing they may already be conducting today.

Technical Rationale for Reliability Standard CIP-008-5

This section contains the Guidelines and Technical basis as a "cut and paste" from CIP-008-5 standard to preserve any historical references.

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report.

Requirement R2:

Requirement R2 ensures entities periodically test the Cyber Security Incident response plan. This includes the requirement in Part 2.2 to ensure the plan is actually used when testing. The testing requirements are specifically for Reportable Cyber Security Incidents.

Entities may use an actual response to a Reportable Cyber Security Incident as a substitute for exercising the plan annually. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or full operational exercise.

In addition to the requirements to implement the response plan, Part 2.3 specifies entities must retain relevant records for Reportable Cyber Security Incidents. There are several examples of specific types of evidence listed in the measure.

Requirement R3:

This requirement ensures entities maintain Cyber Security Incident response plans. There are two requirement parts that trigger plan updates: (1) lessons learned from Part 3.1 and (2) organizational or technology changes from Part 3.2.

The documentation of lessons learned from Part 3.1 is associated with each Reportable Cyber Security Incident and involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the incident in recognition that complex incidents on complex systems can take a few days or weeks to complete response activities. It is possible to have a *Reportable Cyber Security Incident* without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the *Reportable Cyber Security Incident*.

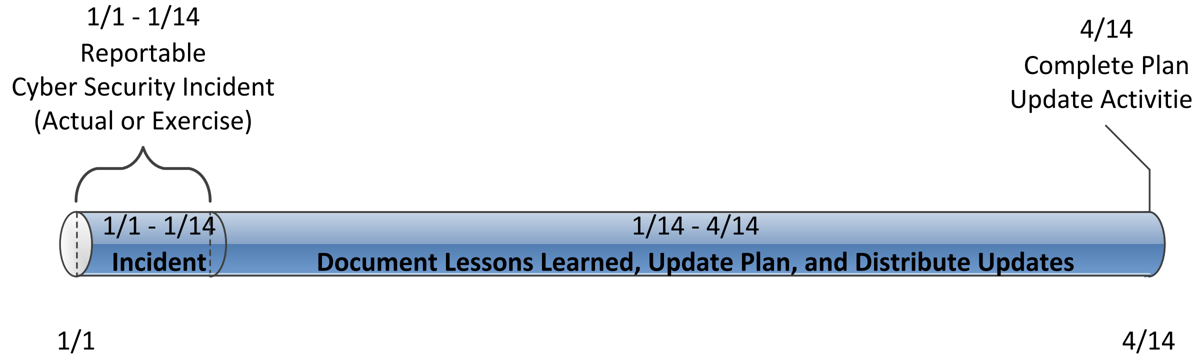

Figure 1: CIP-008-5 R3 Timeline for Reportable Cyber Security Incidents

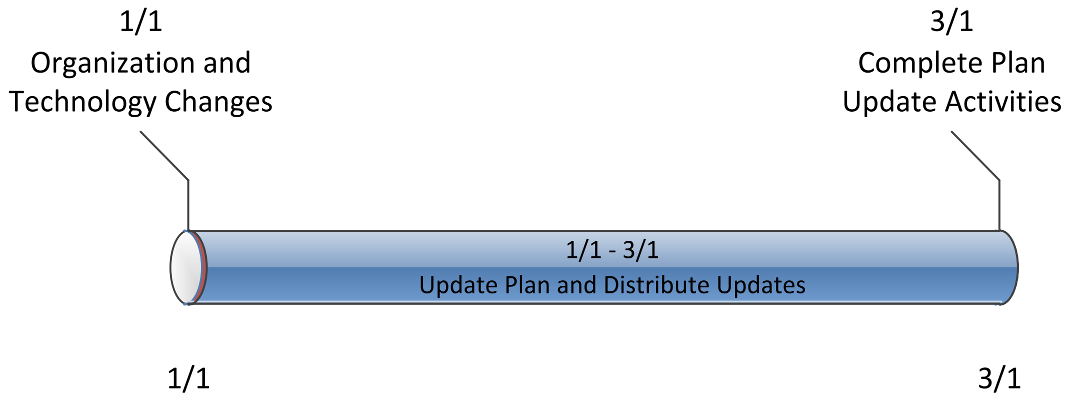
The activities necessary to complete the lessons learned include updating the plan and distributing those updates.

The plan change requirement in Part 3.2 is associated with organization and technology changes referenced in the plan and involves the activities illustrated in **Error! Reference source not found.**, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals.

Figure 2: Timeline for Plan Changes in 3.2



Rationale for R1:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned incident response capability is therefore necessary for rapidly detecting incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services.

Summary of Changes: Wording changes have been incorporated based primarily on industry feedback to more specifically describe required actions.

Reference to prior version: (Part 1.1) CIP-008, R1.1

Change Description and Justification: (Part 1.1)
"Characterize" has been changed to "identify" for clarity. "Response actions" has been changed to "respond to" for clarity.

Reference to prior version: (Part 1.2) CIP-008, R1.1

Change Description and Justification: (Part 1.2)
Addresses the reporting requirements from previous versions of CIP-008. This requirement part only obligates entities to have a process for determining Reportable Cyber Security Incidents. Also addresses the directive in FERC Order No. 706, paragraphs 673 and 676 to report within one hour (at least preliminarily).

Reference to prior version: (Part 1.3) CIP-008, R1.2

Change Description and Justification: (Part 1.3)
Replaced incident response teams with incident response "groups or individuals" to avoid the interpretation that roles and responsibilities sections must reference specific teams.

Reference to prior version: (Part 1.4) CIP-008, R1.2

Change Description and Justification: (Part 1.4)
Conforming change to reference new defined term Cyber Security Incidents.

Rationale for R2:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. This requirement ensures implementation of the response plans. Requirement Part 2.3 ensures the retention of incident documentation for post event analysis.

This requirement obligates entities to follow the Cyber Security Incident response plan when an incident occurs or when testing, but does not restrict entities from taking needed deviations from the plan. It ensures the plan represents the actual response and does not exist for documentation only.

Summary of Changes: Added testing requirements to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System.

Reference to prior version: (Part 2.1) CIP-008, R1.6

Change Description and Justification: (Part 2.1)
Minor wording changes; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-008, R1.6

Change Description and Justification: (Part 2.2)
Allows deviation from plan(s) during actual events or testing if deviations are recorded for review.

Reference to prior version: (Part 2.3) CIP-008, R2

Change Description and Justification: (Part 2.3)
Removed references to the retention period because the Standard addresses data retention in the Compliance Section.

Rationale for R3:

Conduct sufficient reviews, updates and communications to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System. A separate plan is not required for those requirement parts of the table applicable to High or Medium Impact BES Cyber Systems. If an entity has a single Cyber Security Incident response plan and High or Medium Impact BES Cyber Systems, then the additional requirements would apply to the single plan.

Summary of Changes: Changes here address the FERC Order 706, Paragraph 686, which includes a directive to perform after-action review for tests or actual incidents and update the plan based on lessons learned. Additional changes include specification of what it means to review the plan and specification of changes that would require an update to the plan.

Reference to prior version: (Part 3.1) CIP-008, R1.5

Change Description and Justification: (Part 3.1)
Addresses FERC Order 706, Paragraph 686 to document test or actual incidents and lessons learned.

Reference to prior version: (Part 3.2) CIP-008, R1.4

Change Description and Justification: (Part 3.2)
Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the changes that would require an update.

Technical Rationale for Reliability Standard CIP-009-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-009-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-009-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition Advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1 – Requirement R3

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-009-7 to align recovery planning requirements with the virtualization changes and Shared Cyber Infrastructure (SCI).

The use of the term BES Cyber System has been replaced with “Applicable System” within the requirement language of Requirement R1 Part 1.3 and Requirement R2 Part 2.2 to align the requirement with the applicability for each Requirement Part.

Requirement R1 Part 1.5 has added ‘SCI supporting an Applicable System in this Part’ to the applicability. This requires that SCI be included in the process to preserve data, per system capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Having any SCI included in the forensics for a compromised applicable VCA, or the SCI itself, is the reason for the inclusion.

SCI is not specifically included in any other Requirement Parts of CIP-009, because CIP-009 focuses on the ability to recover the BCS functionality, which may or may not require recovery of SCI. The SDT has therefore not included SCI as a direct object of the other recovery plan Requirements and Parts. However, if recovery of the Applicable System’s functionality is dependent on recovery of any SCI, then the recovery plan(s) should include such dependencies.

Former Background Section from Reliability Standard CIP-009-6

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements.

An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

Technical Rationale for Reliability Standard CIP-009-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-009-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, “A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Tabletop exercises (TTX)] can be used to assess plans, policies, and procedures.”

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, “[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and ‘boots on the ground’ response (e.g., firefighters decontaminating mock victims).”

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

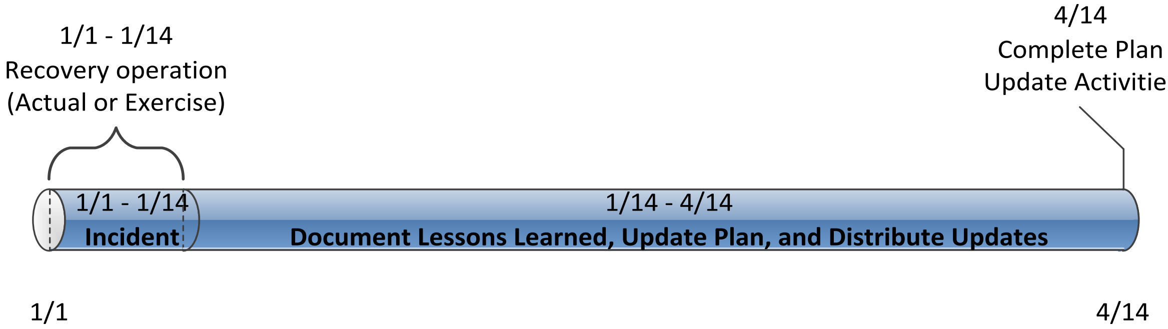

Figure 1: CIP-009-6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

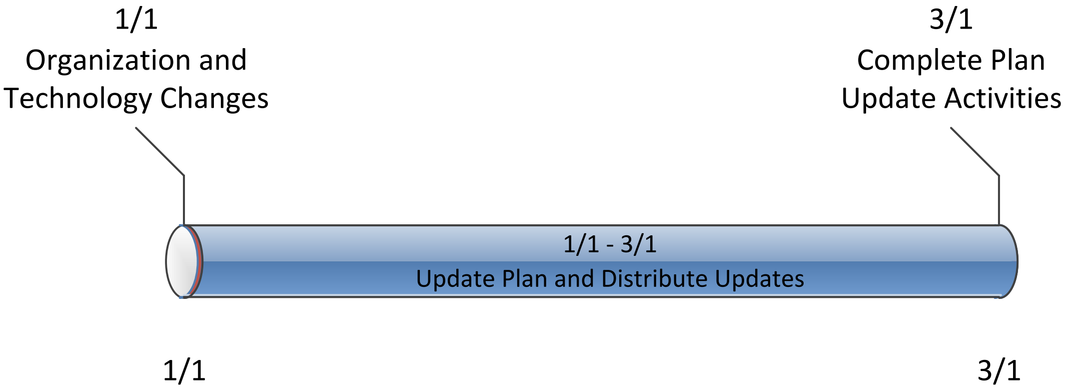

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

Technical Rationale for Reliability Standard CIP-010-5

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-010-5. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-010-5 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference.

Virtualization Concepts Driving CIP-010 Changes

The proposed changes in CIP-010-5 from the Project 2016-02 SDT concern the use of several facets of virtualization technologies. Virtualization allows for such technologies as new controls for Shared Cyber Infrastructure (SCI), remediation VLAN, containers, parent/child images, and dormant virtual machines (VMs). Enabling and clarifying the use of these technologies is the basis of the proposed changes in CIP-010-5. A general introduction to each of these technologies follows.

Shared Cyber Infrastructure (SCI)

Where entries elect to utilize "Shared Cyber Infrastructure", virtualization abstracts the software layers (the OS and applications) from the underlying hardware to allow the hardware infrastructure to be shared among several Virtual Cyber Assets (VCAs) that may be of differing impact levels. Hypervisors must include security controls to keep these workloads logically isolated from one another and those requirements are within other CIP standards such as CIP-005 and CIP-007. However, with any type of shared infrastructure, the need for change management requirements is elevated for those security controls that allow for the 'shared' in SCI. Such controls are added to the change management requirements in CIP-010-5. As discussed elsewhere, entities may choose to high watermark all VCAs executing in their virtualized infrastructure, known as the "all-in" scenario, and not be concerned with SCI specific requirements. They simply consider the underlay part of the highest impact BCS executing on it and comply with the appropriate security controls and requirements for it.

Remediation VLAN

Remediation VLAN is a term used to describe a logical network segment in which a Cyber Asset or VCA can be isolated from having routable connectivity to any BES Cyber Systems (typically only having visibility of remediation services such as patching and antimalware updates, etc.) while it is examined to ensure the integrity and validity of the configuration and software installed on it. After this examination and subsequent remediation of deficiencies is completed, it is then joined to its production network.

This examination is policy driven, meaning that the administrator is able to configure what the minimum requirements are for a successful examination. Examples of this might be minimum operating system patch levels or recent anti-virus definitions.

If during the examination of the asset, it is found to not comply with the requirements defined in the policy, an administrator may intervene to manually remediate the deficiencies, or the system which was used to examine the asset may communicate the deficiencies to the asset with instructions on how to remediate itself in an automated fashion. After the remediation actions are taken, the asset can request to be re-examined and if the requirements dictated by the policy are now met, it will be joined to its production network.

Containers (Application Containers)

Containers are a form of virtualization at an individual application level, bundling the application code and its runtime environment into a self-contained, sandboxed environment. The application can then be instantiated dynamically on one or multiple dynamic hosts. The benefit is it makes the application or logic as portable as possible and able to be instantiated as-is without modification on a developer’s workstation, a test environment, or a production data center without the notion of installing the application or the various runtime dependencies into a particular OS instance. This notion of applications no longer being installed into an OS has significant implications for previous versions of CIP-010 R1 which were based almost solely on a ‘baseline configuration’ of installed software. The images from which application containers are instantiated that meet the conditions of R1.1 should not be outside the scope of change authorization because they are not “installed” in a particular instance of an OS. To limit R1 to only “installed” software may leave out the way applications are beginning to be delivered in systems of today.

Parent/Child Images

When a VCA is ‘powered on’ or begins execution, it instantiates (“boots”) from a disk image file. Since the boot ‘disk’ is a file and not physical disk, many individual VCAs can use the same “parent” image as the basis for their own “child” image. Among other things, this allows for patching of an OS to occur to a parent image and the child images then pick up that patched image upon their next instantiation. A common use of parent/child images is Virtual Desktop Infrastructures (VDI) that deliver a temporary desktop environment to each remote user for the duration of their session that are VCAs instantiated from a parent image.

Dormant VMs

A VCA that is not currently executing or instantiated (i.e., not ‘booted up’) is a dormant VM. It exists not as a traditional VCA, but simply as a file. VCA’s can be created for specialized purposes such as to run troubleshooting tools and are only instantiated when needed and may be dormant for long periods of time. They are not instantiated and on the network where they are managed and patched on a regular basis. However, these can go hand-in-hand with remediation VLANs which would bring them up to date as soon as they do begin to instantiate.

General Considerations

SCI is mutually exclusive from Cyber Assets (CA) by definition. To enable CIP-010-5 for virtualization, the SDT evaluated the existing Applicable Systems and added “SCI that supports an Applicable System in this Part”. This approach keeps the SCI applicability parallel to each existing variant of Medium Impact BCS (i.e. Medium Impact BCS vs. Medium Impact BCS with External Routable Connectivity (ERC) vs. Medium Impact BCS at Control Centers etc.).

Requirement R1

General Considerations for Requirement R1

In prior versions, CIP-010 Requirement R1 has required developing a baseline configuration that consisted of five (5) items (OS or firmware, installed and custom software, ports, and patches). The baseline configuration was then used in the remainder of Requirement R1 and R2 as the basis of change management including testing. At a high level, the CIP-010-4 Requirement Part 1.1 was to develop a baseline configuration, Requirement R1 Part 1.2 was to authorize and document changes to the items in the baseline configuration, and Requirement R1 Part 1.3 was to update the baseline configuration within a specific timeframe after a change. This tended to focus the requirement on maintaining documentation of past changes. However, in CIP-010-4 the core security objective of R1 was in Part 1.2 to authorize and document changes and the baseline configuration was used primarily to set the scope of those changes. Maintaining the baseline configuration information within 30 days after making changes is not a security objective, and as we implement more dynamic systems and more automation of change with virtualization, it becomes more problematic.

In CIP-010-5, the SDT considered the more dynamic, policy-based, and automated virtualization technologies discussed in the previous section and determined to focus Requirement R1 on the true security objective of change management and authorizing intended changes for those changes that can affect the security posture. In other words, make R1.2 from version 4 the main focal point in version 5. Maintaining documentation of ever more automated updates to systems after the fact gives way in this version to authorizing changes that will affect the security posture of the system. The SDT is addressing VCA’s that may be dormant for long periods of time and dynamically patched at a future instantiation when needed. The SDT considered the focus of R1 is not for entities to track the date/time a VCA may be dynamically instantiated and patched in an automated fashion in a remediation VLAN and then provide evidence that a baseline configuration was updated within 30 days of that dynamic event.

In addition, with the introduction of application containers and orchestration (Kubernetes, Docker Swarm, etc.), application software may no longer be “installed” on a particular OS instance on a particular server. Instead, an orchestration service may instantiate an application container on the best “node” (server with container runtime) at the moment. For example, a dedicated “database server” gives way to a “database service” that can be instantiated in a container on any VCA or CA managed by the orchestrator. Therefore, baseline configurations of statically installed software and open ports loses value as it becomes dynamically managed in these scenarios. The focus of R1 has thus changed from documenting the installed software and its open ports on a Cyber Asset or VCA at some point post-change to authorizing the changes that will occur to it when it does instantiate, which provides more security value.

Entities may of course continue to maintain and use baseline configurations, but in CIP-010-5 it is no longer the singular prescribed way of setting change management scope and documenting changes. Baseline configurations may continue to be used as evidence for CIP-007 R1 for example, documenting the enabled ports on a system. In fact, baseline configurations will probably continue to be a very common method used by entities to help detect unauthorized changes in CIP-010 R2, but the standard does not prescribe it as the singular way to meet these security objectives. Therefore, the phrase “baseline configuration” has been removed from CIP-010-5 though entities may continue using it as their “how”. Again, the focus of R1 in CIP-010-4 and CIP-010-5 is authorizing changes that affect the security posture of the applicable systems; the SDT has just brough it forward as the “what” with baseline configurations as one possible, but not prescribed, “how”. Entities may also wish to reference NIST SP 800-128 “Guide for Security-Focused Configuration Management of Information Systems” as a guide for additional information.

The SDT also considered at length the scope of changes that should be subject to R1. In CIP-010-4, the scope was set by the prescribed elements in the baseline config, consisting essentially of software, patches, and ports. As mentioned above, the security objective of putting ports in the baseline configuration is not to document and maintain a list of listening ports; that security objective is covered in CIP-007 R1 to reduce the attack surface by disabling unneeded ports. Maintaining documentation of the patches installed on a system (which becomes more problematic over time with vendor-bundled monthly updates that may install/remove patches differently per each system's needs) is not the security objective. Knowing what patches are available and applicable to the systems and installing them and mitigating the risk is the goal as covered in CIP-007 R2. In CIP-010 R1, authorizing the action in order to manage change is the objective.

In addition, the SDT considered the prescribed list of baseline configuration elements was insufficient as the scope of a change management requirement. For example, in an SCI that is configured to isolate VCAs of different impact levels from each other, managing and authorizing change to that configuration is vital. As Zero Trust architectures come to fruition, managing and authorizing changes to those access policies is crucial. These are all very important security configurations that were not enumerated in CIP-010-4's baseline configuration and thus not in scope. The SDT concluded that creating a longer prescriptive list of items was not appropriate, in that such a list would need to be maintained as technology changes. The SDT decided to put objective language in the requirement and use the Measures to show examples of more detailed lists of items.

Rationale for Requirement R1 Part 1.1

The SDT brought the security objective to the forefront in this requirement part by starting it with "Authorize changes…". Next it narrows the scope to those "that affect Applicable Systems" and the SDT made conforming changes to Applicable Systems to add SCI. The SDT considered that many entities scope their own internal change management processes this way; if a change is to or affects something in their NERC CIP program for medium/highs, it goes through change management. However, the requirement needs a bit more precise scoping accomplished with the objective language of "…altered behaviors…" to the underlying technical controls so it doesn't include changes such as a user changing their password or desktop background, or a system log being written to hundreds of times an hour. The requirement needs a lower bound, a floor, without attempting to incorporate a prescriptive list of change types or categories.

The SDT used the objective language "…where those changes alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 and CIP-007, as defined by the Responsible Entity." The intent is to bound the scope to those changes that affect the system's CIP security posture. *More precisely, the intent is to set the floor of the scope to changes that alter the behavior of a cyber security control the entity uses to keep the system secure per CIP-005 and CIP-007 requirements.*

The phrasing "alter the behavior of one or more cyber security controls" is intended to help clarify the scope. For example, the intent is that a user changing their password is not in scope; that is a change that may be required on some periodicity by a cyber security control such as a domain password policy but is not a change that alters the behavior *of the control itself*. What would be in scope is a change to that domain password policy.

The "excluding procedural and physical controls" (as well as the "*cyber security* controls" phrase) is intended to exclude from CIP-010 R1's scope changes to controls from CIP-005 and CIP-007 that are not technical controls. An example would be an entity may have signage or port-blockers as a procedural/physical control for meeting CIP-007 R1.2 concerning physical ports. Installing/removing port blockers or changes to the signage is not intended to be subject to CIP-010 R1. A change to the affinity rules for a hypervisor, if the entity uses that in an SCI scenario to meet CIP-007 R1.3, would meet the intent, as well as changes to EAP firewall rules/policy that the entity uses as the control to meet CIP-005 R1. The configuration of anti-malware controls the entity uses, such as update mechanisms or alerting mechanisms that change *how* the control functions in meeting CIP-007 R3 would be included but not the regular signature updates the control uses; those are not changes to the control's configuration that alter the way the control behaves.

Along these lines, rather than including a prescriptive list of change categories or types within the requirement, the SDT did analyze the requirements in CIP-005 and CIP-007 and included examples of cyber security controls that may serve those requirements in the Measures column to help clarify the intent. These are examples and are not a mandatory prescriptive list of the types of changes that would be included and for which evidence of authorization through change records could be provided.

It is important to note the SDT did not include prescriptive timeframes for this requirement. The rationale for this is to account for emergency changes, those that need to occur for reliability of the system when it may not be possible to put in a request and gain authorization beforehand. The SDT intent is for these system reliability related emergency changes to not become a violation of this standard, which it would if it had "prior to" type phrases within it, or required prescriptive definition of what constitutes emergency changes, etc. However, emergency changes will still need to be authorized, after the fact, to meet the requirement.

Rationale for Requirement R1 Part 1.2

Requirement R1 Part 1.2 is where CIP-010-4 Requirement R1 Part 1.5 now lands in CIP-010-5, with minor modifications to Part 1.2.1, and conforming changes to remove the 'baseline configuration' terminology to enable for virtualization.

The SDT chose to remove the reliance on a "Technical Feasibility Exception" in favor of permitting "CIP Exceptional Circumstances" in Part 1.2.1. The SDT contends testing in a test environment prior to implementing any change in production, and documenting test results may impede Responsible Entities' efforts to recover from events or conditions that qualify as CIP Exceptional Circumstances, and that term still requires an entity to document when that condition occurs with regards to the requirement language, while not incurring the additional documentation overhead of a Technical Feasibility Exception (TFE).

Additionally, Requirement R1 language negates the need for both the "technically feasible" and "per system capability" because the focus is on testing the implemented CIP-005 and/or CIP-007 cybersecurity controls the responsible entity determines as serving the requirements in CIP-005 and CIP-007 and require authorization. If a particular CIP-005 or CIP-007 cyber security control cannot be implemented due to "technical infeasibility" or "per system capability", then that unimplemented cyber security control would not be in scope for CIP-010-5 Requirement R1, nor Requirement Part 1.2 rendering the need for that language moot.

Additionally, the SDT chose to add to the phrase "that minimizes differences with the production environment" to eliminate the dependency on baseline configuration, as well as to mitigate the need for a TFE.

Rationale for Requirement R1 Part 1.3

Conforming changes to Applicable Systems (see General Considerations above).

Requirement R1 Part 1.3 is where CIP-010-4 Requirement R1 Part 1.6 now lands in CIP-010-5, with conforming changes to remove the 'baseline configuration' terminology and instead referring to operating systems, firmware, software, or software patches changes as the trigger for the Requirement Part.

The SDT acknowledges virtualization vendors may provide a "golden image" to clone multiple other Virtual Cyber Assets as described in the "Parent/Child Images" section above. The SDT intent is for entities that use the golden image technology to account for the software source and integrity of the golden image which covers any unmodified clones derived from it.

Rationale for Requirement R1 Part 1.4

Requirement Part 1.4 is a simplified version of the same part 1.4 in the previous version. The SDT made conforming changes to align the scope of this part with 1.1 with the phrasing "As a part of the changes authorized per Part 1.1…".

It is important to note the SDT intent and rationale behind the wording "As a part of the change". The rationale for that phrase is the entity, before closing out that change, will verify that the change has not adversely affected the altered cyber security controls. If the entity, as part of the post change verification, finds that it did, the entity must remediate that issue. The intent is this change not be completed until it is verified that the cyber security controls are not adversely affected.

What was 1.4.1 in the previous version required the entity to determine, prior to the change, the CIP-005 and CIP-007 controls that might be affected. With the automated remediation technology at instantiation, this is no longer possible and the SDT considered it was not the security objective. The security objective, the required behavior, is that entities ensure that changes don't adversely affect the cyber security controls by verifying them after making the change. That is now the clearly stated focus of 1.4. It is not the SDT's intent that the entity must test *every* cyber security control for *every* change, which is the rationale for the wording "of the altered cyber security controls". If an entity is installing a patch to an application on a BCS, it's not the intent that the entity verify that the domain password policy wasn't changed, however, the entity should verify the patch did not open or enable any unnecessary ports for example. The requirement part 1.4.3 from the previous version to document the results of the verification has been deleted and the SDT rationale is that is essentially a requirement to provide evidence for the actions taken to comply with the requirement part. Therefore 1.4 is now a simplified security objective to be met.

The rationale for the phrasing of "adversely affected" is simply to recognize that the desired effect of a change may be to impact a cyber security control – for example an entity may wish to change a password policy such that it requires stronger passwords than the CIP standard requires. That would not be an "adverse" change.

Requirement R2

General Considerations for Requirement R2

The scoping of Requirement R2 is an intentional subset of the scope for Requirement R1. The focus of CIP-010-5 Requirement R1 is authorizing changes that affect the security posture of those Applicable Systems as well as the logical environments that protect them. This is why R1 includes the obligation to authorize changes that alter the behavior of one or more cyber security controls that are implemented to protect the system or environment. The Applicable Systems for the R2 monitoring requirement for unauthorized changes is an intentional a subset of cyber security controls (CIP-007) to align with the Appliable Systems scope and those technical controls that have been implemented at the System or Cyber Asset level to maintain that cyber security posture.

The SDT has reworked R2 for monitoring for unauthorized changes to work better with the additional scope of R1's change management. The SDT's rationale is that all changes that should be included and authorized in a change management program may not have an automated solution for monitoring for unauthorized change and the SDT's intent is for this requirement's scope to be items that have a greater potential to for automated monitoring by technical controls, recognizing monitoring outputs (alarms, alerts, reports, logs etc.) may require manual review by the recipients to determine if the change was unauthorized and what subsequent actions, if any, may need to be taken. Therefore, the SDT tied R2 loosely to R1's scope but with a required list of seven cyber security-related categories to monitor. The SDT's intent when using the 'per system capability' language is to keep the scope of R2 to those things for which automated solutions are available and likely to monitor these areas and alert entities to changes. It should be noted the 'system' in 'per system capability' refers to the Applicable Systems for the requirement, and not the capability of the automated tool used to monitor. As a result, the 'per system capability' language does not absolve entities of the obligation to implement monitoring methods where automated solutions have not been implemented, and while potentially less ideal, manual methods to accomplish the same results where automated monitoring cannot be done remains a requirement where the Applicable System is capable of producing data related to the list of seven cyber security-related categories to monitor. The reference to manual reviews is also in the measures because the manual response actions to automated monitoring serves as supporting evidence and a means to demonstrate compliance with the final component of Part 2.1, which is to 'Document and investigate detected unauthorized changes'.

The SDT has added the term "unauthorized" into Requirement R2 Part 2.1 to focus it on the risk of unauthorized changes. Many implementations will perform this task by monitoring all changes and looking for unauthorized changes within that population. However, the SDT is allowing for a capability that may filter out authorized changes such that the entity can have methods to monitor for unauthorized changes only. The SDT also added "per system capability" in recognition that not all changes in scope can be monitored on every potential in-scope Cyber System.

This addition makes the requirement conditional if a system is incapable of monitoring a particular unauthorized change category.

The SDT has used the phrasing “that include at least one cyber security control for each of the following” in order to allow entities to monitor a primary security control if they have multiple overlapping controls. The SDT’s intent is that having multiple security controls over these categories is a good and beneficial practice where possible, and entities should not be discouraged from having more than one. This phrasing’s intent is to allow the entity to choose the primary control they monitor for unauthorized change. The entity may of course do more than one, but one is required.

For the seven required control categories, the SDT notes it intent as follows:

2.1.1 – The intent is to monitor for changes to the system’s configuration affecting ports or services that are enabled such that they provide accessibility via routable protocols on a network interface.

2.1.2 – The SDT notes that the intent of this item is conditional – evidence for this is only required “on SCI”. If there is no SCI, then no control is required. If SCI is in scope, then some control to monitor for unauthorized changes to CPU/memory sharing of VCAs (affinity rules, etc.) is required.

2.1.3 - The intent of this is the traditional monitoring of changes to executable code of the various listed types. As noted in the Measures column, the SDT intends to handle the parent/child image issues by monitoring the parent image from which temporary child images are derived. See the “Parent/Child Images” section earlier in this document for examples.

2.1.4 – The intent is to monitor for unauthorized changes to the configuration of malicious code protection methods, for example whether they have been disabled, or alerting turned off, etc. Note this is not the detection or alerting or remediation of malicious code that is covered in CIP-007; this is monitoring the configuration of your method to ensure its configured behavior has not been changed in an unauthorized manner.

2.1.5 – Similar to 2.1.4, this is not monitoring the security event log and alerting as covered in CIP-007; this is monitoring the configuration of your security event logging and alerting for unauthorized changes that would change its expected behavior (disabling it, changing what is logged, changing where alerts go, etc.)

2.1.6 – The intent of “configuration of authentication methods” is to monitor for configuration changes that affect how a system authenticates its users/processes. Examples would include password policies (not individual user passwords), configuration of multi-factor authentication, changes to Pluggable Authentication Modules (PAM) on Linux systems, etc.

2.1.7 – Along with 2.1.6 concerning how a system is configured to authenticate users, this requires a control to monitor for unauthorized changes to enabled or disabled status of accounts. For example, if a “Guest” account or a default “admin” account have been disabled on a system, monitoring for the unauthorized re-enabling of those accounts.

Requirement R3

Rationale for Requirement R3 Part 3.1

Conforming changes only to Applicable Systems (see General Considerations above).

Rationale for Requirement R3 Part 3.2

Conforming changes to Applicable Systems (see General Considerations above).

The SDT chose to remove the reliance on a “Technical Feasibility Exception” in favor of the updated term “per system capability”. The SDT contends that the term still requires an entity to document the limit to the system’s

capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

In Requirement R3 Part 3.2.1, conforming changes have been made to remove the baseline configuration dependency. Additionally, the SDT chose to add to the phrase "that minimizes differences with the production environment" to eliminate the dependency on baseline configuration.

Rationale for Requirement R3 Part 3.3

The previous language of "Prior to adding a new applicable Cyber Asset to a production environment" for the timing of performing a vulnerability assessment has an interesting "chicken or egg" problem when it comes to VCAs. This phrasing for the timing has worked well for hardware "programmable electronic devices" arriving on a loading dock or spares coming in from a warehouse that should be assessed before being physically placed "in production". However, VCA's aren't shipped, they are created in the production environment from a hardware perspective. A VCA image may be created on the hypervisor, an OS installed, the appropriate applications installed, etc., but the VCA is not yet connected to its production network and instantiated in a way that it has connectivity or is performing its function. However, it is from a hardware standpoint in the "production environment" so you can't do an assessment "prior to" that as this is where it's created.

To solve this issue, the SDT replaced this timing phrasing with the language "Prior to becoming a new Applicable System…". The SDT's rationale is the requirement part requires the vulnerability assessment at a point prior to the VCA being instantiated, with the "production" connectivity it requires, to perform its function either as a part of a BES Cyber System or EACMS or PCA. As it begins to perform those functions (i.e., for an EACMS to begin controlling or monitoring electronic access), it becomes an "Applicable System" at that point – prior to that point in time the vulnerability assessment of that VCA should have taken place. The remediation VLAN technologies may perform this automatically at every instantiation. The SDT made this change so that the requirement part did not imply that VCAs had to be created elsewhere, in some other separate hardware environment, assessed, and then somehow imported. Conforming changes have been made to remove the baseline configuration dependency. The exceptions are "Like replacements or additions with a previously assessed configuration of an existing Applicable System; or CIP Exceptional Circumstances".

Conforming changes made to Applicable Systems (see General Considerations above).

Rationale for Requirement R3 Part 3.4

Conforming changes made only to Applicable Systems (see General Considerations above).

Requirement R4

General Considerations for Requirement R4

The SDT updated Requirement R4 to include associated SCI into the scope of the required plans for Transient Cyber Assets (TCA) and Removable Media. The SDT also updated Attachment 1, such that the scope is clarified once within Requirement R4 and applies throughout Attachment 1.

The SDT corrected a perceived mismatch of control to objective by moving the control "Live operating system and software executable only from read only media;" from Part 1.3 to Part 1.4 as a better location for the control to serve the objective of the Part, which aligns with Sections 2.1 & 2.2.

The SDT also made several conforming changes to Attachment 1 for TCAs to ensure continuity in language between the measures and similar sections in CIP-003 Attachment 1.

Former Background Section from Reliability Standard CIP-010-4

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.
Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicability Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rationale for Reliability Standard CIP-010-4

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-010-4. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for CIP-010-4 is not a Reliability Standard and should not be considered mandatory and enforceable.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850[1] on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards, in which the summary on page 1 states, "…the Commission directs NERC to develop and submit modifications to the supply chain risk management Reliability Standards so that the scope of the Reliability Standards include Electronic Access Control and Monitoring Systems." In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report, Staff Report and Recommended Actions[2], to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-010-4 to require responsible entities to meet the directives set forth in the Commission's Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

New and Modified Terms Used on NERC Reliability Standards

CIP-010-4 uses the following definition(s), which are cited below for reference when reading the technical rational that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1

General Considerations for Requirement R1

FERC Order 850, Paragraph 5 and Paragraph 30 directed modifications to Reliability Standard CIP-010-3 Requirement R1 to address supply chain risk management for Electronic Access Control or Monitoring Systems (EACMS) for high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards to address PACS that provide physical access control (excluding alarming and logging) to high and medium impact BES Cyber Systems, and modifications were addressed by the 2019-03 SDT.

Rationale for Requirement R1

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48). The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

---

[1] https://www.ferc.gov/whats-new/comm-meet/2018/101818/E-1.pdf

[2] https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

Requirement R1 Part 1.6 addresses directives in Order No. 850 for verifying software integrity and authenticity prior to installation of an EACMS (P. 5 and P.30), and PACS from the NERC Cyber Security Supply Chain Risk Report[3] recommendation. The objective of verifying software integrity and authenticity is to ensure that the software being installed on EACMS and PACS was not modified without the awareness of the software supplier and is not counterfeit.

Due to the nature of PACS and the potential need for physical presence, the SDT conducted extensive dialogue and consideration for the addition of PACS to the requirements, the SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warrants the inclusion of PACS as an applicable Cyber Asset category for supply chain risk management controls. Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. is consistent with the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[4].

In further support of the SDT's decision to include PACS, as cited on page 4 of NERC's final report on "*Cyber Security Supply Chain Risks"*, "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." While this statement appears in the context of EACMS, it acknowledges physical security threats equally; therefore, the concept is transferable and applicable to PACS, which serve as an integral component to a strategy involving layers of detective and preventive security controls. PACS are intended to manage physical access to BES Cyber Systems in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES and are implemented with that specific intention to protect the BES Cyber System.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical access or monitoring controls that have not been compromised in order to gain access." While it might be a fair point that a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it stands to reason that a threat actor's intention to gain unauthorized electronic access to a PACS does so 1) with the knowledge of it being an initial deliberate action to facilitate undetected reconnaissance, and 2) further undetected methodical compromise and intentional harm to the BES Cyber Systems the PACS is intended to protect.

Furthermore, a precedent is set in CIP-006-6 Requirement R1 Part 1.5 that recognizes the importance of PACS, its functions, and the timeliness of information provided by these systems by requiring issuance of an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter (PSP) to incident response personnel within 15 minutes of detection. This strict timeline suggests that compromised physical security poses an imminent threat to the associated BES Cyber System and the reliable operation of the BES Facilities it serves.

[4] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

The SDT agrees that NERC correctly refers to various Reliability Standards that mitigate certain security risks relating to PACS; however, the SDT asserts that these existing requirements do not address risk associated to the supply chain and therefore do not sufficiently mitigate that risk.

An additional aspect of the NERC Supply Chain Report, the SDT risks associated with the different aspects of both EACMS and PACS. The NERC Supply Chain Report pointed to the increased risk of the control portion of both EACMS and PACS, and the SDT considered limiting the scope of the requirements to only those EACMS and PACS that perform the control functions. However, since the current approved definitions includes both control and monitoring for EACMS and control, logging and alerting for PACS, the SDT concluded it would introduce less confusion by referring to the authoritative term. The SDT did not attempt a change in definition due to the wide spread use of both EACMS and PACS within all the standards, and did not have authorization within its SAR to modify all of those standards.

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The language for use of a testing environment for deviations from baseline configuration was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly.

Software Verification

The concept of verifying the identity of the software source and the integrity of the software obtained from the software source helps prevent the introduction of malware or counterfeit software. This reduces the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The SDT intends for Responsible Entities to provide controls for verifying the baseline elements updated by vendors. It is important to note that this is not limited to only security patches.

Requirement R2

Rationale for Requirement R2

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Baseline Monitoring

The SDT’s intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible

Requirement R3

Rationale for Requirement R3

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Vulnerability Assessments

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement R4

Rationale for Requirement R4

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.
- Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-2 and CIP-007-6 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes

All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

Transient Cyber Assets and Removable Media

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management. With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Attachment 1

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity’s responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity’s security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity’s plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Technical Rationale for Reliability Standard CIP-010-3

This section contains a “cut and paste” of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-010-3 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Section 4 – Scope of Applicability of the CIP Cyber Security Standards:

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1’s categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset’s baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset’s baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity’s use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to “model” the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly.

Software Verification

The concept of software verification (verifying the identity of the software source and the integrity of the software obtained from the software source) is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is for Responsible Entities to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches.

Requirement R2:

The SDT’s intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible. For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media.

The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example,, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.

- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.

- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48). The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for Requirement R4:

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.
- Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-2 and CIP-007-6 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes:

All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes

Technical Rationale for Reliability Standard CIP-011-4

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-011-4 . It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-011-4 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rational that follows.

General Considerations

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-011-4 to align information protection requirements with the virtualization changes.

Requirement R1 and R2

Rationale

To enable CIP-011-4 for virtualization, the SDT added "Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part" within the Applicable Systems column of each of the Parts for Requirement R1 – Requirement R2.

Requirement R2 Part 2.1

Requirement R2 Part 2.1 is an objective level requirement focused on protecting BES Cyber System Information (BCSI) rather than 'Cyber Assets' and 'storage media' and was modified to include the currently approved Requirement R2 Part 2.2. This consolidation is necessary to enable flexibility, allowing for cryptographic erasure in scenarios where BCSI cannot be mapped to one or more disks within a virtualized storage cluster, and where BCSI is stored on Cyber Systems employing deduplication. This adjustment is also future-looking to better position CIP-011 for the enablement of cloud type scenarios where the disks are owned and/or managed by a third-party as a service to the entity for its BCSI storage, analysis, or use.

Requirement R2 Part 2.2

Requirement R2 Part 2.2 has been deleted because it was consolidated into Requirement R2 Part 2.1.

Former Background Section from Reliability Standard CIP-011-3

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rationale for Reliability Standard CIP-011-3

Requirement R1

General Considerations for Requirement R1
None

Rationale for Modifications to Requirement R1:
Requirement R1 still specifies the need to implement one or more documented information protection program(s). The SDT does not intend that this requirement cover publicly available information, such as vendor manuals or information that is deemed to be publicly releasable. Information protection pertains to both digital and hardcopy information.

The SDT clarified the intent of protecting BCSI as opposed to protecting the BES Cyber System(s) and associated applicable systems which may contain BCSI. This was achieved by modifying the parent CIP-011-X R1 requirement language to include "for BES Cyber System Information (BCSI) pertaining to Applicable Systems".

Rationale for Modifications to Requirement R1, Part 1.1
Requirement R1, Part 1.1, is an objective level requirement focused on identifying BES Cyber System Information (BCSI). The intent of the SDT was to simplify the requirement language from CIP-011-2 Part 1.1.

Rationale for Modifications to Requirement R1, Part 1.2
Requirement R1, Part 1.2, is an objective level requirement focused on protecting and securely handling BES Cyber System Information (BCSI) in order to mitigate risks of compromising confidentiality. The reference to different states of information such as "transit" or "storage" or "use" was removed. The intent is to reduce confusion of Responsible Entities attempting to interpret controls specific to different states of information, limiting controls to said states, overlapping controls between states, and reduce confusion from an enforcement perspective. By removing this language, methods to protect BCSI becomes explicitly comprehensive.

Requirement language revisions reflect consistency with other CIP requirements.

Requirement R2

General Considerations for Requirement R2
None

Rationale for Requirement R2:
The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BCSI upon reuse or disposal.

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement 2 has remained unchanged. The requirements are focused more on the reuse and disposal of BCS rather than BCSI. While acknowledging that such BCS and other applicable systems may have BCSI residing on them, the original intent of the requirement is broader than addressing BCSI. This is a lifecycle issue concerning the applicable systems. CIP-002 focuses on the beginning of the BCS lifecycle but not an end. The potential end of the applicable systems lifecycle is absent from CIP-011 to reduce confusion with reuse and disposal of BCSI. The 2019 BCSI Access Management project did not include modification of CIP-002 in the scope of the SAR. This concern has been communicated for future evaluation.

Technical Rationale for Reliability Standard CIP-011-2

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-011-2 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the Responsible Entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].

Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

Technical Rationale for Reliability Standard CIP-013-3

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-013-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-013-3 to align supply chain risk management requirements with the virtualization changes.

To enable CIP-013-3 for virtualization, the SDT added "and Shared Cyber Infrastructure (SCI)" to the parent Requirement R1. Additionally, the SDT simplified the applicability in Requirement R1 Parts 1.1 and 1.2 by replacing the long list of applicable systems with a reference to the list in the parent Requirement R1 through the use of this language, "applicable systems listed in Requirement R1". Note: Because CIP-013-3 does not contain the "Table" construct with an "Applicable Systems" column, this term is not defined within Section 4 Applicability; Therefore, where used, "applicable systems" is intentionally not capitalized within the requirement language of Requirement R1 Parts 1.1 and 1.2.

Technical Rationale for Reliability Standard CIP-013-2

This section contains a “cut and paste” of the Technical Rationale for CIP-013-2 standard to preserve any historical references.

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-2. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. It also contains information on Project 2019-03 Cyber Security Supply Chain Risks Standard Drafting Team’s (SDT’s) intent in drafting the requirements. This Technical Rationale and Justification for CIP-013-2 is not a Reliability Standard and should not be considered mandatory and enforceable.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850 on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards to address Electronic Access Control or Monitoring Systems (EACMS), specifically those systems that provide electronic access control or monitoring to high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-013-2 to require responsible entities to meet the directives set forth in the Commission’s Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

New and Modified Terms Used on NERC Reliability Standards

CIP-013-2 uses the following definition(s), which are cited below for reference when reading the technical rationale that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1 and R2

General Considerations for Requirements R1 and R2

The Requirement addresses Order No. 829 directives for entities to develop and implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;

(2) Vendor remote access;

(3) Information system planning; and

(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems. FERC Order 850, Paragraph 5 and Paragraph 30, directs modifications to Reliability Standards to include EACMS associated with medium and high impact BES Cyber Systems within the scope of the Supply Chain Risk Management Standards. In addition, NERC also recommended revising the Supply Chain Standards in its May 17,

2019 NERC Cyber Security Supply Chain Risk Report [1](Chapter 3, pages 12-15) to address PACS that provide physical access control to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Due to the nature of PACS and the potential need for physical presence, the SDT conducted extensive dialogue and consideration for the addition of PACS to the requirements. The SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warrants the inclusion of PACS as an applicable Cyber Asset category for supply chain risk management controls.

Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. addresses the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[2].

In further support of the SDT's decision to include PACS, as cited on page 4 of NERC's final report on "*Cyber Security Supply Chain Risks"*, "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." While this statement appears in the context of EACMS, it acknowledges physical security threats equally; therefore, the concept is transferable and applicable to PACS, which serve as an integral component to a strategy involving layers of detective and preventive security controls. PACS are intended to manage physical access to BES Cyber Systems in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES and are implemented with that specific intention to protect the BES Cyber System.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical access or monitoring controls that have not been compromised in order to gain access." While a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it could demonstrate a threat Actor's intention to gain fully unauthorized electronic access. With electronic access to the PACS an initial deliberate action to facilitate reconnaissance and intentional harm to the BES Cyber Systems.

Furthermore, there is precedent set in CIP-006-6 Requirement R1 Part 1.5 that speaks to a recognized importance of PACS, its functions, and the timeliness of information provided by these systems by requiring issuance of an alarm or alert in response to detected unauthorized access through a physical access point into a PSP to incident response personnel within 15 minutes of detection. This strict timeline suggests imminent threat that compromised physical security poses to the associated BES Cyber System and the reliable operation of the BES Facilities it serves.

[2] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

The SDT agrees that NERC correctly refers to various Reliability Standards that mitigate certain security risks relating to PACS; however, the SDT asserts that these existing requirements do not address risk associated to the supply chain and therefore do not sufficiently mitigate that risk.

An additional aspect of the NERC Supply Chain Report the SDT considered was around the risk associated with the different aspects of both EACMS and PACS. While both types of systems, under the current definitions, have various functional activities they perform, the NERC Supply Chain Report pointed to the increased risk of the control function. The SDT considered limiting the scope of the requirements to only control functions, however, chose to stay with the currently approved definitions of both EACMS and PACS. The SDT concluded staying with approved definitions would introduce less confusion. Additionally an attempt to change the EACMS and PACS definitions was outside the 2019-03 SAR.

Rational for Requirement 1 and Requirement 2

Requirement R1 Part 1.1 addresses the directive in Order No. 829 (P.56) and Order 850 (P.5) for identification and documentation of cyber security risks in the planning and development processes related to the procurement of medium and high impact BES Cyber Systems, and their associated EACMS and PACS. The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

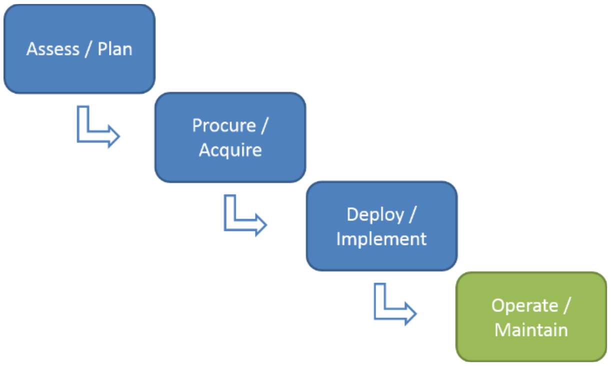
The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The use of remote access in Part 1.2.6 includes vendor-initiated authenticated remote connections and system to system remote connections for EACMS and PACS; and vendor-initiated IRA and system to system access to BCS and PCAs.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-2 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R3

General Considerations for Requirement R3

The requirement addresses Order No. 829 directives for entities periodically to reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

Technical Rational for Reliability Standard CIP-013-1

This section contains a "cut and paste" of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-013-1 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Rationale

Requirement R1:

The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;

(2) Vendor remote access;

(3) Information system planning; and

(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

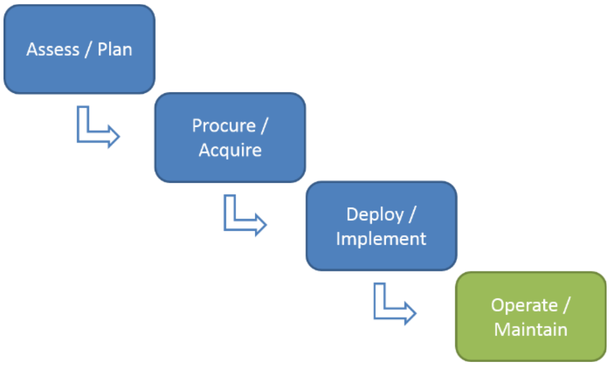
Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R2:

The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

Definitions and Exemptions

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Technical Rationale

New and Modified Terms, and Exemption Language Used in NERC Reliability Standards | Project 2016-02 Modifications to CIP Standards

Introduction

The standard drafting team (SDT) has in several terms made changes based on the intent that the glossary is a dictionary and defines what something is, not its security requirements or necessarily the scope of systems those requirements apply to. The rationale for such changes is:

- If scoping of which specific systems is included in the definition, the definition can no longer be used in other standards or other requirements with a differing scope. If what the term defines is needed in a differing requirement of a slightly different scope, either the definition must change affecting all uses of it in all standards, or we proliferate more glossary terms to include differing scopes in the definition. Removing specific scoping in definitions alleviates this concern. Several terms below now use a far more generic 'Cyber System' in the definition with the specific scoping of requirements left to those requirements in the standards.
- If implicit requirements are included in the definition (e.g., such as where in relation to an Electronic Security Perimeter (ESP) an Intermediate System must be implemented), then if an entity implements that one aspect incorrectly, that is non-conformant with a glossary term, the unintended consequence is that it may lead to non-compliance with all requirements that rely on that term. Putting any requirement-type language in requirements rather than definitions alleviates this concern.

Proposed Modified Terms:

BES Cyber Asset (BCA)

A Cyber Asset or Virtual Cyber Asset, that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the Reliable Operation of the Bulk Electric System (BES). Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.

Rationale

The BCA definition was modified to allow for BCA to be either Cyber Assets (hardware included) or Virtual Cyber Assets (VCA) (software only virtual machines without the underlying hardware). See the VCA and Shared Cyber Infrastructure (SCI) definition below. Note that SCI is not included because if the hardware is supporting VCAs of differing impact levels, it is not a BCA with a single impact category, but it is SCI and subject to the additional "SCI only" requirements. If all the hosted VCAs are treated as "associated PCAs" of the highest impact BCS, then the underlying hardware is no longer SCI and is a BCA of the same impact rating as the highest impact BCS it hosts. The SDT also capitalized the term “Reliable Operation” to tie this to “instability, uncontrolled separation, and cascading” as that is a defined term in the NERC Glossary providing more clarity. Additionally, the glossary term uses the Bulk Power System scope, but the BCA definition uses the specific scope “Reliable Operation of the Bulk Electric System” just as the Reliability Coordinator definition does.

BES Cyber System Information (BCSI)

Information about the BES Cyber System (BCS) that could be used to gain unauthorized access or pose a security threat to the BCS. BCSI does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BCS, such as, but not limited to, device names, individual IP addresses without context, Electronic Security Perimeter names, or policy statements. Examples of BCSI may include, but are not limited to, security procedures or security information about BCS, Shared Cyber Infrastructure, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BCS.

Rationale

The BCSI definition was modified with conforming changes such that BCSI examples include information about SCI that could be used to gain unauthorized access or pose a security threat to the BCS.

Critical Infrastructure Protection (CIP) Senior Manager

A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC CIP Cyber Security Standards.

Rationale

The CIP Senior Manager definition was modified by removing explicit reference to the CIP standards as only “CIP-002 through CIP-011” since the body of CIP Cyber Security Standards has grown beyond CIP-011. For example, the CIP Senior Manager also has requirements within CIP-013.

Cyber Assets

Programmable electronic devices, excluding Shared Cyber Infrastructure, including the hardware, software, and data in those devices. Application containers are considered software of Virtual Cyber Assets (VCA) or Cyber Assets. VCAs are not considered software or data of Cyber Assets.

Rationale

The Cyber Asset definition was modified to explicitly exclude SCI from the definition of Cyber Asset such that SCI is a different hardware class on which the other VCAs of differing impact levels execute. SCI is defined separately such that it can be the object of additional requirements based on its unique risks. The definition is also modified to clarify that ‘Application containers’ (i.e., portable, packaged applications) are considered software of a Cyber Asset (or VCA), though they may have some characteristics of a VCA (a container can be instantiated with its own IP address, etc.). This is because of their packaged quality, typically being updated as a whole and not as individual components, and the limited capabilities that containers have. When viewing applications containers as something to apply CIP Requirements to, the concept breaks down quickly due to the nature of container platforms. Additionally, the capabilities that containers do possess, that would offer services on a network for example, would then exist on the VCA or Cyber Asset that the container is running on and can be controlled as part of the required set of controls for that device. Additionally, executing instances of VCAs are not to be considered simply software or data of the Cyber Asset.

Cyber Security Incident

A malicious act or suspicious event that:

- For a high or medium impact BES Cyber System (BCS), compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, (3) an Electronic Access Control or Monitoring System, or (4) Shared Cyber Infrastructure; or
- Disrupts or attempts to disrupt the operation of a BCS.

Rationale

The Cyber Security Incident definition was modified to add SCI to the scope of compromised or attempted compromises of, the listed perimeters and systems.

Electronic Access Control or Monitoring Systems (EACMS)

Cyber System(s) that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) (ESP) or BES Cyber Systems (BCS), including those not protected by an ESP used by the Responsible Entity to convert routable protocol communications to non-routable communications to a BCS.

Rationale

The EACMS definition was modified to add Cyber Systems so that VCA and SCI are included as two other forms that an EACMS can take. Removed the explicit inclusion of Intermediate Systems as that was moved to the Intermediate Systems definition. Added the inclusion of certain protocol conversion scenarios where the protocol converter is clarified to be an EACMS. This involves a Cyber Asset that does perform electronic access control or monitoring that is also converting from a routable protocol (e.g., IP over Ethernet) to non-routable protocol (e.g., ASCII text over serial) to BCS that are themselves non-routable (serial) only. The SDT intent is this does not include “bump in the wire” type converters (i.e., IP to serial converters) that have no capability to identify users and perform electronic access control or monitoring. It does include those Cyber Assets that users login and select a serial port to then communicate with a BCS and are clearly performing electronic access control or monitoring. In this latter scenario, though the BCS itself is serial non-routable only and therefore has no ESP, the converter is still performing as an EACMS. It may also be performing as an Intermediate System for IRA to the serial only BCS (see changes to the IRA definition).

Electronic Access Point (EAP)

An electronic policy enforcement point or a Cyber Asset interface on an Electronic Access Control or Monitoring Systems that controls routable communication to and from one or more BES Cyber Systems or their associated Protected Cyber Assets.

Rationale

As network security moves deeper into the infrastructure, it’s no longer necessary to prescribe that network security be performed only at a ‘Cyber Asset interface on an ESP’ at one point on a network edge. Zero Trust, for example, highly distributes the network security model and is not perimeter-based, and this is incorporated through the addition of “electronic policy enforcement point or”. With the added flexibility in CIP-005 to adopt these models in addition to the traditional ESP model, the EAP definition was modified to allow for electronic policy enforcement points and no longer prescribes an architecture. The “one or more” and the “associated PCAs” have been added to clarify that EAPs can control communications to a group and not required per individual system.

External Routable Connectivity (ERC)

The ability to access a BES Cyber System through its Electronic Security Perimeter via a bi-directional routable protocol connection.

Rationale

The ERC definition was modified to allow for zero trust or other network models that are not strictly perimeter or network-border based, thus not having concepts of “inside” or “outside”. These concepts are replaced with the language “through its ESP” so that it does not imply a prescriptive network security model. The ERC term is used throughout the CIP Standards within the Applicable Systems column as a scoping mechanism based on the inherent risk associated with ERC as well as to limit the scope of requirements that would require ERC to function. The SDT is maintaining this use of ERC, but also clarifying the relationship between ERC and Interactive Remote Access (IRA) in that a non-routable, serial only BCS (thus with no ESP) may have IRA through a subsequent IP/serial conversion (see changes to IRA definition).

Electronic Security Perimeter (ESP)

The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol; or a logical boundary defined by one or more Electronic Access Points.

Rationale

The ESP definition was modified to provide flexibility and the use of various architectures and access control models. The traditional network border ESP remains a valid network security model, however it is no longer the only prescribed model as CIP-005 allows other access control models that are not based on network perimeters such as Zero Trust architectures. The proposed ESP definition retains its current definition but appends “or a logical boundary defined by one or more EAPs” to incorporate models that move away from implicit trust within network perimeters and using network location as a primary factor in access control decisions. In these models, the perimeter shrinks to increasingly more granular levels, potentially down to a process or resource level on a BCS. The proposed definition allows for an ESP to be (a) a border surrounding an isolated network that has no external connectivity and thus no EAPs, (b) static point(s) on a network boundary such as a traditional firewall as an EAP that is enforcing access policies or configurations (e.g., firewall rulesets), (c) many dynamic, short-lived, session-level ‘perimeters’ established at time of access that are network independent (e.g., users to resources, for example), or (d) hybrid implementations combining elements of more than one model.

The SDT has kept the ‘logical border’ concept for the “surrounding a network” ESP and used the language “logical boundary” for zero trust models. A ‘border’ does indeed surround an object, in this case a network, but a ‘boundary’ may not surround or enclose, it’s a line that can be crossed, such as a policy enforcement point controlling access to a resource. The SDT has also updated language in the standards to remove concepts such as ‘inside’ an ESP and replaced that with more inclusive phrases such as ‘protected by’ an ESP.

Interactive Remote Access (IRA)

User-initiated electronic access by a person using a bi-directional routable protocol:

- To a Cyber System protected by an Entity’s Electronic Security Perimeter(s) (ESP);
- That is converted by the Responsible Entity to a non-routable protocol that allows access to a Cyber System; or
- To a Management Interface.

Interactive Remote Access does not include:

- Communication that originates from a Cyber System protected by any of the Responsible Entity’s ESPs;
- System-to-system process communication.

Rationale

The IRA definition was modified in two fundamental ways: (1) to incorporate IRA situations where users outside of any of the Responsible Entity’s ESPs have interactive access, using a routable protocol, to a non-routable (e.g., serial) Cyber System through a subsequent IP to serial conversion, and (2) to include Management Interfaces as targets of IRA. Note that the scope of which Cyber Systems and Management Interfaces is contained within the applicable requirements in the standards and are not in the definition. The philosophy is scoping of requirements should be in the requirements to keep the definitions usable in other requirements with a different scope if needed. The references to ownership of the remote client have been removed as they are immaterial to the definition of IRA.

The definition begins with “User-initiated electronic access by a person using a bi-directional routable protocol” to match the human interactive (bi-directional) nature of the access to the requirements that secure such access in CIP-005 R2. For example, a batch process cannot read a multi-factor token and enter its displayed code; that security control is designed for interactive humans initiating a remote access session. Also note the person is using a routable protocol to initiate the access.

The definition outlines three targets of IRA:

1) "To a Cyber System protected by an Entity's Electronic Security Perimeter(s) (ESP)" covers the typical Cyber System that is connected to a network via a routable protocol and thus is protected by an ESP. In this instance, the remote user is using a routable protocol and is accessing a Cyber System on a routable protocol network, for example in a typical LAN-WAN-LAN, end to end routable protocol communication.
2) "That is converted by the Responsible Entity to a non-routable protocol that allows access to a Cyber System" clarifies IRA scenarios where the user is using a routable protocol to a site where the Responsible Entity then connects that session (e.g., using a gateway or terminal server) to a device's non-routable serial port to provide interactive remote access to the user. A common example is connecting a serial port on a digital relay in a substation to a terminal server or gateway device which is then connected to a routable network in the substation for the purpose of granting a remote user interactive access to the relay without traveling to the substation. This 2nd target of the definition now clarifies this is IRA even though the device itself may not have an ESP if it is only connected serially.

   Note the clarification and explanation in the EACMS definition above that applies to this scenario. The phrase "converted *by the Responsible Entity*" clarifies certain situations that may involve more than one entity and is best described by an example. Entity 1 has a BCS in a substation or generating resource that Entity 2, a Control Center, needs to access. Entity 2 provides a circuit to Entity 1's site and provides Entity 1 with a serial cable to connect to their BCS. This phrase clarifies that Entity 1 does not require detailed architectural knowledge of what Entity 2 does upstream with the data once delivered to the serial interface if Entity 1 does not do any conversion to routable protocols. If Entity 2 does convert to routable protocols and does provide IRA, then Entity 2 implements the IRA security controls on their routable protocol portion.
3) "To a Management Interface" adds the Management Interface as a valid target of IRA. Note the scope of Management Interfaces covered by CIP is in the CIP-005 requirements, not in the definition.

The definition then has two exclusions of scenarios that are not IRA:

1) "Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs" carries forward this exclusion from the previous definition and is intended to exclude, for example, the scenario of a Control Center operator within one of the Responsible Entity's ESPs interacting with field devices within its other ESPs, because for it to meet the IRA definition, IRA must originate from somewhere other than one of the Responsible Entity's protected ESPs.
2) "System-to-system process communication" carries forward this exclusion from the previous definition to clarify that a process that cannot for instance perform multi-factor authentication using tokens or biometrics is not IRA. It is instead covered by CIP-005 R1.

Note that the definition uses the more generic term Cyber Systems. This is in keeping with using the glossary as a dictionary that merely defines a term, in this case a type of access, but does not create or scope CIP requirements within the definition. The scope is in CIP-005 R2's requirement language. The intent is to create definitions that are scope agnostic so they can be used in multiple standards or requirements with varying scope in each.

Intermediate Systems

One or more Electronic Access Control or Monitoring Systems that are used to restrict Interactive Remote Access to only authorized users.

Rationale

The Intermediate System definition was modified by removing embedded requirement language (i.e., where an Intermediate System must reside). That language moved to CIP-005 Requirement R2 within a mandatory requirement. The definition was also updated from a Cyber Asset focus to an EACMS focus to include other forms (i.e., VCA) the Intermediate System may take. This also moves the clarification of "This includes Intermediate Systems" out of the EACMS definition into this one.

Physical Access Control Systems (PACS)

Cyber Systems that control, alert, or log access to the Physical Security Perimeter(s) (PSP), exclusive of locally mounted hardware or devices at the PSP such as motion sensors, electronic lock control mechanisms, and badge readers.

Rationale

The PACS definition was modified to use the term Cyber Systems to add VCA and SCI as two other forms that a PACS can take.

Physical Security Perimeter (PSP)

The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, Shared Cyber Infrastructure, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.

Rationale

The PSP definition was modified to add SCI as type of Cyber System to be included within a PSP.

Protected Cyber Asset (PCA)

One or more Cyber Assets or Virtual Cyber Assets (VCA) that:

- Are protected by an Electronic Security Perimeter (ESP) but are not part of the highest impact BES Cyber System (BCS) protected by the same ESP; or
- Share CPU resources or memory resources with any part of the BCS, excluding VCAs that are being actively remediated in an environment that isolates routable connectivity from BCS;

Excluding Transient Cyber Assets.

Rationale

The PCA definition was modified to ensure additional implementation scenarios in a virtualized environment that present similar risks to the BCS are accounted for through PCA protections. The PCA definition exists to identify other Cyber Assets or VCAs that must be protected by various CIP requirements due to what they share with a BES Cyber System. This sharing could allow the PCA to be a 'pivot point', a location from which to access the BCS. In the past, this sharing was limited to local network connectivity; the PCA being a network peer within the same ESP. With virtualization there is now another aspect of sharing and the PCA definition was modified to include "share CPU resources or memory resources with any part of the BCS" to mitigate the risks of hardware-based vulnerabilities (e.g., Spectre, Meltdown, Rowhammer, Zenbleed, etc.) on SCI. Since virtualization can allow systems of differing trust levels to simultaneously execute on the same hypervisor servers in the hardware underlay and thus share the same CPU resources or memory resources, this addition to the PCA definition requires that those VCAs that do share CPU resources or memory resources with a BCS become associated PCA's of the BCS. This provides the high water marking of VCAs sharing a single hypervisor's CPU resources or memory resources. Affinity rules can be used within the virtualization configuration to prevent this situation and keep other VCAs of differing impact levels from becoming associated PCAs. Thus, there is no "mixed mode" allowed on the same CPU resources or memory resources.

Finally, the definition was modified to account for "remediation VLAN" automation of security controls where a VCA may instantiate in a logical network reserved for vulnerability assessment and updates (e.g., OS patches, AV updates, etc.) that limits its connectivity to only remediation resources during the remediation process. Even though it may share CPU resources or memory resources during the remediation, the intent is to exclude the VCA from becoming a PCA while temporarily in this state as its being updated prior to being connected to its production network.

Removable Media

Storage media that (i) are not Cyber Assets or Shared Cyber Infrastructure (SCI), (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, SCI, a network protected by an Electronic Security Perimeter, or a Protected Cyber Asset.

Rationale

The Removable Media definition was modified to add SCI as a target of the Removable Media connection and incorporate the new ESP definition ("protected by" rather than "within").

Reportable Cyber Security Incident

A Cyber Security Incident that compromised or disrupted:

- A BES Cyber System (BCS) that performs one or more reliability tasks of a functional entity;
- An Electronic Security Perimeter of a high or medium impact BCS;
- An Electronic Access Control or Monitoring System of a high or medium impact BCS; or

- Shared Cyber Infrastructure supporting a BCS.

Rationale

The Reportable Cyber security Incident definition was modified to add compromised or disrupted SCI supporting a BCS as a target.

Transient Cyber Asset (TCA)

A Cyber Asset or Virtual Cyber Asset (VCA) that is:

1. Capable of transmitting or transferring executable code,
2. Not included in a BCS,
3. Not a Protected Cyber Asset (PCA) associated with high or medium impact BCS, and
4. Connected for 30 consecutive calendar days or less:
   - On a network within an Electronic Security Perimeter containing high or medium impact BCS; or
   - Directly (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth communication) to a:
     - BES Cyber Asset;
     - Shared Cyber Infrastructure; or
     - PCA associated with high or medium impact BCS.

Virtual machines hosted on a physical Transient Cyber Asset (TCA) are treated as software on that physical TCA. Examples of TCAs include, but are not limited to, Cyber Assets or VCAs used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Rationale

The TCA definition was modified to add VCA as a form a TCA can take. The SDT is addressing two different transient connection scenarios.

The first scenario is a physical TCA such as a laptop. These TCAs may require older, 32-bit software and OS to connect to and configure older equipment in the field. These are often executed within VM 'player' environments on the physical TCA. The SDT asserts these packaged environments in an image file on a physical TCA should not be considered their own distinct virtual TCA and included the statement "Virtual machines hosted on a physical TCA are treated as software on that physical TCA" within the definition. The SDT asserts that a user that is authorized to use the physical TCA should not be required to be separately authorized to execute the software they need to use on the TCA, simply because it's in an image file and executed in a VM "player" type environment on the TCA. The SDT also asserts that if the user 'checks out' a physical laptop TCA to perform a task, it should not be a standard violation if they do not also 'check out' any VM images residing on that physical TCA's disk. The intent is that physical TCA is considered a 'unit' to perform a job and not several distinct TCAs on one laptop.

The second scenario is a more recent phenomenon where a service vendor (e.g., a pen-tester or security firm) may send an entity a VCA image (e.g., a vulnerability scanner instance) to temporarily instantiate within their virtualization environment. This VCA may only exist for a few hours and is functionally no different than the vendor bringing a physical laptop and connecting it to a physical network switch to perform the same task as a TCA. This transient VCA is not a part of the entity's CIP program and is treated as a TCA. This also handles VCAs the entity creates for typical TCA uses but are normally dormant on the same hardware as the BCS (e.g., a VCA with Wireshark for troubleshooting network issues within a virtualized infrastructure).

Additionally, SCI was added as a target to which TCAs can be directly connected.

Proposed New Terms:

Cyber System

One or more Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure.

Rationale

The term Cyber System was defined to simplify applicability when referring in the standards or other definitions to all the forms an object may take (Cyber Asset, VCA, or SCI). If other forms are needed in the future, their addition to this one definition can reduce needed edits throughout the standards and definitions where it is used.

Management Interface

An administrative interface that:

- Controls the processes of initializing, deploying, and configuring Shared Cyber Infrastructure;
- Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or
- Configures an EAP.

Rationale

The term Management Interface was defined so that requirements are established for SCI and EACMS Management Interfaces to target the unique risks for virtualized environments presented by unrestricted access to the Management Interfaces for such environments. With ‘infrastructure as a service’ (IaaS) environments, the management consoles can not only be used to create, but also to destroy or reconfigure virtual servers, networks, switches, firewalls, etc. The term also includes interfaces commonly known as ILO (Integrated Lights Out), that can be used to remotely access the console. It also includes interfaces used to configure an EAP (such as on firewalls or a network switch that is enforcing an ESP between different virtual networks (e.g., VLANs). Note that scoping is included in requirements in the standard, not in the definition.

Shared Cyber Infrastructure (SCI)

One or more programmable electronic devices, including the software that shares the devices’ resources, that:

- Hosts one or more Virtual Cyber Assets (VCA) included in a BES Cyber System (BCS) or their associated Electronic Access Control or Monitoring Systems (EACMS) or Physical Access Control

Systems (PACS); and hosts one or more VCAs that are not included in, or associated with, BCS of the same impact categorization; or

- Provides storage resources required for system functionality of one or more Cyber Assets or VCAs included in a BCS or their associated EACMS or PACS; and also, for one or more Cyber Assets or VCAs that are not included in, or associated with, BCS of the same impact categorization.

SCI does not include the supported VCAs or Cyber Assets with which it shares its resources.

Rationale

The term SCI was defined to separate the underlying hardware from VCAs in the situation where the shared hardware resources support VCAs of varying impact levels. This allows security requirements to be targeted to SCI to address the unique risks of shared hardware. There are many requirements that now include the newly defined term SCI in the "Applicable Systems" column to maintain security level parity with traditional Cyber Assets.

Beyond security level parity with protecting a typical hardware based Cyber Asset, the SCI can have a more significant impact in a virtualized environment since it can host, and therefore impact, multiple virtualized systems of varying impact levels. Because of this capability, some additional controls only apply to SCI, such as the management plane isolation required by the proposed CIP-005. Addressing these unique risks requires separation of the hardware underlay into a separate definition.

The phrase "SCI does not include the supported VCAs or Cyber Assets with which it shares its resources" is included to clarify that, for example, electronic access to a hosted VCA by a user is not electronic access to the SCI on which it executes.

Of note is that shared network devices are not in the scope of this definition. Since network switches and firewalls share their resources by nature, this exclusion avoids pulling all network hardware into scope as SCI. However, network switches and other hardware that does enforce an ESP, such as a network switch configured to host different VLANs to which systems of differing impact levels are connected, comes into scope as an EACMS.

Virtual Cyber Asset (VCA)

A logical instance of an operating system or firmware, currently executing on a virtual machine hosted on a BES Cyber Asset, Electronic Access Control or Monitoring System, Physical Access Control System, Protected Cyber Asset, or Shared Cyber Infrastructure (SCI). Virtual Cyber Assets (VCAs) do not include:

- Logical instances that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems;
- Dormant file-based images that contain operating systems or firmware; and
- SCI or Cyber Assets that host VCAs.

Application containers are considered software of VCAs or Cyber Assets.

Rationale

The term VCA was defined to allow the tie between a specific piece of hardware and the related applicable systems to no longer be singularly defined as is the case in the Cyber Asset definition. The NERC Glossary definition of Cyber Asset has a direct tie to its hardware and software ("including the hardware, software, and data in the device") and assumes the electronic device is self-contained with a one-to-one relationship between a device and its software (including the operating system). This affected the definitions of the "Applicable Systems" terms such as BCS, EACMS, PACS, and PCAs that were all based on the Cyber Asset definition. Because the Reliability Standard is applicable to the aforementioned systems, the security controls for the Cyber Assets also applies to the hardware. The one-to-one relationship between a Cyber Asset and its underlying hardware and software is what virtualization intentionally breaks to increase reliability and resiliency by allowing VCAs to be abstracted from the hardware and therefore able move to any available hardware out of a pool of resources.

The phrase "currently executing on a virtual machine" is used to clarify:

- That a VCA does not include disk image files that are not currently instantiated or executing and are thus providing no functions or services.
- That a "logical instance of an operating system or firmware" only refers to those running on a hypervisor as a virtual machine and does not refer to a locally installed OS or firmware on the hardware.

The definition excludes "logical instances that are being actively remediated…" to allow for automated solutions (such as remediation VLANs) to bring newly instantiated instances into compliance in an isolated environment before they are moved to production networks and begin providing their function or service, at which point they become a VCA.

The phrase "hosted on a BCA, EACMS, PACS, PCA, or SCI" is to clarify that an entity for an "all-in" scenario can still classify the underlying hardware as one or several of these types, yet the VCAs remain their own object subject to requirements and are not simply "software in the device" as in the Cyber Asset definition.

Examples of VCAs may include, but are not limited to, logical instances of the following:

- Operating Systems (Virtual Machines (VM));
- Networking devices such as switches, routers, and load balancers;
- Security appliances such as firewalls and VPN concentrators; and
- Helper appliances with logical connectivity (such as malware detection, plugins, etc.).

The definition also clarifies that 'Application containers' (i.e., portable, packaged applications) are considered software of a VCA or Cyber Asset, though they may have some characteristics of a VCA. This is because of their packaged quality, typically being updated as a whole and not as individual components, and the limited capabilities that containers have. When viewing applications containers as something to apply CIP Requirements to, the concept breaks down quickly due to the nature of container platforms. Additionally, the capabilities that containers do possess, that would offer services on a network for example, would then exist on the VCA or Cyber Asset that the container is running on and can be controlled as part of the required set of controls for that device.

Technical Rationale for Exemptions Section:

Rationale for Exemption 4.2.3.1

The term 'Cyber Assets' was replaced with the new proposed term 'Cyber Systems'. Rather than changing this language to a list of all possible forms (Cyber Assets, VCAs, or SCI) as the object of the exemption, the SDT chose to instead use the existing language in the 4.2.3.4 and 4.2.3.5 exemptions such that all five exemptions use a form of 'systems' as their object.

Rationale for Exemption 4.2.3.2 and 4.2.3.3

In 4.2.3.2, the term 'Cyber Assets' was replaced with the new proposed term 'Cyber Systems' which is a new proposed glossary addition. Rather than changing these two exemptions to list all possible forms (Cyber Assets, VCAs, or SCI), the SDT chose to define a new term that incorporates all forms and use it within the multiple exemptions and at other points within the standards.

For 4.2.3.3, the ability to move workloads or VMs seamlessly across different sites for increased resiliency can require different sites to be connected as a flat network without layer 3 ESPs at each discrete site (e.g., a layer 2 adjacency across the sites). A "Super ESP" as it has been historically known is created across the sites and thus an exemption based on having a discrete layer 3 ESP at each site no longer works to exclude, for example, the network transport equipment that may belong to carriers. The SDT included the 4.2.3.3 exemption to further clarify this scenario. Responsible Entities should notice the exemption uses the word "between" – when extending an ESP between geographic locations, CIP-005 requires the confidentiality and integrity protection of the data (typically through encryption) between the relevant PSPs. This exemption then covers the related Cyber Systems "between" those encryption points but does not exclude the endpoints performing the encryption.

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Exhibit F

Analysis of Violation Risk Factors and Violation Severity Levels

Violation Risk Factor and Violation Severity Level Justifications

Project 2016-02 Modifications to CIP Standards

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in the project-related standards. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

The VRFs and VSLs can be found within each Reliability Standard. This document provides justification for Reliability Standards with more substantive changes to the VRFs and VSLs, not justification for the Reliability Standards without substantive changes or only conforming changes to VRFs and VSLs from the last FERC-approved versions.

- CIP-002-7: There were no changes to VRFs and only conforming or non-substantive changes to VSLs.
- CIP-003-10: There were no changes to VRFs and justification for VSLs is provided below.
- CIP-004-8: There were no changes to VRFs and justification for VSLs is provided below.
- CIP-005-8: There were no changes to VRFs and justification for VSLs is provided below.
- CIP-006-7: There were no changes to VRFs and only conforming changes to VSLs.
- CIP-007-7: There were no changes to VRFs and justification for VSLs is provided below.
- CIP-008-7: There were no changes to VRFs and no substantive changes to VSLs.
- CIP-010-5: There were no changes to VRFs and justification for VSLs is provided below.
- CIP-011-4: There were no changes to VRFs and no substantive changes to VSLs.
- CIP-013-3: There were no changes to VRFs and no substantive changes to VSLs.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management

- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSL justification for CIP-003-10 Requirements R1, R2, R3, and R4

The VSLs were revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-003-10, Requirements R1, R2, R3, and R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-004-8 Requirement R1

The VSL did not substantively change from the previously FERC approved Reliability Standard CIP-004-7.

VSL justification for CIP-004-8 Requirements R2, R3, R5 and R6

The VSLs were revised for readability by deleting the deliverable language associated with certain violations.

VSL justification for CIP-004-8 Requirement R4

The VSLs were revised from the previously FERC approved Reliability Standard CIP-004-7 to add a moderate VSL and a high VSL to account for failing to authorize electronic access based on need for one or two individuals, respectively, to be consistent with the VSL in Requirement R5 and to align with FERC VSL G2a.

VSL Justifications for CIP-004-8, Requirements R2, R3, R4, R5 and R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VSL Justifications for CIP-004-8, Requirements R2, R3, R4, R5 and R6	
Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-005-8 Requirement R1

The VSL changed from the previously FERC approved Reliability Standard CIP-005-7:

1. To add severe VSLs to conform with the addition of SCI to Appliable Systems;
2. To accommodate for the modified requirement part language to enable for virtualization through protections for Management Interfaces, routable protocol communications, and the exclusion time sensitive communications of Protection Systems;
3. To account for the consolidation of the previously FERC approved CIP-006-6 Requirement R1 Part 1.10 into the final draft of CIP-005-8 Requirement R1 Part 1.6; and
4. Were also revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-005-8, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VSL Justifications for CIP-005-8, Requirement R1	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-005-8 Requirement R2

The VSL changed from the previously FERC approved Reliability Standard CIP-005-7.

1. To add severe VSLs to conform with the addition of SCI to Appliable Systems;
2. To accommodate for the modified requirement part language to prevent Intermediate Systems from sharing CPU resources or memory resources with any part of a high or medium impact BCS, and to ensure routable protocol communications from and Intermediate System to a high or medium BCS went through an ESP; and
3. Were revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-005-8, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-005-8, Requirement R2	
for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-005-8 Requirement R3

The VSL changed from the previously FERC approved Reliability Standard CIP-005-7:

1. To add severe VSLs to conform with the addition of SCI to Appliable Systems; and
2. Were also revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-005-8, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity

VSL Justifications for CIP-005-8, Requirement R3	
Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-007-7 Requirement R1

The VSL changed from the previously FERC approved Reliability Standard CIP-007-6:

1. To add lower and high VSLs to align with FERC VSL G2a;
2. To accommodate for the modified requirement part language to prevent sharing of CPU resources or memory resources between VCAs that are, or are associated with, a Medium or High Impact BCS, and VCAs that are not, or are not associated with a Medium or High Impact BCS;
3. To account for network accessible services; and
4. Were revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-007-7 Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VSL Justifications for CIP-007-7 Requirement R1	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-007-7 Requirement R2
The VSLs were revised for readability by deleting the deliverable language associated with certain violations and to assure consistency in language by qualifying the term ‘patches’ with ‘cyber security’.

VSL justification for CIP-007-7 Requirements R3 and R4
The VSLs were revised for readability by deleting the deliverable language associated with certain violations.

VSL justification for CIP-007-7 Requirement R5
The VSLs were revised for readability by deleting the deliverable language associated with certain violations and updated to accommodate for the replacement of technical feasibility exception language with per cyber system capability language in certain requirement parts.

VSL Justifications for CIP-007-7 Requirements R2, R3, R4 and R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-007-7 Requirements R2, R3, R4 and R5	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-010-5 Requirement R1

The VSL changed from the previously FERC approved Reliability Standard CIP-010-4:

1. To add moderate VSLs to conform with the addition of SCI to Appliable Systems; and
2. To accommodate for the consolidated requirement parts and language to enable for virtualization through the shift from a prescriptive baseline to an objective level requirement for processes to authorize changes that alter the behavior of cyber security controls serving the requirement parts of CIP-005 and CIP-007.

VSL Justifications for CIP-010-5 Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VSL Justifications for CIP-010-5 Requirement R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-010-5 Requirement R2

The VSL changed from the previously FERC approved Reliability Standard CIP-010-4 to align with FERC VSL G2a:

1. By adding a moderate, and a high VSL to account for failing to include in documented and implemented configuration monitoring process(es) ‘one or two’, or ‘three or four’, of the required Parts 2.1.1 through 2.1.7 for Applicable Systems, respectively; and modifying the severe VSL for failing to include 5 or more of the required Parts 2.1.1 through 2.1.7 for Applicable Systems in documented and implemented configuration monitoring process(es).
2. By adding a lower, moderate, and a high VSL to account for failing to monitor within 35 calendar days and exceeding the required cadence by monitoring for 36 to 69 calendar days, 70 to 104 calendar days, 105 to 139 calendar days, respectively; and modifying the severe VSL for failing to monitor for 140 calendar days or more as required by Part 2.1.

VSL Justifications for CIP-010-5 Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-010-5 Requirement R2	
for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSL justification for CIP-010-5 Requirements R3 and R4

The VSLs were revised for readability by deleting the deliverable language associated with certain violations.

VSL Justifications for CIP-010-5 Requirements R3 and R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-010-5 Requirements R3 and R4	
Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

Exhibit G

Summary of Development History and Complete Record of Development

Summary of Development History

The following is a summary of the development record for proposed Reliability Standards. As development of the proposed Reliability Standards occurred over several years, the versions of the proposed Reliability Standards shifted if other versions of the same Reliability Standard were developed concurrently. As such, the complete record of development provides those shifts in version numbers, while the summary of development maintains the version numbers proposed in the petition.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived from the drafting team ("DT") selected to lead each project in accordance with Section 4.3 of the NERC Standard Processes Manual.[2] For this project, the DT consisted of industry experts, all with a diverse set of experiences. A roster of the Project 2016-02 – Modifications to CIP Standards DT members is included in **Exhibit H**.

II. Standard Development History

A. Standard Authorization Request Development

On March 9, 2016, the Standards Committee authorized posting a Standards Authorization Request ("SAR") to address Commission directives from Order No. 822[3] and CIP Version 5 Transition Advisory Group issues for a 30-day informal comment period from March 23, 2016 through April 4, 2016 and authorized solicitation of nominations for the Project 2016-02 –

[2] The NERC *Standard Processes Manual* is available at https://www.nerc.com/AboutNERC/RulesOfProcedure/Appendix_3A_SPM_Clean_Mar2019.pdf.

[3] *Revised Critical Infrastructure Protection Reliability Standards*, Order No. 822, 154 FERC ¶ 61,037, at P 17, *order on reh'g,* Order No. 822-A, 156 FERC ¶ 61,052 (2016).

Modifications to CIP Standards DT.[4] Based on comments received, the DT revised the SAR and posted for another 30-day informal comment period from June 1, 2016 through June 30, 2016. The Standards Committee accepted the revised SAR on July 20, 2016.[5]

B. First Posting - Comment Period, Initial Ballot, and Non-binding Poll

On January 20, 2021, the Standards Committee authorized initial posting of the proposed Reliability Standards and associated definitions, the associated Implementation Plan, Violation Risk Factors ("VRFs"), Violation Severity Levels ("VSLs"), and other associated documents for a 60-day formal comment period from January 22 – March 22, 2021, with a parallel initial ballot and non-binding poll held during the last 10 days of the comment period from March 12 – March 22, 2021.[6] There were 91 sets of responses, including comments from approximately 210 different individuals and approximately 133 companies, representing all 10 industry segments.[7] The following table provides for each Reliability Standard: 1) the percentage of affirmative votes,[8] 2) the quorum reached, and 3) the results of the non-binding poll and quorum for the associated VRFs and VSLs.

Standard	Approval	Quorum	Non-binding Poll / Quorum
CIP-002-7	38.97	91.42	43.46 / 90.61
CIP-003-10	48.44	91.09	53.72 / 90.25
CIP-004-8	51.31	91.03	61.17 / 90.25
CIP-005-8	26.36	91.03	29.32 / 89.53
CIP-006-7	42.81	91.03	48.37 / 89.21
CIP-007-7	42.43	91.03	48.17 / 89.21
CIP-008-7	52.87	91.03	62.84 / 89.21

[8] A ballot needs 66 and two-thirds percentage approval to pass.

CIP-009-7	53.26	90.7	62.64 / 88.85
CIP-010-5	32.53	91.03	38.74 / 89.21
CIP-011-4	47.38	90.7	59.89 / 89.21
CIP-013-3	51.37	90.7	59.78 / 89.21

C. Second Posting - Comment Period, Additional Ballot, and Non-binding Poll

The proposed Reliability Standards and associated definitions, the associated Implementation Plan, VRFs, VSLs, and other associated documents were posted for a 64-day formal comment period from June 30 – September 1, 2021, with a parallel additional ballot and non-binding poll held during the last 10 days of the comment period from August 23 – September 1, 2021. There were 93 sets of responses, including comments from approximately 218 different individuals and approximately 137 companies, representing all 10 industry segments.[9] The following table provides for each Reliability Standard: 1) the percentage of affirmative votes, 2) the quorum reached, and 3) the results of the non-binding poll and quorum for the associated VRFs and VSLs.

Standard	Approval	Quorum	Non-binding Poll/Quorum
CIP-002-7	36.32	88.12	37.36 / 87.73
CIP-003-10	41.67	88.12	43.96 / 88.09
CIP-004-8	38.21	88.37	44.81 / 88.09
CIP-005-8	20.31	88.04	19.67 / 88.09
CIP-006-7	42.32	88.04	45.6 / 88.13
CIP-007-7	29.49	88.04	28.02 / 87.77
CIP-008-7	49.63	88.37	52.46 / 88.13
CIP-009-7	49.88	88.37	53.3 / 87.77
CIP-010-5	33.32	88.37	36.07 / 88.13
CIP-011-4	40.29	88.37	45 / 87.73
CIP-013-3	41.56	88.37	45.56 / 87.41

D. Third Posting - Comment Period, Initial Ballot, and Non-binding Poll

The proposed Reliability Standards and associated definitions, the associated Implementation Plan, VRFs, VSLs, and other associated documents were posted for a 54-day formal comment period from February 18 – April 12, 2022, with a parallel additional ballot and non-binding poll held during the last 12 days of the comment period from April 1 – April 12, 2022. There were 85 sets of responses, including comments from approximately 187 different individuals and approximately 125 companies, representing all 10 industry segments.[10] The following table provides for each Reliability Standard: 1) the percentage of affirmative votes, 2) the quorum reached, and 3) the results of the non-binding poll and quorum for the associated VRFs and VSLs.

Standard	Approval	Quorum	Non-binding Poll/Quorum
CIP-002-7	72.84	82.89	80 / 81.25
CIP-003-10	73.36	82.89	77.25 / 81.25
CIP-004-8	76.97	83.11	79.64 / 81.25
CIP-005-8	60.73	83.11	63.41 / 81.25
CIP-006-7	76.08	83.11	82.63 / 80.95
CIP-007-7	61.36	83.11	65.06 / 80.95
CIP-008-7	78.62	83.11	83.23 / 80.95
CIP-009-7	78.37	82.77	82.63 / 80.95
CIP-010-5	56.69	82.77	66.46 / 80.95
CIP-011-4	79.04	82.77	82.53 / 80.95
CIP-013-3	78.62	83.11	82.42 / 80.95

E. Fourth Posting - Comment Period, Additional Ballot, and Non-binding Poll

The proposed Reliability Standards and associated definitions, the associated Implementation Plan, VRFs, VSLs, and other associated documents were posted for a 52-day formal comment period from August 17 – October 7, 2022, with a parallel additional ballot held during the last 10 days of the comment period from September 28 – October 7, 2022 and non-

---

binding poll held from September 28 – October 10, 2022. There were 72 sets of responses, including comments from approximately 188 different individuals and approximately 121 companies, representing all 10 industry segments.[11] The following table provides for each Reliability Standard: 1) the percentage of affirmative votes, 2) the quorum reached, and 3) the results of the non-binding poll and quorum for the associated VRFs and VSLs.

Standard	Approval	Quorum	Non-binding Poll/Quorum
CIP-002-7	94.63	77.89	97.25 / 80.87
CIP-003-10	84.90	77.89	87.36 / 76.09
CIP-004-8	84.60	78.07	88.46 / 80.87
CIP-005-8	65.26	78.41	69.95 / 81.23
CIP-006-7	92.60	78.07	93.44 / 80.58
CIP-007-7	67.38	77.74	73.08 / 80.58
CIP-008-7	95.67	77.74	96.7 / 80.58
CIP-009-7	95.38	77.74	96.15 / 80.58
CIP-010-5	46.35	78.07	57.46 / 80.58
CIP-011-4	82.59	77.74	87.5 / 80.94
CIP-013-3	82.88	77.74	87.98 / 80.58

F. Waiver

On October 19, 2022, the Standards Committee approved a waiver under Section 16.0 of the Standard Processes Manual authorizing additional formal comment and ballot periods to be

---

[11] NERC, *Draft 4 Consideration of Comments – Virtualization*, *Project 2016-02 Modifications to CIP Standards October. 2023*, https://www.nerc.com/pa/Stand/Project%20201602%20Modifications%20to%20CIP%20Standards%20DL/2016-02_CIP_Virtualization_Draft_4_Consideration_of_Comments.pdf.

reduced from 45 days to as few as 20 calendar days, with ballot conducted during the last 10 days of the comment period.[12]

G. Fifth Posting - Comment Period, Additional Ballot, and Non-binding Poll

In the fifth posting, the DT balloted those Reliability Standards that either did not achieve the requisite approval in the fourth posting or had further substantive revisions. The proposed Reliability Standards and associated definitions, the associated Implementation Plan, VRFs, VSLs, and other associated documents were posted for a 58-day formal comment period from October 3 – November 29, 2023, with a parallel additional ballot and non-binding poll held during the last 10 days of the comment period from November 20 – November 29, 2023. There were 71 sets of responses, including comments from approximately 185 different individuals and approximately 116 companies, representing all 10 industry segments.[13] The following table provides for each Reliability Standard: 1) the percentage of affirmative votes, 2) the quorum reached, and 3) the results of the non-binding poll and quorum for the associated VRFs and VSLs.

Standard	Approval	Quorum	Non-binding Poll/Quorum
CIP-003-10	93.80	83.5	92.61 / 82.29
CIP-004-8	84.73	84.41	81.03 / 83.03
CIP-005-8	72.73	84.41	70.18 / 83.03
CIP-007-7	89.32	84.41	87.79 / 82.35
CIP-010-5	74.46	84.75	75.14 / 83.09

H. Final Ballot

The proposed Reliability Standards and associated definitions, the associated Implementation Plan, VRFs, VSLs, and other associated documents were posted for a 10-day final ballot from April 3 – April 12, 2024. The following table provides for each Reliability Standard: 1) the percentage of affirmative votes, and 2) the quorum reached.

Standard	Approval	Quorum
CIP-002-7	94.37	84.62
CIP-003-10	93.63	85.86
CIP-004-8	86.3	86.1
CIP-005-8	75.73	86.1
CIP-006-7	94.7	83.84
CIP-007-7	90.24	86.1
CIP-008-7	96.05	83.84
CIP-009-7	95.8	83.84
CIP-010-5	76.98	86.44
CIP-011-4	86.21	83.84
CIP-013-3	86.47	83.84

I. Board of Trustees Adoption

The NERC Board of Trustees adopted the Reliability Standards and associated definitions on May 9, 2024.[14]

Status

The final ballots for the **CIP Virtualization standards (outlined below)** concluded **8 p.m. Eastern, Friday, April 12, 2024**. The voting results can be accessed via the links below. The standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

-CIP-002-7 - Cyber Security – BES Cyber System Categorization

-CIP-003-10* - Cyber Security – Security Management Controls

-CIP-004-8* - Cyber Security – Personnel & Training

-CIP-005-8 - Cyber Security – BES Cyber System Logical Isolation

-CIP-006-7 - Cyber Security – Physical Security of BES Cyber Systems

-CIP-007-7 - Cyber Security – Systems Security Management

-CIP-008-7 - Cyber Security – Incident Reporting and Response Planning

-CIP-009-7 - Cyber Security – Recovery Plans for BES Cyber Systems

-CIP-010-5 - Cyber Security – Configuration Change Management and Vulnerability Assessments

-CIP-011-4* - Cyber Security – Information Protection

-CIP-013-3 - Cyber Security – Supply Chain Risk Management

***Based on recent board adopted standards for CIP-003-9, CIP-004-7, and CIP-011-3, the posted versions for the 2016-02 Modifications to CIP Standards were updated to reflect CIP-003-10, CIP-004-8, and CIP-011-4. The Standards Balloting and Commenting System (SBS) does not allow edits once a ballot pool has been formed. Even though the standard versioning within the SBS states CIP-003-9, CIP-004-7, and CIP-011-3, the version numbers within this posting are correct and entities will be voting on CIP-003-10, CIP-004-8, and CIP-011-4.*

Background

The Version 5 Transition Advisory Group (V5 TAG) transferred issues to the Version 5 SDT that were identified during the industry transition to implementation of the Version 5 CIP Standards. Specifically, the issues that the SDT will address are:

- Cyber Asset and BES Cyber Asset Definition
- Network and Externally Accessible Devices
- Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations
- Virtualization

On January 21, 2016, FERC issued Order No. 822 Revised Critical Infrastructure Protection Reliability Standards. In this order, FERC approved revisions to version 5 of the CIP standards and also directed that NERC address each of the Order 822 directives by developing modifications to requirements in CIP standards and the definition of Low Impact External Routable Connectivity (LERC), or the SDT shall develop an equally efficient and effective alternative. To address concerns identified in Order 822, the Commission directed the following:

- Develop modifications to the CIP Reliability Standards to provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability.
- Develop modifications to the CIP Reliability Standards to require responsible entities to implement controls to protect, at a minimum, communication links and sensitive bulk electric system data communicated between bulk electric system Control Centers in a manner that is appropriately tailored to address the risks posed to the bulk electric system by the assets being protected (i.e., high, medium, or low impact).
- Develop a modification to provide the needed clarity, within one year of the effective date of this Final Rule, to the LERC definition consistent with the commentary in the Guidelines and Technical Basis section of CIP-003-6.

Standard(s) Affected –CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010, CIP-011, CIP-012-1, CIP-013

Purpose/Industry Need

The SDT will modify the CIP family of standards (or develop an equally efficient and effective alternative) to:

- Address issues identified by the CIP V5 TAG;
- Address FERC directives contained in Order 822; and
- Address requests for interpretations as directed by the NERC Standards

Standards Announcement

Project 2016-02 Modifications to CIP Standards

Supplemental Nomination Period Open through March 23, 2016

Now Available

Nominations are being sought for additional standard drafting team (SDT) members through **8 p.m. Eastern, Wednesday, March 23, 2016**.

Use the electronic form to submit a nomination. If you experience any difficulties in using the electronic form, contact Wendy Muller. An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page and the project page.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls.

Previous drafting or review team experience is beneficial, but not required.

The time commitment for this project is expected to be significant. Participants should anticipate an average workload of 20 hours per week devoted to the SDT efforts. In person meetings will occur typically for 2 ½ - 3 days most months (not including travel time) and meetings will take place in different parts of North America. When not meeting in person, regularly scheduled conference calls will be used to conduct drafting team work. Outside the scheduled meetings, individuals or subgroups will have additional preparation and support work such as researching and developing proposed concepts, reviewing proposals, compiling comments and drafting responses, etc. Lastly, outreach is an important component of this SDT's effort. Members of the team are expected to interact with other stakeholders during the revision development process.

See the project page and unofficial nomination form for more information.

Next Steps

The Standards Committee is expected to appoint members to the team in April 2016. Nominees will be notified shortly after they have been appointed.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact either Senior Standards Developer, Stephen Crutchfield at (609) 651-9455 or Al McMeekin at (404) 446-9675.

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard

Title of Proposed Standard(s):	Modifications to CIP Standards
Date Submitted:	March 9, 2016

SAR Requester Information

Name:	Stephen Crutchfield		
Organization:	NERC		
Telephone:	609-651-9455	E-mail:	Stephen.Crutchfield@nerc.net

SAR Type (Check as many as applicable)

☒ New Standard	☒ Withdrawal of existing Standard
☒ Revision to existing Standard	☐ Urgent Action

SAR Information

Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):

The purpose of this project is to (1) consider the Version 5 Transition Advisory Group (V5TAG) issues identified in the *CIP V5 Issues for Standard Drafting Team Consideration* (V5TAG Transfer Document) and (2) address the Federal Energy Regulatory Commission (Commission) directives contained in Order 822. These revisions will increase reliability and security to the Bulk-Power System (BPS) by enhancing cyber protection of BPS facilities.

Industry Need (What is the industry problem this request is trying to solve?):

The V5TAG, which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP version 5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by the existing standard drafting team (SDT) for the CIP Reliability Standards.

SAR Information

The V5 TAG developed the V5TAG Transfer Document to explain the issues and recommend that the SDT consider them in future development activity.

On January 21, 2016, the Commission issued Order No. 822 approving revisions to the CIP version 5 standards and also directing NERC to develop modifications to address:

- Protection of transient electronic devices used at low-impact BES Cyber Systems;
- Protections for communication network components between control centers; and
- Refinement of the Low Impact External Routable Connectivity (LERC) definition.

The Commission did not provide a date by which the modifications for transient devices or communication networks must be completed. For the LERC definition, however, the Commission directed that NERC submit the modification within one year of the effective date of Order No. 822 (March 31, 2017).

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The proposed project will consider the issues raised by the V5TAG in the V5TAG Transfer Document and will address the Commission directives in Order No. 822 through modifications to the CIP standards. The work will include development of Violation Risk Factors, Violation Severity Levels, and an Implementation Plan for the modified standards and will meet the deadlines established by the Commission in Order No. 822.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

As stated above, the purpose of this project is to consider the V5TAG issues in the initial transfer document V5TAG Transfer Document and address the Commission directives contained in Order 822. For the directive on the LERC definition, the project is to respond within the deadline required in the order.

As noted above, the V5TAG identified specific issues with the CIP V5 standards. The V5TAG drafted the V5TAG Transfer Document to formally recommend that the SDT address these issues during standards development to consider whether modifications can be made to the standard language. As outlined in the V5TAG Transfer Document, the specific issues are as follows:

- <u>Cyber Asset and BES Cyber Asset (BCA) Definitions</u> – as foundational definitions within the CIP V5 standards, the understanding of Cyber Asset and BCA terms impacts the scope of the applicable requirements. The V5TAG recommends the following enhancements:
  - Clarify the intent of “programmable” in Cyber Asset.
  - Clarify and focus the definition of “BES Cyber Asset” including:

SAR Information

    - Focusing the definition so that it does not subsume all other cyber asset types.
    - Considering a lower bound to the term 'adverse' in "adverse impact".
    - Clarifying the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that "N-1 contingency" is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.
- Network and Externally Accessible Devices – V5TAG recommends improving clarity within the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
    - The 4.2.3.2 exemption phrase "between discrete Electronic Security Perimeters"
    - The meaning of the word 'associated' in the ERC definition.
    - The applicability of ERC including the concept of the term "directly" used in the phrase "cannot be directly accessed through External Routable Connectivity" within the Applicability section.
    - The IRA definition placement of the phrase "using a routable protocol" in the definition and with respect to Dial-up Connectivity.
    - The Guidelines and Technical Basis sentence, "If dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies."
- Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations – V5TAG is aware of multiple interpretations of the language "used to perform the functional obligation of" in CIP-002-5.1 Attachment 1, section 2.12 and recommends clarification of:
    - The applicability of requirements on a TO Control Center that performs the functional obligations of a TOP, particularly if the TO has the ability to operate switches, breakers and relays in the BES.
    - The definition of Control Center.
    - The language scope of "perform the functional obligations of" throughout the Attachment 1 criteria.
- Virtualization – The CIP V5 standards do not specifically address virtualization. Because of the increasing use of virtualization in industrial control system environments, V5TAG asked that the SDT consider CIP-005 and the definitions of Cyber Asset and Electronic Access Point regarding permitted architecture and the security risks of network, server and storage virtualization technologies.

The SDT shall also address the Order No. 822 directives by developing modifications to requirements in CIP standards and the definition of LERC. The Commission directed the following:

- *Per paragraph 32, "...we direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability. While NERC has flexibility in the manner in which it addresses the Commission's concerns, the proposed modifications should be designed to effectively address the risks posed by*

SAR Information
transient devices to Low Impact BES Cyber Systems in a manner that is consistent with the risk-based approach reflected in the CIP version 5 Standards." • *Per paragraph 53, "…the Commission concludes that modifications to CIP-006-6 to provide controls to protect, at a minimum, communication links and data communicated between bulk electric system Control Centers are necessary in light of the critical role Control Center communications play in maintaining bulk electric system reliability. Therefore, we adopt the NOPR proposal and direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to require responsible entities to implement controls to protect, at a minimum, communication links and sensitive bulk electric system data communicated between bulk electric system Control Centers in a manner that is appropriately tailored to address the risks posed to the bulk electric system by the assets being protected (i.e., high, medium, or low impact)."* • *Per paragraph 73, "…the Commission concludes that a modification to the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6 is necessary to provide needed clarity to the definition and eliminate ambiguity surrounding the term "direct" as it is used in the proposed definition. Therefore, pursuant to section 215(d)(5) of the FPA, we direct NERC to develop a modification to provide the needed clarity, within one year of the effective date of this Final Rule…."*

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.

Reliability Functions		
☒	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.

Reliability and Market Interface Principles	
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Project 2016-02 Modifications to CIP Standards
Standards Authorization Request (SAR)

Do not use this form for submitting comments. Use the electronic form to submit comments on the Project 2016-02 Modifications to CIP Standards SAR. The electronic comment form must be submitted by **8 p.m. Eastern, Thursday, April 21, 2016**.

Documents and information about this project are available on the Project 2016-02 Modifications to CIP Standards. If you have questions, contact either Senior Standards Developer, Stephen Crutchfield at (609) 651-9455 or Al McMeekin at (404) 446-9675.

Background Information

On January 21, 2016, FERC issued Order No. 822, *Revised Critical Infrastructure Protection Reliability Standards,* approving seven CIP Reliability Standards and new or modified definitions. FERC also directed NERC to develop modifications to address:

- Protection of transient electronic devices used at low-impact bulk electric system cyber systems;
- Protections for communication network components between control centers; and
- Refinement of the definition for Low Impact External Routable Connectivity (LERC)

FERC directed NERC to submit new or modified standards responding to the directives related to the definition of LERC by March 30, 2016, one year from the effective date of Order No. 822. FERC did not place any time frame for NERC to respond to the remaining directives.

The CIP Version 5 Transition Advisory Group (V5 TAG) transferred issues to the CIP Version 5 Standard Drafting Team (SDT) that were identified during the industry transition to implementation of the CIP Version 5 Standards. Specifically, the issues that the SDT will address are:

- Cyber Asset and BES Cyber Asset Definitions
- Network and Externally Accessible Devices
- Transmission Owner Control Centers Performing Transmission Operator Obligations
- Virtualization

On March 9, 2016, the NERC Standards Committee accepted and authorized the posting of the Modifications to CIP Standards SAR. It is posted for a 30-day informal comment period because it is addressing FERC directives.

Questions

1. Do you agree with the scope and objectives of this SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

   Yes:

   No:

   Comments:

2. Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

   Yes:

   No:

   Comments:

3. Are there any other concerns with this SAR that haven't been covered in previous questions?

   Yes:

   No:

   Comments:

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CIP V5 Issues for Standard Drafting Team Consideration

September 15, 2015

From experience in the V5 Transition Study and the on-going implementation efforts, the CIP Version 5 Transition Advisory Group (V5TAG) identified specific issues with the CIP Version 5 standard language that caused difficulty in implementation of the requirements. In many cases, the V5TAG members found that select language within the CIP Version 5 standards may be understood in multiple ways. These interpretations appear to go beyond the intended flexibility of the standard language that is necessary to accommodate the diverse nature of facts and circumstances across the electric sector. At this time, the V5TAG proposes the following issues to be addressed by the CIP V5 Revisions drafting team (SDT) or other appropriate team for standards development:

- **<u>Cyber Asset and BES Cyber Asset definitions</u>**
  The foundational definition for the CIP Version 5 standards is 'Cyber Assets.' When Cyber Assets meet a threshold of Bulk Electric System (BES) impact they become 'BES Cyber Assets (BCA)' which are grouped, by a Responsible Entity, into 'BES Cyber Systems (BCS).' Viewing BCAs too broadly can lead to many thousands of devices in the typical utility becoming an administrative burden for which few if any cyber security controls can actually be applied or where there is limited associated cyber security risk. Vast amounts of effort would be expended for these types of cyber assets to track and document their lack of capability for even the most basic cyber security controls. Viewing BCAs too narrowly could lead to missing consideration of devices that have a sufficient level of cyber capability and risk impact.

  The SDT should consider the definition of Cyber Asset and clarify the intent of "programmable" by considering such factors as if a device is merely configurable, its executable code is not field upgradable, or if its functionality can only be changed via physical DIP switches, swapping internal chips, etc.

  The SDT should consider clarifying and focusing the definition of "BES Cyber Asset" including:
    a. Focusing the definition so that it does not subsume all other cyber asset types. Protected Cyber Assets (PCA), by nature of being on the same network, can have some form of adverse impact if misused. Electronic Access Control or Monitoring Systems (EACMS) if misused or unavailable can have some form of adverse impact. This can result in a "hall of

mirrors” effect where everything in or that creates an Electronic Security Perimeter (ESP) also meets the BCA definition.

   b. Considering if there is a lower bound to the term ‘adverse’ in “adverse impact”. For example, is the focus of a typical generating unit the servers and operator human machine interfaces (HMI) and controller cabinets and Programmable Logic Controllers (PLCs) or is it the thousands of individual sensors and transmitters throughout the plant?
   c. Clarify the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that “N-1 contingency” is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.

- **Network and Externally Accessible Devices (ERC, ESP, IRA)**

  The SDT should consider the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
   a. Clarify the 4.2.3.2 exemption phrase “between discrete Electronic Security Perimeters.” When there is not an ESP at the location, consider clarity that the communication equipment considered out of scope is the same communication equipment that would be considered out of scope if it were between two ESPs.
   b. The word ‘associated’ in the ERC definition is unclear in that it alludes to some form of relationship but does not define the relationship between the items. Striking ‘associated’ and defining the intended relationship would provide much needed clarity.
   c. Review of the applicability of ERC including the concept of the term “directly” used in the phrase “cannot be directly accessed through External Routable Connectivity” within the Applicability section. As well, consider the interplay between IRA and ERC.
   d. Clarify the IRA definition to address the placement of the phrase “using a routable protocol” in the definition and clarity with respect to Dial-up Connectivity.
   e. Address the Guidelines and Technical Basis sentence, “If dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.”

- **Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations**

  CIP-002-5.1 Attachment 1 – Impact Reliability Criteria, sections 1.1, 1.2, 1.3, 1.4, 2.11, 2.12, and 2.13 employ the language “used to perform the functional obligation of”, and then lists the functional registration. It was intended that this caveat would capture entities that perform obligations of a specific registered function, whether they are registered for that function or not. However, this language has caused confusion, especially in section 2.12 concerning TOP Control Centers. The term “functional obligation” may be interpreted to have different meaning in a variety of situations.

One interpretation is for the defined term Control Center to be strictly associated with the Balancing Authority (BA), Generator Operator (GOP), Reliability Coordinator (RC), and Transmission Operator (TOP) functional registrations, and that control rooms or dispatch centers owned and operated by Transmission Owners (TOs) with control of limited BES facilities would be excluded. A second interpretation may expand or contract the applicability of the Control Center designation, based on criteria that may not take into consideration overall risk to reliable operations of the BES.

Early analysis found the potential for TOs (not Registered as TOPs) that only operate limited breakers to be pulled in as medium impact Control Centers, even if the few Facilities they control are low impact. (For example, an entity with one 161kV breaker in one substation and a second 161kV breaker in a different substation, both breakers associated with low impact Facilities.) As currently written, low impact Control Centers are to be identified per criteria 3.1 and could be commensurate with risk for these scenarios.

Areas for the SDT to address are:

a. CIP-002-5.1, Attachment 1 Control Center criteria for additional clarity and for possible revisions related to TOP or TO Control Centers performing the functional obligations of a TOP, in particular for small or lower-risk entities. A potential revision could be a size for criteria 2.12, Control Centers performing the functional obligations of a TOP.
b. Clarify the applicability of requirements on a TO Control Center that perform the functional obligations of a TOP, particularly if the TO has the ability to operate switches, breakers and relays in the BES. Review the corresponding Guidelines and Technical Basis of CIP-002-5.1, specifically: the “CIP-002-5” section paragraph starting with “Responsibility for the reliable operation of the BES is spread across all Entity Registrations”; the table following that paragraph; the “High Impact Rating (H)” section; and the criterion bullets for Control Centers under the “Medium Impact Rating (M)” section.
c. The definition of Control Center (if pursued, recognize possible impacts on operations and planning standards and/or glossary terms that include ‘Control Center’, for example, the revised Glossary term for “System Operator” to be effective July 1, 2016).
d. The language scope of “perform the functional obligations of” throughout the Attachment 1 criteria.

- <u>**Virtualization**</u>

  The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration.

> The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies.

The transition to CIP Version 5 continues as the compliance deadline of April 1, 2016 approaches. The V5TAG continues to discuss challenging issues being undertaken during the on-going implementation. The group may find additional issues to transfer to the SDT for consideration.

Standards Announcement

Project 2016-02 Modifications to CIP Standards
Standards Authorization Request

Informal Comment Period Open through April 21, 2016

Now Available

A 30-day informal comment period for the **Project 2016-02** Standard Authorization Request (SAR), is open through **8 p.m. Eastern, Thursday, April 21, 2016**.

Commenting

Use the electronic form to submit comments on the SAR. If you experience any difficulties in using the electronic form, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The drafting team will consider all responses received during the comment period and determine the next steps of the project

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact either Senior Standards Developer, Stephen Crutchfield at (609) 651-9455 or Al McMeekin at (404) 446-9675.

Comments Received Report

Project Name:	2016-02 Modifications to CIP Standards SAR
Comment Period Start Date:	3/23/2016
Comment Period End Date:	4/21/2016
Associated Ballots:	

There were 33 sets of responses, including comments from approximately 33 different people from approximately 32 companies representing 9 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the scope and objectives of this SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

2. Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

3. Are there any other concerns with this SAR that haven't been covered in the previous questions?

Comment

The SPP RE respectfully submits the following eight comments to the Project 2016-02 Standards Authorization Request: (1) With respect to clarifying or revising the definition of Cyber Asset, consider including misuse of the Programmable Electronic Device through misconfiguration or reconfiguration of the device in the instance that its behavior is affected and its altered behavior impacts the associated Facility. Consider the risk of misuse (i.e., how would someone misconfigure or reconfigure the device to cause undesired behavior) as appropriate. (2) With respect to clarifying or revising the definition of External Routable Connectivity (ERC), consider the point in the communication path at which a conversion from routable to non-routable communication protocol occurs. Is ERC only established if the conversion occurs in the same asset as the BES Cyber Asset or can ERC be established if the conversion occurs at the remote end of the communication path (e.g., conversion at the Control Center for communication to a serially connected relay in a substation)? Consider whether ERC exists only if the conversion occurs outside of an established ESP (i.e., there is no ERC if the device performing the conversion is inside an ESP and protected per the CIP Standards). (3) With respect to CIP-002-5.1, Impact Rating Criteria 3.2 and 3.3, clarify that the Low Impact BES Cyber Systems are associated with Facilities located within the asset as opposed to being associated with the asset itself. The opening statement in Section 3 of the Impact Rating Criteria states "BES Cyber Systems not included in Sections 1 or 2 above that are associated with any of the following assets…" The SPP RE has already been presented with an argument that flow meters in a substation are not BES Cyber Assets because they are associated with a Transmission line and not the Transmission station or substation cited in Impact Rating Criterion 3.2. (4) With respect to Tie Line and other Transmission line flow meters, these Cyber Assets appear to have been unintentionally excluded from consideration under CIP-002-5.1, Impact Rating Criterion 2.5. Impact Rating Criterion 2.5 excludes consideration of BES Cyber Assets associated with Transmission lines through its use of "operating between 200 kV and 499 kV at a single station or substation" language. In the instance where the tie line or other flow meter is associated with a Transmission Line operated between 200 and 499 KV in a substation that satisfies the qualifications of Impact Rating Criterion 2.5, the meter will be excluded and not be categorized as Medium Impacting. Additionally, some entities are proffering the argument that the flow meter is not a BES Cyber Asset because its loss or misuse will not affect the reliable operation of the Transmission Facilities in the substation where the meter resides, overlooking the impact the loss of meter information may have on Control Center operations including ACE calculation, security-constrained generation dispatch, AGC, and Situational Awareness. An additional Criterion, specific to Transmission line flow meters, may be required to address this issue. (5) With respect to Physical Security Perimeters and their associated Requirements, clarification is needed regarding the concept of zoned access within a defined PSP. Specifically, is it acceptable to define an overarching PSP and then establish areas of access control within the defined PSP where BES Cyber Systems are present and for which different access permissions are established? For example, can a building containing a Control Center and its associated data center be declared a single PSP while access controls are established that do not permit all personnel with authorized unescorted access into the building to have authorized unescorted access into one or more access control zones within the building (e.g., the data center). And, if the zoned access areas are deemed to be independent PSPs, would the application of CIP-006-6 R1 Part 1.3 require two access controls to enter the interior PSP containing High Impact BES Cyber Systems, or would the requirement for two access controls to enter the outer (building) PSP suffice such that a single access control is permitted for the interior PSPs? (6) In consideration of the results of the investigation of the Ukraine cyberattack, the SPP RE recommends that Cyber Assets outside of the ESP with a machine-to-machine connection to a Cyber Asset inside the ESP be subjected to the same controls as the Intermediate System. There is a gap in the Standards today whereby a communication protocol typically used for interactive access (e.g., FTP, SSH, web services) can also be used for system-to-system communication. While Interactive Remote Access requires the use of an Intermediate System, encryption, and multi-factor authentication to the

Intermediate System, system-to-system communication using the exact same protocols do not require such controls. The Electronic Access Point cannot tell the difference, thus a successful compromise of the Cyber Asset residing outside of the ESP affords the attacker trusted access into the ESP. (7) In consideration of the results of the investigation of the Ukraine cyberattack, the SPP RE recommends the Standards Drafting Team consider whether essential support systems (UPS, PBX/VOIP phone, fire suppression, emergency generation) should be afforded certain protective controls to mitigate the risk that a successful attack directed at the support systems would adversely impact the asset containing BES Cyber Systems. For example, one element of the Ukraine attack was directed at a network-connected Uninterruptible Power Supply, removing power from essential Cyber Assets. (8) The SPP RE understands that a number of Requests for Interpretation have been submitted against CIP Version 5. While NERC staff has stated publicly that the RFIs would be addressed by the Standards Drafting team, there is no mention of RFIs in the Standards Authorization Request. To the extent that there are RFIs not included in either the Order 822 or V5TAG items, the Standards Authorization Request should state that pending RFIs will be considered and addressed in any revisions to the CIP standards.

We recommend that the term, Adverse Impact, contained within the BES Cyber Asset definition be itself added as a defined Glossary term. Any attempt to clarify this phrase by adding language within the BES Cyber Asset definition is likely to complicate, rather than simplify, understanding of the term.

The current outstanding Requests For Interpretation should be added as issues to be addressed by the Standards Drafting Team under this SAR. Per the Standards Process Manual, Section 7, Interpretations “shall stand until such time as the Interpretation can be incorporated into a future revision of the Reliability Standard.” Although this statement does not directly apply to the currently open, and unresolved, Requests for Interpretation, we believe the most logical approach would be to address the identified issues via this SAR rather than a separate interpretation development effort.

We recommend that the scope of the SAR be expanded to address the increasing use of 3rd party (i.e. cloud) services. Numerous utilities are leveraging new capabilities available from 3rd party providers in ways that enhance the overall security of the grid. Examples include cloud-based vulnerability scanners, offsite log monitoring services, cloud-based malware analysis and threat detection, cloud-based network monitoring, and colocation facilities. Unfortunately, the current standards are unduly prohibitive towards these services and as a result may be lowering the overall security of the grid by discouraging the use of effective, cutting edge tools, techniques, and services. For example, CIP-006 requires EACMS devices to be within a Physical Security Perimeter. It is not clear how, or if, this requirement can be met for cloud services. The SDT should review existing language and add, modify, or remove language as needed to accommodate any such services that can be prudently deployed to enhance overall grid security.

Comment	
Xcel Energy has some concern that the SAR’s inclusion of communication network components between control centers could extend to cabling between Control Centers. The inclusion of cabling between Control Centers would be in direct contrast to guidance in the CIP standards and the authority granted in section 215(d)(5) of the FPA by asking entities to be held accountable for equipment they do not own. Communication networks between discrete Electronic Security Perimeters (ESPs) have been excluded from the CIP standards. Additionally, it is unclear how physical protection of cabling would afford any additional protection to networks already in compliance with the suite of CIP standards. Furthermore, the documentation of any physical protection would be administratively burdensome without adding any additional protection. If any requirement is to be added regarding cabling between Control Centers, we would encourage the drafting team to add it as logical controls such as encryption or other such measures under CIP-005 and/or CIP-007. To require physical protection of equipment not owned by Registered Entities seems in direct contrast to previous guidance, outside of the authority documented in section 215(d)(5) of the FPA and add administrate burden with little value.

Comment	

Seminole concurs with all items currently listed in the draft Standards Authorization Request. Seminole recommends that additional items should be included in the SAR

The industry has received guidance from NERC's Compliance Monitoring and Enforcement group in the form of Frequently Asked Questions and Lessons Learned. These guidance items need to become formal Guidelines, with appropriate Technical Basis, and placed within the Standards and approved by the NERC membership

Issues related to Shared Facilities that are not adequately addressed in the standards. Specifically, when multiple entities have BES Cyber Assets residing at a shared location, there is no clear delineation of responsibility. Without defined responsibilities in the Standard, there is also no documented process to determine who has responsibility and to document those responsibilities. CFRs, JROs, MOUs, and other contractual agreements have been discussed as possible solutions to this issue. However, at a minimum, clear formal Guidelines should be added to CIP-002-5.1. Additional guidance should be added where appropriate.

Based on experience of both the V5TAG and of entities preparing for the standards, it is clear that significant updates are needed to the Guidelines and Technical Basis for all CIP Reliability Standards.

Based on these comments, Seminole recommends adding language to address the following items:

1. **Guidelines and Technical Basis** – As core information used by Entities to ensure a consistent understanding of requirements and based on Lessons Learned by Entities, Reliability Standards CIP-002 through CIP-011 are authorized for modification by the Standards Development Team and submitted for ballot to the NERC Ballot Body. These clarifications should minimally consider
    1. Lessons Learned and FAQs published by NERC and Regional Compliance
    2. Items that may be determined unsupported by the standard and definitions (i.e. BES Reliability Operating Services); and
    3. Industry practices that have evolved from industry's compliance efforts.
2. **Paragraph 51 option** - Option to consider removal of Requirement Parts in specific cases considering the same guidelines as those used in the Paragraph 51 project.
3. **Definitions of Low Impact External Routable Connectivity AND External Routable Connectivity** - Consider modifying the definitions of External Routable Connectivity and LERC to ensure consistent language and communication of both ERC and LERC definitions
4. **Definitions of Cyber Asset, BES Cyber Asset (BCA), and BES Cyber System (BCS)** – The SAR should also authorize changes to clarify the definition of BES Cyber System, specifically whether BES Cyber Systems include any Cyber Asset type other than a BCA (such as PCA, EACMS, PACS)
5. **Measures and Audit Expectations** - Using information provided by the NERC Compliance Monitoring group as one source of information, the measures section of all requirements and requirements parts should be reviewed and updated as necessary to ensure that an entity who provides the evidence listed in the measure is able to fully demonstrate compliance under normal circumstances.
6. **Exceptional Circumstances** - Recommend formalizing guidance for Exceptional Circumstances in a single location.

Document Name	

Comment

The phrase “control centers” in the “Industry Need” section which lists the FERC directives has not been capitalized. FERC Order 822 uses “bulk electric system Control Centers” when speaking about this directive. Tri-State believes the SAR should use that same language used by FERC in order to accurately represent what is expected to be in scope of this project.

There is also an error in the “Reliability Functions” section. “Transmission Service Provider” is checked off instead of “Distribution Provider”. The new versions of the CIP standards do not include Transmission Service Providers, but do include the Distribution Providers.

Chris Gowder - Florida Municipal Power Agency - 3,4,5,6 - FRCC, Group Name FMPA

Answer	No
Document Name	

Comment

FMPA is concerned that the Project 2016-02 SAR is too narrowly focused. There are a number of issues with the current CIP Standards, mostly concentrated in CIP-002-5.1. The SAR should be written to allow the drafting team to consider how the suite of CIP standards work together. CIP-002-5.1 is the foundation of the remainder of the CIP requirements. Narrowly scoping this SAR just prolongs dealing with these problems, and ties the drafting team's hands should they identify other concerns. Also, ignoring these issues now will cause more revisions, which in turn will add to the pervasive confusion and uncertainty already surrounding the CIP standards. The industry needs clarity and resolution to these matters in order to be assured their efforts to comply are effective and that companies understand their investments are going to the right places.

The following additional items should be considered by the SDT:

1) Section 4.2.2 states "All BES Facilities" as being subject to the standards for all Responsible Entities except for DP's. This effectively negates the rest of the requirements, as anything that qualifies as a "Cyber Asset" could not possibly be a "Facility" as well. The language is missing the "Cyber Assets" component. Suggested language would be "Cyber Assets at all BES Facilities".

2) Ownership isn't properly accounted for in the requirements. Shared facilities (generally speaking substations) often involve multiple entities that own equipment, who may or may not be Responsible Entities as described in CIP-002-5.1. There should be specific language requiring the owner of the equipment to communicate with the owner of the Facility.

3) Clarify what is meant by "associated with" in the context of the Impact Rating Criteria in CIP-002-5.1 – Attachment 1. Clear up the inconsistencies in the requirements between the use of "associated with" (criterion 2 & 3 in Attachment 1) in some areas and "used by and located at" (criterion 1 in Attachment 1) in other parts. Have a process developed for ensuring entities notify if there are devices owned by a different entity that are "associated with" their BESCS (for example, a meter that one entity needs for the reliable operation of their Control Center that isn't owned by them).

4) Leasing equipment is a loophole in the requirements based on the language in section 4.2. This should be fixed so an entity isn't able to lease equipment and avoid meeting CIP requirements.

5) The scope of equipment applicable to CIP due to applicability to other NERC standards (such as CIP-002-5.1 Section 4.2.1.3) should be clarified further. For example, a "Protection System" can be made up of multiple devices owned by multiple entities. If an entity owns a component of a Protection System that isn't a Cyber Asset, they shouldn't have to meet CIP requirements.

6) Voice over Internet Protocol (VoIP), much like virtualized servers and environments, is not discussed in the CIP requirements. VoIP telephony devices should be excluded from the requirements unless they are networked with other BESCS, in which case they could become protected CA's.

7) There is no mention of "data at rest" in this SAR, although it was clearly part of Order 822 (paragraph 56 – "NERC's response to the directives in this Final Rule should identify the scope of sensitive bulk electric system data that must be protected and specify how the confidentiality, integrity, and availability of each type of bulk electric system data should be protected while it is being transmitted **or at rest**").

8) CIP-002-5.1 should be re-written to make sure all assets are properly identified. For example, under R1 of CIP-002-5.1, a Responsible Entity is only required to find Cyber Assets at each of the six locations listed under R1. However, in Attachment 1 for medium and low impact, the language of "associated with" is introduced, indicating that there could be assets/locations containing Cyber Assets that are not part of the list of six asset types listed under R1. The approach taken by R1 is not the one being recommended by NERC or the Regional Entities. The standard should be revised to clarify the relationship between the six asset types/locations in R1 and the "used by and located at"/ "associated with" language in Attachment 1.

The SAR should be modified to include the following language and scope:Update obsolete references to NERC defined terms or standards through modifications to the CIP standards. References which are obsolete or require clarification include, but are not limited to:

- To improve consistency within Registered Entity compliance programs, phrasing in CIP-002-5.1 Requirement 1 and Attachment 1 referencing undefined or unclear terms or phrases such as “Transmission stations and substations”, “generation interconnection Facilities”, “Systems and facilities critical to system restoration”, “Generation resources”, “BES reactive resource or group of resources” should be removed by the SDT and instead reference the FERC approved definition of Bulk Electric System (BES) which now included clear and defined qualifications for inclusion and exclusion of these assets as well as an appeals process to address exceptions. An example would be changing the following language:
- R1.ii. Stations and Substations containing BES Facilities
- R1.iii BES Generation Facilities
- RAS: Phrasing in CIP-002-5.1 Applicability, Requirement 1, and Attachment 1 referencing variations of Special Protection System (SPS), Remedial Action Scheme (RAS), or automated switching System that operates BES Elements should be clarified and simplified by the SDT to reference the new Remedial Action Scheme (RAS) definition which FERC approved 11/19/2015.
- The current PSP definition should be clarified by the SDT to address that it should not apply to assets in CIP-006-6 Part 1.1 simply because they may be secured in a location which meets the PSP definition: “The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.”
- Interactive Remote Access definition: The SDT should clarify the phrase “system-to-system process communications” to address scripts or batch operations performed on-demand or on a periodic basis as not meeting the definition.
- The phrase “Collector Bus” as it appears in Attachment 1, Criteria 2.4 and 2.5 should be defined by the SDT. The guidance document references a report (*Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface*) which predated the adoption of the NERC BES definition and has not been picked up for development since. The BES definition provides additional clarification of the applicability to multiple generation scenarios in I2, I4, E1, E2, E3, and E4. Notably, CIP-014-1 does provide a diagram of the collector bus, but does not include an associated definition.
- Attachment 1, Criterion 2.4: Clarify if the Transmission Facilities operated at 500kV or higher are “at a single station or substation” to make the language and application consistent with Criterion 2.5 to correctly scope BES Cyber Assets.
- Clarify CIP-002-5.1 R1.vi for Registered Entities registered for additional functions other than Distribution Providers. Revising the language of CIP-002-5.1 R1.vi. to state “*For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above at assets which have not already been considered under Ri-Rv*” would be a possible solution.

Laura Nelson - IDACORP - Idaho Power Company - 1

Answer	Yes
Document Name	

Comment

Idaho Power agrees with the items that are currently scoped into the SAR, but also believe it does not go far enough. There are numerous areas within the v5/v6 standards where clarifications need to be made. Idaho Power doesn’t think that a full re-write of all of the CIP standards is prudent as it will create continued churn in the industry. Idaho Power believes there should be continual slow improvement in the standards and not large swings that create guidance gaps from the regulators and understanding gaps from the industry.

The proposed scope does not include a change to the applicability columns to tier ratings (i.e., medium with and without ERC). These need to be more explicitly split out as they create odd breakdowns in the standards that seem to be creating inconsistencies in the standards. For example, under CIP-010-2 R4 Attachment 1, R1.2 requires authorizations for all Transient Devices and R3.1 for removable media for Medium Impact BCS. However, Medium Impact BCS without external routable connectivity (ERC) do not require an authorization records under CIP-004, specifically R4.1. This means the critical devices/systems themselves have no authorization requirements, but the transient devices and removable media associated with them do. A second example is information protection for Medium Impact BCS without ERC. CIP-011-2 requires information protection policies/procedures be applied equally to all Medium Impact BCS, which includes protecting it in storage, transit, and use. However, once again, there are no requirements to authorize an individual to gain access to “designated storage locations” under CIP-004-6 Part 4.1.3. This means the information needs to be protected, but only those Medium BCS with ERC have to have individuals get authorized for access to the information. This seems consistent with not authorizing individuals to get access to Medium Impact BCS without ERC but not with applying information protection policies to one tier of Medium Impact BCS.

The SDT should consider four risk tiers rather than three if they are going to treat ERC and non-ERC separately in the standards. These are simply two examples of inconsistencies that have been created by trying to treat them within the same “medium” risk tier. There could still be similar requirements that would be applied to a Medium Impact BCS with ERC and a Medium Impact BCS without ERC, but inconsistencies would be more easily identified by breaking out the Medium BCS tier and the Medium without ERC.

The proposed scope does not include changes to CIP-002-5.1. CIP-002 has several inconsistencies and logic issues and no clearly delineated process allowing no clear way to comply with the standard other than simply deciding on a direction and hoping the regional entity is okay with your approach. The wording and processes required by CIP-002 need to be refined and clarified to make the expectations more clearly known. For example, the Guidelines and Technical Basis state, “The following provides guidance that a Responsible Entity may use to identify the BES Cyber Systems that would be in scope. The concept of BES reliability operating service is useful in providing Responsible Entities with the option of a defined process for scoping those BES Cyber Systems that would be subject to CIP-002-5.1.” This reference to use of the BROS is stated as an option that may be useful in identifying BCAs/BCSs. Nowhere in CIP-002 the definition of BCA or BCS does it speak directly to the BROS. The only loose tie-in is that the definition of BCS talks about reliability tasks, which FERC, in Order 791, clarified they believed it alluded to the NERC Functional Model, which relates to the high-level responsibilities of registered entities. However, it seems regions are beginning to take a stance that BROS is the hard-line approach as the only acceptable way to approach identification of CIP assets and BCAs/BCSs. Additionally, the wording of the CIP-002 standard does not ever specifically state that an entity needs to identify Protected Cyber Assets (PCAs), Electronic Access Control or Monitoring System (EACMS) or Physical Access Control Systems (PACS), yet the standards expect that entities will know what those devices are in order to apply specific requirements to them. Entities should not have to read between the lines when trying to comply with mandated compliance standards. Doing so creates confusion, inconsistencies, and distrust between the regulators and the industry who should be working together to meet common objectives.

ERCOT recommends that *Project 2016-02 – Modification to CIP standards* be limited to 1.) clarifying existing language,2.) addressing the V5 TAG issue list, and 3.) incorporating the FERC-directed changes discussed in FERC Order No. 822. Introducing new concepts through substantive language changes in this iteration would be premature. In order to allow CIP Version 5 and 6 concepts to be fully implemented, any proposed substantive changes should be reserved for future CIP standards projects.

Comment

Arizona Public Service (AZPS) appreciates the opportunity to comment on the proposed SAR. Although AZPS generally supports the scope as described in the SAR, we believe that there are additional clarifications that should be considered beyond those detailed in the FERC Order 822 and the CIP Version 5 Transition Advisory Group (V5TAG) considerations.

AZPS believes the industry would benefit from clarification of the definition of the following terms:

- Transmission Facility – Transmission Facility is not a defined term. Although Facility is a defined term, AZPS does not believe that the Facility definition aligns with the standard’s intent. AZPS suggests that a definition be provided by the Standard Drafting Team (SDT).
- Programmable - The SDT should consider defining programmable to clarify that a device would not be included simply because it was configurable, e.g., has functionality that can be changed locally.

AZPS would also like to suggest that the SDT clarify the intent of the grouping BCAs into BCS by leveraging the logically based perimeter security controls at the Electronic Security Perimeter (ESP) as well as local, device specific security controls per each BES Cyber Asset’s (BCA) capability.

AZPS would also like to add some additional comments to the discussion in the V5TAG CIP V5 Issues for Standard Drafting Team Consideration document.

- AZPS recommends that the SDT consider not defining “adverse impact” or defining a lower bound thereof within the definition of BES Cyber Asset, but to revise the body of CIP standards and/or applicable defined terms to utilize already defined terms such as “Adverse Reliability Impact.” Such would facilitate consistency as well as clarity regarding the N-1 contingency issue and other issues regarding that term identified by the V5TAG.
- AZPS believes that when BES Cyber Assets (BCA), such as relays, RTUs, and others, are connected via serial links to IP converters and/or IP-enabled security gateways, it would be appropriate to consider those elements downstream of the security gateways as BCA that do not have External Routable Connectivity (ERC). This is appropriate because the IP- converters and/or IP-enable security gateways require authentication and provide a protocol break. AZPS believes accurate and timely guidance related to serially connected devices supports the overall goal of providing appropriate and effective cyber security controls; thus, improving reliability.
- AZPS supports the CIP V5TAG analysis regarding virtualization. Virtualization is an effective tool for utilities and consideration should be given to ensuring that flexibility is maintained. An approach should consider the required outcome rather than the specifics of how that outcome is achieved.

The SDT should prioritize the issues based on whether it is associated with a FERC directive or not. For issues that are not directed by FERC, there may need to be additional time to find a resolution associated with these issues. The only deadlines on this project are related to the FERC directives.

Burns & McDonnell appreciates the opportunity to comment on the Standard Authorization Request (SAR) titled “Modifications to CIP Standards” with the following input:

The V5TAG recommended the Standard Drafting Team (SDT) consider Virtualization as part of the SAR due to the increased use of this technology in industry control system environments. Burns & McDonnell is recommending the Virtualization section of the SAR be amended to indicate that the SDT not only consider virtualization technology usage by Responsibility Entities (Entity) which they own and operate, but usage of similar technology not owned or operated by an Entity. Increased interest in “cloud” based services such as Software as a Service (SaaS) and Platform as a Service (PaaS) have created questions on the application of the standards with no guidance on how they should be applied. Cloud usage of virtual technology is similar to Entity owned usage of the same technology, but Burns & McDonnell feels it is important that both usage conditions be considered and any differences in approach be indicated in any final SDT work product. Burns & McDonnell does not believe a separate section should be created for “cloud” usage, but the SAR section on Virtualization could be updated to cover virtualization technology owned by or usage of services by an Entity. One recommendation for the re-wording is:

The CIP V5 standards do not specifically address virtualization. Because of the increasing use of virtualization in industrial control system environments either owned and operated by a Responsible Entity, or from a service provider who owns and operates the environment under the service providers control, V5TAG asked that the SDT consider CIP-005 and the definitions of Cyber Asset and Electronic Access Point regarding permitted architecture and the security risks of network, server and storage virtualization technologies under these two type of conditions.

Currently there are no specific requirements or guidelines included within the NERC CIP Reliability Standards v.5/6 relating to utilization of the cloud. Based on discussions with the regional auditing body, it has been agreed upon that utilization of the cloud for storage of BES Cyber System Information may be sufficiently secured through field level packet encryption with the responsible entity only holding the private key. It would be in the interest of the California ISO for there to be a provision included within the NERC CIP Reliability Standards addressing cloud scenarios.

We belong to the FMPA municipal organization and have arrived at a consensus with the help of one of its SMEs who is immersed in CIP Standards. Comments follow below:

The SAR falls short of fixing a lot of the core issues related to CIP-002-5.1. The following additional items should be addressed by the SDT:

1) Section 4.2.2 states “All BES Facilities” as being subject to the standards for all Responsible Entities except for DPs. This effectively negates the rest of the requirements, as anything that qualifies as a “Cyber Asset” could not possibly be a “Facility” as well. The language is missing the “Cyber Assets” component. Suggested language would be “Cyber Assets at all BES Facilities.”

2) Ownership isn’t properly accounted for in the requirements. Shared facilities (generally speaking substations) often involve multiple entities that own equipment, who may or may not be Responsible Entities as described in CIP-002-5.1. There should be specific language requiring the owner of the equipment to communicate with the owner of the Facility.

3) Clarify what is meant by “associated with” in the context of the Impact Rating Criteria in CIP-002-5.1 – Attachment 1. Clear up the inconsistencies in the requirements between the use of “associated with” (criterion 2 & 3 in Attachment 1) in some areas and “used by and located at” (criterion 1 in Attachment 1) in other parts. Have a process developed for ensuring entities notify if there are devices owned by a different entity that are “associated with” their BESCS (for example, a meter that one entity needs for the reliable operation of their Control Center that isn’t owned by them).

4) Leasing equipment is a loophole in the requirements based on the language in section 4.2. This should be fixed so an entity isn't able to lease equipment and avoid meeting CIP requirements.

5) The scope of equipment applicable to CIP due to applicability to other NERC standards (such as CIP-002-5.1 Section 4.2.1.3) should be clarified further. For example, a "Protection System" can be made up of multiple devices owned by multiple entities. If an entity owns a component of a Protection System that isn't a Cyber Asset, they shouldn't have to meet CIP requirements.

6) Voice over Internet Protocol (VoIP), much like virtualized servers and environments, is not discussed in the CIP requirements. VoIP telephony devices should be excluded from the requirements unless they are networked with other BESCS, in which case they could become protected CA's.

7) There is no mention of "data at rest" in this SAR, although it was clearly part of Order 822 (paragraph 56 – "NERC's response to the directives in this Final Rule should identify the scope of sensitive bulk electric system data that must be protected and specify how the confidentiality, integrity, and availability of each type of bulk electric system data should be protected while it is being transmitted **or at rest**").

8) CIP-002-5.1 should be re-written to make sure all assets are properly identified. For example, under R1 of CIP-002-5.1, a Responsible Entity is only required to find Cyber Assets at each of the six locations listed under R1. However, in Attachment 1 for medium and low impact, the language of "associated with" is introduced, indicating that there could be assets/locations containing Cyber Assets that are not part of the list of six asset types listed under R1. The approach taken by R1 is not the one being recommended by NERC or the Regional Entities. The standard should be revised to allow for the proper capture of all Cyber Assets either ONLY at the six asset locations, OR both at these locations as well as any other associated location.

For network and externally accessible devices, SRP agrees with improving clarity within the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA). However, SRP has additional concerns.

Although much of CIP-005-5 is compatible to CIP V3 requirements, it does include a new requirement related to IRA for High Impact BES Cyber Systems and Medium Impact BES Cyber Systems with ERC. R2.1 states: *Utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.*

Based on R2.1 and the defined terms, demonstrating compliance with this requirement fundamentally requires evidence of two items:

1. That an Intermediate System is utilized such that the Cyber Asset initiating IRA does not **“directly access”** an applicable Cyber Asset; and

2. That technology for facilitating IRA meets the definition of an Intermediate System.

Issues with #1 – Ambiguity of “Directly Access”

In SRP’s experience the ERO and Regional Entities have used undefined terminology such as “protocol break”, “OSI layer 7 application break”, “session break” and others to describe what is intended by or compliant with the phrase “does not directly access”. However, SRP believes these terms mean different things to different subject matter experts and auditors. FERC articulated as much in Order 822. Although this issue has focused on LERC/LEAP requirements for low impact assets, the same ambiguity exists in the requirements for high/medium impact facilities. Where standards are unclear or ambiguous, entities are typically afforded flexibility in their compliance approaches. However, SRP believes the ERO has taken a rather prescriptive view of these requirements where reasonable people could easily differ in their interpretation. These ambiguities in defined terms and requirements need to be addressed by the SDT.

Issues with #2 – Ambiguity on acceptable Intermediate Systems

As noted in the Glossary of Terms, an Intermediate System is an Electronic Access Control or Monitoring System (EACMS). That notwithstanding, the ERO and Regional Entities have articulated rather informally and only fairly recently a need to assess each Intermediate System against the definition of BES Cyber Asset. This creates the potential for the proverbial “hall of mirrors” result, in the sense that individuals can rationalize a circumstance where seemingly all Cyber Assets (PACS, EACMS, other) could, under some scenario qualify as a BES Cyber Asset. SRP believes this was clearly not the intent of the Standard Drafting Team, and SRP does not believe this concept was considered for Intermediate Systems evaluated during the CIP V5 pilot project.

Most specifically, an entity that was on the drafting team and participated in the implementation pilot project with no issues was “surprised” with the Regional Entity’s assessment of compliance on this subject at time of audit. There is clearly a disconnect that needs to be addressed.

Architectures to support Interactive Remote Access to high, medium impact control centers, transmission stations and generation resources are very costly. Current ambiguity could cause extensive and rework for high and medium impact systems, and be even more impactful if similar architectures are applied to low impact assets.

The Standards Drafting Team (SDT) must clearly define the term “direct access” for high and medium facilities, ensuring “direct access” has same meaning for low impact facilities as ordered by FERC in its approval of the CIP V5 revisions. To the extent different controls are appropriate for high/medium vs. low impact systems, those distinctions must be clear in the language of the standard. SRP further recommends the SDT re-evaluate the definitions of Interactive Remote Access, Intermediate System, and BES Cyber Asset to ensure entities have a clear understanding of the security and compliance expectations associated with the standards.

I believe that the CIP standards do not properly address security monitoring of networks (routable and non-routable). In my experience in the security industry that breaches (like electric disturbances) are inevitable, even for control systems. It's a matter of when, not if. The Security Event Monitoring logging requirements in CIP 007-5 R4 is a start, but I don't believe this data (4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.) provides enough digital forensic evidence in the aftermath of an intrusion or even a cyber attack. Also, the retention period in 4.3 of a minimum of "90 consecutive calendar days" is not sufficient. According to the 2016 M-Trends Report from FireEye (https://www2.fireeye.com/rs/848-DID-242/images/Mtrends2016.pdf), the median time of network compromise to discovery of the attacker is 146 days. If a utility only kept 90 days of logs, then it's quite possible that they won't have the forensics data to determine if the attacker used stolen credentials or malicious code. Also, many utilities don't use authentication or encryption with their Control System Protocols such as DNP3, ICCP, and Modbus. If an attacker were to spoof, replay, or modify the SCADA traffic, this would not be detected by the current set of monitoring and logging requirements.

However, IT security best practice of network security montoring (NSM) does provide sufficient network forensics data. NSM is similar to the type of monitoring and visibility required by NERC PRC 002-2 Disturbance Monitoring and Reporting standard. I wrote a blog post (https://www.linkedin.com/pulse/comparing-nerc-disturbance-monitoring-reporting-network-sistrunk) about the similarities between PRC 002-2 and NSM...and how NERC CIP 007 R4 could be improved to provide a bit more forensics data. Collecting NSM type data such as Session Data (timestamp, source IP address, source port, destination IP, destination port at a minimum) does not require a lot of storage space and would provide a better level of visibility. Collecting a shorter time period of full network packet captures for High or Medium BES Cyber Systems (including non-routable dial-up access) also is not very complicated, as IT systems have been doing this a long time.

Since BES systems are becoming more connected, we cannot ignore network security monitoring in the future. I hope it doesn't take a serious cyber incident to convince the need for monitoring...much like the 1965 and 2003 blackouts convinced us to do disturbance monitoring. I know we haven't had a cyber attack that caused a power outage here in North America, but as an Electrical Engineer who has worked in the electric utility industry, now representing the ICS security industry, and also a customer, I want to help ensure that this doesn't happen.

Duke Energy requests that the SDT consider revisiting the transfer of employees and the requirement to remove access for that employee in 1 calendar day which may be viewed as overly burdensome. While this may be outside the scope of this particular SAR, we feel that since the project is regarding revisions to CIP standards, that we would be remiss not to request further discussion around this topic.

Melanie Seader - Edison Electric Institute - NA - Not Applicable - NA - Not Applicable

Answer	Yes
Document Name	

Comment

In addition to the issues addressed by the SAR, the Edison Electric Institute, on behalf of our members, recommends that the proposed project also consider the following ten issues:

Issue 1: CIP Exceptional Circumstances

A CIP Exceptional Circumstance is defined as:

“A situation that involves or threatens to involve one or more of the following, or similar, conditions that impact safety or BES reliability: a risk of injury or death; a natural disaster; civil unrest; an imminent or existing hardware, software, or equipment failure; a Cyber Security Incident requiring emergency assistance; a response by emergency services; the enactment of a mutual assistance agreement; or an impediment of large scale workforce availability.”

We appreciate the understanding and recognition for the need to enable provisions for CIP Exceptional Circumstances. However, during implementation of CIP V5, it has become apparent that the CIP Exceptional Circumstances provision may need to be added to several requirements. Below are a few situation-based examples:

- *Risk of injury or death*: CIP-004-6 R2 and R4 allow for CIP Exceptional Circumstances to waive the need for Training and the Authorization based on need to be waived during such circumstances. We believe that CIP-004-6 R3 also should allow for CIP Exceptional Circumstances because the requirement to obtain a Personal Risk Assessment takes additional time that would hinder the ability of first responders to enter a Physical Security Perimeter in the event of the need for life saving measures. This would be consistent with CIP-004-3 “except in specified circumstances such as an emergency.”
- *Impediment of large scale workforce availability*: CIP-007-6 R2 Security Patch Management requirements may be difficult to meet in the event that a major storm impacts a responsible entity, which requires all employees to report for storm duty for restoration efforts.
- *Natural disaster*: CIP-006-6 R1 Part 1.4 monitoring may not be possible if the physical access point to a PSP is under water or destroyed by a storm. Similarly, Part 1.3 causes compliance issues if for example, a fire renders a PACS controller panel inoperable and the PSP access points have failed secure. Emergency response may have to use a physical key, mechanical lock, or an axe to gain access. Without the IAC language or CIP Exceptional Circumstance provision, PSP access point monitoring is a zero defect issue.

We recommend that the SDT review all of the requirements of CIP V5 to determine whether: a CIP Exceptional Circumstances provision should be added, the definition of CIP Exceptional Circumstances should be edited, and/or additional explanatory language should be added to the Guidelines and Technical Basis for each standard regarding CIP Exceptional Circumstances.

Issue 2: BES Cyber Asset definition – “redundancy”

The application of the redundancy clause in the BES Cyber Asset (BCA) definition is unclear because the use of different and separate technologies and methods reduce reliability risk by providing alternative data sources. For example, VoIP systems, data center phone systems, radios, and other backup communication systems are alternatives, yet could be considered redundant by auditors and therefore it is unclear whether there are limits to the application of the BCA adverse impact to these systems. Without such limitations, the BCA definition may encourage registered entities to reduce their use of backup/alternative systems to reduce their compliance burdens and risk. While redundant assets may typically have identical security risks and vulnerabilities, requiring both/all to be similarly protected, alternative systems or assets are often substantially different and have drastically dissimilar risks and vulnerabilities, which reduces overall risk to the BES.

Issue 3: VoIP as a BES Cyber Asset

CIP-002-5.1 4.2.3.2 exempts “Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters” from CIP-002-5.1; however, the Guidelines and Technical Basis for CIP-002-5.1 calls out operational directives (TOP, RC, BA) as an aspect of Inter-Entity Coordination and Communication function. As a result, some auditors are viewing VoIP as in scope for CIP-002-5.1 despite the exemption and fact that different and separate communication technologies are used for this function. If the exemption does not apply, then the BES Cyber Asset definition should also apply; however, EEI members are hearing that auditors do not agree and believe that VoIP used for operational directives are BES Cyber Assets even if the 15 minute impact does not apply due to the redundancy issue mentioned above.

We recommend that the SDT consider these issues and determine how best to address VoIP in the standard that is aligned with the risk to the bulk electric system.

Issue 4: LERC definition application to assets located external to the low impact asset

The last three asset classes in CIP-002-5.1 R1 are typically implemented across multiple instances of the first three classes (i.e., systems and facilities critical to system restoration, special protection systems, and distribution provider protection systems are typically implemented at control centers, substations, and generating resources).

The Low Impact External Routable Connectivity (LERC) definition appears to be based on single asset locations (“direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s) from a Cyber Asset ***outside the asset*** containing those low impact BES Cyber System(s) via a bi-directional routable protocol connection.”) The phrase “outside the asset” can cause confusion in determining whether LERC exists for these classes of assets that are implemented across multiple sites.

For example, when evaluating a cranking path as an asset to determine if it has LERC, what does “outside the asset” mean? This could also allow for routable protocol based communication within the multiple substation cranking path to not be considered LERC and left unprotected if the entire cranking path is considered a single “asset containing low impact BES Cyber Systems.” It appears these last 3 asset classes are actually criteria that should affect the categorization of the single site asset class where they are implemented.

Issue 5: Custom software (scripts)

CIP-010-2 R1, Part 1.1, subpart 1.1.3 requires a baseline configuration for “any custom software installed.” The Guidelines and Technical Basis for this requirement states that “custom software installed may include scripts developed for local entity functions.” It is unclear whether all scripts must be considered custom software or whether only scripts that can have an impact on the bulk electric system within 15 minutes must be considered custom software under this requirement. A risk-based clarification should be added to this requirement to set boundaries as to what is considered custom software. For example, a script that alters the behavior or function of a BES Cyber Asset or System should be included; however, a script that simply gathers log data, and whose only impact to the BES Cyber Asset is the allocation of incidental CPU cycles, need not be included.

Issue 6: Applicability of the requirement part to Cyber Asset vs. Cyber System

Some requirements such as in the CIP-007-6 standard apply to Cyber Assets within a BES Cyber System (e.g., the R2 security patch management requirements), others apply at either the BES Cyber System level or Cyber Asset level (e.g., the R4 Part 4.1 logging requirements), and others don't specific if they apply at the system or asset level (e.g., R3 Part 3.1 method to deter, detect, or prevent malicious code). Although the applicable systems for each of these requirements is generally the same (i.e., high and medium impact BES Cyber Systems and their associated EACMS, PACS, and PCA), the difference in the requirements language applicability to Cyber Assets, BES Cyber System, or both makes what is necessary to comply with the requirements unclear.

For example, the requirements section for CIP-007-6 R3 Part 3.1 does not specify whether this requirement applies at the BES Cyber System level or Cyber Asset level, therefore it is unclear whether a responsible entity can protect a medium impact BES Cyber System through deploying an anti-virus solution at the BES Cyber System level or whether the entity must deploy the solution at each Cyber Asset to comply with the requirement part. Consistency among the requirements language would be helpful in clearing up this confusion.

Issue 7: Control Center definition

The NERC document titled "CIP V5 Issues for Standard Drafting Team Consideration" already raises issues with the Control Center definition related to Transmission Owner Control Centers; however, it does not address issues related to Generator Operators.

By definition, a Control Center is "one or more facilities hosting operating personnel that monitor and control the Bulk Electric System (BES) in real-time to perform the reliability tasks, including their associated data centers … 4) a Generator Operator for generation Facilities at two or more locations."

Dispersed or distributed generation facilities (e.g., wind, solar, hydro) may not have the traditional control building with a horseshoe operator control desk ("facility hosting operating personnel that monitor and control"). Does the facility have to perform all "real-time … reliability tasks" or as few as one? Does a control room at a single wind farm, which controls a hundred turbines spread over many miles, meet the control center definition or does it become a control center only if it controls multiple wind farms? Also, if personnel maintains the Cyber Assets (e.g., patching or troubleshooting) is this considered "monitor and control" even though they are not personnel performing real-time reliability tasks. Does operating personnel mean those charged with the responsibility to monitor and control the BES or simply personnel who may be located at the generation Facility to maintain the equipment? Also, do each of the "generation Facilities at two or more locations" need to meet the Bulk Electric System definition to be within scope of the Control Center definition? CIP-002-5.1 Requirement R1, iii uses Generation resources, which could be interpreted to include all generation sources, even those that do not meet the Bulk Electric System definition.

As dispersed or distributed generation increases, clarity in language of the standard will become more important.

Issue 8: Security patches for operating Cyber Assets brought into scope under CIP V5

CIP-007-6 R2, Part 2.2 is clear concerning the ongoing evaluation of security patches as of July 1, 2016, but is unclear on what is required for the initial execution of the process ("evaluate security patches for applicability that have been released since the last evaluation") when there is no "last evaluation."

The standard does not require all Systems to be updated by July 1, 2016, but does require a baseline configuration, which includes a listing of all applied patches. The Guidelines and Technical Basis for CIP-010-2 states that "security patches applied would include all patches that have been applied on the cyber asset… CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches." This documentation requirement is particularly burdensome for an asset that has been in service for six years or longer as it requires entities to contact and work closely with their vendors to identify and get historical security patches. Also, documenting all historical patches, especially those that happened years ago will have little, if any impact on reliability.

Issue 9: Guidance for Secure Interactive Remote Access

In the Guidelines and Technical Basis for CIP-005-5, under Requirement R2 it states: “see Secure Remote Access Reference Document (see remote access alert).” Also, the Rationale for R2 states “Additional information is provided in Guidance for Secure Interactive Remote Access published by NERC in July 2011.” We believe these references are to the same document, which is properly titled under the Rationale and note that the 2011 NERC document was written in the context of V3 and not V5. Please evaluate the relevance of this guidance document to the most recent version (currently CIP-005-5). Also please clarify that IRA is intended to address access remotely from outside the organization (i.e., not to include accesses internally between protected networks).

Issue 10: Mistakes in Guidelines and Technical Basis

In implementing CIP V5, we’ve noticed a number of mistakes, which should be addressed, including:

- The rationale statements from the -5 standards were lost in several of the -6 versions of the standards. For example, the second sentence of the CIP-007-5 R2 rationale “The remediation plan can be updated as necessary to maintain the reliability of the BES, including an explanation of any rescheduling of the remediation actions.” was not carried forward to the -6 Guidelines and Technical Basis, even though there were no changes to the requirement between versions. We recommend reviewing the Rationales in the -6 standards and adding any that were deleted to the Guidelines and Technical Basis of the standard.
- For CIP-007-6 Part 2.2 the Guidelines and Technical Basis states: “Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.” However there are no CIP-007-6 R2 Parts have TFE provisions.
- For CIP-004-6 R4, under the Guidelines and Technical Basis, the Rationale for this requirement states: “to ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. “ ‘Authorization’ should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants ***and included in the delegations referenced in CIP-003-6***” CIP V3 required designating approvers; however this requirement was not included in CIP-003-6 and therefore the emphasized text should be removed***.***
- For CIP-004-6 R4, the Rationale also references “quarterly reviews in Part 4.5”; however there is no Part 4.5 in CIP-004-6 R4.

Jeri Freimuth - APS - Arizona Public Service Co. - 1,3,5,6

Answer	Yes
Document Name	

Comment

NERC’s webpage for this SAR “Project 2016-02 Modifications to CIP Standards”, as of 4/11/2016, states the following:

“Also the scope of this work will incorporate existing and future RFIs relating to the CIP-002 through CIP-011 family of standards.”

AZPS does not believe any RFIs are addressed in the current SAR. We recommend updating the SAR to reference existing submitted RFIs as appropriate. Finally, AZPS recommends removal from the SAR of functional registrations that are no longer included in the Compliance Registry, e.g., Interchange Authority, Load-Serving Entity and Purchasing-Selling Entity.

Comments received from Ginette Lacasse, Seattle City Light

Here are our Subject Matter Expert's (SME) comments. Non-italicized text is copied from SAR, with SME additions in RED. Additional SME comments are *in italics*.

Questions

1. **Do you agree with the scope and objectives of this SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.**

Yes:
No: X

Comments:

In several sections the language of the SAR summarizes that of the foundation V5TAG document, but in doing so conflates or glosses over important concepts. Seattle City Light would like to see clarification to the SAR in the following two sections: (added text in red to clarify)

A) Cyber Asset and BES Cyber Asset (BCA) Definitions – as foundational definitions within the CIP V5 standards, the understanding of Cyber Asset and BCA terms impacts the scope of the applicable requirements. 'Right-sizing' the definitions of "Cyber Asset" and "BES Cyber Asset" balances between the administrative burden and negligible security benefit of an overly broad interpretation and the cyber security risk of too narrow an interpretation. The V5TAG recommends the following enhancements:

- Clarify the intent of “programmable” in Cyber Asset.
- Clarify and focus the definition of “BES Cyber Asset” including:
- Focusing the definition so that it does not subsume all other cyber asset types.
- Considering a lower bound to the term ‘adverse’ in “adverse impact”.
- Clarifying the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that “N-1 contingency” is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.

B) Network and Externally Accessible Devices – V5TAG recommends improving clarity within the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
- The 4.2.3.2 exemption phrase “between discrete Electronic Security Perimeters.” When there is not an ESP at the location, consider clarity that the communication equipment considered out of scope is the same communication equipment that would be considered out of scope if it were between two ESPs.

2 Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

Yes:
No: X

Comments:

3 Are there any other concerns with this SAR that haven’t been covered in previous questions?

Yes: X
No:

Comments*:*

Seattle would like to see the SAR address three additional areas:

A) Clarify those standards and parts where the requirement applies solely to the applicable BES Cyber System, those standards and parts where the requirement applies solely to individual BES Cyber Assets, those where the requirement applies to both BCS and BCA or to either at the option of the responsible entity, and those where the requirement applies to both BCS and BCA or to either depending on the circumstances and configuration.

B) Clarify application of CIP-002-5, in particular the R1 identification of BES Cyber Systems and their association with specific types of assets (small “a”). The linkage is inconsistent: for High impact rating it is any “BCS located at and used by” a Control Center whereas for Medium *impact rating it is any "BCS associated with any of the following," the "following" being a mixed-bag collection of capital "F" Facilities, various systems or groups of Elements, specifically defined terms such as Control Center and Special Protection System, and undefined common-language concepts such as "generation" and "BES reactive resource." Please also clarify the intent of "used by" and "associated with." Does "used by" mean "essential to the operation of," "involved in the operation of," or something else? Does "associated with" combine the concepts of "used by and located at," or would it be sufficient to be either "situated at the physical location of" or "used by"? The present language creates considerable confusion.*

C) Clarify the application of Intermediate System, as discussed by Salt River Project in their comments. Seattle supports Salt River's position and analysis.

Seattle also supports the position that Florida Municipal Power Authority as they submitted in their comments.

Comments received from Kara Douglas – NRG

Questions

1. Do you agree with the scope and objectives of this SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

   Yes:
   No: X
   Comments:

   A) Please consider the definition of Cyber Asset and clarify the intent of the term "Programmable" through consideration of whether a device is merely configurable, its executable code is not field upgradable or field Programmable, or if its functionality can only be changed via physical DIP switches, swapping internal chips, etc. (which relates to upgrading the executable in the Programmable code and the ability to field program the configuration)

   B) In relation to the terms: "adverse impact" and "control center", NRG proposes that when addressing TO and TOP Control Center functional obligations in CIP-002-5.1 Attachment 1, it also consider addressing similar issues facing Generator Owners (GO) and Generator Operators (GOP). There are GOP "control centers" that do not have traditional control capabilities over generator breakers or output but simply verbally direct generator actions. In this case it is the GOs that perform the actual output changes and breaker operation. Clarifying GO/GOP obligations in tandem with proposed TO/TOP clarification for determining impact is a step forward.

2. Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

Yes:
No: X
Comments:

3. Are there any other concerns with this SAR that haven't been covered in previous questions?

   Yes:
   No: X

Comments received from Marc Donaldson, Tacoma Power

1. Do you agree with the scope and objectives of this SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

   Yes:

   No: X

   Comments: Tacoma Power suggests the following scope changes:

   - SDT should clarify CIP-005 R1 Part 1.5 with respect to encrypted communications, either in the G&TB or, directly within the requirement language.
   - SDT could provide clarity on CIP-002 eliminating ambiguous language ("Facility" vs. "facility" & "location") etc.
   - SDT should clarify whether CIP Exceptional Circumstance exception applies to CIP-004 R3 (PRA). Within the Guidelines and Technical Basis, there is this clarifier "except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response." We suggest the SDT include an exception for CIP Exceptional Circumstance specifically within the requirement language.

2. Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

   Yes:

No: X

Comments:

3. Are there any other concerns with this SAR that haven’t been covered in previous questions?

   Yes:

   No: X

Request to propose a new or a revision to a Reliability Standard

Title of Proposed Standard(s):	Modifications to CIP Standards		
Date Submitted:	June 1, 2016		
SAR Requester Information			
Name:	Stephen Crutchfield		
Organization:	NERC		
Telephone:	609-651-9455	E-mail:	Stephen.Crutchfield@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☒ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information

Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):

The purpose of this project is to (1) consider the Version 5 Transition Advisory Group (V5TAG) issues identified in the *CIP V5 Issues for Standard Drafting Team Consideration* (V5TAG Transfer Document) and (2) address the Federal Energy Regulatory Commission (Commission) directives contained in Order 822. These revisions will increase reliability and security to the Bulk-Power System (BPS) by enhancing cyber protection of BPS facilities.

Industry Need (What is the industry problem this request is trying to solve?):

The V5TAG, which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by the existing standard drafting team (SDT) for the CIP Reliability Standards.

SAR Information

The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that the SDT consider them in future development activity.

On January 21, 2016, the Commission issued Order No. 822 approving revisions to the CIP version 5 standards and also directing NERC to develop modifications to address:

- Protection of transient electronic devices used at low-impact BES Cyber Systems;
- Protections for communication network components between control centers; and
- Refinement of the Low Impact External Routable Connectivity (LERC) definition.

The Commission did not provide a date by which the modifications for transient devices or communication networks must be completed. For the LERC definition, however, the Commission directed that NERC submit the modification within one year of the effective date of Order No. 822 (March 31, 2017).

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The proposed project will consider the issues raised by the V5TAG in the V5TAG Transfer Document and will address the Commission directives in Order No. 822 through modifications to the CIP standards. The work will include development of Violation Risk Factors, Violation Severity Levels, and an Implementation Plan for the modified standards and will meet the deadlines established by the Commission in Order No. 822.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

As stated above, the purpose of this project is to consider the V5TAG issues in the initial transfer document V5TAG Transfer Document and address the Commission directives contained in Order 822. For the directive on the LERC definition, the project is to respond within the deadline required in the order.

As noted above, the V5TAG identified specific issues with the CIP V5 standards. The V5TAG drafted the V5TAG Transfer Document to formally recommend that the SDT address these issues during standards development to consider whether modifications can be made to the standard language. As outlined in the V5TAG Transfer Document, the specific issues are as follows:

- <u>Cyber Asset and BES Cyber Asset (BCA) Definitions</u> – as foundational definitions within the CIP V5 standards, the understanding of Cyber Asset and BCA terms impacts the scope of the applicable requirements. The V5TAG recommends the following enhancements:
    - Clarify the intent of “programmable” in Cyber Asset.
    - Clarify and focus the definition of “BES Cyber Asset” including:
        - Focusing the definition so that it does not subsume all other cyber asset types.
        - Considering a lower bound to the term ‘adverse’ in “adverse impact”.

SAR Information

        - Clarifying the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that “N-1 contingency” is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.
- <u>Network and Externally Accessible Devices</u> – V5TAG recommends improving clarity within the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
    - The 4.2.3.2 exemption phrase “between discrete Electronic Security Perimeters”
    - The meaning of the word ‘associated’ in the ERC definition.
    - The applicability of ERC including the concept of the term “directly” used in the phrase “cannot be directly accessed through External Routable Connectivity” within the Applicability section.
    - The IRA definition placement of the phrase “using a routable protocol” in the definition and with respect to Dial-up Connectivity.
    - The Guidelines and Technical Basis sentence, “If dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.”
- <u>Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations</u> – V5TAG is aware of multiple interpretations of the language “used to perform the functional obligation of” in CIP-002-5.1 Attachment 1, section 2.12 and recommends clarification of:
    - The applicability of requirements on a TO Control Center that performs the functional obligations of a TOP, particularly if the TO has the ability to operate switches, breakers and relays in the BES.
    - The definition of Control Center.
    - The language scope of “perform the functional obligations of” throughout the Attachment 1 criteria.
- <u>Virtualization</u> – The CIP V5 standards do not specifically address virtualization. Because of the increasing use of virtualization in industrial control system environments, V5TAG asked that the SDT consider the CIP V5 standards and the associated definitions regarding permitted architecture and the security risks of virtualization technologies.

The SDT shall also address the Order No. 822 directives by developing modifications to requirements in CIP standards and the definition of LERC. The Commission directed the following:

- *Per paragraph 32, “...we direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability. While NERC has flexibility in the manner in which it addresses the Commission’s concerns, the proposed modifications should be designed to effectively address the risks posed by transient devices to Low Impact BES Cyber Systems in a manner that is consistent with the risk-based approach reflected in the CIP version 5 Standards.”*

SAR Information
- *Per paragraph 53, "…the Commission concludes that modifications to CIP-006-6 to provide controls to protect, at a minimum, communication links and data communicated between bulk electric system Control Centers are necessary in light of the critical role Control Center communications play in maintaining bulk electric system reliability. Therefore, we adopt the NOPR proposal and direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to require responsible entities to implement controls to protect, at a minimum, communication links and sensitive bulk electric system data communicated between bulk electric system Control Centers in a manner that is appropriately tailored to address the risks posed to the bulk electric system by the assets being protected (i.e., high, medium, or low impact)."* - *Per paragraph 73, "…the Commission concludes that a modification to the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6 is necessary to provide needed clarity to the definition and eliminate ambiguity surrounding the term "direct" as it is used in the proposed definition. Therefore, pursuant to section 215(d)(5) of the FPA, we direct NERC to develop a modification to provide the needed clarity, within one year of the effective date of this Final Rule…."* In addition, the SDT will review and address the CIP V5 requirements for CIP Exceptional Circumstances exceptions. Finally, the SDT will review the Guidelines and Technical Basis sections of the CIP V5 standards and adjust where appropriate as well as correct any grammatical, punctuation, and/or formatting errors, and make other errata changes to the CIP V5 standards, as necessary.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.

Reliability Functions	
☒ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☒ Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐ Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐ Market Operator	Interface point for reliability functions with commercial functions.
☐ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

☒ New Standard	☒ Withdrawal of existing Standard
☒ Revision to existing Standard	☐ Urgent Action

SAR Information

Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):

The purpose of this project is to (1) consider the Version 5 Transition Advisory Group (V5TAG) issues identified in the *CIP V5 Issues for Standard Drafting Team Consideration* (V5TAG Transfer Document) and (2) address the Federal Energy Regulatory Commission (Commission) directives contained in Order 822. These revisions will increase reliability and security to the Bulk-Power System (BPS) by enhancing cyber protection of BPS facilities.

Industry Need (What is the industry problem this request is trying to solve?):

The V5TAG, which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP ~~version 5~~V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by the existing standard drafting team (SDT) for the CIP Reliability Standards.

SAR Information

The V5~~-~~TAG developed the V5TAG Transfer Document to explain the issues and recommend that the SDT consider them in future development activity.

On January 21, 2016, the Commission issued Order No. 822 approving revisions to the CIP version 5 standards and also directing NERC to develop modifications to address:

- Protection of transient electronic devices used at low-impact BES Cyber Systems;
- Protections for communication network components between control centers; and
- Refinement of the Low Impact External Routable Connectivity (LERC) definition.

The Commission did not provide a date by which the modifications for transient devices or communication networks must be completed. For the LERC definition, however, the Commission directed that NERC submit the modification within one year of the effective date of Order No. 822 (March 31, 2017).

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The proposed project will consider the issues raised by the V5TAG in the V5TAG Transfer Document and will address the Commission directives in Order No. 822 through modifications to the CIP standards. The work will include development of Violation Risk Factors, Violation Severity Levels, and an Implementation Plan for the modified standards and will meet the deadlines established by the Commission in Order No. 822.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

As stated above, the purpose of this project is to consider the V5TAG issues in the initial transfer document V5TAG Transfer Document and address the Commission directives contained in Order 822. For the directive on the LERC definition, the project is to respond within the deadline required in the order.

As noted above, the V5TAG identified specific issues with the CIP V5 standards. The V5TAG drafted the V5TAG Transfer Document to formally recommend that the SDT address these issues during standards development to consider whether modifications can be made to the standard language. As outlined in the V5TAG Transfer Document, the specific issues are as follows:

- <u>Cyber Asset and BES Cyber Asset (BCA) Definitions</u> – as foundational definitions within the CIP V5 standards, the understanding of Cyber Asset and BCA terms impacts the scope of the applicable requirements. The V5TAG recommends the following enhancements:
  - Clarify the intent of “programmable” in Cyber Asset.
  - Clarify and focus the definition of “BES Cyber Asset” including:

SAR Information

  - ▪ Focusing the definition so that it does not subsume all other cyber asset types.
  - ▪ Considering a lower bound to the term 'adverse' in "adverse impact".
  - ▪ Clarifying the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that "N-1 contingency" is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.

- Network and Externally Accessible Devices – V5TAG recommends improving clarity within the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
  - The 4.2.3.2 exemption phrase "between discrete Electronic Security Perimeters"
  - The meaning of the word 'associated' in the ERC definition.
  - The applicability of ERC including the concept of the term "directly" used in the phrase "cannot be directly accessed through External Routable Connectivity" within the Applicability section.
  - The IRA definition placement of the phrase "using a routable protocol" in the definition and with respect to Dial-up Connectivity.
  - The Guidelines and Technical Basis sentence, "If dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies."
- Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations – V5TAG is aware of multiple interpretations of the language "used to perform the functional obligation of" in CIP-002-5.1 Attachment 1, section 2.12 and recommends clarification of:
  - The applicability of requirements on a TO Control Center that performs the functional obligations of a TOP, particularly if the TO has the ability to operate switches, breakers and relays in the BES.
  - The definition of Control Center.
  - The language scope of "perform the functional obligations of" throughout the Attachment 1 criteria.
- Virtualization – The CIP V5 standards do not specifically address virtualization. Because of the increasing use of virtualization in industrial control system environments, V5TAG asked that the SDT consider the CIP~~-005~~ V5 standards and the associated definitions ~~of Cyber Asset and Electronic Access Point~~ regarding permitted architecture and the security risks of ~~network, server and storage~~ virtualization technologies.

The SDT shall also address the Order No. 822 directives by developing modifications to requirements in CIP standards and the definition of LERC. The Commission directed the following:

- *Per paragraph 32, "...we direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability. While NERC has flexibility in the manner in which it addresses the Commission's concerns, the proposed modifications should be designed to effectively address the risks posed by*

SAR Information
transient devices to Low Impact BES Cyber Systems in a manner that is consistent with the risk-based approach reflected in the CIP version 5 Standards." - *Per paragraph 53, "…the Commission concludes that modifications to CIP-006-6 to provide controls to protect, at a minimum, communication links and data communicated between bulk electric system Control Centers are necessary in light of the critical role Control Center communications play in maintaining bulk electric system reliability. Therefore, we adopt the NOPR proposal and direct that NERC, pursuant to section 215(d)(5) of the FPA, develop modifications to the CIP Reliability Standards to require responsible entities to implement controls to protect, at a minimum, communication links and sensitive bulk electric system data communicated between bulk electric system Control Centers in a manner that is appropriately tailored to address the risks posed to the bulk electric system by the assets being protected (i.e., high, medium, or low impact)."* - *Per paragraph 73, "…the Commission concludes that a modification to the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6 is necessary to provide needed clarity to the definition and eliminate ambiguity surrounding the term "direct" as it is used in the proposed definition. Therefore, pursuant to section 215(d)(5) of the FPA, we direct NERC to develop a modification to provide the needed clarity, within one year of the effective date of this Final Rule…."* In addition, the SDT will review and address the CIP V5 requirements for CIP Exceptional Circumstances exceptions. Finally, the SDT will review the Guidelines and Technical Basis sections of the CIP V5 standards and adjust where appropriate as well as correct any grammatical, punctuation, and/or formatting errors, and make other errata changes to the CIP V5 standards, as necessary.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.

Reliability Functions	
☒ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
~~☒~~ ☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
~~☐~~ ☒ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☒ Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐ Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐ Market Operator	Interface point for reliability functions with commercial functions.
☐ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Unofficial Comment Form

Project 2016-02 Modifications to CIP Standards Standards Authorization Request (SAR)

Do not use this form for submitting comments. Use the electronic form to submit comments on the **Project 2016-02 Modifications to CIP Standards SAR**. The electronic comment form must be submitted by **8 p.m. Eastern, Thursday, June 30, 2016**.

Additional information about this project is available on the Project 2016-02 Modifications to CIP Standards page. If you have questions, contact either Senior Standards Developer, Stephen Crutchfield at (609) 651-9455 or Al McMeekin at (404) 446-9675.

Background Information

On January 21, 2016, the Commission issued Order No. 822, *Revised Critical Infrastructure Protection Reliability Standards,* approving seven CIP Reliability Standards and new or modified definitions. On March 9, 2016, the NERC Standards Committee accepted the Standards Authorization Request (SAR) and authorized the posting of the Modifications to CIP Standards SAR. It was posted for a 30-day informal comment period March 23 – April 21, 2016. Based on the comments received, the Standard Drafting Team (SDT) made minor revisions to the SAR which will be posted for an additional 30-day informal comment period.

It was noted in the comments received on the SAR that the Virtualization issue involved more than just CIP-005 standards and the defined terms Cyber Asset and Electronic Access Point. To correct this, the SDT revised the sentence to: "Because of the increasing use of virtualization in industrial control system environments, V5TAG asked that the SDT consider ~~CIP-005 and the definitions of Cyber Asset and Electronic Access Point~~ the CIP V5 standards and the associated definitions regarding permitted architecture and the security risks of ~~network, server and storage~~ virtualization technologies."

Other commenters suggested that the SDT include provisions to address CIP Exceptional Circumstances. A sentence was added to the SAR to include this topic: "In addition, the SDT will review and address the CIP V5 requirements for CIP Exceptional Circumstances exceptions."

A sentence was also added to the SAR allowing the SDT to make errata changes to the standards as necessary and to correct grammatical, punctuation and/or formatting errors in the V5 Standards: "Finally, the SDT will review the Guidelines and Technical Basis sections of the CIP V5 standards and adjust where appropriate as well as correct any grammatical, punctuation, and/or formatting errors, and make other errata changes to the CIP V5 standards, as necessary."

In the previous version of the SAR, the Transmission Service Provide (TSP) Reliability Function was checked as an applicable function. The TSP is not applicable under the CIP standards and this function was corrected by unchecking the TSP Reliability Function in this version of the SAR. Similarly, the Distribution

Provider (DP) Reliability Function was left unchecked in the original SAR. The CIP Standards apply to the DP, so this was corrected by checking the DP Reliability Function in this version of the SAR.

Questions

1. The CIP SDT revised the SAR based on the comments received in the previous posting as noted above. Do you agree with these revisions to the SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

   Yes:

   No:

CIP V5 Issues for Standard Drafting Team Consideration

September 15, 2015

From experience in the V5 Transition Study and the on-going implementation efforts, the CIP Version 5 Transition Advisory Group (V5TAG) identified specific issues with the CIP Version 5 standard language that caused difficulty in implementation of the requirements. In many cases, the V5TAG members found that select language within the CIP Version 5 standards may be understood in multiple ways. These interpretations appear to go beyond the intended flexibility of the standard language that is necessary to accommodate the diverse nature of facts and circumstances across the electric sector. At this time, the V5TAG proposes the following issues to be addressed by the CIP V5 Revisions drafting team (SDT) or other appropriate team for standards development:

- **Cyber Asset and BES Cyber Asset definitions**
  The foundational definition for the CIP Version 5 standards is 'Cyber Assets.' When Cyber Assets meet a threshold of Bulk Electric System (BES) impact they become 'BES Cyber Assets (BCA)' which are grouped, by a Responsible Entity, into 'BES Cyber Systems (BCS).' Viewing BCAs too broadly can lead to many thousands of devices in the typical utility becoming an administrative burden for which few if any cyber security controls can actually be applied or where there is limited associated cyber security risk. Vast amounts of effort would be expended for these types of cyber assets to track and document their lack of capability for even the most basic cyber security controls. Viewing BCAs too narrowly could lead to missing consideration of devices that have a sufficient level of cyber capability and risk impact.

  The SDT should consider the definition of Cyber Asset and clarify the intent of "programmable" by considering such factors as if a device is merely configurable, its executable code is not field upgradable, or if its functionality can only be changed via physical DIP switches, swapping internal chips, etc.

  The SDT should consider clarifying and focusing the definition of "BES Cyber Asset" including:
    a. Focusing the definition so that it does not subsume all other cyber asset types. Protected Cyber Assets (PCA), by nature of being on the same network, can have some form of adverse impact if misused. Electronic Access Control or Monitoring Systems (EACMS) if misused or unavailable can have some form of adverse impact. This can result in a "hall of

mirrors" effect where everything in or that creates an Electronic Security Perimeter (ESP) also meets the BCA definition.

  b. Considering if there is a lower bound to the term 'adverse' in "adverse impact". For example, is the focus of a typical generating unit the servers and operator human machine interfaces (HMI) and controller cabinets and Programmable Logic Controllers (PLCs) or is it the thousands of individual sensors and transmitters throughout the plant?
  c. Clarify the double impact criteria (cyber asset affects a facility and that facility affects the reliable operation of the BES) such that "N-1 contingency" is not a valid methodology that can eliminate an entire site and all of its Cyber Assets from scope.

- **Network and Externally Accessible Devices (ERC, ESP, IRA)**

  The SDT should consider the concepts and requirements concerning Electronic Security Perimeters (ESP), External Routable Connectivity (ERC), and Interactive Remote Access (IRA) including:
  a. Clarify the 4.2.3.2 exemption phrase "between discrete Electronic Security Perimeters." When there is not an ESP at the location, consider clarity that the communication equipment considered out of scope is the same communication equipment that would be considered out of scope if it were between two ESPs.
  b. The word 'associated' in the ERC definition is unclear in that it alludes to some form of relationship but does not define the relationship between the items. Striking 'associated' and defining the intended relationship would provide much needed clarity.
  c. Review of the applicability of ERC including the concept of the term "directly" used in the phrase "cannot be directly accessed through External Routable Connectivity" within the Applicability section. As well, consider the interplay between IRA and ERC.
  d. Clarify the IRA definition to address the placement of the phrase "using a routable protocol" in the definition and clarity with respect to Dial-up Connectivity.
  e. Address the Guidelines and Technical Basis sentence, "If dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies."

- **Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations**

  CIP-002-5.1 Attachment 1 – Impact Reliability Criteria, sections 1.1, 1.2, 1.3, 1.4, 2.11, 2.12, and 2.13 employ the language "used to perform the functional obligation of", and then lists the functional registration. It was intended that this caveat would capture entities that perform obligations of a specific registered function, whether they are registered for that function or not. However, this language has caused confusion, especially in section 2.12 concerning TOP Control Centers. The term "functional obligation" may be interpreted to have different meaning in a variety of situations.

One interpretation is for the defined term Control Center to be strictly associated with the Balancing Authority (BA), Generator Operator (GOP), Reliability Coordinator (RC), and Transmission Operator (TOP) functional registrations, and that control rooms or dispatch centers owned and operated by Transmission Owners (TOs) with control of limited BES facilities would be excluded. A second interpretation may expand or contract the applicability of the Control Center designation, based on criteria that may not take into consideration overall risk to reliable operations of the BES.

Early analysis found the potential for TOs (not Registered as TOPs) that only operate limited breakers to be pulled in as medium impact Control Centers, even if the few Facilities they control are low impact. (For example, an entity with one 161kV breaker in one substation and a second 161kV breaker in a different substation, both breakers associated with low impact Facilities.) As currently written, low impact Control Centers are to be identified per criteria 3.1 and could be commensurate with risk for these scenarios.

Areas for the SDT to address are:

a. CIP-002-5.1, Attachment 1 Control Center criteria for additional clarity and for possible revisions related to TOP or TO Control Centers performing the functional obligations of a TOP, in particular for small or lower-risk entities. A potential revision could be a size for criteria 2.12, Control Centers performing the functional obligations of a TOP.
b. Clarify the applicability of requirements on a TO Control Center that perform the functional obligations of a TOP, particularly if the TO has the ability to operate switches, breakers and relays in the BES. Review the corresponding Guidelines and Technical Basis of CIP-002-5.1, specifically: the “CIP-002-5” section paragraph starting with “Responsibility for the reliable operation of the BES is spread across all Entity Registrations”; the table following that paragraph; the “High Impact Rating (H)” section; and the criterion bullets for Control Centers under the “Medium Impact Rating (M)” section.
c. The definition of Control Center (if pursued, recognize possible impacts on operations and planning standards and/or glossary terms that include ‘Control Center’, for example, the revised Glossary term for “System Operator” to be effective July 1, 2016).
d. The language scope of “perform the functional obligations of” throughout the Attachment 1 criteria.

- **Virtualization**

  The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration.

> The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies.

The transition to CIP Version 5 continues as the compliance deadline of April 1, 2016 approaches. The V5TAG continues to discuss challenging issues being undertaken during the on-going implementation. The group may find additional issues to transfer to the SDT for consideration.

Standards Announcement

Project 2016-02 Modifications to CIP Standards
Standards Authorization Request

Informal Comment Period Open through June 30, 2016

Now Available

A 30-day informal comment period for the **Project 2016-02 Standards Authorization Request (SAR)**, is open through **8 p.m. Eastern, Thursday, June 30, 2016**.

Commenting
Use the electronic form to submit comments on the SAR. If you experience any difficulties in using the electronic form, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps
The drafting team will review all responses received during the comment period and determine the next steps of the project

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact either Senior Standards Developer, Stephen Crutchfield at (609) 651-9455 or Al McMeekin at (404) 446-9675.

Comment Report

Project Name: 2016-02 Modifications to CIP Standards SAR June 2016

Comment Period Start Date: 6/1/2016

Comment Period End Date: 6/30/2016

Associated Ballots:

There were 21 sets of responses, including comments from approximately 21 different people from approximately 21 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. The CIP SDT revised the SAR based on the comments received in the previous posting as noted above. Do you agree with these revisions to the SAR? If not, please explain why you do not agree, and, if possible, provide specific language revisions that would make it acceptable to you.

Comment	
The SPP RE respectfully submits the following two comments to the Project 2016-02 Standards Authorization Request: (1) Reference the comments submitted by the SPP Regional Entity (SPP RE) April 2016. In those comments, the SPP RE pointed out that Tie Line and other Transmission line flow meters appear to have been unintentionally excluded from consideration under CIP-002-5.1, Impact Rating Criterion 2.5. This significant issue does not appear to have been included in the revised SAR. The original SPP RE comment is restated here: “Impact Rating Criterion 2.5 excludes consideration of BES Cyber Assets associated with Transmission lines through its use of “operating between 200 kV and 499 kV at a single station or substation” language. In the instance where the tie line or other flow meter is associated with a Transmission Line operated between 200 and 499 KV in a substation that satisfies the qualifications of Impact Rating Criterion 2.5, the meter will be excluded and not be categorized as Medium Impacting. Additionally, some entities are proffering the argument that the flow meter is not a BES Cyber Asset because its loss or misuse will not affect the reliable operation of the Transmission Facilities in the substation where the meter resides, overlooking the impact the loss of meter information may have on Control Center operations including ACE calculation, security-constrained generation dispatch, AGC, and Situational Awareness. An additional Criterion, specific to Transmission line flow meters, may be required to address this issue.” (2) The SPP RE notes that the revised SAR still makes no mention of the consideration of submitted and outstanding Requests for Interpretation. NERC staff has stated publicly that the RFIs would be addressed by the Standards Drafting Team. The SPP RE is aware that at least one of the issues discussed in the April 2016 comments to the SAR has been formally submitted as a Request for Interpretation. To fail to consider outstanding RFIs in the course of modifying the CIP Standards under this SAR would be a missed opportunity to address significant confusion regarding the expectations of the Requirements under question.

For virtualization, Manitoba Hydro does not agree with NERC prescribing specific system architecture, technologies or designs. SDT should continue to focus on identifying requirements to meet specific objectives for the virtualization. Manitoba Hydro agrees with adding more CIP V5 requirements exceptions for CIP Exceptional Circumstance.

Emily Rousseau - 1,2,3,4,5,6 - MRO, Group Name MRO-NERC Standards Review Forum (NSRF)

Answer	No
Document Name	

Comment

The NSRF agrees with the drafting team’s addition of “reviewing and addressing the CIP V5 requirements for CIP Exceptional Circumstances exceptions” to the SAR. However, we request clarification on the scope of Guidelines and Technical Basis sections that may be changed with updates to the associated Standards within this project. We believe that addressing all CIP V5 Guidelines and Technical Basis sections within the scope of this revision may make the project unwieldy as it already contains a substantial scope of work to address FERC directives. We suggest that only Guidelines and Technical Basis sections related to standards language updates should be addressed within the scope of this project.

Comment

CIP-002-5.1

A) The topic of adverse impact should provide more clarity on the real-time requirement as well.

B) Per Medium Impact criterion 2.3 for generation resources, need further clarity on the extent of planning horizon > 1 year contingencies to consider regarding the determination of BES Adverse Reliability Impacts to a given Interconnection. The Guidelines and Technical basis of CIP-002-5.1 reference as an example, TPL-003 Category C3 contingency system studies but otherwise, there is no lower or upper limit indicated regarding the depth of contingencies to be considered. The limit is currently subjective for Transmission Planners and Planning Coordinators.

Furthermore, per the definition of Adverse Reliability Impact, there is direct reference to impacts on a given Interconnection but it is not clear whether this is only considering inter-tie paths or general BES impacts beyond a specific BES location (i.e. generation plant or substation). The Guidelines and Technical basis state only widespread impacts are to be considered instead of localized impacts but it is not clear what is considered ‘widespread’.

CIP-005-5 The fundamental concepts of the intermediate system are omitted or subjective. The standards should define what the requirements are for this system, whether it is strictly a jump host (not mentioned in the standards) or can have more functionality (i.e. software installed upon it). This should be included in the ’Network and Externally Accessible Devices’ section.

CIP-005-5/CIP-003-6 A clear exemption is given for low impact systems is given in CIP-003-6 Guidelines and Technical Basis (CIP-006-6 pg 28) “To future-proof the standards, and in order to avoid future technology issues, the definitions specifically exclude “point-to-point communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions between Transmission station or substation assets containing low impact BES Cyber Systems,” such as IEC 61850 messaging.” The ‘Network and Externally Accessible Device’” section should address this topic for medium impact BCS/BCA as well. These technologies are not limited to low impact systems and guidance should be provided.

CIP-007-5: Regarding security patch applications and cyber vulnerability assessments:

- Certain legacy devices (i.e. HMIs, PLCs, etc.) can be in a “fragile” state and are at high-risk regarding the application of software updates, which include cyber security related updates. There is a demonstrable risk in breaking their functionality which can have an adverse impact on the BES as the only solution is to replace the device entirely or at best, perform a complete reset of the device. This is mainly due to bugs that could be introduced by vendors through their patches (not enough regression testing done by the vendors) and for which even testing prior to implementation in a production environment may not identify all such bugs prior to implementation. Recommend providing guidance around how to handle the application of cyber security patches to these “fragile” devices and to potentially not mandate security patch applications in all cases where there may be demonstrable evidence of adverse BES impact.

- Further guidance is required within the Guidelines and Technical basis on the exact difference between a ‘paper’ exercise cyber vulnerability assessments (CVA) and ‘active’ CVA with respect to Medium Impact facilities and the extent an entity is expected to go to achieve this. It has been communicated by Regional Entities’ audit approach that paper scans must incorporate some active component to pull configuration settings, etc. from a device for analysis. For legacy devices (namely firmware devices), these active component scans can also pose a risk in breaking the functionality of said devices, which can cause adverse impact to the BES. Recommend including guidance around how to handle CVAs pertaining to these firmware devices without potentially breaking their functionality.

Comment

Tacoma asks that the SDT consider removing the final two sentences from the last paragraph of CIP-005-5, Guidelines and Technical Basis, Section 4 – Scope and Applicability of the CIP Cyber Security Standards, Requirement R1. These are shown in bold below for identification:

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. ***Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.***

Tacoma is asking the SDT to consider that there are other methods and technologies for detecting malicious traffic in addition to deep packet inspection. This change to the G&TB would make the standard more consistent with the language in FERC Order No. 706, Paragraph 501 which indicates that it is not the commission’s intent to mandate any specific mechanism to be the second security measure. The language from the FERC order is shown below for reference and the pertinent language is shown in bold:

Paragraph 501. In response to SDG&E and Entergy, in stating that the placement of security measures in front of systems provides a layer of protection for those systems, the Commission was not giving priority to “in front” measures. In fact, the Commission acknowledged in the CIP NOPR that defense *in depth measures are generally integrated within and constitute part of a system or program. In commenting that defense in depth measures may also be effectively placed in front of a system, the Commission intended only to acknowledge that there are multiple ways to implement a defense in depth strategy.* ***The Commission is not mandating any specific mechanism to be the second security measure. We are also not requiring uniformity of security measures, only that each responsible entity have at least two security measures unless it is not technically feasible to do so.*** *The revised CIP Reliability Standard should allow enough flexibility for a responsible entity to take into account each site's specific environment. The Commission believes that this, in conjunction with the allowance of technical feasibility exceptions, alleviates FPL Group's concern that the Commission's proposal is a "one size fits all" approach.*

Also, the SDT should clarify CIP-005 R1 Part 1.5 with respect to encrypted communications either in the G&TB or directly within the requirement language. It important that the SDT clarify how to detect malicious communications when the communications includes encrypted information that is not readily decrypted to allow inspection.

.

Although Seminole concurs with all items currently listed in the draft Standards Authorization Request, Seminole recommends that additional items should be included in the SAR. Seminole thanks the SAR team for addressing our previous comments, in addition to those of others, related to Exceptional Circumstances and the Guidelines and Technical Basis.

While the changes addressed are necessary to address mandatory requirements from FERC, this SAR does not address the fundamental deficiencies in the current CIP standards. Until these fundamental issues are addressed, the electric sector will continue to struggle implementing the current standard, be faced with inefficiencies in the standard that do not improve cyber and physical security, and have difficulty using new and improved capabilities in a rapidly evolving marketplace.

Seminole recommends adding the following items to the SAR:

1. Update CIP-002 Requirements and the Guidelines and Technical Basis section to clarify the expectations in complying with this standard. Update evidence requirements to make clear the expectations of the standard. Clarify attachment 1 to address V5TAG Lessons Learned and FAQs. Resolve issues in the Guidelines and Technical Basis that are inconsistent with the definition of BES Cyber Asset and BES Cyber System.

2. The SDT will review applicable Standards and Requirements to clarify the SDT's intent for management of shared Facilities when more than one Registered Entity owns Facilities inside a single asset. Interconnections within the BES and with Distribution Providers within a single asset create significant complexity for entities in some regions. This results in a need for a significant number of MOU, CFR, or JRO that both complicates compliance and the audit process.

3. The SDT will review the Measures in the CIP V5 standards and adjust where appropriate to allow an entity that provides evidence consistent with the identified measures to determine compliance if no deficiencies are identified in the provided evidence. This may include modifying measures to match the CIP Version 5 Evidence Request or by clarifying either the measures or Guidelines and Technical basis to clarify intent for adjustment of the evidence request.

Comments: Entergy requests that more detail be provided regarding the actions that will be considered regarding CIP Exceptional Circumstances. Is more specificity regarding what constitutes a CIP Exceptional Circumstance being considered? Is more specificity regarding how to declare and document a CIP Exceptional Circumstance being considered? Will more clarity regarding standards affected by CIP Exceptional Circumstance, including a possible increase of applicable standards, be considered? Some particular questions Entergy has regarding the scope of standards affected by CIP Exceptional Circumstances include:

- CIP-004-5.1 R3 does not include the “except during CIP Exceptional Circumstances” language, yet the Guidelines and Technical Basis section states “Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response.” The language in the Guidelines and Technical Basis seems logical as it may not be feasible to validate PRA’s during a widespread emergency response (i.e. a hurricane) especially when response support is provided by many other companies and/or vendors across the country. It is requested that the “except during CIP Exceptional Circumstances” language be added to the appropriate parts of CIP-004-5.1 R3, particularly CIP-004-5.1 R3 Part 3.5.

- The “except during CIP Exceptional Circumstances” language exists in CIP-006-5 R2 Part 2.1 and Part 2.2 which states that logging and continuous escorting of visitors is not required during CIP Exceptional Circumstances. However, none of the CIP-006-5 R1 parts include the “except during CIP Exceptional Circumstances” language, which in turn requires alerting, monitoring, logging of access approved individuals. This may not be feasible during a widespread event that results in total loss of power at many sites over a widespread geographical area. It is requested that the “except during CIP Exceptional Circumstances” language be added to the appropriate parts of CIP-006-5, particularly R1 to ensure consistency across CIP-006-5.

Comment

The following comments are from my CIP SME.

• Per paragraph 73, “…the Commission concludes that a modification to the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6 is necessary to provide needed clarity to the definition and eliminate ambiguity surrounding the term “direct” as it is used in the proposed definition. Therefore, pursuant to section 215(d) (5) of the FPA, we direct NERC to develop a modification.

This is where I believe FERC’s order falls short. Although, the definition for LERC needs to be improved and needs to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6. In my opinion, the requirements for low impact critical assets is incomplete. It appears like the SDT was rushed to provide requirements for low impact. Although, the SDT included some basic requirements for low impact critical assets they should have also included requirements for malware and virus protections. In addition, there should be requirements for logging and auditing of systems and system access. These requirements do not need to be as stringent and comprehensive as what is required for medium and high impact critical assets, but they should also be required for low impact critical assets.

Thank you for the opportunity to provide comments regarding the Standards Authorization Request (SAR) in response to FERC Directives and v5TAG recommendations. While the current SAR attempts to resolve issues around LERC, virtualization and communication protections, ACES believes the SAR doesn’t adequately detail the areas of concern for LERC and fails to allow for technology advances, which may ultimately hinder industry adoption of more secure solutions to address cyber security threats.

How LERC will be defined based upon the ability to communicate and interactive communication capabilities between Low Impact Facilities that have BES Cyber Assets associated with them has yet to be fully vetted. The ability to communicate with a BES Cyber Asset isn’t the same as interacting with the BES Cyber Asset. This distinction needs to be clearly defined. Another issue for Low Impact BES Cyber Systems is the need for a common definition of when serial devices are in scope and not in scope for consistent industry implementation.

Host-based security applications, advanced security threat analysis services, and cloud-based networks are not in scope for the SAR. There are mechanisms in place in the CIP standards that allow for exceptions, such as TFEs and CIP Exceptional Circumstances. ACES believes that these definitions could be expanded to include technology that exists outside of the standard to be able to be used, with approval, in order to provide the entity with a stronger defense in depth security profile.

If the drafting team proposes to modify definitions, they should consider a process that is non-prescriptive and provides flexibility for registered entities to decide how to best defend against cyber security threats based on their risk analysis. There may be significant advantages for industry to adopt new emerging security applications and cloud based security services. The CIP standards should not limit the tools or technology available to mitigate cyber security risks. We ask the drafting team to consider how the revisions to the CIP standards would allow for the power industry to match the security best practices of other industries against the latest security threats and vulnerabilities. Thank you for your time and attention regarding this SAR.

The Bureau of Reclamation agrees with the drafting team's addition of "reviewing and addressing the CIP V5 requirements for CIP Exceptional Circumstances exceptions" to the SAR. However, Reclamation requests clarification on the scope of Guidelines and Technical Basis sections that may be changed with updates to the associated Standards within this project. Reclamation believes that addressing all CIP V5 Guidelines and Technical Basis sections within the scope of this revision may make the project unwieldy as it already contains a substantial scope of work to address FERC directives. Reclamation suggests that only Guidelines and Technical Basis sections related to standards language updates should be addressed within the scope of this project.

AEP suggests that the SDT include separate balloting and commenting for Guidelines and Technical Basis throughout this project. With the development of implementation guidance, AEP is unsure whether the Guidelines and Technical Basis document should remain a part of the codified Reliability Standard. If it does, then stakeholders should have the ability to vote and comment on the contents specifically.

Comment	
As our review group evaluated the revised SAR, we noticed that the V5TAG recommends providing clarity in the definitions of the two terms ‘External Routable Connectivity (ERC)’ and ‘Interactive Remote Access (IRA). We suggest the drafting team either develop a new SAR or modify this one in order to require the term ‘External Routable Connectivity (ERC)’ to have the acronym and revised definition updated in the NERC Glossary and also included in the Rules of Procedure (RoP) for consistency and proper alignment. Additionally, we suggest the drafting team edit the SAR to review the Rules of Procedure where the acronym (IRA), is used to refer to ‘Inherent Risk Assessment’ wheras the CIP Standards refer to a term ‘Interactive Remote Access’ but do not use an acronym. There could be confusion if an acronym is used in either document for either of these terms. We suggest not using an acronym for either term in any document. We also request clarification on why there is a specific deadline for updating the definition of LERC. As for the term ‘Low Impact External Routable Connectivity-LERC’, we suggest the drafting team edit the SAR to clarify that a revised definition will also be included in the RoP.	

When clarifying the ‘lower bound’ clarification in “adverse impact”, we would appreciate a clear example (beyond the one used in the V5TAG document) that explains this concept.

We also request the SDT review or consider creating definitions or otherwise providing clarity for ‘custom software’ and the use of ‘scripts’. There are several instances of regional inconsistencies in the scope of ‘scripts’ that should be included in an entity’s baseline. Direction or clarity from this drafting team would be appreciated. Additional requirements or definitions may not be required, but guidance, rationale, or technical background would be beneficial.

Comment

Arizona Public Service (AZPS) appreciates the opportunity to comment on the revised SAR, and submits the following comments previously provided in response to the initial SAR. Although AZPS generally supports the scope as described in the SAR, we believe that there are additional clarifications that should be considered beyond those detailed in the FERC Oder 822 and the CIP Version 5 Transition Advisory Group (V5TAG) considerations.

AZPS believes the industry would benefit from clarification of the definition of the following terms:

- Transmission Facility – Transmission Facility is not a defined term. Although Facility is a defined term, AZPS does not believe that the Facility definition aligns with the standard’s intent. AZPS suggests that a definition be provided by the Standard Drafting Team (SDT).
- Programmable - The SDT should consider defining programmable to clarify that a device would not be included simply because it was configurable, e.g., has functionality that can be changed locally.

AZPS would also like to suggest that the SDT clarify the intent of the grouping BCAs into BCS by leveraging the logically based perimeter security controls at the Electronic Security Perimeter (ESP) as well as local, device specific security controls per each BES Cyber Asset’s (BCA) capability.

AZPS would also like to add some additional comments to the discussion in the V5TAG CIP V5 Issues for Standard Drafting Team Consideration document.

- AZPS recommends that the SDT consider not defining “adverse impact” or defining a lower bound thereof within the definition of BES Cyber Asset, but to revise the body of CIP standards and/or applicable defined terms to utilize already defined terms such as “Adverse Reliability Impact.” Such would facilitate consistency as well as clarity regarding the N-1 contingency issue and other issues regarding that term identified by the V5TAG.
- AZPS believes that when BES Cyber Assets (BCA), such as relays, RTUs, and others, are connected via serial links to IP converters and/or IP-enabled security gateways, it would be appropriate to consider those elements downstream of the security gateways as BCA that do not have External Routable Connectivity (ERC). This is appropriate because the IP- converters and/or IP-enable security gateways require authentication and provide a protocol break. AZPS believes accurate and timely guidance related to serially connected devices supports the overall goal of providing appropriate and effective cyber security controls; thus, improving reliability.

- AZPS supports the CIP V5TAG analysis regarding virtualization. Virtualization is an effective tool for utilities and consideration should be given to ensuring that flexibility is maintained. An approach should consider the required outcome rather than the specifics of how that outcome is achieved.

AZPS also notes that NERC's webpage for this SAR "Project 2016-02 Modifications to CIP Standards", as of 4/11/2016, states the following:

"Also the scope of this work will incorporate existing and future RFIs relating to the CIP-002 through CIP-011 family of standards."

AZPS does not believe any RFIs are addressed in the current SAR. We recommend updating the SAR to reference existing submitted RFIs as appropriate. Finally, AZPS recommends removal from the SAR of functional registrations that are no longer included in the Compliance Registry, e.g., Interchange Authority, Load-Serving Entity and Purchasing-Selling Entity.

BPA agrees with the revised scope of the SAR with three exceptions regarding the "Transmission Owner (TO) Control Centers Performing Transmission Operator (TOP) Obligations –" bullet and sub-bullets:

1. BPA proposes that the SDT clearly identify which function holds the compliance documentation responsibilities.
2. BPA believes the NERC Glossary definition of control center is adequate and should not be revised. The current definition maintains the distinction between control centers and substations.
3. BPA believes no clarification of the 'performs the functions of' language is needed for Attachment 1.

Texas RE supports those comments suggesting that this project should identify continued areas for improvement within the existing CIP V5 Standards and avoid engaging in a wholesale “rewrite” of the CIP Standards at this point in time. Consistent with this principle, the Standards Drafting Team (SDT) has properly identified the FERC directives from Order No. 822 and the various V5 Tag recommendations as the framework upon which to base the scope of this project.

However, Texas RE believes that the SDT should also take the opportunity to address two other areas to develop a strong record and enhance regulatory certainty around the application of the new suite of CIP Standards becoming effective on July 1, 2016. First, Texas RE agrees with those comments suggesting that the Commission should consider the interaction among the various CIP Standards, including the interaction between CIP-002-5.1 and the rest of the Standards as a group. The SDT may specifically wish to address the interplay between the various bright-line impact categories in the CIP-002-5.1 Standard and the risk assessments associated with the other CIP-005 Standards.

Second, Texas RE recommends that the SDT explicitly consider and determine whether aspects of the various supporting materials associated with the CIP Standards, including a number of Lessons Learned, FAQs, and other guidance documents should be incorporated directly into the CIP Standards themselves. For example, the October 2015 CIP V5 Consolidated FAQs and Answers provided that “HVAV, UPS, and other support systems . . . will not be the focus of compliance monitoring” unless such systems are within an Electronic Security Perimeter. (p. 7). However, some HVAC and other systems may fall within the definition of a BES Cyber System and be subject, among other things, to the categorization requirements set forth in CIP-002-5.1, R1. The SDT could add clarity to the Standards by explicitly considering whether HVAC and other support systems should be (or is already) included within the BES Cyber System definition or conversely carved out of the CIP Standards in certain circumstances. This will encourage reliability and regulatory certainty by permitting entities to look to the Standard language to understand their compliance obligations, as well as produce a transparent record of the rationale underpinning a particular approach.

Changes to SAR Redlined Language

In addition to Texas RE’s suggestions regarding the scope of this project, Texas RE also suggests two additional revisions to the revised SAR language. First, the scope of the CIP Exceptional Circumstances exception language appears vague. Texas RE presumes that the SDT incorporated the recommendations from the Edison Electric Institute and others suggesting primarily that the SDT should consider whether the CIP Exceptional Circumstances exception should be added to additional CIP V5 requirements. Texas RE recommends making this more explicit by revising the SAR language to state: “In addition, the SDT will review and address whether it is appropriate to include CIP Exceptional Circumstances exceptions within additional CIP V5 requirements.”

Second, Texas RE supports the SDT’s inclusion of language in the SAR permitting the SDT to make non-substantive changes to the Standards and Guidelines and Technical Basis sections to correct grammar, punctuation, and/or formatting errors. However, it is possible to read the proposed language to suggest that “errata” changes are somehow broader than such non-substantive revisions. Texas RE would suggest clarifying that “errata” changes to the CIP V5 Standards by inserting the word “non-substantive” in front of the word “errata” in the existing redline language.

Posting Document/Unofficial Comment Form

Project 2016-02 Modifications to CIP Standards
Modifications to address CIP Exceptional Circumstances

Do not use this form for submitting comments. Use the electronic form to submit comments on the modifications **to address CIP Exceptional Circumstances.** The electronic form must be submitted by **8 p.m. Eastern, March 13, 2017.**

To minimize the number of posted documents, the Standard Drafting Team (SDT) included everything in this single document with the questions following the suggested approach and draft language.

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Al McMeekin at (404) 446-9675.

Introduction

A CIP Exceptional Circumstance (CEC) is defined in the NERC Glossary of Terms Used in Reliability Standards as:

> A situation that involves or threatens to involve one or more of the following, or similar, conditions that impact safety or BES reliability: a risk of injury or death; a natural disaster; civil unrest; an imminent or existing hardware, software, or equipment failure; a Cyber Security Incident requiring emergency assistance; a response by emergency services; the enactment of a mutual assistance agreement; or an impediment of large scale workforce availability.

CEC are included in a Responsible Entity's cyber security policy from CIP-003 which describes how the entity would declare and respond to a CEC. During a declared CEC, the entity is allowed exception(s) to adhering to the specific reliability objective of the requirement(s); however, the entity is still compliant with the requirement(s) if the entity properly declares and responds to the CEC and adheres to its applicable cyber security policies.

From the experience and knowledge gained in the on-going efforts to implement the CIP Version 5 standards, stakeholders requested in the SAR that the CIP Modifications Standard Drafting Team (SDT) review the entire suite of CIP standards to determine whether there are any additional requirements that could be impacted during a declared CEC, and if so, to recommend revisions to those requirements. The SDT reviewed the CIP Version 5 suite of standards and identified several more instances where including the phrase "except during CIP Exceptional Circumstances" is deemed appropriate. The SDT is proposing[1] to

---

[1] The SDT previously considered a second option to handle CIP Exceptional Circumstances which required the development of a formal CEC program that allowed for a CEC to be taken for any CIP requirement, based on need. Through additional review and input, the SDT determined that any CEC declared under the framework of a holistic CEC program would require treatment under the Compliance Monitoring and Enforcement Program as an instance of potential non-compliance. Consequently, the SDT dismissed this approach and is moving forward with a proposal based on the existing CEC paradigm.

retain the existing language in the currently approved CEC-related Requirements and add the same language to additional selected Requirements/Parts as outlined below.

List of Additional Requirements for Consideration

Standard	Requirement	Rationale
CIP-004	Requirement R3, Part 3.5 Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	This is similar to the CIP-004-5 Requirement R2, Part 2.2 training requirement. A personnel risk assessment cannot be performed on first responders, and may not be possible on relevant vendors. This would cover the entity's personnel as well as contractors and service vendors
CIP-006	Requirement R1, Part 1.8 Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	This aligns to CIP-006-6 Requirement R2, Part 2.2. During certain events, logging may not be possible if the facility is damaged or destroyed.
CIP-006	Requirement R1, Part 1.9 Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	This aligns to CIP-007-6 Requirement R4, Part 4.3. During certain events, logging may not be possible if the facility is damaged or destroyed.
CIP-006	Requirement R2, Part 2.3 Retain visitor logs for at least ninety calendar days.	This aligns to CIP-007-6 Requirement R4, Part 4.3. During certain events, logging may not be possible if the facility is damaged or destroyed.
CIP-007	Requirement R4, Part 4.1 Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a	This aligns to CIP-006-6 Requirement R2, Part 2.2. During certain events, logging may not be possible if the facility is damaged or destroyed.

Standard	Requirement	Rationale
	minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	
CIP-010	Requirement R1, Part 1.4.1 Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change;	This aligns to Requirement R3, Part 3.3. During the event, security controls testing may impede recovery efforts.
CIP-010	Requirement R1, Part 1.5 Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	This aligns to Requirement R3, Part 3.3. During the event, security controls testing may impede recovery efforts.

Receiving thoughtful and constructive feedback from stakeholders is critical to the success of this plan. Submitting comments in advance of the deadline is welcomed and encouraged. The SDT thanks you for your participation.

Questions

Note: The new (revised) language is shown in red text.

1. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

    CIP-004 R3, Part 3.5: Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years, except during CIP Exceptional Circumstances.

    ☐ Yes
    ☐ No

    Comments:

2. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

    CIP-006 R1, Part 1.8: Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry, except during CIP Exceptional Circumstances.

    ☐ Yes
    ☐ No

    Comments:

3. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

    CIP-006 R1, Part 1.9: Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days, except during CIP Exceptional Circumstances.

    ☐ Yes
    ☐ No

    Comments:

4. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

   CIP-006 R2, Part 2.3: Retain visitor logs for at least ninety calendar days, except during CIP Exceptional Circumstances.

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

   CIP-007 R4, Part 4.1: Log events, except during CIP Exceptional Circumstances, at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events:

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

   CIP-010 R1, Part 1.4.1: Prior to the change, except during CIP Exceptional Circumstances, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change.

   ☐ Yes
   ☐ No

   Comments:

7. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

    CIP-010 R1, Part 1.5: Where technically feasible, for each change that deviates from the existing baseline configuration:

    1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected, except during CIP Exceptional Circumstances; and

    1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments, except during CIP Exceptional Circumstances.

    ☐ Yes
    ☐ No

    Comments:

8. Are there other Requirement(s) or Part(s) that should include the CIP Exceptional Circumstance language other than those already identified in this request? If so, please identify and provide the rationale.

    ☐ Yes
    ☐ No

    Comments:

9. If you have additional comments on the proposed approach that you have not provided in response to the questions above, please provide them here.

    Comments:

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

2016-02 Modifications to CIP Standards Communication Networks and CIP Exceptional Circumstances

Informal Comment Period Open through March 13, 2017

Now Available

The Project 2016-02 Standard Drafting Team (SDT) is requesting stakeholder input on two issues it is addressing: (1) the Federal Energy Regulatory Commission directive regarding Communication Networks; and, (2) determining if additional CIP requirements are impacted during a declared CIP Exceptional Circumstance. 30-day informal comment periods are open through **8 p.m. Eastern, Monday, March 13, 2017** for stakeholders to provide feedback on the SDT's approach and draft language for each issue. To minimize the number of posted documents, the SDT included everything in a single document for each issue with the suggested approach and draft language preceding the questions.

Commenting

Use the electronic form to submit comments. If you experience any difficulties using the electronic form, contact Wendy Muller.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The drafting team will review all responses received during the informal comment period and determine the next steps of the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Al McMeekin (via email) or at (404) 446-9675.

Comment Report

Project Name:	2016-02 Modifications to CIP Standards | Modifications to Address CIP Exceptional Circumstances
Comment Period Start Date:	2/10/2017
Comment Period End Date:	3/13/2017
Associated Ballots:	

There were 51 sets of responses, including comments from approximately 128 different people from approximately 97 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-004 R3, Part 3.5: Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years, except during CIP Exceptional Circumstances.

2. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-006 R1, Part 1.8: Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry, except during CIP Exceptional Circumstances.

3. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-006 R1, Part 1.9: Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days, except during CIP Exceptional Circumstances.

4. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-006 R2, Part 2.3: Retain visitor logs for at least ninety calendar days, except during CIP Exceptional Circumstances.

5. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-007 R4, Part 4.1: Log events, except during CIP Exceptional Circumstances, at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events:

6. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-010 R1, Part 1.4.1: Prior to the change, except during CIP Exceptional Circumstances, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change.

7. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-010 R1, Part 1.5: Where technically feasible, for each change that deviates from the existing baseline configuration:

1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected, except during CIP Exceptional Circumstances; and

1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments, except during CIP Exceptional Circumstances.

8. Are there other Requirement(s) or Part(s) that should include the CIP Exceptional Circumstance language other than those already identified in this request? If so, please identify and provide the rationale.

9. If you have additional comments on the proposed approach that you have not provided in response to the questions above, please provide them here.

Comment

While the NSRF agrees with identifying those requirements impacted by CECs, we do not support revising the standards to add CEC exclusions as suggested. There is significant overhead to the Industry every time a standard is opened. It can also lead to more questions and additional standards changes to address questions raised by the Commission. There will also be additional work in the compliance arena as the RSAWS will likely ask to document all CEC events and whether they were properly assessed, or to provide proof that no CEC cases occurred.

In an effort to stabilize the CIP standards, we would recommend using NERC's new Compliance Guidance process. NERC should ask the CIPC to develop simple implementation guidance outlining how Registered Entities can document and report CECs to get Compliance Exception treatment. NERC should also draft a companion CMEP Practice Guide to enable expeditious Compliance Exception handling of access issues occurring during a CEC.

Comment

Texas RE recognizes there are instances where declaring a CIP Exceptional Circumstance (CEC) is appropriate and the Standard Drafting Team (SDT) did identify such circumstances. Given the definition of CEC, however, Texas RE recommends the SDT not extend the current application of CIP Exceptional Circumstances to the additional standards identified. The definition of CEC specifically includes situations that "involve[] or threaten[] to involve . . .an imminent or existing hardware, software, or equipment failure." That is to say, under the SDT proposal, an entity experiencing a hardware failure or system outage may declare a "CIP Exceptional Circumstance" and avoid Standard requirements that are expressly designed to encourage redundant controls and backup systems precisely in such circumstances. As a result, the proposal appears designed solely to reduce compliance risk rather than encourage sound “defense-in-depth” practices.

Consider the proposal to extend the CEC language to CIP-006 R1, P1.8, concerning the logging of physical entry into a Physical Security Perimeter. Currently, registered entities routinely accomplish this logging function through electronic devices such as card readers. However, if these devices fail, entities are expected to deploy secondary physical controls to control access. In particular, registered entities routinely post security personnel at perimeters to log entry and exit during an outage. Under the SDT’s proposal, however, such entities would no longer be required to deploy such physical personnel to log access. Rather, they could declare a CEC during the duration of the hardware failure. The net effect is to reduce the overall protections for physical assets. The same logic extend to the retention of physical access logs and visitor logs under CIP-006 R1, P1.9 and CIP-006 R2, P.2.3, respectively.

A similar rationale applies to the extension of the CEC language to the CIP-004 R3, P. 3.5 Personal Risk Assessment (PRA) requirement. In Texas RE’s experience, the best practice for entities handling the PRA process is to ensure sufficient lead-time for PRA updates and other actions. Given the seven-year review window, entities should be encouraged to perform any and all reviews with sufficient lead time so that unforeseen circumstances and events do not result in a possible violation. Again, the SDT’s proposal reduces this incentive. Critically, the SDT’s proposal applies to all entity personnel and contractors. Given the potentially broad nature of an “imminent or existing hardware, software, or equipment failure,” an entity could avoid performing background diligence on any contractor entering its facilities to perform any unscheduled, non-routine maintenance. This appears overbroad and beyond the SDT’s intent. Texas RE has identified similar issues with CIP-007 and CIP-010 listed by the SDT above.

In the alternative, Texas RE recommends the SDT revise the definition of CEC to remove “an imminent or existing hardware, software, or equipment failure”. This properly aligns the focus of the CEC definition with the rationale statements provided by the SDT for the examples above.

Texas RE also recommends clarifying entities’ compliance expectations around CECs. In particular, Texas RE has encountered a number of entities that view a CIP Exceptional Circumstances declaration as exculpatory without more. Rather, if an entity declares a CIP Exceptional Circumstance, the entity must fully document and justify the scope and duration of the event, as well as establish that regular controls were in place and appropriate elements of its emergency response plan were implemented. This proceeding is an opportunity to clarify these expectations.

It is impractical to refuse entry to an emergency responder or SME due to the lack of a PRA or have to wait to validate a PRA. This would potentially hinder recovery/response efforts.

CIP Exceptional Circumstance was approved for this requirement in previous versions. If there is an emergency situation as described by the definition of a CIP Exceptional Circumstance, there isn’t time to get a background check completed before allowing rescue/medical personnel in to assist.

AZPS respectfully requests that the addition of the existing CIP Exceptional Circumstance language be applied to CIP-004 R3, Parts 3.1 through 3.5 and be placed at the beginning of the opening phrase. AZPS believes that the performance of all Parts under Requirement R3 would not be feasible during a CIP Exceptional Circumstance, e.g., companies would not seek to confirm the identity of paramedics responding to the medical emergency of an employee.

Chris Scanlon - Exelon - 1,3,5,6

Answer	Yes
Document Name	

Comment

Exelon supports the addition of “except during CIP Exceptional Circumstance” to the Requirement parts. Specifically, it is important to highlight that for CIP-004-5, R3, the Personnel Risk Assessments (PRA) may not be able to be performed on first responders, whether they are entity personnel or external contractors, vendors or emergency personnel, within a reasonable period of time prior to authorizing unescorted physical access during a CIP exceptional circumstance.

CIP Exceptional Circumstances are declared in emergency situations to protect life, safety and the reliability of the BES. Entities are given the flexibility to design programs that articulate how to declare and respond to a CEC. That flexibility should extend to the entity’s ability to appoint or allow individuals with appropriate skills to assist with recovery to gain access as necessary to mitigate risk.

Additionally, during a major BES Cyber System event there may be a need to provide access to the vendor to address the system issue where obtaining a PRA for electronic access would prohibit addressing maintaining reliability. The seven (7) year criminal history checks may may require searches across multiple jurisdictions for a single individual based on resident history. Jurisdications are not required to respond to requests for criminal history information within a specified service level agreement (SLA). In addition, some jurisdications require fingerprinting or other means to authenticate the criminal history of an individual, which would extend the amount of time required to complete the PRA.

Requirement 3 of CIP-004-6 Guidelines and Technical Basis already referenced CEC:"Each Responsible Entity shall ensure a personnel risk assessment … except for program specified exceptional circumstances". Can a requirement be suspended for CEC even if it does not allow CEC explicitly? What if the G&TB makes a reference to CEC but not the requirement? What should be the procedure for reporting the CEC in a case where CEC is not explicitly mentioned in the requirement?

Comment	
As noted in the rationale, this is consistent with CIP-004 R2, Part 2.2. This exception is needed to address instances where first responders or others providing assistance in a CEC require access. In the event of a CEC, obtaining a personnel risk assessment prior to allowing access may cause risk to life or property. Additionally, in the event of a CEC, obtaining a PRA for vendors involved with restoration may not be practical. ERCOT also suggests the SDT consider revising the language to further clarify that the exception applies to the need to conduct a PRA, and not to the period covered by the PRA. This could be addressed as follows: "Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years. The requirement to complete a personnel risk assessment does not apply during CIP Exceptional Circumstances."

To provide consistency between the two major pre-requisites contained within CIP-004-6 R2 (Training) and CIP-004-6 R3 (PRA), the CEC langauge could be added where if Training is not required during a CEC prior to allowing emergency access, the requirements for R3 should allow for the same. Additionally, it could also be considered that CEC exemptions under R2 and R3 are not necessary based on the CEC exemption under CIP-004-6 R4.1, which allows an Entity to forego "authorizing access based on need" during a CEC. For example - if emergency responders are responding to a fire in a PSP, there would be no intention to "authorize" those personnel for unescorted access (which would require background checks and training) because they would be considered visitors, and the exemption under CIP-004-6 R4.1 should be sufficient. CIP-006-6 R2 also allows a CEC exemption to allow an Entity to forego escorting and logging visitors into a PSP during a CEC.

Southern supports the inclusion of a CEC exemption under R1.8, but also provides the following for consideration under CIP-006: Under CIP-006-6 R1.4 and R1.6 – ‘Monitor for unauthorized access’ is a requirement where your ability to monitor constantly, 24x7, may be impacted by the onset of a CEC. For example – if a tornado or flood renders your ability to perform 24x7 monitoring unavailable until you can dispatch personnel or implement alternative means of monitoring – are you in violation of not performing 24x7 monitoring during the period you are convening and dispatching personnel to perform human observation and monitoring? What if, due to flooding, the PSP access points (or PACS assets) are inaccessible and monitoring communications circuits are down – removing your ability to dispatch personnel? Shouldn’t R1.4 and R1.6 provide the ability to respond to and address monitoring when it has been impacted by a CEC? Similarly, if you are unable to monitor due to the onset of a CEC, you are likely also unable to issue an alarm or alert during that CEC. Consider, under CIP-006-6 R1.5 and 1.7 – ‘Issue an alert in response to detected unauthorized access,’ should be included as requirements that need a CEC exemption; otherwsie, are you in violation if a tornado or flood has taken out your standard implementation of alarm issuance during the period you are implementing back-up measures?

This makes the requirement consistent with that for visitors in Part 2.2. However, I believe some measure of control is needed to ensure that, even during CIP Exceptional Circumstances, carte blanche access is not provided to all. This provides a potential secondary attack vector to those who	

otherwise might not have access. While perhaps full-fledged logging may not be required, some access list verification (including "approved visitors" needed for addressing the emergency is required.

Exelon supports the addition of "except during CIP Exceptional Circumstance" to the Requirement part. Authorized unescorted physical access is logged automatically, or manually in the event that the automated system is unavailable. If a facility is damaged or destroyed, it may not be possible to control access via the automated system. Having resources to manually log individuals with authorized unescorted physical access to PSPs during a declared CEC may compromise the safety of the personnel logging access. Additionally, the amount of time to manually log entry could hinder recovery efforts resulting in increased risk to the BES. CIP Exceptional Circumstances are declared in emergency situations to protect life, safety and the reliability of the BES. Entities are given the flexibility to design programs that articulate how to declare and respond to a CEC. That flexibility should extend to the entity's ability to appoint or allow individuals with appropriate skills to assist with recovery to gain physical access as necessary to mitigate reliability risks.

3. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language. **CIP-006 R1, Part 1.9: Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days, except during CIP Exceptional Circumstances.**

Stephanie Little - APS - Arizona Public Service Co. - 1,3,5,6	
Answer	No
Document Name	
Comment	
Because logging may not be occurring during a CIP Exceptional Cirumstance, there may be no logs to actually retain pursuant to this requirement. Further, if logging is ocurring, there is no need for a CIP Exceptional Circumstance to be applied to the log retention requirements. Thus, AZPS recommends that, relative to retention requirements, the phrase 'except during a CIP Exceptional Circumstance' be modified to state 'except if such logs are adversely impacted or destroyed as a result of a CIP Exceptional Circumstance'.

Chris Scanlon - Exelon - 1,3,5,6

Answer	Yes
Document Name	

Comment

Exelon supports the addition of “except during CIP Exceptional Circumstance” to the Requirement part. As discussed in the response to question 2, it was noted that logging of authorized unescorted physical access could increase risks to personal safety and the reliability of the BES. During CECs where logging is not possible or practical, logs would not exist to retain for 90 days. Further, It is understood that for CECs where logging of authorized unescorted physical access took place, the entity would adhere to the 90 day retention requirement to the best of its ability. There may be situations where databases or manual records have gaps despite the fact that authorized unescorted physical access was granted as a result of the circumstances pertaining to the declared CEC. Additionally, where automation is used to record and retain the historical records of physical access logs, depending on the circumstances of the declared CEC, it is possible those records could have been partially or completely lost due to events of the declared CEC.

Exelon recommends that the SDT add language to the Guidelines and Technical Basis that provide brief discussion about examples of scenarios where the ability to retain physical access logs for 90 days may not be possible as a result of a declared CEC.

As noted in the rationale, this aligns to CIP-007-6 R4, Part 4.3. During certain events, logging may not be possible if the facility is damaged or destroyed. If the events are not logged due to a failure of CIP-006 R1, Part 1.8, the logs cannot be retained for ninety calendar days. Also, the current phrasing of the exception could suggest that the retention obligation does not apply during a CEC; however, ERCOT assumes the intent of the exception is that there should be no obligation to retain information that wasn't logged in the first place due to a CEC, consistent with the exception in part 1.8. In keeping with this purpose, ERCOT suggests modifying the sentence as follows: "…for at least ninety calendar days, except for any entry that was not logged due to a CIP Exceptional Circumstance."

AECI agrees with adding the existing CIP Exceptional Circumstance language to CIP-006 R2, Part 2.3. During certain events, logging may not be possible if the facility is damaged or destroyed.

Comment	
As noted in the rationale, this aligns to CIP-007-6 R4, Part 4.3. During certain events, logging may not be possible if the facility is damaged or destroyed. If the events are not logged due to a failure of CIP-006 R2, Part 2.2, the logs cannot be retained for ninety calendar days. Also, ERCOT notes that the current exception language could be read to apply to the duration of retention, and not to the underlying obligation to retain visitor logs that weren't created in the first place due to a CEC. ERCOT therefore suggests that the SDT consider the following clarification: "…for at least ninety calendar days, except for any visitor entry that was not logged due to a CIP Exceptional Circumstance."

Chris Scanlon - Exelon - 1,3,5,6	
Answer	Yes
Document Name	
Comment	

Exelon supports the addition of “except during CIP Exceptional Circumstance” to the Requirement part. Vistors are manually logged by site personnel. Manually logging individuals who are visitors during CECs may compromise the safety of the personnel logging access. Additionally, the amount of time to manually log entry could hinder recovery efforts resulting in increased risk to the BES.

CIP Exceptional Circumstances are declared in emergency situations to protect life, safety and the reliability of the BES. Entities are given the flexibility to design programs that articulate how to declare and respond to a CEC. That flexibility should extend to the entity’s ability to appoint or allow individuals with appropriate skills to assist with recovery to gain access as necessary to mitigate risk.

Just as with the physical access log retention, there may be situations where databases or manual records have gaps despite the fact that physical access for visitors was granted. Additionally, where automation is used to record and retain the historical records of physical access logs for visitors, depending on the circumstances of the declared CEC, it is possible those records could have been partially or completely lost as a result of the events pertaining to the declared CEC event.

Exelon recommends that the SDT add language to the Guidelines and Technical Basis that provide brief discussion about examples of scenarios where the ability to retain physical access logs for visitors for 90 days may not be possible as a result of a declared CEC.

CIP Exceptional Circumstances exists for CIP-006 R2, Part 2.2 regarding logging visitors. It logically follows that it won’t be possible to retain visitor logs if they weren’t created due to CIP

Depending on the nature of the incident, the RE should make every reasonable effort to maintain logs of physical attendance; however, this process should not hinder recovery/response efforts.

5. Do you agree with adding the existing CIP Exceptional Circumstance language to the Requirement/Part listed below? Please provide a detailed explanation/rationale for inclusion or exclusion of the CEC language.

CIP-007 R4, Part 4.1: Log events, except during CIP Exceptional Circumstances, at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events:

Jamie Monette - Allete - Minnesota Power, Inc. - 1	
Answer	No
Document Name	
Comment	
By stating “per BES Cyber Asset/System capability” this additional language does not seem necessary. In the event of an exceptional circumstance that causes damage to a device, it would seem reasonable to assume that capability is not present during that time period.

Mike Kraft - Basin Electric Power Cooperative - 1,3,5,6	
Answer	No
Document Name	
Comment	
Basin Electric would prefer the removal of CIP Exceptional Circumstance Language on a per requirement/part level and instead focus on CIP-003 enhancements and related Implementation Guidance. The overhead of including the exception in multiple standards/requirements/parts seems to outweigh the benefit of a low frequency circumstance.

AZPS respectfully submits that the complex software and tool sets utilized to log events for malicious code may also be utilized to generate alerting for such events. Therefore, if such software and tool sets are impacted during a CIP Exceptional Circumstance and are unable to log, they may also be unable to generate alerts. Accordingly, we recommend the addition of the existing CIP Exceptional Circumstance language to Part 4.2.

Chris Scanlon - Exelon - 1,3,5,6	
Answer	Yes
Document Name	
Comment	
Exelon supports the addition of “except during CIP Exceptional Circumstance” to the Requirement part. Event logging at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) may not be possible during certain CECs if a facility is damaged or destroyed. For some operational technology devices where a replacement device is a new device type, it may be necessary to develop custom log parsing settings in order to obtain and import the logs to an automated log management solution as a result of the declared CEC.

If the device is destroyed due to hardware failure, fire, water damage, or other, and the only logging capability is local to the device, the entity should be able to follow their CIP Exceptional Circumstances process. This might be the case for devices that are serial only and do not have the capability/connections to send logs to a SIEM tool.
