                4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

                4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

            4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

            4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

        4.1.3. **Generator Operator**

        4.1.4. **Generator Owner**

        4.1.5. **Reliability Coordinator**

        4.1.6. **Transmission Operator**

        4.1.7. **Transmission Owner**

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-3:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002 or any subsequent version of that Reliability Standard.

5. Effective Date: See "Project 2016-02 Modifications to CIP Standards Implementation Plan".

B. Requirements and Measures

R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI). The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of applicable systems listed in Requirement R1 to identify and assess cyber security risk(s) to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring applicable systems listed in Requirement R1 that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor; and

1.2.6. Coordination of controls for vendor-initiated remote access.

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited

to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity's supply chain cyber risk management plan(s) did not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1. OR The Responsible Entitiy's supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement applicable systems as specified in Part 1.1, and the supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in Requirement R1.
R2.	The Responsible Entity did not implement one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity did not implement the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1, and did not implement the use of process(es) for

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				procuring applicable systems as specified in Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in Requirement R2.
R3.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 16th calendar month since the previous review.	The Responsible Entity exceeded the 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 17th calendar month since the previous review.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 18th calendar month since the previous review.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review.

D. Regional Variances

None.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed of modified terms titled "Project 2016-02 Draft ~~3~~4 Definitions"

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-3**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems (BCS).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

- **4.2.1.** **Distribution Provider:** One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:
  - **4.2.1.1.** Each UFLS or UVLS System that:
    - **4.2.1.1.1.** Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and
    - **4.2.1.1.2.** Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.
  - **4.2.1.2.** Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.
  - **4.2.1.3.** Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.
  - **4.2.1.4.** Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.
- **4.2.2.** **Responsible Entities listed in 4.1 other than Distribution Providers:** All BES Facilities.
- **4.2.3.** **Exemptions:** The following are exempt from Standard CIP-013-3:
  - **4.2.3.1.** Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.
  - **4.2.3.2.** Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).
  - **4.2.3.3.** Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002 or any subsequent version of that Reliability Standard.

5. **Effective Date:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan".

B. Requirements and Measures

R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI). The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of applicable systems listed in Requirement R1 to identify and assess cyber security risk(s) to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring applicable systems listed in Requirement R1 that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor; and

1.2.6. Coordination of controls for vendor-initiated remote access.

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited

to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity's supply chain cyber risk management plan(s) did not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1. OR The Responsible Entitiy's supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity's supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement applicable systems as specified in Part 1.1, and the supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring applicable systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in Requirement R1.
R2.	The Responsible Entity did not implement one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity did not implement the use of process(es) for procuring applicable systems as specified in Part 1.2.	The Responsible Entity did not implement the use of process(es) in planning for procurement of applicable systems as specified in Part 1.1, and did not implement the use of process(es) for

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				procuring applicable systems as specified in Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in Requirement R2.
R3.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 16th calendar month since the previous review.	The Responsible Entity exceeded the 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 17th calendar month since the previous review.	The Responsible Entity exceeded 15 calendar months by reviewing and obtaining CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) in the 18th calendar month since the previous review.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review.

Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed of modified terms titled “Project 2016-02 Draft 4 Definitions”

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-3~~2~~**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems (BCS).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. Balancing Authority

    4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.3. Generator Operator

    4.1.4. Generator Owner

    4.1.5. Reliability Coordinator

    4.1.6. Transmission Operator

    4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-3~~2~~:

4.2.3.1. Cyber ~~Assets~~ Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~ Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3.~~4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5.~~4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002 or any subsequent version of that Reliability Standard.

5. Effective Date: See "Project 2016-02 Modifications to CIP Standards Implementation Plan" ~~for Project 2019-03~~.

B. Requirements and Measures

R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact ~~BES Cyber Systems~~BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), ~~and~~ Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI). The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of applicable ~~BES Cyber S~~systems ~~and their associated EACMS and PACS~~listed in Requirement R1 to identify and assess cyber security risk(s) to the ~~Bulk Electric System~~BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring ~~BES Cyber~~applicable ~~S~~systems~~, and their associated EACMS and PACS,~~listed in Requirement R1 that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor~~for use in the BES Cyber System and their associated EACMS and PACS~~; and

1.2.6. Coordination of controls for vendor-initiated remote access.

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the

scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity's ~~developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber Systems and their associated EACMS and PACS, as specified in Part 1.2, but the~~ supply chain cyber risk management plan(s) ~~do~~did not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's ~~developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber Systems and their associated EACMS and PACS, as specified in Part 1.2, but the~~ supply chain cyber security risk management plan(s) ~~do~~did not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity's ~~developed one or more documented supply chain cyber security risk management plan(s), but the~~supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement of ~~BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES~~ applicable systems as specified in Part 1.1.~~,~~ OR The Responsible Entitiy's supply chain cyber security risk management ~~or the~~ plan(s) did not include the use of process(es) for procuring ~~BES Cyber Systems and their associated EACMS and~~	The Responsible Entity's ~~developed one or more documented supply chain cyber security risk management plan(s), but the~~ supply chain cyber security risk management plan(s) did not include the use of process(es) in planning for procurement ~~of BES Cyber Systems, and their associated EACMS and PACS, to identify and assess cyber security risk(s) to the BES~~ applicable systems as specified in Part 1.1, and the supply chain cyber security risk management plan(s) did not include the use of process(es) for procuring ~~BES Cyber Systems and their associated EACMS and PACS,~~ applicable systems as specified in Part 1.2. Implementation Plan

Project 2016-02 Modifications to CIP Standards
Virtualization | Draft 4

Applicable Standard(s)

- Reliability Standard CIP-002-7 – Cyber Security – BES Cyber System Categorization
- Reliability Standard CIP-003-Y – Cyber Security – Security Management Controls
- Reliability Standard CIP-004-8 – Cyber Security – Personnel & Training
- Reliability Standard CIP-005-8 – Cyber Security – BES Cyber System Logical Isolation
- Reliability Standard CIP-006-7 – Cyber Security – Physical Security of BES Cyber Systems
- Reliability Standard CIP-007-7 – Cyber Security – System Security Management
- Reliability Standard CIP-008-7 – Cyber Security – Incident Reporting and Response Planning
- Reliability Standard CIP-009-7 – Cyber Security – Recovery Plans for BES Cyber Systems
- Reliability Standard CIP-010-5 – Cyber Security – Change Management and Vulnerability Assessments
- Reliability Standard CIP-011-4 – Cyber Security – Information Protection
- Reliability Standard CIP-013-3 – Cyber Security – Supply Chain Risk Management
- Proposed new or modified terms listed in the "CIP Definitions Posting Document (Project 2016-02)"

  These standards and Definitions of Terms used in the versions listed above of the CIP Cyber Security Standards are posted for ballot by NERC concurrently with this Implementation Plan.

  These standards and new and modified terms used in the standards above will be referenced as the "Revised CIP Standards and Definitions" within the Implementation Plan.

Requested Retirement(s)

- Reliability Standard CIP-002-6 – Cyber Security – BES Cyber System Categorization
- Reliability Standard CIP-003-8 – Cyber Security – Security Management Controls
- Reliability Standard CIP-004-7 – Cyber Security – Personnel & Training
- Reliability Standard CIP-005-7 – Cyber Security – Electronic Security Perimeter(s)
- Reliability Standard CIP-006-6 – Cyber Security – Physical Security of BES Cyber Systems

- Reliability Standard CIP-007-6 – Cyber Security – System Security Management
- Reliability Standard CIP-008-6 – Cyber Security – Incident Reporting and Response Planning
- Reliability Standard CIP-009-6 – Cyber Security – Recovery Plans for BES Cyber Systems
- Reliability Standard CIP-010-4 – Cyber Security – Configuration Change Management and Vulnerability Assessments
- Reliability Standard CIP-011-3 – Cyber Security – Information Protection
- Reliability Standard CIP-013-2 – Cyber Security – Supply Chain Risk Management

These standards and definitions used in the versions listed above will be referenced as the "Requested CIP Retired Standards and Definitions" within the Implementation Plan.

Prerequisite Standard(s) or Definitions

These standard(s) or definitions must be approved or retired before the Applicable Standard become effective:

- BES Cyber Asset (BCA)
- BES Cyber System (BCS)
- BES Cyber System Information (BCSI)
- CIP Senior Manager
- Cyber Assets
- Cyber Security Incident
- Cyber System
- Electronic Access Control or Monitoring Systems (EACMS)
- Electronic Access Point (EAP)
- External Routable Connectivity (ERC)
- Electronic Security Perimeter (ESP)
- Interactive Remote Access (IRA)
- Intermediate System
- Management Interface
- Physical Access Control Systems (PACS)
- Physical Security Perimeter (PSP)
- Protected Cyber Asset (PCA)
- Removable Media

- Reportable Cyber Security Incident
- Shared Cyber Infrastructure (SCI)
- Transient Cyber Asset (TCA)
- Virtual Cyber Asset (VCA)

Applicable Entities

- Balancing Authority
- Distribution Provider[1]
- Generator Operator
- Generator Owner
- Reliability Coordinator
- Transmission Operator
- Transmission Owner

General Considerations

The intent of the Initial Performance of Periodic Requirements section is for Responsible Entities to remain on the same time interval of the prior versions of the standards for their performance of the requirements under the new versions. The intent of the Compliance Dates for Early Adoption of Revised CIP Standards and Definitions section is to permit Responsible Entities the option to comply with the Revised CIP Standards and Definitions prior to the Effective Date. While the Revised CIP Standards and Definitions are designed to be backwards compatible with perimeter-based security, some Responsible Entities may elect to comply early to leverage different security options associated with zero trust architecture.

Effective Date and Phased-in Compliance Dates

The Effective Dates for the Revised CIP Standards and Definitions are provided below. As noted in the General Considerations section above, the standard drafting team determined to clarify initial performance of periodic requirements and permit Responsible Entities to comply with the Revised CIP Standards and Definitions prior to the effective date. These provisions also are provided below.

Revised CIP Standards and Definitions

Where approval by an applicable governmental authority is required, the Revised CIP Standards and Definitions shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the

---

[1] See Applicability section of Revised CIP Standards and Definitions for additional information on Distribution Providers subject to the standards.

Revised CIP Standards and Definitions, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Revised CIP Standards and Definitions shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the Revised CIP Standards and Definitions are adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

Responsible Entities shall initially comply with the periodic requirements in the Revised CIP Standards and Definitions within the periodic timeframes of their last performance under the Requested CIP Retired Standards and Definitions.

Compliance Dates for Early Adoption of Revised CIP Standards and Definitions

A Responsible Entity may elect to comply with the Revised CIP Standards and Definitions following their approval by the applicable governmental authority, but prior to the Effective Date. In such a case, the Responsible Entity shall select one of the following Early Adoption Dates and shall notify the applicable Regional Entities of their selected Early Adoption Date within fifteen (15) calendar days after their selected Early Adoption Date:

Early Adoption Date
Option 1: First day of the first calendar quarter that is six (6) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions
Option 2: First day of the first calendar quarter that is twelve (12) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions
Option 3: First day of the first calendar quarter that is eighteen (18) months after the effective date of the applicable governmental authority's order approving the Revised CIP Standards and Definitions

Responsible Entities must comply with applicable Requested CIP Retired Standards and Definitions until their selected Early Adoption Date. All Responsible Entities, regardless of whether or not they selected an Early Adoption Date, must comply with the Revised CIP Standards and Definitions by the Effective Date.

Planned or Unplanned Changes

Planned Changes

Planned changes refer to any changes of the electric system or BES Cyber System which were planned and implemented by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2.

For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-7, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change, and must, therefore, be in compliance with the CIP Cyber Security Standards upon the commissioning of the modernized transmission substation.

For planned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the CIP Cyber Security Standards on the update of the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan.

Unplanned Changes

Unplanned changes refer to any changes of the electric system or BES Cyber System which were not planned by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2.

For example, consider the scenario where a particular BES Cyber System at a transmission substation does not meet the criteria in CIP-002-7, Attachment 1, then, later, an action is performed outside of that particular transmission substation; such as, a transmission line is constructed or retired, a generation plant is modified, changing its rated output, and that unchanged BES Cyber System may become a medium impact BES Cyber System based on the CIP-002-7, Attachment 1, criteria.

For unplanned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the CIP Cyber Security Standards, according to the following timelines, following the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan.

Scenario of Unplanned Changes After the Effective Date	Compliance Implementation
New high impact BES Cyber System	12 months
New medium impact BES Cyber System	12 months

Scenario of Unplanned Changes After the Effective Date	Compliance Implementation
Newly categorized high impact BES Cyber System from medium impact BES Cyber System	12 months for requirement not applicable to Medium impact BES Cyber Systems
Newly categorized medium impact BES Cyber System	12 months
Responsible Entity identifies its first high impact or medium impact BES Cyber System (i.e., the Responsible Entity previously had no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes)	24 months

Retirement Date

Requested CIP Retired Standards and Definitions

The Requested CIP Retired Standards and Definitions shall be retired immediately prior to the effective date of the Revised CIP Standards and Definitions in the particular jurisdiction in which the Revised CIP Standards and Definitions are becoming effective.

CIP Definitions

Project 2016-02 Modifications to CIP Standards

Virtualization – Draft 4

The standard drafting team (SDT) is seeking comment on the following new, modified, or retired terms used in the proposed standards. The first column (*NERC Glossary Term*) provides the NERC Glossary term being modified or proposed as a new. The SDT is proposing acronyms to some currently approved and new glossary terms as shown in redline. The second column (*Currently Approved Definition*) provides the currently approved definition and the third column (*CIP SDT Proposed New or Revised)* reflects the proposed modifications to the current definitions in redline and also reflects newly proposed definitions in clean view.

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised REDLINE TO Currently Approved**
BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.	A Cyber Asset or Virtual Cyber Asset that, if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the ~~r~~Reliable ~~o~~Operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
BES Cyber System (BCS) **Update is Acronym only.**	One or more BES Cyber Assets logically grouped by a responsible entity to perform one or more reliability tasks for a functional entity.	
BES Cyber System Information	Information about the BES Cyber System that could be used to gain	Information about the BES Cyber System or Shared Cyber

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions

NERC Glossary Term	Currently Approved Definition	CIP SDT Proposed New or Revised REDLINE TO Currently Approved
(BCSI)	unauthorized access or pose a security threat to the BES Cyber System. BES Cyber System Information does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BES Cyber Systems, such as, but not limited to, device names, individual IP addresses without context, ESP names, or policy statements. Examples of BES Cyber System Information may include, but are not limited to, security procedures or security information about BES Cyber Systems, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BES Cyber System	Infrastructure that could be used to gain unauthorized access or pose a security threat to the BES Cyber System. BES Cyber System Information does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BES Cyber Systems, such as, but not limited to, device names, individual IP addresses without context, ESP names, or policy statements. Examples of BES Cyber System Information may include, but are not limited to, security procedures or security information about BES Cyber Systems, Shared Cyber Infrastructure, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BES Cyber System.
CIP Senior Manager	A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC CIP Standards, CIP-002 through CIP-011.	A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC ~~CIP Standards, CIP-002 through CIP-011~~Critical Infrastructure Protection Standards.
Cyber Assets	Programmable electronic devices, including the hardware, software, and	Programmable electronic devices, excluding Shared Cyber

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised REDLINE TO Currently Approved**
	data in those devices.	Infrastructure, including the hardware, software, and data in those devices. Application containers are considered software of Virtual Cyber Assets (VCAs) or Cyber Assets. VCAs are not considered software or data of Cyber Assets.
Cyber Security Incident	A malicious act or suspicious event that: - For a high or medium impact BES Cyber System, compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, or (3) an Electronic Access Control or Monitoring System; or - Disrupts or attempts to disrupt the operation of a BES Cyber System	A malicious act or suspicious event that: • For a high or medium impact BES Cyber System, compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, ~~or~~ (3) an Electronic Access Control or Monitoring System; or (4) Shared Cyber Infrastructure; or • Disrupts or attempts to disrupt the operation of a BES Cyber System.
Cyber System ***New Definition***		A group of one or more Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure.
Electronic Access Control or Monitoring Systems (EACMS)	Cyber Assets that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems. This includes Intermediate Systems.	Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure (SCI) that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems or SCI. This includes Intermediate Systems.
Electronic Access Point (EAP)	A Cyber Asset interface on an Electronic Security Perimeter that allows routable communication	An electronic policy enforcement point or a Cyber Asset interface on an EACMS ~~on an Electronic Security~~

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions

NERC Glossary Term	Currently Approved Definition	CIP SDT Proposed New or Revised REDLINE TO Currently Approved
	between Cyber Assets outside an Electronic Security Perimeter and Cyber Assets inside an Electronic Security Perimeter.	~~Perimeter~~ that ~~allows~~controls routable communication to and from one or more BES Cyber Systems and their associated Protected Cyber Assets (PCAs) ~~between Cyber Assets outside an Electronic Security Perimeter and Cyber Assets inside an Electronic Security Perimeter~~.
External Routable Connectivity (ERC)	The ability to access a BES Cyber System from a Cyber Asset that is outside of its associated Electronic Security Perimeter via a bi-directional routable protocol connection.	The ability to access a BES Cyber System ~~from a Cyber Asset that is outside of its associated~~through its ~~Electronic Security Perimeter~~ Electronic Security Perimeter via a bi-directional routable protocol connection.
Electronic Security Perimeter (ESP)	The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol.	The logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol; or a logical boundary defined by one or more EAPs.
Interactive Remote Access (IRA)	User-initiated access by a person employing a remote access client or other remote access technology using a routable protocol. Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications.	User-initiated electronic access by a person ~~employing a remote access client or other remote access technology~~ using a routable protocol:~~.~~ • To a Cyber System protected by an ~~Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's~~ Electronic Security Perimeter(s) (ESP); • That is converted by the Responsible Entity to a non-routable protocol to a Cyber System; or

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised REDLINE TO Currently Approved**
		• To a Management Interface of Shared Cyber Infrastructure. Interactive Remote Access does not include: • Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs; • Communication that originates from an Intermediate System; or • System-to-system process communication. ~~at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications.~~
Intermediate System~~s~~	A Cyber Asset or collection of Cyber Assets performing access control to restrict Interactive Remote Access to only authorized users. The Intermediate System must not be located inside the Electronic Security Perimeter.	One or more Electronic Access Control or Monitoring Systems that are used to restrict Interactive Remote Access to only authorized users. ~~A Cyber Asset or collection of Cyber Assets performing access control to restrict Interactive Remote Access to only authorized users. The Intermediate System must not be~~

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions		
NERC Glossary Term	**Currently Approved Definition**	**CIP SDT Proposed New or Revised REDLINE TO Currently Approved**
		~~located inside the Electronic Security Perimeter.~~
Management Interface ***New Definition***		An administrative interface that: - Controls the processes of initializing, deploying, and configuring Shared Cyber Infrastructure; or - Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or - Configures an Electronic Security Perimeter.
Physical Access Control Systems (PACS)	Cyber Assets that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers	Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure (SCI) that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers.
Physical Security Perimeter (PSP)	The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.	The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, Shared Cyber Infrastructure, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber	One or more Cyber Assets or Virtual Cyber Assets that: - ~~connected using a routable protocol~~Are ~~within~~ protected by ~~or on~~ an Electronic Security Perimeter (ESP) but are ~~that is~~ not part of the

~~Table 1:~~ Retired, Modified, or Newly Proposed Definitions

NERC Glossary Term	Currently Approved Definition	CIP SDT Proposed New or Revised REDLINE TO Currently Approved
	Assets is equal to the highest rated BES Cyber System in the same ESP.	highest impact BES Cyber System ~~within~~ protected by the same ~~Electronic Security Perimeter~~ESP; or • ~~.~~Share CPU or memory resources with any part of the ~~The impact rating of Protected Cyber Assets is equal to the highest rated~~ BES Cyber System, excluding Virtual Cyber Assets that are being actively remediated ~~in the same ESP~~in an environment that isolates routable connectivity from BES Cyber Systems;~~.~~ Excluding Transient Cyber Assets.
Removable Media	Storage media that (i) are not Cyber Assets, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, a network within an ESP, or a Protected Cyber Asset. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.	Storage media that (i) are not Cyber Assets or Shared Cyber Infrastructure, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, Shared Cyber Infrastructure, a network ~~within~~ protected by an ESP, or a Protected Cyber Asset. ~~Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.~~

		medium impact BES Cyber Systems. Virtual machines hosted on a physical TCA are treated as software on that physical TCA. Examples of Transient Cyber Assets include, but are not limited to, Cyber Assets or Virtual Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Virtual Cyber Asset (VCA) ***New Definition***		A logical instance of an operating system or firmware, currently executing on a virtual machine hosted on a BES Cyber Asset; Electronic Access Control or Monitoring System; Physical Access Control System; Protected Cyber Asset; or Shared Cyber Infrastructure.~~;~~ VCAs do not include: • Logical instances that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems; • Dormant file based images that contain operating systems or firmware; and • SCI or Cyber Assets (CA) that host VCAs. Application containers are considered software of VCAs or CAs.

Unofficial Comment Form

Project 2016-02 Modifications to CIP Standards
Virtualization – Draft 4

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on the **CIP Virtualization suite of Standards** by **8 p.m. Eastern, Friday, September 30, 2022.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Jordan Mallory (via email) or at 404-446-2589.

Background Information

Project 2016-02 (1) addresses the Federal Energy Regulatory Commission (Commission) directives contained in Order No. 822 and (2) considers the Version 5 Transition Advisory Group (V5TAG) issues identified in the CIP V5 Issues for Standard Drafting Team Consideration (V5TAG Transfer Document).

The V5TAG, which consisted of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP Version 5 standards and to support industry's implementation activities. During the V5TAG's activities, it identified certain issues with the CIP Reliability Standards that would be better addressed by a standard drafting team (SDT) for the CIP Reliability Standards. The V5TAG developed the CIP Version 5 Transition Advisory Group Issues for Consideration document to formally recommend that the SDT address these issues and consider modifications to the standard language during the standards development process.

Summary of Changes Overview

The SDT reviewed all comments and made modifications to the Reliability Standards and Definitions accordingly. There are currently two drafting teams working on modifications to CIP-003-8. The NERC Project 2016-02 SDT is posting its modifications as CIP-003-Y to differentiate its work from the Supply Chain Low drafting teams (Project 2020-03) modifications, which has posted CIP-003-X.

In addition, the proposed new and revised definitions are not balloted separately but are being balloted via the standards. As such, when voting on the standards, ballot body participants will also be voting on the proposed new and revised definitions used in those standards. The definitions are posted in one document among the other ballot materials. While CIP-002, CIP-003, CIP-004, CIP-006, CIP-008, CIP-009, CIP-011, and CIP-013 passed ballot during the draft 3 posting, the SDT will be balloting all standards again based on updated definitions.

Below are questions for which the SDT is seeking industry input. In order to allow the SDT to sort comments received by topic, the SDT respectfully requests comments be submitted with the respective question topic. The SDT thanks all stakeholders for your time and responses during this comment period.

Questions

1. The SDT has modified the IRA definition to simplify it, primarily in regards to the routable protocol to serial conversion scenario. Do you agree with the proposed change? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

2. The SDT modified other definitions used in the CIP standards based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

3. The SDT revised CIP-005 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

4. The SDT revised CIP-007 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

5. The SDT has used phrasing such as “SCI supporting an Applicable System from this Part” in the Applicable Systems column across many of the standards. Is it clear that this scopes the requirements for SCI to match the system(s) it hosts?

   ☐ Yes
   ☐ No

   Comments:

6. The SDT made numerous clarifying changes to CIP-010 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

7. The SDT revised CIP-003, CIP-004, CIP-006, CIP-008, CIP-009, CIP-011, and CIP-013 mostly with conforming changes or scoping clarifications related to SCI. Do you agree with the proposed changes to these Reliability Standards? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

8. The SDT has revised the Implementation Plan to include 3 defined early adoption dates as options should Responsible Entities choose to do so. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

   ☐ Yes
   ☐ No

   Comments:

9. Please provide any additional comments for the standard drafting team to consider, if desired.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Technical Rationale

Project 2016-02 Modifications to CIP Standards

New and Modified Terms, and Exemption Language Used in NERC Reliability Standards

Proposed Modified Terms:

BES Cyber Asset (BCA)

A Cyber Asset or Virtual Cyber Asset, that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.

Rationale

The BCA definition is changing to allow for BCA to be either Cyber Assets (hardware included) or Virtual Cyber Assets (VCA) (software only virtual machines without the underlying hardware). See the VCA and Shared Cyber Infrastructure (SCI) definition below.

BES Cyber System Information (BCSI)

Information about the BES Cyber System or Shared Cyber Infrastructure that could be used to gain unauthorized access or pose a security threat to the BES Cyber System. BES Cyber System Information does not include individual pieces of information that by themselves do not pose a threat or could not be used to allow unauthorized access to BES Cyber Systems, such as, but not limited to, device names, individual IP addresses without context, ESP names, or policy statements. Examples of BES Cyber System Information may include, but are not limited to, security procedures or security information about BES Cyber Systems, Shared Cyber Infrastructure, Physical Access Control Systems, and Electronic Access Control or Monitoring Systems that is not publicly available and could be used to allow unauthorized access or unauthorized distribution; collections of network addresses; and network topology of the BES Cyber System.

Rationale

Conforming changes such that BCSI includes information about SCI.

CIP Senior Manager

A single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC Critical Infrastructure Protection Standards.

Rationale

Remove explicit reference to the CIP standards as only "CIP-002 through CIP-011" as the body of CIP standards has grown beyond CIP-011. As an example, the CIP Senior Manager also has requirements within CIP-013.

Cyber Assets

Programmable electronic devices, excluding Shared Cyber Infrastructure, including the hardware, software, and data in those devices;. Application containers are considered software of VCAs or Cyber Assets. VCAs are not considered software or data of Cyber Assets.

Rationale

Modified to explicitly exclude SCI from the definition of Cyber Asset such that SCI is a different hardware class on which the other VCAs of differing impact levels execute. SCI is defined separately such that it can be the object of additional requirements based on its unique risks. The definition is also modified to clarify that 'Application containers' (i.e., portable, packaged applications) are considered software of a Cyber Asset (or VCA), though they may have some characteristics of a VCA. Executing instances of VCAs are not to be considered simply software or data of the Cyber Asset.

Cyber Security Incident

A malicious act or suspicious event that:

- For a high or medium impact BES Cyber System, compromises or attempts to compromise (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, (3) an Electronic Access Control or Monitoring System, or (4) Shared Cyber Infrastructure; or
- Disrupts or attempts to disrupt the operation of a BES Cyber System.

Rationale

Modified to add SCI to the scope of compromised or attempted compromise systems.

Electronic Access Control or Monitoring Systems (EACMS)

Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems or Shared Cyber Infrastructure. This includes Intermediate Systems.

Rationale

Modified to add VCA and SCI as two other forms that an EACMS can take and add SCI as an object of the access control or monitoring.

Electronic Access Point (EAP)

An electronic policy enforcement point or a Cyber Asset interface on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.

Rationale

As network security moves deeper into the infrastructure, it's no longer necessary to prescribe that network security be performed only at a 'Cyber Asset interface on an ESP'; at one point on a network edge. Zero Trust, for example, highly distributes the network security model and is not perimeter-based, and this is incorporated through the addition of "electronic policy enforcement point or". With the added flexibility in CIP-005 to adopt these models in addition to the traditional Electronic Security Perimeter (ESP) model, the term EAP is being modified to allow for electronic policy enforcement points and no longer prescribes an architecture. The "one or more" and the "associated PCAs" have been added to clarify that EAPs can control communications to a group and not required per individual system.

External Routable Connectivity (ERC)

The ability to access a BES Cyber System through its ESP via a bi-directional routable protocol connection.

Rationale

The ERC definition is changing to allow for zero trust or other network models that are not strictly perimeter or network-border based, thus not having concepts of "inside" or "outside". These concepts are replaced with the language "through its ESP" so that it does not imply a prescriptive network security model. The ERC term is used throughout the CIP Standards within the Applicable Systems column as a scoping mechanism based on the inherent risk associated with External Routable Connectivity as well as to limit the scope of requirements that would require ERC to function. The SDT is maintaining this use of ERC, but also clarifying the relationship between ERC and Interactive Remote Access (IRA) in that a non-routable, serial only BCS (thus with no ESP) may have IRA through a subsequent IP/serial conversion (see changes to IRA definition).

Electronic Security Perimeter (ESP)

A logical border surrounding a network to which BES Cyber Systems are connected using a routable protocol; or a logical boundary defined by one or more EAPs.

Rationale

The traditional network border ESP remains a valid network security model, however it is no longer the only prescribed model as CIP-005 allows other access control models that are not based on network perimeters such as Zero Trust architectures. The proposed ESP definition retains its current definition but appends "or a logical boundary defined by one or more EAPs" to incorporate models that move away from implicit trust within network perimeters and using network location as a primary factor in access control decisions. In these models, the perimeter shrinks to increasingly more granular levels, potentially down to a process or resource level on a BCS. The proposed definition allows for an ESP to be (a) a border surrounding an isolated network that has no external connectivity and thus no EAPs, (b) static point(s) on a network boundary such as a traditional firewall as an EAP that is enforcing access policies or configurations (e.g., firewall rulesets), (c) many dynamic, short-lived, session-level 'perimeters' established at time of access that are network independent (e.g., users to resources, for example), or (d) hybrid implementations combining elements of both.

The SDT has kept the 'logical border' concept for the "surrounding a network" ESP and used the language "logical boundary" for zero trust models. A 'border' does indeed surround an object, in this case a network, but a 'boundary' may not surround or enclose, it's a line that can be crossed, such as a policy enforcement point controlling access to a resource. The SDT has also updated language in the standards to remove concepts such as 'inside' an ESP and replaced that with more inclusive phrases such as 'protected by' an ESP.

Interactive Remote Access (IRA)

User-initiated electronic access by a person using a routable protocol:

- To a Cyber System protected by an Electronic Security Perimeter (ESP);
- That is converted by the Responsible Entity to a non-routable protocol to a Cyber System; or
- To a Management Interface of Shared Cyber Infrastructure.

Interactive Remote Access does not include:

- Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs;
- Communication that originates from an Intermediate System; or
- System-to-system process communication.

Rationale

The proposed IRA definition changes in two fundamental ways: (1) to incorporate IRA situations where users outside of any of the Responsible Entity's ESPs have interactive access, using a routable protocol, to a non-routable (e.g., serial) Cyber System through a subsequent IP to serial conversion, and (2) to include the Management Interfaces of SCI as targets of IRA. The references to ownership of the remote client have been removed as they are immaterial to the definition of IRA.

The definition begins with "User-initiated electronic access by a person using a routable protocol" to match the human interactive nature of the access to the requirements that secure such access in CIP-005 R2. For example, a batch process cannot read a multi-factor token and enter its displayed code; that security control is designed for interactive humans initiating a remote access session. Also note the person is using a routable protocol to initiate the access.

The definition outlines three targets of IRA:

1) "To a Cyber System protected by an Electronic Security Perimeter (ESP)" covers the typical Cyber System that is connected to a network via a routable protocol and thus is protected by an ESP. In this instance, the remote user is using a routable protocol and is accessing a Cyber System on a routable protocol network, for example in a typical LAN-WAN-LAN, end to end routable protocol communication.

2) "That is converted by the Responsible Entity to a non-routable protocol to a Cyber System" clarifies as IRA scenarios where the user is using a routable protocol to a site where the Responsible Entity then connects that session (e.g., using a gateway or terminal server) to a device's non-routable serial port to provide interactive remote access to the user. A common example is connecting a serial port on a digital relay in a substation to a terminal server or gateway device which is then connected to a routable network in the substation for the purpose of granting a remote user interactive access to the relay without traveling to the substation. This 2nd target of the definition now clarifies this is IRA even though the device itself may not have an ESP if it is only connected serially.

   The phrase "converted *by the Responsible Entity*" clarifies certain situations that may involve more than one entity and is best described by an example. Entity 1 has a BCS in a substation or generating resource that Entity 2, a Control Center, needs to access. Entity 2 provides a circuit to Entity 1's site and provides Entity 1 with a serial cable to connect to their BCS. This phrase clarifies that Entity 1 does not require detailed architectural knowledge of what Entity 2 does upstream with the data once delivered to the interface if Entity 1 does not do any conversion to routable protocols. If Entity 2 does convert to routable protocols and does provide IRA, then Entity 2 implements the IRA security controls on their routable protocol portion.

3) "To a Management Interface of Shared Cyber Infrastructure" adds the Management Interface of an SCI as a valid target of IRA.

The definition then has three exclusions of scenarios that are not IRA:

1) "Communication that originates from a Cyber System protected by any of the Responsible Entity's ESPs" carries forward this exclusion from previous definitions and is intended to exclude, for example, the scenario of a Control Center operator within one of the Responsible Entity's ESPs interacting with field devices within its other ESPs, because for it to meet the IRA definition, IRA originates from somewhere other than one of the Responsible Entity's protected ESPs.
2) "Communication that originates from an Intermediate System" prevents the 'hall of mirrors' situation where an Intermediate System would need its own Intermediate System, ad infinitum.
3) "System-to-system process communication" carries forward this exclusion from previous definitions to clarify that a process that cannot for instance perform multi-factor authentication using tokens or biometrics is not IRA.

Note that the definition uses the more generic term Cyber Systems. This is in keeping with using the glossary as a dictionary that merely defines a term, in this case a type of access, but does not create or scope CIP requirements within the definition. The scope of access that requires an Intermediate System is in CIP-005 R2's requirement language.

Intermediate Systems

One or more Electronic Access Control or Monitoring Systems that are used to restrict Interactive Remote Access to only authorized users.

Rationale

This definition is changing to remove requirement language (i.e., where an Intermediate System must reside) embedded within the definition. That language has been moved to CIP-005 Requirement R2 Part 2.6.2 within a mandatory requirement. The definition was also updated from a Cyber Asset focus to an EACMS focus to include other forms (i.e., VCA) the Intermediate System may take.

Physical Access Control Systems (PACS)

Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure (SCI) that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers.

Rationale

Modified to add VCA and SCI as two other forms that a PACS can take.

Physical Security Perimeter (PSP)

The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, Shared Cyber Infrastructure, or Electronic Access Control or Monitoring Systems reside, and for which access is controlled.

Rationale

The PSP definition is changing to add SCI as type of device to be included within a PSP.

Protected Cyber Asset (PCA)

One or more Cyber Assets or Virtual Cyber Assets that:

- Are protected by an Electronic Security Perimeter (ESP) but are not part of the highest impact BES Cyber System protected by the same ESP; or
- Share CPU or memory resources with any part of the BES Cyber System, excluding Virtual Cyber Assets that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems;

Excluding TCAs.

Rationale

The PCA definition exists to identify other Cyber Assets or VCAs that must be protected by various CIP requirements due to what they share with a BES Cyber System. This sharing could allow the PCA to be a ‘pivot point’, a location from which to access the BCS. In the past, this sharing was limited to local network connectivity; the PCA being a network peer within the same ESP. With virtualization there is now another aspect of sharing and the PCA definition is being updated to include “share CPU or memory resources with any part of the BES Cyber System” to mitigate the risks of hardware-based vulnerabilities (e.g., Spectre, Meltdown, Rowhammer, etc.) on Shared Cyber Infrastructure. Since virtualization can allow systems of differing trust levels to simultaneously execute on the same hypervisor servers in the hardware underlay and thus share the same CPU and memory resources, this addition to the PCA definition requires that those

VCAs that do share CPU and memory resources with a BCS become associated PCA's of the BCS. This provides the high water marking of VCAs sharing a single hypervisor's CPU or memory resources. Affinity rules can be used within the virtualization configuration to prevent this situation and keep other VCAs of differing impact levels from becoming associated PCAs. Finally, the definition is being modified to account for "remediation VLAN" automation of security controls where a VCA may instantiate in a logical network reserved for vulnerability assessment and updates (OS patches, AV updates, etc.) that isolates its connectivity during the remediation process. Even though it may share CPU/memory resources during the remediation, the intent is to exclude the VCA from becoming a PCA while temporarily in this state as its being updated prior to being connected to its production network.

Removable Media

Storage media that (i) are not Cyber Assets or Shared Cyber Infrastructure, (ii) are capable of transferring executable code, (iii) can be used to store, copy, move, or access data, and (iv) are directly connected for 30 consecutive calendar days or less to a BES Cyber Asset, Shared Cyber Infrastructure, a network protected by an ESP, or a Protected Cyber Asset.

Rationale

The Removable Media definition is being updated to add SCI as a target of the Removable Media connection and incorporate the new ESP definition.

Reportable Cyber Security Incident

A Cyber Security Incident that compromised or disrupted:

- A BES Cyber System that performs one or more reliability tasks of a functional entity;
- An Electronic Security Perimeter of a high or medium impact BES Cyber System;
- An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber System; or
- Shared Cyber Infrastructure supporting a BES Cyber System.

Rationale

This definition is being modified to add compromised or disrupted SCI supporting a BCS as a target.

Transient Cyber Asset (TCA)

A Cyber Asset or Virtual Cyber Asset that is:

1. capable of transmitting or transferring executable code,
2. not included in a BES Cyber System,
3. not a Protected Cyber Asset (PCA) associated with high or medium impact BES Cyber Systems, and
4. connected for 30 consecutive calendar days or less:
    a. to a network within an Electronic Security Perimeter containing high or medium impact BES Cyber Systems, or

b. directly (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth communication) to a:
    i. BES Cyber Asset,
    ii. Shared Cyber Infrastructure, or
    iii. Protected Cyber Asset associated with high or medium impact BES Cyber Systems.

Virtual machines hosted on a physical TCA are treated as software on that physical TCA. Examples of Transient Cyber Assets include, but are not limited to, Cyber Assets or Virtual Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Rationale

The TCA definition is being updated to add VCA as a form a TCA can take. The SDT is addressing two different transient connection scenarios.

The first scenario is a physical TCA such as a laptop. These TCA's may require older, 32-bit software and OS to connect to and configure older equipment in the field. These are often executed within VM 'player' environments on the physical TCA. The SDT asserts these packaged environments in an image file on a physical TCA should not be considered their own distinct virtual TCA and included the statement "Virtual machines hosted on a physical TCA are treated as software on that physical TCA." The SDT asserts that a user that is authorized to use the physical TCA should not be required to be separately authorized to execute the software they need to use on the TCA, simply because it's in an image file and executed in a VM "player" type environment on the TCA. The SDT also asserts that if the user 'checks out' a physical laptop to perform a task, it should not be a standard violation if they do not also 'check out' any VM images residing on that physical TCA's disk. The intent is that physical TCA is considered a 'unit' to perform a job and not several distinct TCAs on one laptop. Corresponding clarifications have been made to the methods in CIP-003 and CIP-010 used to mitigate the risks of TCA software.

The second scenario is a more recent phenomenon where a service vendor (e.g., a pen-tester or security firm) may send an entity a VCA image (e.g., a vulnerability scanner instance) to temporarily instantiate within their virtualization environment. This VCA may only exist for a few hours and is functionally no different than the vendor bringing a physical laptop and connecting it to a physical network switch to perform the same task as a TCA. This transient VCA is not a part of the entity's CIP program and is treated as a TCA. This also handles VCAs the entity creates for typical TCA uses but are normally dormant on the same hardware as the BCS (e.g., a VCA with Wireshark for troubleshooting network issues within a virtualized infrastructure).

Additionally, SCI was added as a target to which TCA's can be directly connected.

Proposed New Terms:

Cyber System

A group of one or more Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure.

Rationale

This proposed new term is used to simplify applicability when referring in the standards or other definitions to all the forms an object may take (CA, VCA, or SCI). If other forms are needed in the future, their addition to this one definition can reduce needed edits throughout the standards.

Management Interface

An administrative interface that:

- Controls the processes of initializing, deploying, and configuring Shared Cyber Infrastructure; or
- Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or
- Configures an Electronic Security Perimeter;

Rationale

This term is being defined so that requirements can be addressed to SCI and EACMS Management Interfaces to target the unique risks for virtualized environments presented by unrestricted access to the Management Interfaces for such environments. With 'infrastructure as a service' (IaaS) environments, the management consoles can not only be used to create, but also to destroy or reconfigure virtual servers, networks, switches, firewalls, etc. The term also includes interfaces commonly known as ILO (Integrated Lights Out), that can be used to remotely access the console. It also includes interfaces used to configure an ESP (such as on firewalls or a network switch that is enforcing an ESP between different logical networks (e.g., VLANs).

Shared Cyber Infrastructure (SCI)

One or more programmable electronic devices, including the software that shares the devices' resources, that:

- Hosts one or more Virtual Cyber Assets (VCA) included in a BES Cyber System (BCS) or their associated Electronic Access Control or Monitoring Systems (EACMS) or Physical Access Control Systems (PACS); and hosts one or more VCAs that are not included in, or associated with, BCS of the same impact categorization; or
- Provides storage resources required for system functionality of one or more Cyber Assets or VCAs included in a BCS or their associated EACMS or PACS; and also for one or more Cyber Assets or VCAs that are not included in, or associated with, BCS of the same impact categorization.

SCI does not include the supported VCA or Cyber Assets with which it shares its resources.

Rationale

The SCI definition is being created to separate the underlying hardware from VCAs in the situation where the shared hardware resources support VCAs of varying impact levels. This allows security requirements to be targeted to SCI to address the unique risks of shared hardware. There are many requirements that now include the newly defined term SCI in the "Applicable Systems" column to maintain security level parity with traditional Cyber Assets.

Beyond security level parity with protecting a typical hardware based Cyber Asset, the SCI can have a more significant impact in a virtualized environment since it can host, and therefore impact, multiple virtualized systems of varying impact levels. Because of this capability, some additional controls only apply to SCI, such as the management plane isolation required by the proposed CIP-005. Addressing these unique risks requires separation of the hardware underlay into a separate definition.

The phrase "SCI does not include the supported VCA or Cyber Assets with which it shares its resources" is included to clarify that, for example, electronic access to a hosted VCA by a user is not electronic access to the SCI on which it executes.

Of note is that shared network devices are not in the scope of this definition. Since network switches and firewalls share their resources by nature, this exclusion avoids pulling all network hardware into scope as SCI. However, network switches and other hardware that does enforce an ESP, such as a network switch configured to host different VLANs to which systems of differing impact levels are connected, comes into scope as an EACMS.

Virtual Cyber Asset (VCA)

A logical instance of an operating system or firmware, currently executing on a virtual machine hosted on a BES Cyber Asset, Electronic Access Control or Monitoring System, Physical Access Control System, Protected Cyber Asset, or Shared Cyber Infrastructure. VCAs do not include:

- Logical instances that are being actively remediated in an environment that isolates routable connectivity from BES Cyber Systems;
- Dormant file based images that contain operating systems or firmware; and
- SCI or Cyber Assets that host VCAs.

Application containers are considered software of VCAs or Cyber Assets.

Rationale

The NERC Glossary definition of Cyber Asset has a direct tie to its hardware and software ("including the hardware, software, and data in the device") and assumes a one-to-one relationship between a device and its software (including the operating system). This affected the definitions of the "Applicable Systems" terms such as BES Cyber Systems (BCS), EACMS, PACS, and Protected Cyber Assets (PCAs) that were all based on the Cyber Asset definition. Because the Reliability Standard is applicable to the aforementioned systems, the security controls for the Cyber Assets also applies to the hardware. The one-to-one relationship between a Cyber Asset and its underlying hardware and software is what virtualization intentionally breaks to increase reliability and resiliency by allowing Virtual Cyber Assets to be abstracted from the hardware and therefore able move to any available hardware out of a pool of resources. The proposed NERC Glossary definition of Virtual Cyber Asset (VCA) allows the tie between a specific piece of hardware and the related applicable systems to no longer be singularly defined.

The phrase "currently executing on a virtual machine" is used to clarify that a VCA does not include disk image files that are not currently instantiated or executing and are thus providing no functions or services. Likewise, the definition excludes "logical instances that are being actively remediated…" to allow for automated solutions (such as remediation VLANs) to bring newly instantiated instances into compliance in an isolated environment before they are moved to production networks and begin providing their function or service, at which point they become a VCA.

The phrase "on a virtual machine" is used to clarify that a dedicated, non-virtualized Cyber Asset may have a 'logical instance of an Operating System (OS) or firmware', but that is not a VCA, only a logical instance of an OS or firewall on a virtual machine is a VCA.

The phrase "hosted on a BCA, EACMS, PACS, PCA, or SCI" is to clarify that an entity for an "all-in" scenario can still classify the underlying hardware as one or several of these types, yet the VCA's remain their own object subject to requirements and are not simply "software in the device" as in the Cyber Asset definition.

Examples of Virtual Cyber Assets may include, but are not limited to, logical instances of the following:

- Operating Systems (Virtual Machines (VM));
- Networking devices such as switches, routers, and load balancers;
- Security appliances such as firewalls and VPN concentrators; and
- Helper appliances with logical connectivity (such as malware detection, plugins, etc.).

Proposed Retired Terms:
None

Technical Rationale for Exemptions Section:
Rationale for Exemption 4.2.3.1
The term 'Cyber Assets' was changed to the new proposed term 'Cyber Systems'. Rather than changing this language to a list of all possible forms (Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure) as the object of the exemption, the SDT chose to instead use the existing language in the 4.2.3.4 and 4.2.3.5 exemptions such that all five exemptions use a form of 'systems' as their object.

Rationale for Exemption 4.2.3.2 and 4.2.3.3
In 4.2.3.2, the term 'Cyber Assets' was changed to 'Cyber Systems' which is a new proposed glossary addition. Rather than changing these two exemptions to list all possible forms (Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure), the SDT chose to define a new term that incorporates all forms and use it within the multiple exemptions and at other points within the standards.

For 4.2.3.3, the ability to move workloads or VM’s seamlessly across different sites for increased resiliency can require different sites to be connected as a flat network without layer 3 ESP’s at each discrete site (e.g., a layer 2 adjacency across the sites). A “Super ESP” as it’s been historically known is created across the sites and thus an exemption based on having a discrete layer 3 ESP at each site no longer works to exclude, for example, the network transport equipment that may belong to carriers. The SDT is including the 4.2.3.3 exemption to further clarify this scenario. Responsible Entities should notice the exemption uses the word “between” – when extending an ESP between geographic locations, CIP-005 requires the confidentiality and integrity protection of the data (typically through encryption) between the relevant PSPs. This exemption then covers the related Cyber Systems “between” those encryption points but does not exclude the endpoints performing the encryption.

Technical Rationale for Reliability Standard CIP-002-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-002-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-002-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a SDT. The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Attachment 1 – Impact Rating Criteria

Change Rationale:

In the medium impact rating criterion 2.1 referencing shared BCS for commissioned generation, the SDT has proposed a change to incorporate an earlier approved Request For Interpretation (RFI). The RFI was submitted seeking clarification of Criterion 2.1 of Attachment 1 regarding the use of the phrase "shared BES Cyber Systems." The resulting approved interpretation was introduced as Appendix 1 in CIP-002-5.1a.

The SDT incorporated the interpretation into CIP-002-7 Attachement 1 criterion 2.1 by modifying it to reference "each discrete shared BCS" and removed the RFI appendix from the standard.

Former Background Section from Reliability Standard CIP-002-5.1a

The **Background** section has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

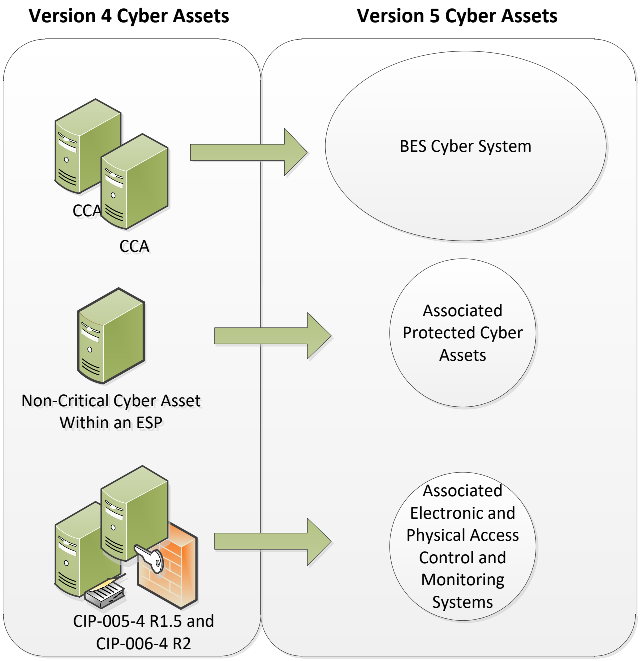
This standard provides "bright-line" criteria for applicable Responsible Entities to categorize their BES Cyber Systems based on the impact of their associated Facilities, systems, and equipment, which, if destroyed, degraded, misused, or otherwise rendered unavailable, would affect the reliable operation of the Bulk Electric System. Several concepts provide the basis for the approach to the standard.

Throughout the standards, unless otherwise stated, bulleted items in the requirements are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section and the criteria in Attachment 1 of CIP-002 use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

BES Cyber Systems

One of the fundamental differences between Versions 4 and 5 of the CIP Cyber Security Standards is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change results from the drafting team's review of the NIST Risk Management Framework and the use of an analogous term "information system" as the target for categorizing and applying security controls.



In transitioning from Version 4 to Version 5, a BES Cyber System can be viewed simply as a grouping of Critical Cyber Assets (as that term is used in Version 4). The CIP Cyber Security Standards use the "BES Cyber System" term primarily

to provide a higher level for referencing the object of a requirement. For example, it becomes possible to apply requirements dealing with recovery and malware protection to a grouping rather than individual Cyber Assets, and it becomes clearer in the requirement that malware protection applies to the system as a whole and may not be necessary for every individual device to comply.

Another reason for using the term "BES Cyber System" is to provide a convenient level at which a Responsible Entity can organize their documented implementation of the requirements and compliance evidence. Responsible Entities can use the well-developed concept of a *security plan* for each BES Cyber System to document the programs, processes, and plans in place to comply with security requirements.

It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System. For example, the Responsible Entity might choose to view an entire plant control system as a single BES Cyber System, or it might choose to view certain components of the plant control system as distinct BES Cyber Systems. The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.

Reliable Operation of the BES

The scope of the CIP Cyber Security Standards is restricted to BES Cyber Systems that would impact the reliable operation of the BES. In order to identify BES Cyber Systems, Responsible Entities determine whether the BES Cyber Systems perform or support any BES reliability function according to those reliability tasks identified for their reliability function and the corresponding functional entity's responsibilities as defined in its relationships with other functional entities in the NERC Functional Model. This ensures that the *initial* scope for consideration includes only those BES Cyber Systems and their associated BES Cyber Assets that perform or support the reliable operation of the BES. The definition of BES Cyber Asset provides the basis for this scoping.

Real-time Operations

One characteristic of the BES Cyber Asset is a real-time scoping characteristic. The time horizon that is significant for BES Cyber Systems and BES Cyber Assets subject to the application of these Version 5 CIP Cyber Security Standards is defined as that which is material to real-time operations for the reliable operation of the BES. To provide a better defined time horizon than "Real-time," BES Cyber Assets are those Cyber Assets that, if rendered unavailable, degraded, or misused, would adversely impact the reliable operation of the BES within 15 minutes of the activation or exercise of the compromise. This time window must not include in its consideration the activation of redundant BES Cyber Assets or BES Cyber Systems: from the cyber security standpoint, redundancy does not mitigate cyber security vulnerabilities.

Categorization Criteria

The criteria defined in Attachment 1 are used to categorize BES Cyber Systems into impact categories. Requirement 1 only requires the discrete identification of BES Cyber Systems for those in the high impact and medium impact categories. All BES Cyber Systems for Facilities not included in Attachment 1 – Impact Rating Criteria, Criteria 1.1 to 1.4 and Criteria 2.1 to 2.11 default to be low impact.

This general process of categorization of BES Cyber Systems based on impact on the reliable operation of the BES is consistent with risk management approaches for the purpose of application of cyber security requirements in the remainder of the Version 5 CIP Cyber Security Standards.

Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets that are associated with BES Cyber Systems

BES Cyber Systems have associated Cyber Assets, which, if compromised, pose a threat to the BES Cyber System by virtue of: (a) their location within the Electronic Security Perimeter (Protected Cyber Assets), or (b) the security control function they perform (Electronic Access Control or Monitoring Systems and Physical Access Control Systems). These Cyber Assets include:

Electronic Access Control or Monitoring Systems ("EACMS")

Examples include: Electronic Access Points, Intermediate Systems, authentication servers (e.g., RADIUS servers, Active Directory servers, Certificate Authorities), security event monitoring systems, and intrusion detection systems.

Physical Access Control Systems ("PACS")

Examples include: authentication servers, card systems, and badge control systems.

Protected Cyber Assets ("PCA")

Examples may include, to the extent they are within the ESP: file servers, ftp servers, time servers, LAN switches, networked printers, digital fault recorders, and emission monitoring systems.

Technical Rationale for Reliability Standard CIP-002-5.1a

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from the CIP-002-5.1a standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the qualified set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards. This section is especially significant in CIP-002-5.1a and represents the total scope of Facilities, systems, and equipment to which the criteria in Attachment 1 apply. This is important because it determines the balance of these Facilities, systems, and equipment that are Low Impact once those that qualify under the High and Medium Impact categories are filtered out.

For the purpose of identifying groups of Facilities, systems, and equipment, whether by location or otherwise, the Responsible Entity identifies assets as described in Requirement R1 of CIP-002-5.1a. This is a process familiar to Responsible Entities that have to comply with versions 1, 2, 3, and 4 of the CIP standards for Critical Assets. As in versions 1, 2, 3, and 4, Responsible Entities may use substations, generation plants, and Control Centers at single site locations as identifiers of these groups of Facilities, systems, and equipment.

CIP-002-5.1a

CIP-002-5.1a requires that applicable Responsible Entities categorize their BES Cyber Systems and associated BES Cyber Assets according to the criteria in Attachment 1. A BES Cyber Asset includes in its definition, "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact the reliable operation of the BES."

The following provides guidance that a Responsible Entity may use to identify the BES Cyber Systems that would be in scope. The concept of BES reliability operating service is useful in providing Responsible Entities with the option of a defined process for scoping those BES Cyber Systems that would be subject to CIP-002-5.1a. The concept includes a number of named BES reliability operating services. These named services include:

- Dynamic Response to BES conditions
- Balancing Load and Generation
- Controlling Frequency (Real Power)
- Controlling Voltage (Reactive Power)
- Managing Constraints

- Monitoring & Control
- Restoration of BES
- Situational Awareness
- Inter-Entity Real-Time Coordination and Communication

Responsibility for the reliable operation of the BES is spread across all Entity Registrations. Each entity registration has its own special contribution to reliable operations and the following discussion helps identify which entity registration, in the context of those functional entities to which these CIP standards apply, performs which reliability operating service, as a process to identify BES Cyber Systems that would be in scope. The following provides guidance for Responsible Entities to determine applicable reliability operations services according to their Function Registration type.

Entity Registration	RC	BA	TOP	TO	DP	GOP	GO
Dynamic Response		X	X	X	X	X	X
Balancing Load & Generation	X	X	X	X	X	X	X
Controlling Frequency		X				X	X
Controlling Voltage			X	X	X		X
Managing Constraints	X		X			X	
Monitoring and Control			X			X	
Restoration			X			X	
Situation Awareness	X	X	X			X	
Inter-Entity coordination	X	X	X	X		X	X

Dynamic Response

The Dynamic Response Operating Service includes those actions performed by BES Elements or subsystems which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition. The types of dynamic responses that may be considered as potentially having an impact on the BES are:

- Spinning reserves (contingency reserves)
  - Providing actual reserve generation when called upon (GO,GOP)
  - Monitoring that reserves are sufficient (BA)
- Governor Response
  - Control system used to actuate governor response (GO)
    - Protection Systems (transmission & generation)
  - Lines, buses, transformers, generators (DP, TO, TOP, GO, GOP)
  - Zone protection for breaker failure (DP, TO, TOP)
  - Breaker protection (DP, TO, TOP)
  - Current, frequency, speed, phase (TO,TOP, GO,GOP)

    - Special Protection Systems or Remedial Action Schemes
  - Sensors, relays, and breakers, possibly software (DP, TO, TOP)
    - Under and Over Frequency relay protection (includes automatic load shedding)
  - Sensors, relays & breakers (DP)
    - Under and Over Voltage relay protection (includes automatic load shedding)
  - Sensors, relays & breakers (DP)
    - Power System Stabilizers (GO)

Balancing Load and Generation

The Balancing Load and Generation Operations Service includes activities, actions and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time. Aspects of the Balancing Load and Generation function include, but are not limited to:

- Calculation of Area Control Error (ACE)
  - Field data sources (real time tie flows, frequency sources, time error, etc) (TO, TOP)
  - Software used to perform calculation (BA)
- Demand Response
  - Ability to identify load change need (BA)
  - Ability to implement load changes (TOP,DP)
- Manually Initiated Load shedding
  - Ability to identify load change need (BA)
  - Ability to implement load changes (TOP, DP)
- Non-spinning reserve (contingency reserve)
  - Know generation status, capability, ramp rate, start time (GO, BA)
  - Start units and provide energy (GOP)

Controlling Frequency (Real Power)

The Controlling Frequency Operations Service includes activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Frequency function include, but are limited to:

- Generation Control (such as AGC)
  - ACE, current generator output, ramp rate, unit characteristics (BA, GOP, GO)
  - Software to calculate unit adjustments (BA)
  - Transmit adjustments to individual units (GOP)
  - Unit controls implementing adjustments (GOP)
- Regulation (regulating reserves)
  - Frequency source, schedule (BA)
  - Governor control system (GO)

Controlling Voltage (Reactive Power)

The Controlling Voltage Operations Service includes activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Voltage function include, but are not limited to:

- Automatic Voltage Regulation (AVR)
  - Sensors, stator control system, feedback (GO)
- Capacitive resources
  - Status, control (manual or auto), feedback (TOP, TO, DP)
- Inductive resources (transformer tap changer, or inductors)
  - Status, control (manual or auto), feedback (TOP, TO, DP)
- Static VAR Compensators (SVC)
  - Status, computations, control (manual or auto), feedback (TOP, TO, DP)

Managing Constraints

Managing Constraints includes activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES. Aspects of the Managing Constraints include, but are not limited to:

- Available Transfer Capability (ATC) (TOP)
- Interchange schedules (TOP, RC)
- Generation re-dispatch and unit commit (GOP)
- Identify and monitor SOL's & IROL's (TOP, RC)
- Identify and monitor Flow gates (TOP, RC)

Monitoring and Control

Monitoring and Control includes those activities, actions and conditions that provide monitoring and control of BES Elements. An example aspect of the Control and Operation function is:

- All methods of operating breakers and switches
  - SCADA (TOP, GOP)
  - Substation automation (TOP)

Restoration of BES

The Restoration of BES Operations Service includes activities, actions and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Aspects of the Restoration of BES function include, but are not limited to:

- Restoration including planned cranking path
  - Through black start units (TOP, GOP)
  - Through tie lines (TOP, GOP)
- Off-site power for nuclear facilities. (TOP, TO, BA, RC, DP, GO, GOP)
- Coordination (TOP, TO, BA, RC, DP, GO, GOP)

Situational Awareness

The Situational Awareness function includes activities, actions and conditions established by policy, directive or standard operating procedure necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions. Aspects of the Situation Awareness function include:

- Monitoring and alerting (such as EMS alarms) (TOP, GOP, RC, BA)
- Change management (TOP,GOP,RC,BA)
- Current Day and Next Day planning (TOP)
- Contingency Analysis (RC)
- Frequency monitoring (BA, RC)

Inter-Entity Coordination

The Inter-Entity coordination and communication function includes activities, actions, and conditions established by policy, directive, or standard operating procedure necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES. Aspects of the Inter-Entity Coordination and Communication function include:

- Scheduled interchange (BA,TOP,GOP,RC)
- Facility operational data and status (TO, TOP, GO, GOP, RC, BA)
- Operational directives (TOP, RC, BA)

Applicability to Distribution Providers

It is expected that only Distribution Providers that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. Distribution Providers that do not own or operate any facility that qualifies are not subject to these standards. The qualifications are based on the requirements for registration as a Distribution Provider and on the requirements applicable to Distribution Providers in NERC Standard EOP-005.

Requirement R1:

Requirement R1 implements the methodology for the categorization of BES Cyber Systems according to their impact on the BES. Using the traditional risk assessment equation, it reduces the measure of the risk to an impact (consequence) assessment, assuming the vulnerability index of 1 (the Systems are assumed to be vulnerable) and a probability of threat of 1 (100 percent). The criteria in Attachment 1 provide a measure of the impact of the BES assets supported by these BES Cyber Systems.

Responsible Entities are required to identify and categorize those BES Cyber Systems that have high and medium impact. BES Cyber Systems for BES assets not specified in Attachment 1, Criteria 1.1 – 1.4 and Criteria 2.1 – 2.11 default to low impact.

Attachment 1

Overall Application

In the application of the criteria in Attachment 1, Responsible Entities should note that the approach used is based on the impact of the BES Cyber System as measured by the bright-line criteria defined in Attachment 1.

- When the drafting team uses the term "Facilities", there is some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases, the criteria refer to a group of Facilities in a given location that supports

the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to consider only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that supports reliable operation of the BES, as the Facilities that are subject to the criteria for categorization of BES Cyber Systems. Generation Facilities are separately discussed in the Generation section below. In CIP-002-5.1a, these groups of Facilities, systems, and equipment are sometimes designated as BES assets. For example, an identified BES asset may be a named substation, generating plant, or Control Center. Responsible Entities have flexibility in how they group Facilities, systems, and equipment at a location.

- In certain cases, a BES Cyber System may be categorized by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that result in the categorization. This will avoid inadvertent miscategorization when it no longer meets one of the criteria, but still meets another.
- It is recommended that each BES Cyber System should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

High Impact Rating (H)

This category includes those BES Cyber Systems, used by and at Control Centers (and the associated data centers included in the definition of Control Centers), that perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), or Generator Operator (GOP), as defined under the Tasks heading of the applicable Function and the Relationship with Other Entities heading of the functional entity in the NERC Functional Model, and as scoped by the qualification in Attachment 1, Criteria 1.1, 1.2, 1.3 and 1.4. While those entities that have been registered as the above-named functional entities are specifically referenced, it must be noted that there may be agreements where some of the functional obligations of a Transmission Operator may be delegated to a Transmission Owner (TO). In these cases, BES Cyber Systems at these TO Control Centers that perform these functional obligations would be subject to categorization as high impact. The criteria notably specifically emphasize functional obligations, not necessarily the RC, BA, TOP, or GOP facilities. One must note that the definition of Control Center specifically refers to reliability tasks for RCs, Bas, TOPs, and GOPs. A TO BES Cyber System in a TO facility that does not perform or does not have an agreement with a TOP to perform any of these functional tasks does not meet the definition of a Control Center. However, if that BES Cyber System operates any of the facilities that meet criteria in the Medium Impact category, that BES Cyber System would be categorized as a Medium Impact BES Cyber System.

The 3000 MW threshold defined in criterion 1.2 for BA Control Centers provides a sufficient differentiation of the threshold defined for Medium Impact BA Control Centers. An analysis of BA footprints shows that the majority of Bas with significant impact are covered under this criterion.

Additional thresholds as specified in the criteria apply for this category.

Medium Impact Rating (M)

Generation

The criteria in Attachment 1's medium impact category that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are criteria 2.1, 2.3, 2.6, 2.9, and 2.11. Criterion 2.13 for BA Control Centers is also included here.

- Criterion 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002, whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance." In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Bas in all regions.

In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements as proposed by NERC standard MOD-024 and current development efforts in that area.

By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of 1500 MW or more of generation at a single plant for a unit or group of units are adequately protected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In Criterion 2.3, the drafting team sought to ensure that BES Cyber Systems for those generation Facilities that have been designated by the Planning Coordinator or Transmission Planner as necessary to avoid BES Adverse Reliability Impacts in the planning horizon of one year or more are categorized as medium impact. In specifying a planning horizon of one year or more, the intent is to ensure that those are units that are identified as a result of a "long term" reliability planning, i.e that the plans are spanning an operating period of at least 12 months: it does not mean that the operating day for the unit is necessarily beyond one year, but that the period that is being planned for is more than 1 year: it is specifically intended to avoid designating generation that is required to be run to remediate short term emergency reliability issues. These Facilities may be designated as "Reliability Must Run," and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  If it is determined through System studies that a unit must run in order to preserve the reliability of the BES, such as due to a Category C3 contingency as defined in TPL-003, then BES Cyber Systems for that unit are categorized as medium impact.

  The TPL standards require that, where the studies and plans indicate additional actions, that these studies and plans be communicated by the Planning Coordinator or Transmission Planner in writing to the Regional Entity/RRO. Actions necessary for the implementation of these plans by affected parties (generation owners/operators and Reliability Coordinators or other necessary party) are usually formalized in the form of an agreement and/or contract.

- Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.

  IROLs may be based on dynamic System phenomena such as instability or voltage collapse. Derivation of these IROLs and their associated contingencies often considers the effect of generation inertia and AVR response.

- Criterion 2.9 categorizes BES Cyber Systems for Special Protection Systems and Remedial Action Schemes as medium impact. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Generator Operators which own BES Cyber Systems for such Systems and schemes designate them as medium impact.
- Criterion 2.11 categorizes as medium impact BES Cyber Systems used by and at Control Centers that perform the functional obligations of the Generator Operator for an aggregate generation of 1500 MW or higher in a single interconnection, and that have not already been included in Part 1.
- Criterion 2.13 categorizes as medium impact those BA Control Centers that “control” 1500 MW of generation or more in a single interconnection and that have not already been included in Part 1. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.

Transmission

The SDT uses the phrases “Transmission Facilities at a single station or substation” and “Transmission stations or substations” to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both “station” and “substation” to refer to the locations where groups of Transmission Facilities exist.

- Criteria 2.2, 2.4 through 2.10, and 2.12 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a System to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). Criterion 2.2 includes BES Cyber Systems for those Facilities in Transmission Systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.
- Criterion 2.4 includes BES Cyber Systems for any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion in the medium impact category.

  It must be noted that if the collector bus for a generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation in Criterion 2.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility, and not a Transmission Facility, according to the “Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface.” This collector bus would not be a facility for a medium impact BES Cyber System because it does not significantly affect the 500kV Transmission grid; it only affects a plant which is below the generation threshold.
- Criterion 2.5 includes BES Cyber Systems for facilities at the lower end of BES Transmission with qualifications for inclusion if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for significant impact on the BES, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES. The drafting team:
  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least three transmission stations or substations to ensure that the level of impact would be appropriate.

The total aggregated weighted value of 3,000 was derived from weighted values related to three connected 345 kV lines and five connected 230 kV lines at a transmission station or substation. The total aggregated weighted value is used to account for the true impact to the BES, irrespective of line kV rating and mix of multiple kV rated lines.

Additionally, in NERC's document "Integrated Risk Assessment Approach – Refinement to Severity Risk Index", Attachment 1, the report used an average MVA line loading based on kV rating:

- 230 kV –> 700 MVA
- 345 kV –> 1,300 MVA
- 500 kV –> 2,000 MVA
- 765 kV –> 3,000 MVA

In the terms of applicable lines and connecting "other Transmission stations or substations" determinations, the following should be considered:

- For autotransformers in a station, Responsible Entities have flexibility in determining whether the groups of Facilities are considered a single substation or station location or multiple substations or stations. In most cases, Responsible Entities would probably consider them as Facilities at a single substation or station unless geographically dispersed. In these cases of these transformers being within the "fence" of the substation or station, autotransformers may not count as separate connections to other stations. The use of common BES Cyber Systems may negate any rationale for any consideration otherwise. In the case of autotransformers that are geographically dispersed from a station location, the calculation would take into account the connections in and out of each station or substation location.
- Multiple-point (or multiple-tap) lines are considered to contribute a single weight value per line and affect the number of connections to other stations. Therefore, a single 230 kV multiple-point line between three Transmission stations or substations would contribute an aggregated weighted value of 700 and connect Transmission Facilities at a single station or substation to two other Transmission stations or substations.
- Multiple lines between two Transmission stations or substations are considered to contribute multiple weight values per line, but these multiple lines between the two stations only connect one station to one other station. Therefore, two 345 kV lines between two Transmission stations or substations would contribute an aggregated weighted value of 2600 and connect Transmission Facilities at a single station or substation to one other Transmission station or substation.

Criterion 2.5's qualification for Transmission Facilities at a Transmission station or substation is based on 2 distinct conditions.

1. The first condition is that Transmission Facilities at a single station or substation where that station or substation connect, at voltage levels of 200 kV or higher to three (3) other stations or substations, to three other stations or substations. This qualification is meant to ensure that connections that operate at voltages of 500 kV or higher are included in the count of connections to other stations or substations as well.
2. The second qualification is that the aggregate value of all lines entering or leaving the station or substation must exceed 3000. This qualification does not include the consideration of lines operating at lower than 200 kV, or 500 kV or higher, the latter already qualifying as medium impact under criterion 2.4. : there is no value to be assigned to lines at voltages of less than 200 kV or 500 kV or higher in the table of values for the contribution to the aggregate value of 3000.

The Transmission Facilities at the station or substation must meet both qualifications to be considered as qualified under criterion 2.5.

- Criterion 2.6 include BES Cyber Systems for those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.
- Criterion 2.7 is sourced from the NUC-001 NERC standard, Requirement R9.2.2, for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown." In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.
- Criterion 2.8 designates as medium impact those BES Cyber Systems that impact Transmission Facilities necessary to directly support generation that meet the criteria in Criteria 2.1 (generation Facilities with output greater than 1500 MW) and 2.3 (generation Facilities generally designated as "must run" for wide area reliability in the planning horizon). The Responsible Entity can request a formal statement from the Generation owner as to the qualification of generation Facilities connected to their Transmission systems.
- Criterion 2.9 designates as medium impact those BES Cyber Systems for those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching Systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these BES Cyber Systems would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.
- Criterion 2.10 designates as medium impact those BES Cyber Systems for Systems or Elements that perform automatic Load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of Criterion 2.10, and chose the term "Each" to represent that the criterion applied to a discrete System or Facility. In the drafting of this criterion, the drafting team sought to include only those Systems that did not require human operator initiation, and targeted in particular those underfrequency load shedding (UFLS) Facilities and systems and undervoltage load shedding (UVLS) systems and Elements that would be subject to a regional Load shedding requirement to prevent Adverse Reliability Impact. These include automated UFLS systems or UVLS systems that are capable of Load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as medium impact. The 300 MW threshold has been defined as the aggregate of the highest MW Load value, as defined by the applicable regional Load Shedding standards, for the preceding 12 months to account for seasonal fluctuations.

  This particular threshold (300 MW) was provided in CIP, Version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

  In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market. In general, similar demand response programs that are not part of the NERC or regional reliability Load shedding programs, but are offered as components of an ancillary services market do not qualify under this criterion.

The language used in section 4 for UVLS and UFLS and in criterion 2.10 of Attachment 1 is designed to be consistent with requirements set in the PRC standards for UFLS and UVLS.

- Criterion 2.12 categorizes as medium impact those BES Cyber Systems used by and at Control Centers and associated data centers performing the functional obligations of a Transmission Operator and that have not already been categorized as high impact.
- Criterion 2.13 categorizes as Medium Impact those BA Control Centers that "control" 1500 MW of generation or more in a single Interconnection. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.

Low Impact Rating (L)

BES Cyber Systems not categorized in high impact or medium impact default to low impact. Note that low impact BES Cyber Systems do not require discrete identification.

Restoration Facilities

- Several discussions on the CIP Version 5 standards suggest entities owning Blackstart Resources and Cranking Paths might elect to remove those services to avoid higher compliance costs. For example, one Reliability Coordinator reported a 25% reduction of Blackstart Resources as a result of the Version 1 language, and there could be more entities that make this choice under Version 5.

  In response, the CIP Version 5 drafting team sought informal input from NERC's Operating and Planning Committees. The committees indicate there has already been a reduction in Blackstart Resources because of increased CIP compliance costs, environmental rules, and other risks; continued inclusion within Version 5 at a category that would very significantly increase compliance costs can result in further reduction of a vulnerable pool.

  The drafting team moved from the categorization of restoration assets such as Blackstart Resources and Cranking Paths as medium impact (as was the case in earlier drafts) to categorization of these assets as low impact as a result of these considerations. This will not relieve asset owners of all responsibilities, as would have been the case in CIP-002, Versions 1-4 (since only Cyber Assets with routable connectivity which are essential to restoration assets are included in those versions). Under the low impact categorization, those assets will be protected in the areas of cyber security awareness, physical access control, and electronic access control, and they will have obligations regarding incident response. This represents a net gain to bulk power system reliability, however, since many of those assets do not meet criteria for inclusion under Versions 1-4.

  Weighing the risks to overall BES reliability, the drafting team determined that this re-categorization represents the option that would be the least detrimental to restoration function and, thus, overall BES reliability. Removing Blackstart Resources and Cranking Paths from medium impact promotes overall reliability, as the likely alternative is fewer Blackstart Resources supporting timely restoration when needed.

  BES Cyber Systems for generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan default to low impact. NERC Standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan, as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC Standard EOP-005-2 to "provide the entities identified in

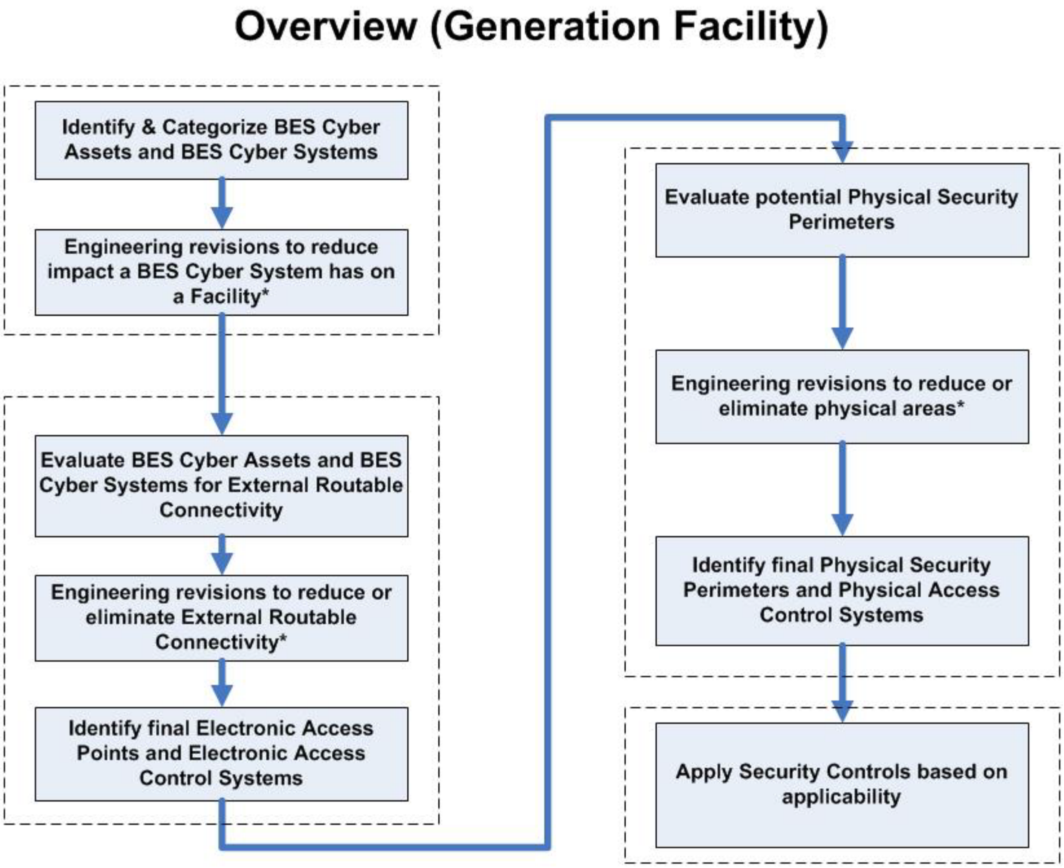
its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- BES Cyber Systems for Facilities and Elements comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first Interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, default to the category of low impact: however, these systems are explicitly called out to ensure consideration for inclusion in the scope of the version 5 CIP standards. This requirement for inclusion in the scope is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started.

  Distribution Providers may note that they may have BES Cyber Systems that must be scoped in if they have Elements listed in the Transmission Operator's Restoration Plan that are components of the Cranking Path.

Use Case: CIP Process Flow

The following CIP use case process flow for a generator Operator/Owner was provided by a participant in the development of the Version 5 standards and is provided here as an example of a process used to identify and categorize BES Cyber Systems and BES Cyber Assets; review, develop, and implement strategies to mitigate overall risks; and apply applicable security controls.



*** - Engineering revisions will need to be reviewed for cost justification, operational\safety requirements, support requirements, and technical limitations.**

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

BES Cyber Systems at each site location have varying impact on the reliable operation of the Bulk Electric System. Attachment 1 provides a set of "bright-line" criteria that the Responsible Entity must use to identify these BES Cyber Systems in accordance with the impact on the BES. BES Cyber Systems must be identified and categorized according to their impact so that the appropriate measures can be applied, commensurate with their impact. These impact categories will be the basis for the application of appropriate requirements in CIP-003-CIP-011.

Rationale for R2:

The lists required by Requirement R1 are reviewed on a periodic basis to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. The miscategorization or non-categorization of a BES Cyber System can lead to the application of inadequate or non-existent cyber security controls that can lead to compromise or misuse that can affect the real-time operation of the BES. The CIP Senior Manager's approval ensures proper oversight of the process by the appropriate Responsible Entity personnel.

Appendix 1

Requirement Number and Text of Requirement
<u>CIP-002-5.1, Requirement R1</u> R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3: i. Control Centers and backup Control Centers; ii. Transmission stations and substations; iii. Generation resources; iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements; v. Special Protection Systems that support the reliable operation of the Bulk Electric System; and vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above. 1.1. Identify each of the high impact BES Cyber Systems according to Attachment 1, Section 1, if any, at each asset; 1.2. Identify each of the medium impact BES Cyber Systems according to Attachment 1, Section 2, if any, at each asset; and 1.3. Identify each asset that contains a low impact BES Cyber System according to Attachment 1, Section 3, if any (a discrete list of low impact BES Cyber Systems is not required). <u>Attachment 1, Criterion 2.1</u> 2. Medium Impact Rating (M) Each BES Cyber System, not included in Section 1 above, associated with any of the following:

2.1 Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BES Cyber Systems that meet this criterion are those shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

Questions

Energy Sector Security Consortium, Inc. (EnergySec) submitted a Request for Interpretation (RFI) seeking clarification of Criterion 2.1 of Attachment 1 in Reliability Standard CIP-002-5.1 regarding the use of the phrase "shared BES Cyber Systems."

The Interpretation Drafting Team identified the following questions in the RFI:

1. Whether the phrase "shared BES Cyber Systems" means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?
2. Whether the phrase "shared BES Cyber Systems" refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?
3. If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?

Responses

Question 1: Whether the phrase "shared BES Cyber Systems," means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?

The evaluation as to whether a BES Cyber System is shared should be performed individually for each discrete BES Cyber System. In the standard language of CIP-002-5.1, there is no reference to or obligation to group BES Cyber Systems. Requirement R1, part 1.2 states "Identify *each* of the medium impact BES Cyber Systems according to Attachment 1, Section 2…" Further, the preamble of Section 2 of CIP-002-5.1 Attachment 1 states "*Each BES Cyber System*…associated with any of the following [criteria]." (emphasis added)

Additionally, the Background section of CIP-002-5.1 states that "[i]t is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System." The Background section also provides:

> The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.

Question 2: Whether the phrase "shared BES Cyber Systems" refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?

The phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple generation units.

The use of the term “shared” is also clarified in the NERC Frequently Asked Questions (FAQ) document issued by NERC Compliance to support implementation of the CIP Reliability Standards. FAQ #49 provides:

> Shared BES Cyber Systems are those that are associated with any combination of units in a single Interconnection, as referenced in CIP-002-5.1, Attachment 1, impact rating criteria 2.1 and 2.2. For criterion 2.1 “BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.” For criterion 2.2: “BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR. Also refer to the Lesson Learned for CIP-002-5.1 Requirement R1: **Impact Rating of Generation Resource Shared BES Cyber Systems** for further information and examples.

Question 3: If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?

The phrase applies to each discrete BES Cyber System.

Technical Rationale for Reliability Standard CIP-003-Y

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-003-9. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-003-Y is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document stated, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale." document for reference when reading the technical rationale that follows.

Requirement R1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-Y to shorten applicability statements within the body of CIP standards with “BCS” as the defined acronym for “BES Cyber System”.

Requirement R2

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-Y to align security management control requirements with the virtualization changes.

To ensure SCI supporting low impact BCS is afforded equal security controls as the BCS, the SDT added “SCI that supports a low impact BCS”.

Attachment 1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-Y to shorten applicability statements within the body of CIP standards with “BCS” as the defined acronym for “BES Cyber System”.

To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs), the SDT adjusted the language to refer to communications that are between a low impact BCS and a system(s) outside the asset containing low impact BCS, instead of discrete Cyber Assets outside the assets containing low impact BCS. The use of the term system(s) no longer restricts this section to physical Cyber Assets, thereby permitting VCAs as part of the BCS grouping under the modified definition.

Attachment 1 Section 2

Rationale

To ensure virtual infrastructure providing electronic access controls for the low impact BCS is afforded equal physical security controls as the physical Cyber Assets that provide electronic access controls for the low impact BCS, the SDT modified this section to include the Virtual Cyber Asset (VCA) where only Cyber Assets had previously been listed.

Attachment 1 Section 3

Attachment 1 Section 3 Part 3.1

Rationale

Part 3.1(i)

To ensure an asset containing a low impact BCS or an SCI supporting a low impact BCS is afforded equal electronic access controls as the low impact BCS, the SDT added “SCI that supports a low impact BCS and a Cyber System(s) outside the asset containing the low impact BES Cyber System (BCS); or the SCI that supports a low impact BCS””.

To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs), the SDT adjusted the language to refer to communications that are between a low impact BCS and a Cyber System(s) outside the asset containing low impact BCS, instead of discrete Cyber Assets outside the assets containing low impact BCS. The use of the term Cyber System(s) no longer restricts this section to physical Cyber Assets, thereby permitting VCAs as part of the BCS grouping under the modified definition.

Part 3.1(ii) To ensure only necessary inbound and outbound electronic access is permitted for SCI that supports a low impact BCS just as is required for access control to the low impact BCS, the SDT adjusted the language to include communications that are between SCI that supports any part of a low impact BCS and a system(s) outside the asset(s) containing the SCI that supports any part of a low impact BCS.

Part 3.1 (iii) The SDT replaced the undefined 'intelligent electronic devices' with the defined term 'Protection Systems'.

Attachment 1 Section 3 Part 3.2

Rationale

To ensure SCI supporting low impact BCS are afforded equal electronic access controls for Dial-up Connectivity, the SDT added "or SCI that supports a low impact BCS". To stay in keeping with the systems concept and the exclusion for a discrete list of Cyber Assets, while enabling the use of Virtual Cyber Assets (VCAs),, the 'per Cyber Asset capability' was changed to 'per system capability'.

Attachment 1 Section 5

Attachment 1 Section 5 Part 5.1

Rationale

To enable for virtualization technologies and capabilities the SDT added, "Controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code" as an option in Attachment 1 Section 5 Part 5.1.

Attachment 1 Section 5 Part 5.2

Rationale

To enable for virtualization technologies and capabilities the SDT added, "Controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code" as an option in Attachment 1 Section 5 Part 5.2.1.

The final bullet of Attachment 1 Section 5 Part 5.2.1 was preceded with the language "Review of" to make the requirement for other methods parallel to the five options listed above it.

Attachment 1 Section 5 Part 5.3

Rationale

To enable for virtualization technologies and capabilities the SDT added, "or VCA" in Attachment 1 Section 5 Parts 5.3.1.

To ensure SCI supporting a low impact BCS are afforded equal protections from malicious code when using Removable Media, the SDT added "SCI that supports a low impact BCS" to the low impact BCS in Attachment 1 Section 5 Parts 5.3.1 & 5.3.2.

Attachment 2

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-003-Y to shorten applicability statements within the body of CIP standards with "BCS" as the defined acronym for "BES Cyber System". Additional changes were to align the Attachment 2 Measures with the modifications to the Attachment 1 requirement language.

Former Background Section from Reliability Standard CIP-003-8

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term policy refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of policies also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term documented processes refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms program and plan are sometimes used in place of documented processes where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as plans (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term program may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms program and plan do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high, medium, and low impact BES Cyber Systems. For example, a single cyber security awareness program could meet the requirements across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within Regional Reliability Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

Technical Rational for Reliability Standard CIP-003-8

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-003-8 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

In developing policies in compliance with Requirement R1, the number of policies and their content should be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering the required topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-8, Requirement R1.

If a Responsible Entity has any high or medium impact BES Cyber Systems, the one or more cyber security policies must cover the nine subject matter areas required by CIP-003-8, Requirement R1, Part 1.1. If a Responsible Entity has identified from CIP-002 any assets containing low impact BES Cyber Systems, the one or more cyber security policies must cover the six subject matter areas required by Requirement R1, Part 1.2.

Responsible Entities that have multiple-impact rated BES Cyber Systems are not required to create separate cyber security policies for high, medium, or low impact BES Cyber Systems. The Responsible Entities have the flexibility to develop policies that cover all three impact ratings.

Implementation of the cyber security policy is not specifically included in CIP-003-8, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-003 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements in NERC cyber security Reliability Standards, but to develop a holistic cyber security policy appropriate for its organization. Elements of a policy that extend beyond the scope of NERC's cyber security Reliability Standards will not be considered candidates for potential violations although they will help demonstrate the organization's internal culture of compliance and posture towards cyber security.

For Part 1.1, the Responsible Entity may consider the following for each of the required topics in its one or more cyber security policies for medium and high impact BES Cyber Systems, if any:

1.1.1 Personnel and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

For Part 1.2, the Responsible Entity may consider the following for each of the required topics in its one or more cyber security policies for assets containing low impact BES Cyber Systems, if any:

1.2.1 Cyber security awareness

- Method(s) for delivery of security awareness
- Identification of groups to receive cyber security awareness

1.2.2 Physical security controls

- Acceptable approach(es) for selection of physical security control(s)

1.2.3 Electronic access controls

- Acceptable approach(es) for selection of electronic access control(s)

1.2.4 Cyber Security Incident response

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.2.5 Transient Cyber Assets and Removable Media Malicious Code Risk Mitigation

- Acceptable use of Transient Cyber Asset(s) and Removable Media

- Method(s) to mitigate the risk of the introduction of malicious code to low impact BES Cyber Systems from Transient Cyber Assets and Removable Media
- Method(s) to request Transient Cyber Asset and Removable Media

1.2.6 Declaring and responding to CIP Exceptional Circumstances

- Process(es) to declare a CIP Exceptional Circumstance
- Process(es) to respond to a declared CIP Exceptional Circumstance

Requirements relating to exceptions to a Responsible Entity's security policies were removed because it is a general management issue that is not within the scope of a reliability requirement. It is an internal policy requirement and not a reliability requirement. However, Responsible Entities are encouraged to continue this practice as a component of their cyber security policies.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

The intent of Requirement R2 is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that address the security objective for the protection of low impact BES Cyber Systems. The required protections are designed to be part of a program that covers the low impact BES Cyber Systems collectively at an asset level (based on the list of assets containing low impact BES Cyber Systems identified in CIP-002), but not at an individual device or system level.

Requirement R2, Attachment 1

As noted, Attachment 1 contains the sections that must be included in the cyber security plan(s). The intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose, if desired, to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems rather than maintain two separate programs. The purpose of the cyber security plan(s) in Requirement R2 is for Responsible Entities to use the cyber security plan(s) as a means of documenting their approaches to meeting the subject matter areas. The cyber security plan(s) can be used to reference other policies and procedures that demonstrate "how" the Responsible Entity is meeting each of the subject matter areas, or Responsible Entities can develop comprehensive cyber security plan(s) that contain all of the detailed implementation content solely within the cyber security plan itself. To meet the obligation for the cyber security plan, the expectation is that the cyber security plan contains or references sufficient details to address the implementation of each of the required subject matters areas.

Guidance for each of the subject matter areas of Attachment 1 is provided below.

Requirement R2, Attachment 1, Section 1 – Cyber Security Awareness

The intent of the cyber security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. The entity has the discretion to determine the topics to be addressed and the manner in which it will communicate these topics. As evidence of compliance, the Responsible Entity should be able to produce the awareness material that was delivered according to the delivery method(s) (e.g., posters, emails, or topics at staff meetings, etc.). The standard drafting team does not intend for Responsible Entities to be required to maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be included in the program. Appropriate physical security topics (e.g., tailgating awareness and protection of badges for physical security, or "If you see something, say something" campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2, Attachment 1, Section 2 – Physical Security Controls

The Responsible Entity must document and implement methods to control physical access to (1) the asset or the locations of low impact BES Cyber Systems within the asset, and (2) Cyber Assets that implement the electronic access control(s) specified by the Responsible Entity in Attachment 1, Section 3.1, if any. If these Cyber Assets implementing the electronic access controls are located within the same asset as the low impact BES Cyber Asset(s) and inherit the same physical access controls and the same need as outlined in Section 2, this may be noted by the Responsible Entity in either its policies or cyber security plan(s) to avoid duplicate documentation of the same controls.

The Responsible Entity has the flexibility to select the methods used to meet the objective of controlling physical access to (1) the asset(s) containing low impact BES Cyber System(s) or the low impact BES Cyber Systems themselves and (2) the electronic access control Cyber Assets specified by the Responsible Entity, if any. The Responsible Entity may use one or a combination of physical access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may use perimeter controls (e.g., fences with locked gates, guards, or site access policies, etc.) or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses.

The security objective is to control the physical access based on need as determined by the Responsible Entity. The need for physical access can be documented at the policy level. The standard drafting team did not intend to obligate an entity to specify a need for each physical access or authorization of an individual for physical access.

Monitoring as a physical security control can be used as a complement or an alternative to physical access control. Examples of monitoring controls include, but are not limited to: (1) alarm systems to detect motion or entry into a controlled area, or (2) human observation of a controlled area. Monitoring does not necessarily require logging and maintaining logs but could include monitoring that physical access has occurred or been attempted (e.g., door alarm, or human observation, etc.). The standard drafting team's intent is that the monitoring does not need to be per low impact BES Cyber System but should be at the appropriate level to meet the security objective of controlling physical access.

User authorization programs and lists of authorized users for physical access are not required although they are an option to meet the security objective.

Requirement R2, Attachment 1, Section 3 – Electronic Access Controls

Section 3 requires the establishment of electronic access controls for assets containing low impact BES Cyber Systems when there is routable protocol communication or Dial-up Connectivity between Cyber Asset(s) outside of the asset containing the low impact BES Cyber System(s) and the low impact BES Cyber System(s) within such asset. The establishment of electronic access controls is intended to reduce the risks associated with uncontrolled communication using routable protocols or Dial-up Connectivity.

When implementing Attachment 1, Section 3.1, Responsible Entities should note that electronic access controls to permit only necessary inbound and outbound electronic access are required for communications when those communications meet all three of the criteria identified in Attachment 1, Section 3.1. The Responsible Entity should evaluate the communications and when all three criteria are met, the Responsible Entity must document and implement electronic access control(s).

When identifying electronic access controls, Responsible Entities are provided flexibility in the selection of the electronic access controls that meet their operational needs while meeting the security objective of allowing only necessary inbound and outbound electronic access to low impact BES Cyber Systems that use routable protocols between a low impact BES Cyber System(s) and Cyber Asset(s) outside the asset.

In essence, the intent is for Responsible Entities to determine whether there is communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset or Dial-up Connectivity to the low impact BES Cyber System(s). Where such communication is present, Responsible Entities should document and implement electronic access control(s). Where routable protocol communication for time-sensitive protection or control functions between intelligent electronic devices that meets the exclusion language is present, Responsible Entities should document that communication, but are not required to establish any specific electronic access controls.

The inputs to this requirement are the assets identified in CIP-002 as containing low impact BES Cyber System(s); therefore, the determination of routable protocol communications or Dial-up Connectivity is an attribute of the asset. However, it is not intended for communication that provides no access to or from the low impact BES Cyber System(s), but happens to be located at the asset with the low impact BES Cyber System(s), to be evaluated for electronic access controls.

Electronic Access Control Exclusion

In order to avoid future technology issues, the obligations for electronic access controls exclude communications between intelligent electronic devices that use routable communication protocols for time-sensitive protection or control functions, such as IEC TR-61850-90-5 R-GOOSE messaging. Time-sensitive in this context generally means functions that would be negatively impacted by the latency introduced in the communications by the required electronic access controls. This time-sensitivity exclusion does not apply to SCADA communications which typically operate on scan rates of 2 seconds or greater. While technically time-sensitive, SCADA communications over routable protocols can withstand the delay introduced by electronic access controls. Examples of excluded time-sensitive communications are those communications which may necessitate the tripping of a breaker within a few cycles. A Responsible Entity using this technology is not expected to implement the electronic access controls noted herein. This exception was included so as not to inhibit the functionality of the time-sensitive characteristics related to this technology and not to preclude the use of such time-sensitive reliability enhancing functions if they use a routable protocol in the future.

Considerations for Determining Routable Protocol Communications

To determine whether electronic access controls need to be implemented, the Responsible Entity has to determine whether there is communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset.

When determining whether a routable protocol is entering or leaving the asset containing the low impact BES Cyber System(s), Responsible Entities have flexibility in identifying an approach. One approach is for Responsible Entities to identify an "electronic boundary" associated with the asset containing low impact BES Cyber System(s). This is not an Electronic Security Perimeter *per se*, but a demarcation that demonstrates the routable protocol communication entering or leaving the asset between a low impact BES Cyber System and Cyber Asset(s) outside the asset to then have electronic access controls implemented. This electronic boundary may vary by asset type (Control Center, substation, generation resource) and the specific configuration of the asset. If this approach is used, the intent is for the Responsible Entity to define the electronic boundary such that the low impact BES Cyber System(s) located at the asset are contained within the "electronic boundary." This is strictly for determining which routable protocol communications and networks are internal or inside or local to the asset and which are external to or outside the asset.

Alternatively, the Responsible Entity may find the concepts of what is inside and outside to be intuitively obvious for a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s) communicating to a low impact BES Cyber System(s) inside the asset. This may be the case when a low impact BES Cyber System(s) is communicating with a Cyber Asset many miles away and a clear and unambiguous demarcation exists. In this case, a Responsible Entity may decide not to identify an "electronic boundary," but rather to simply leverage the unambiguous asset demarcation to ensure that the electronic access controls are placed between the low impact BES Cyber System(s) and the Cyber Asset(s) outside the asset.

Determining Electronic Access Controls

Once a Responsible Entity has determined that there is routable communication between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) that uses a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s), the intent is for the Responsible Entity to document and implement its chosen electronic access control(s). The control(s) are intended to allow only "necessary" inbound and outbound electronic access as determined by the Responsible Entity. However the Responsible Entity chooses to document the inbound and outbound access permissions and the need, the intent is that the Responsible Entity is able to explain the reasons for the electronic access permitted. The reasoning for "necessary" inbound and outbound electronic access controls may be documented within the Responsible Entity's cyber security plan(s), within a comment on an access control list, a database, spreadsheet or other policies or procedures associated with the electronic access controls.

Concept Diagrams

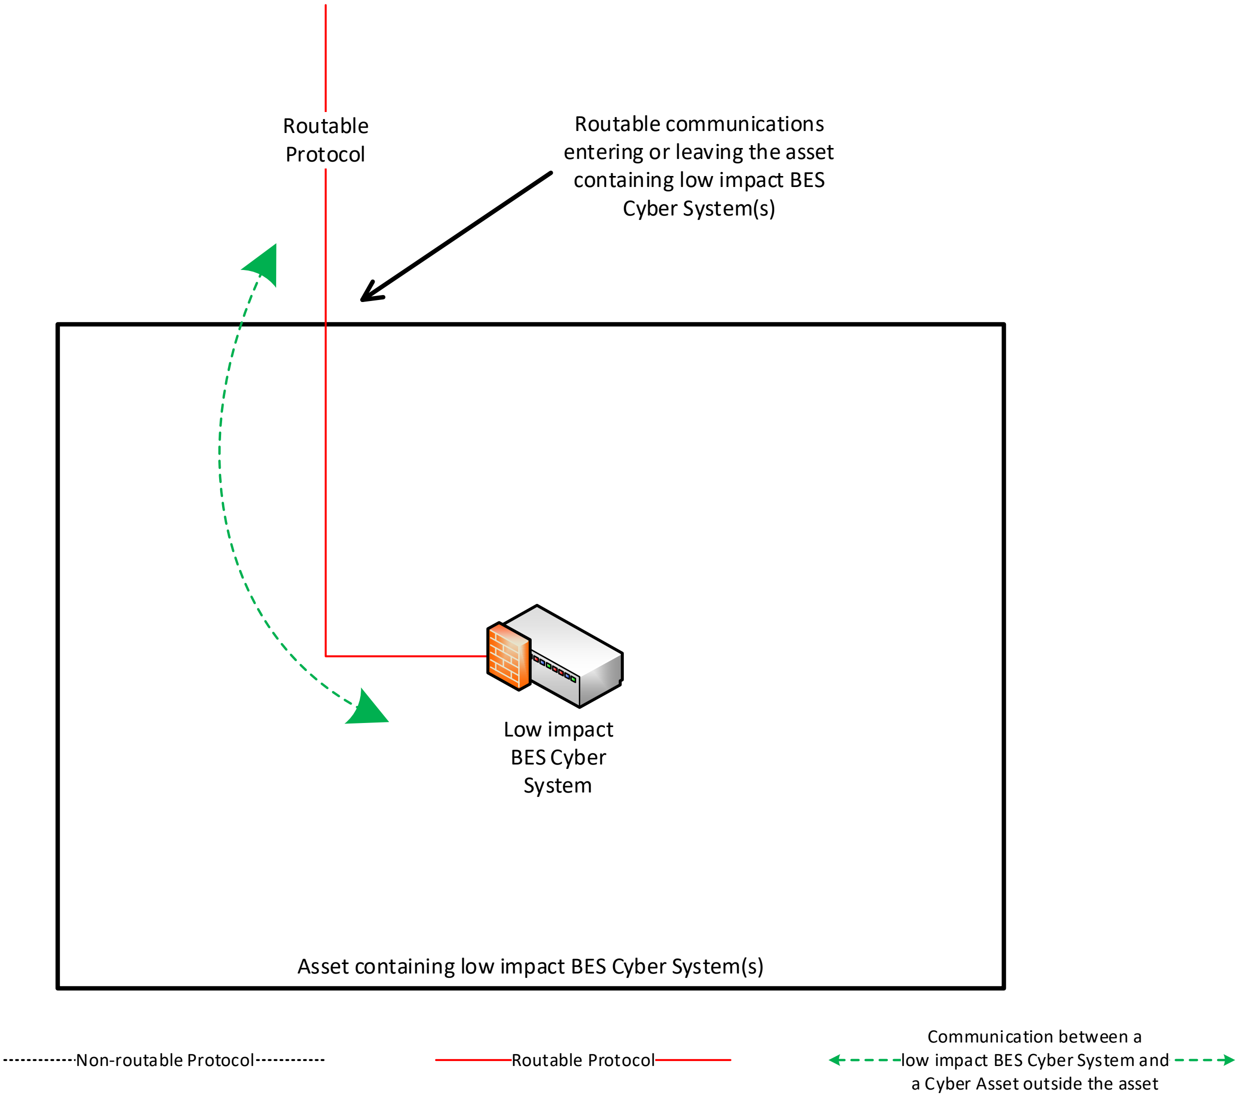
The diagrams on the following pages are provided as examples to illustrate various electronic access controls at a conceptual level. Regardless of the concepts or configurations chosen by the Responsible Entity, the intent is to achieve the security objective of permitting only necessary inbound and outbound electronic access for communication between low impact BES Cyber Systems and Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s) using a routable protocol when entering or leaving the asset.

NOTE:

- This is not an exhaustive list of applicable concepts.
- The same legend is used in each diagram; however, the diagram may not contain all of the articles represented in the legend.

Reference Model 1 – Host-based Inbound & Outbound Access Permissions

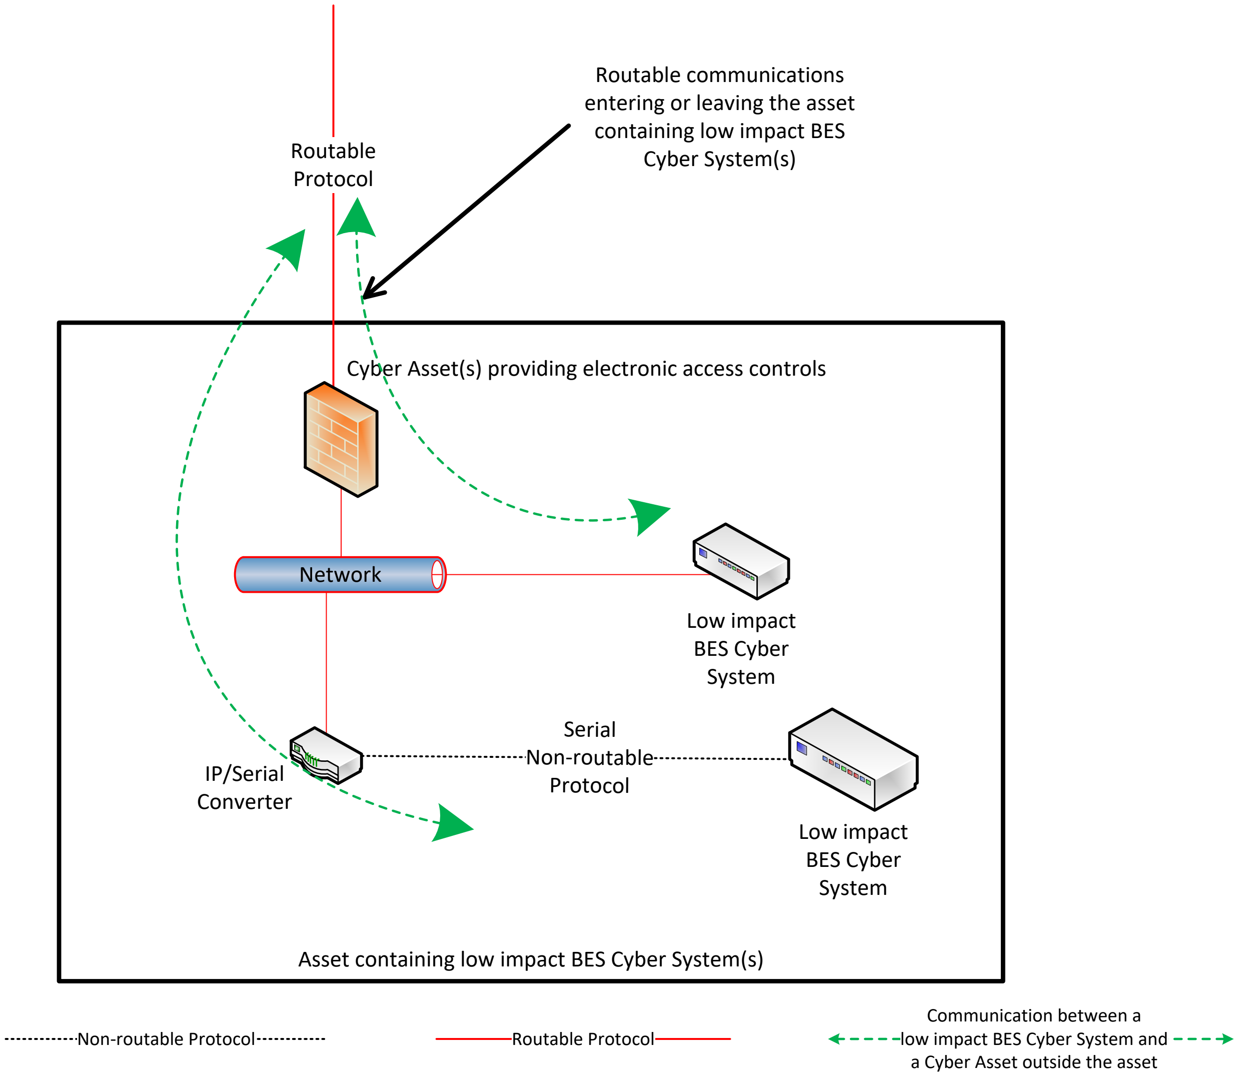
The Responsible Entity may choose to utilize a host-based firewall technology on the low impact BES Cyber System(s) itself that manages the inbound and outbound electronic access permissions so that only necessary inbound and outbound electronic access is allowed between the low impact BES Cyber System(s) and the Cyber Asset(s) outside the asset containing the low impact BES Cyber System(s). When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 1

Reference Model 2 – Network-based Inbound & Outbound Access Permissions

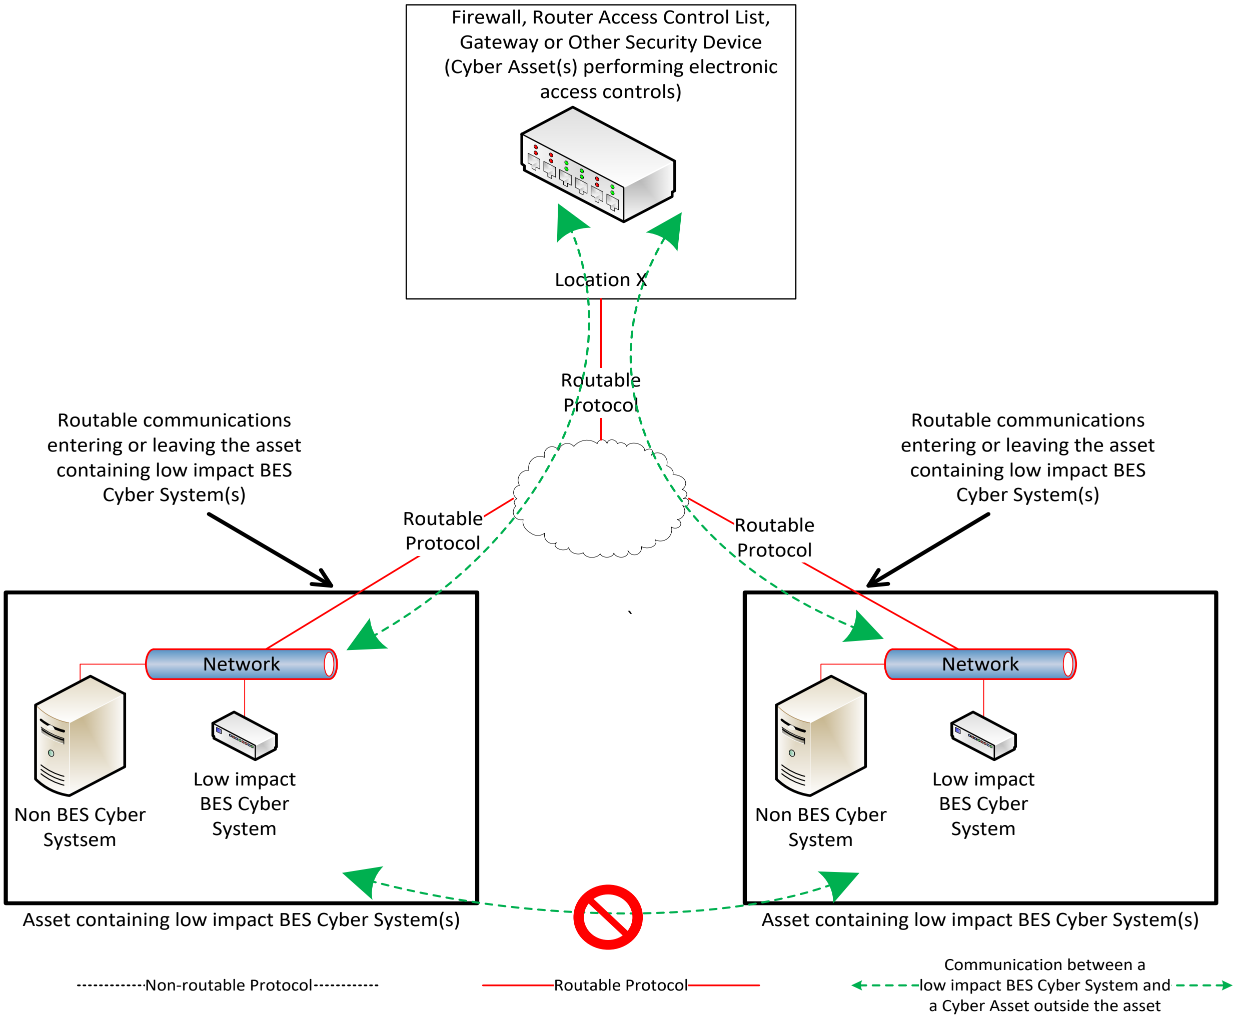
The Responsible Entity may choose to use a security device that permits only necessary inbound and outbound electronic access to the low impact BES Cyber System(s) within the asset containing the low impact BES Cyber System(s). In this example, two low impact BES Cyber Systems are accessed using the routable protocol that is entering or leaving the asset containing the low impact BES Cyber System(s). The IP/Serial converter is continuing the same communications session from the Cyber Asset(s) that are outside the asset to the low impact BES Cyber System(s). The security device provides the electronic access controls to permit only necessary inbound and outbound routable protocol access to the low impact BES Cyber System(s). When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 2

Reference Model 3 – Centralized Network-based Inbound & Outbound Access Permissions

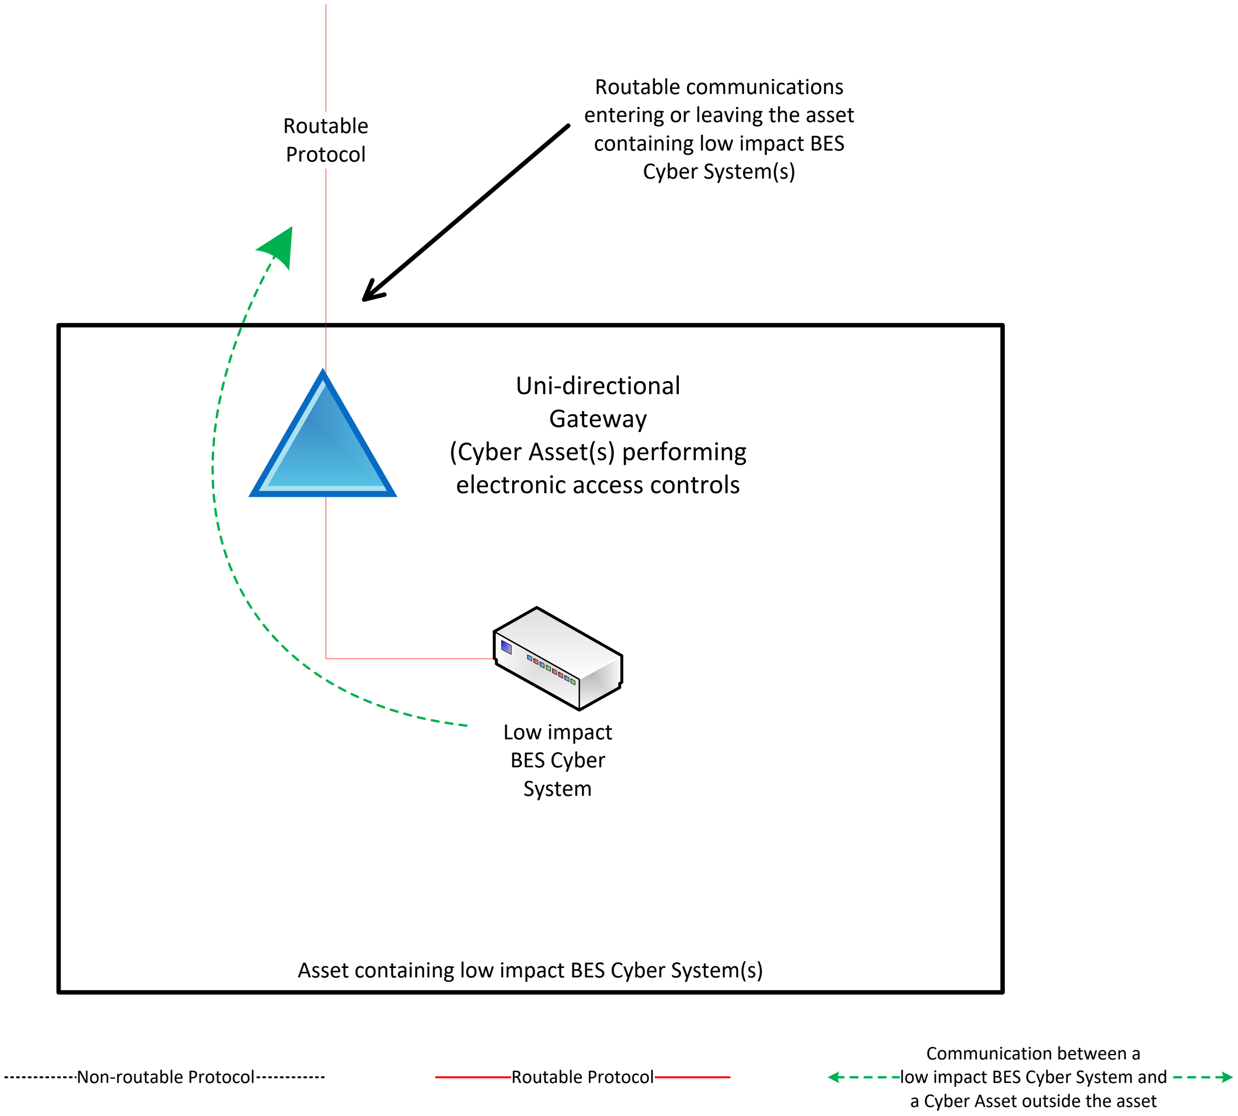
The Responsible Entity may choose to utilize a security device at a centralized location that may or may not be at another asset containing low impact BES Cyber System(s). The electronic access control(s) do not necessarily have to reside inside the asset containing the low impact BES Cyber System(s). A security device is in place at "Location X" to act as the electronic access control and permit only necessary inbound and outbound routable protocol access between the low impact BES Cyber System(s) and the Cyber Asset(s) outside each asset containing low impact BES Cyber System(s). Care should be taken that electronic access to or between each asset is through the Cyber Asset(s) determined by the Responsible Entity to be performing electronic access controls at the centralized location. When permitting the inbound and outbound electronic access permissions using access control lists, the Responsible Entity could restrict communication(s) using source and destination addresses or ranges of addresses. Responsible Entities could also restrict communication(s) using ports or services based on the capability of the electronic access control, the low impact BES Cyber System(s), or the application(s).



Reference Model 3

Reference Model 4 – Uni-directional Gateway

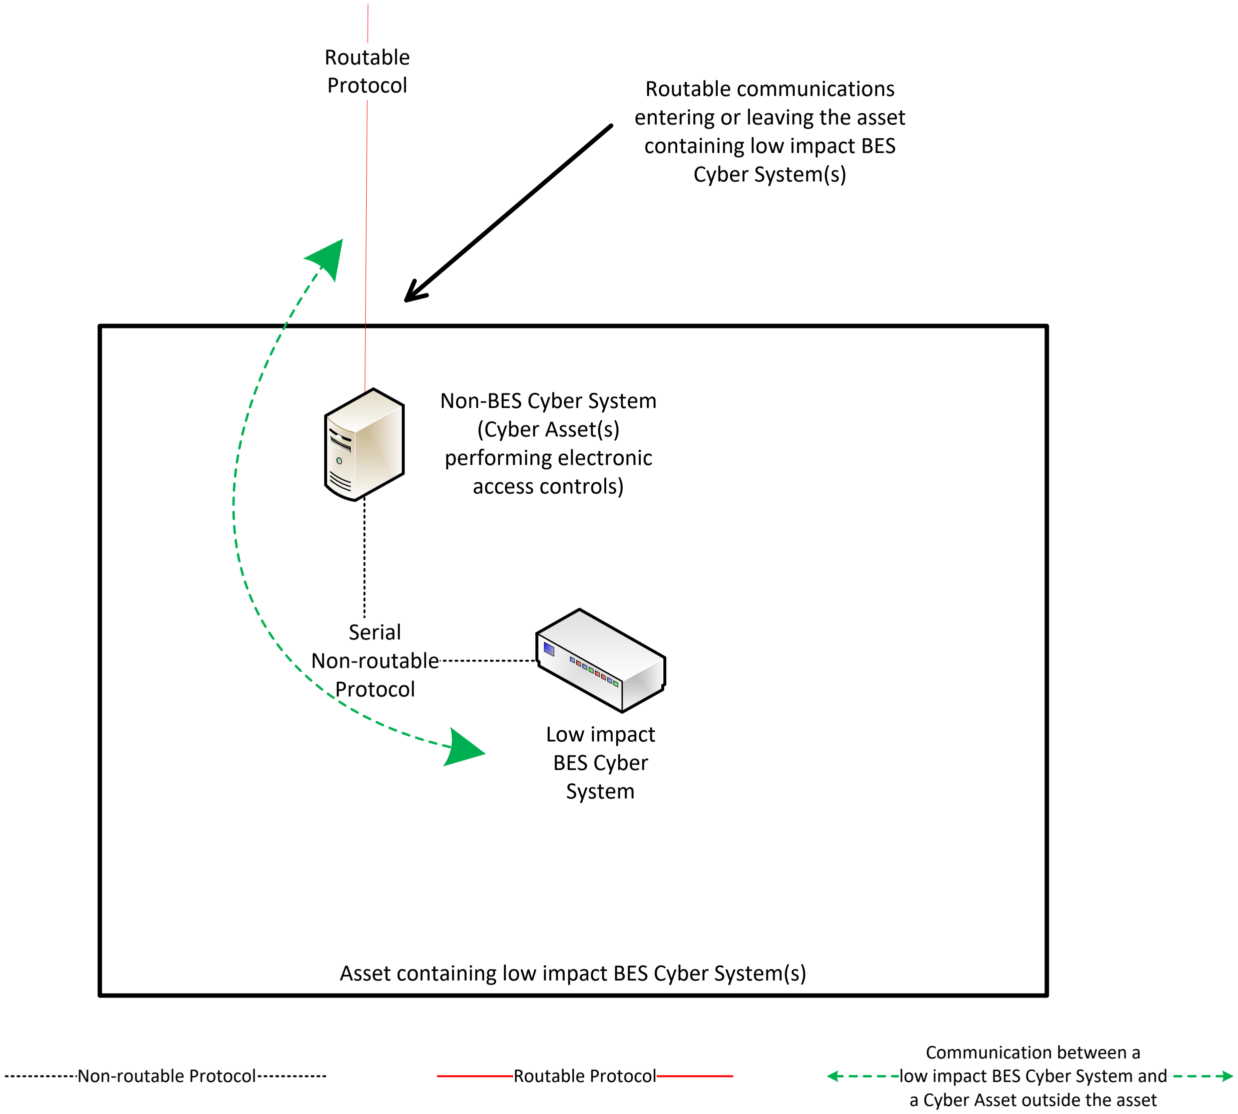
The Responsible Entity may choose to utilize a uni-directional gateway as the electronic access control. The low impact BES Cyber System(s) is not accessible (data cannot flow into the low impact BES Cyber System) using the routable protocol entering the asset due to the implementation of a "one-way" (uni-directional) path for data to flow. The uni-directional gateway is configured to permit only the necessary outbound communications using the routable protocol communication leaving the asset.



Reference Model 4

Reference Model 5 – User Authentication

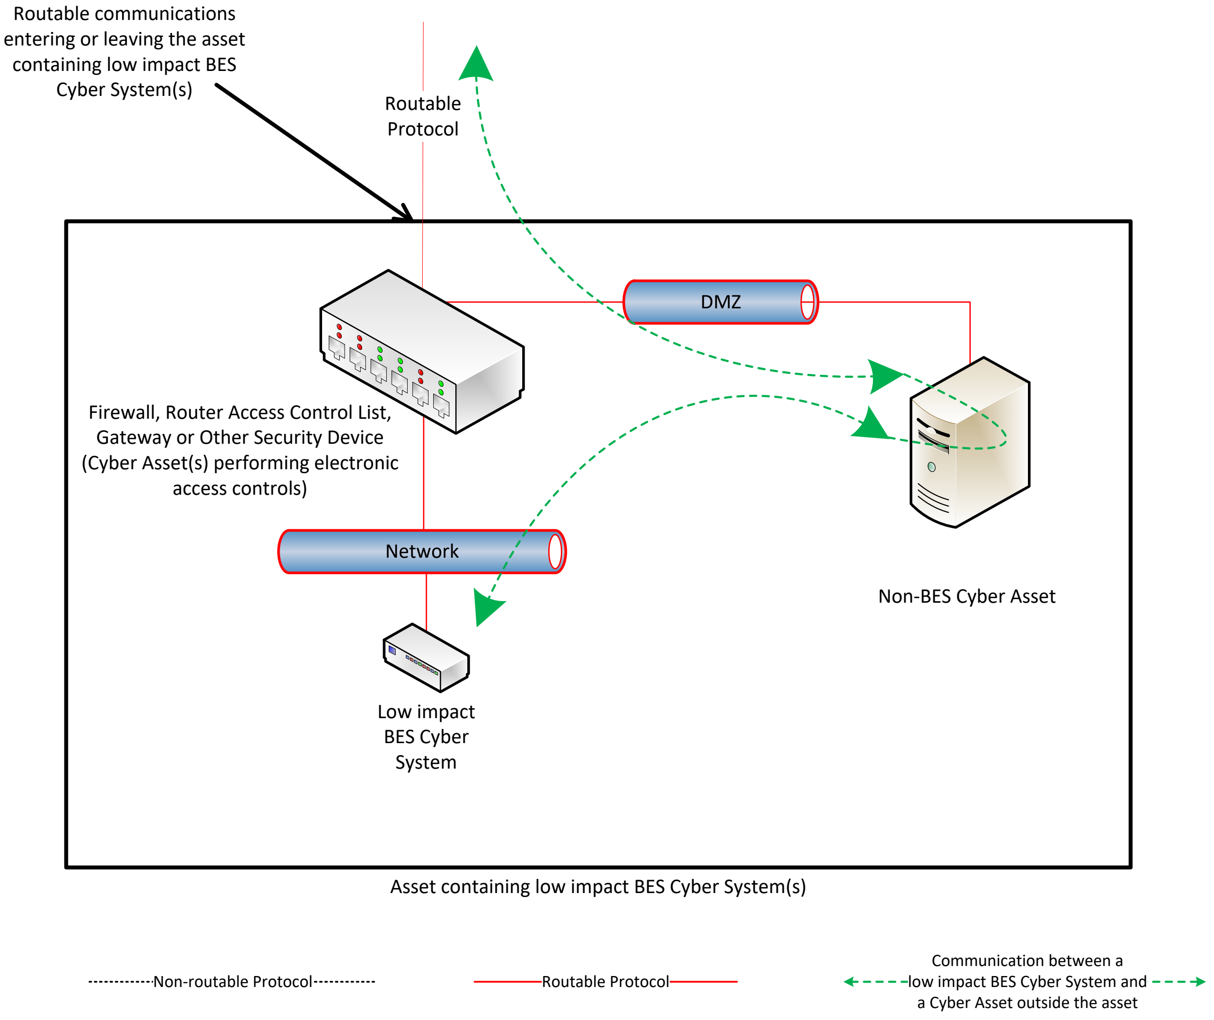
This reference model demonstrates that Responsible Entities have flexibility in choosing electronic access controls so long as the security objective of the requirement is met. The Responsible Entity may choose to utilize a non-BES Cyber Asset located at the asset containing the low impact BES Cyber System that requires authentication for communication from the Cyber Asset(s) outside the asset. This non-BES Cyber System performing the authentication permits only authenticated communication to connect to the low impact BES Cyber System(s), meeting the first half of the security objective to permit only necessary inbound electronic access. Additionally, the non-BES Cyber System performing authentication is configured such that it permits only necessary outbound communication meeting the second half of the security objective. Often, the outbound communications would be controlled in this network architecture by permitting no communication to be initiated from the low impact BES Cyber System. This configuration may be beneficial when the only communication to a device is for user-initiated interactive access.



Reference Model 5

Reference Model 6 – Indirect Access

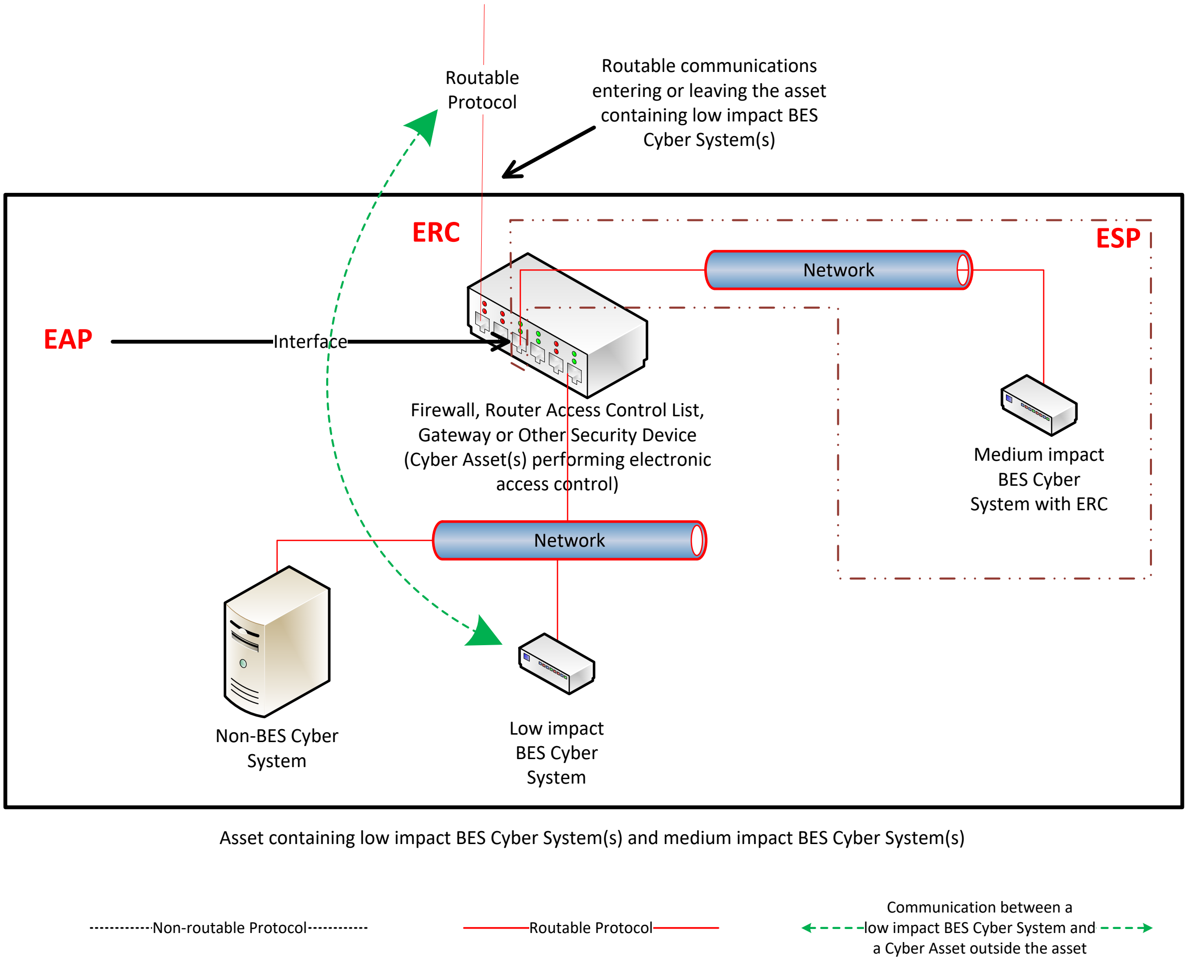
In implementing its electronic access controls, the Responsible Entity may identify that it has indirect access between the low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System through a non-BES Cyber Asset located within the asset. This indirect access meets the criteria of having communication between the low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System. In this reference model, it is intended that the Responsible Entity implement electronic access controls that permit only necessary inbound and outbound electronic access to the low impact BES Cyber System. Consistent with the other reference models provided, the electronic access in this reference model is controlled using the security device that is restricting the communication that is entering or leaving the asset.



Reference Model 6

Reference Model 7 – Electronic Access Controls at assets containing low impact BES Cyber Systems and ERC

In this reference model, there is both a routable protocol entering and leaving the asset containing the low impact BES Cyber System(s) that is used by Cyber Asset(s) outside the asset and External Routable Connectivity because there is at least one medium impact BES Cyber System and one low impact BES Cyber System within the asset using the routable protocol communications. The Responsible Entity may choose to leverage an interface on the medium impact Electronic Access Control or Monitoring Systems (EACMS) to provide electronic access controls for purposes of CIP-003. The EACMS is therefore performing multiple functions – as a medium impact EACMS and as implementing electronic access controls for an asset containing low impact BES Cyber Systems.



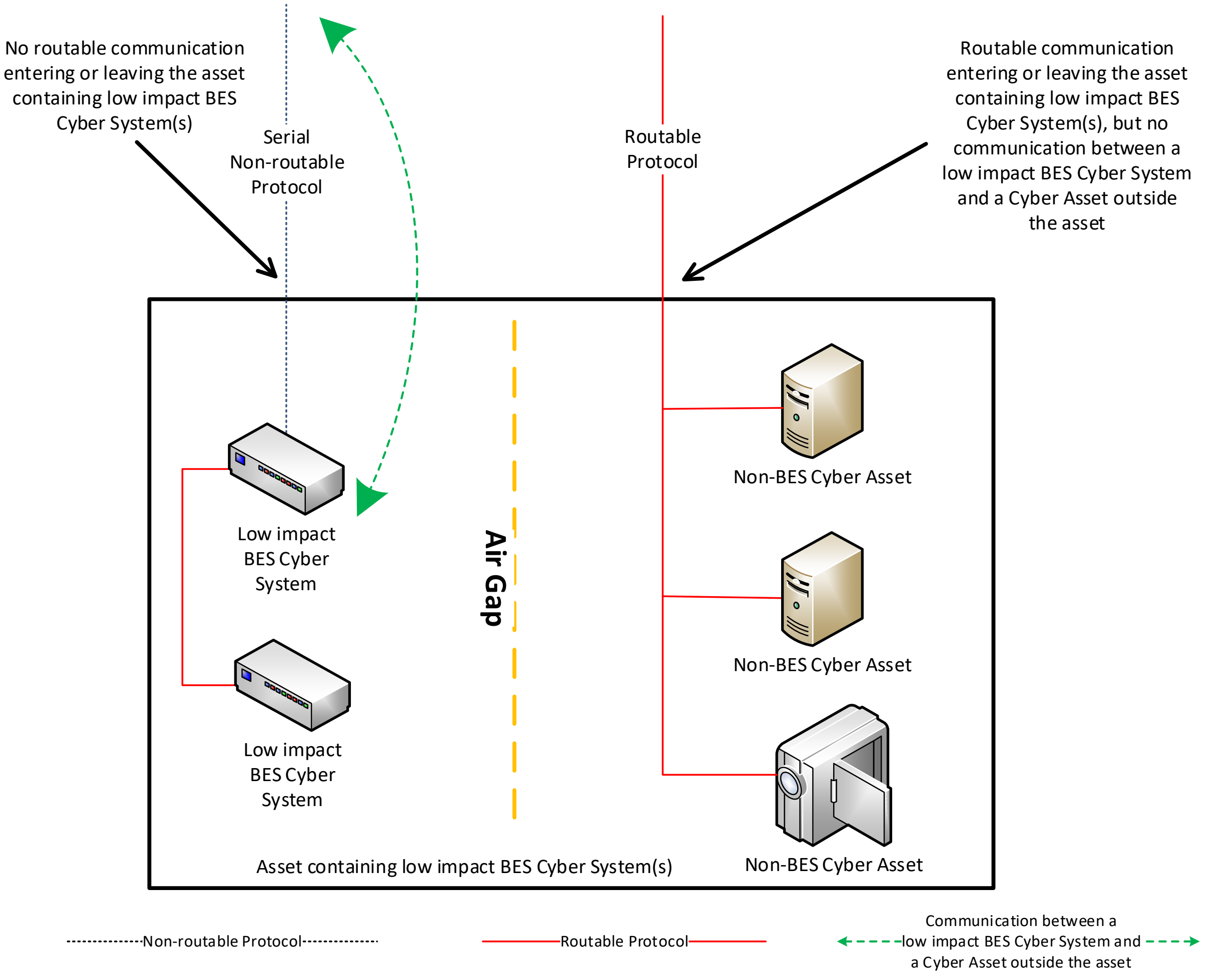
Reference Model 7

Reference Model 8 – Physical Isolation and Serial Non-routable Communications – No Electronic Access Controls Required

In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. This reference model demonstrates three concepts:

1) The physical isolation of the low impact BES Cyber System(s) from the routable protocol communication entering or leaving the asset containing the low impact BES Cyber System(s), commonly referred to as an 'air gap', mitigates the need to implement the required electronic access controls;
2) The communication to the low impact BES Cyber System from a Cyber Asset outside the asset containing the low impact BES Cyber System(s) using only a serial non-routable protocol where such communication is entering or leaving the asset mitigates the need to implement the required electronic access controls.
3) The routable protocol communication between the low impact BES Cyber System(s) and other Cyber Asset(s), such as the second low impact BES Cyber System depicted, may exist without needing to implement the required electronic access controls so long as the routable protocol communications never leaves the asset containing the low impact BES Cyber System(s).

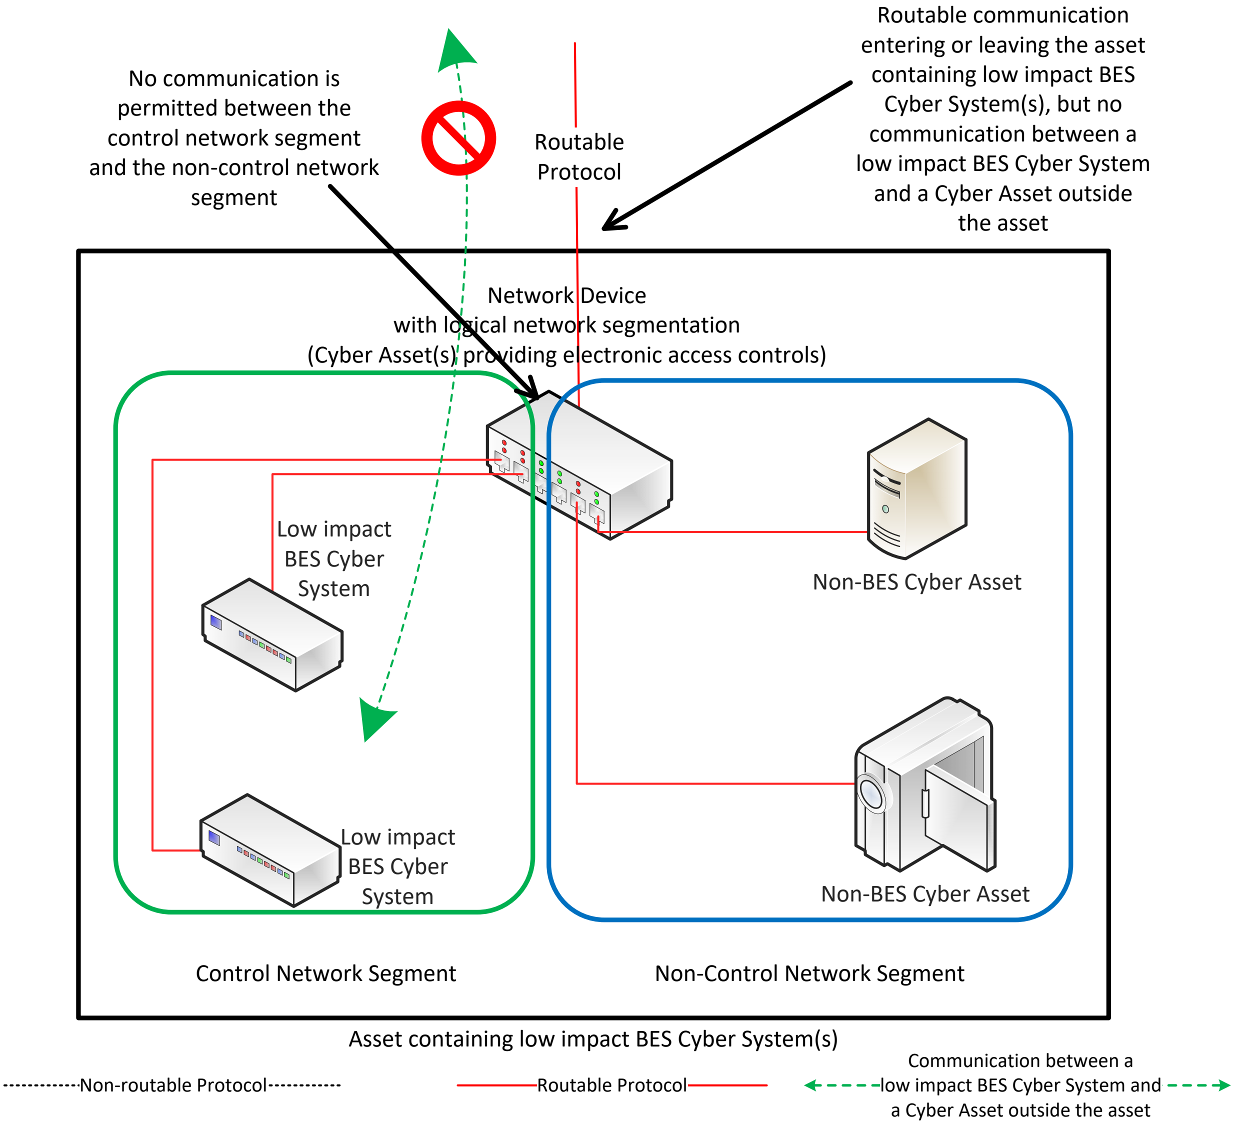
Section 1.



Reference Model 8

Reference Model 9 – Logical Isolation - No Electronic Access Controls Required

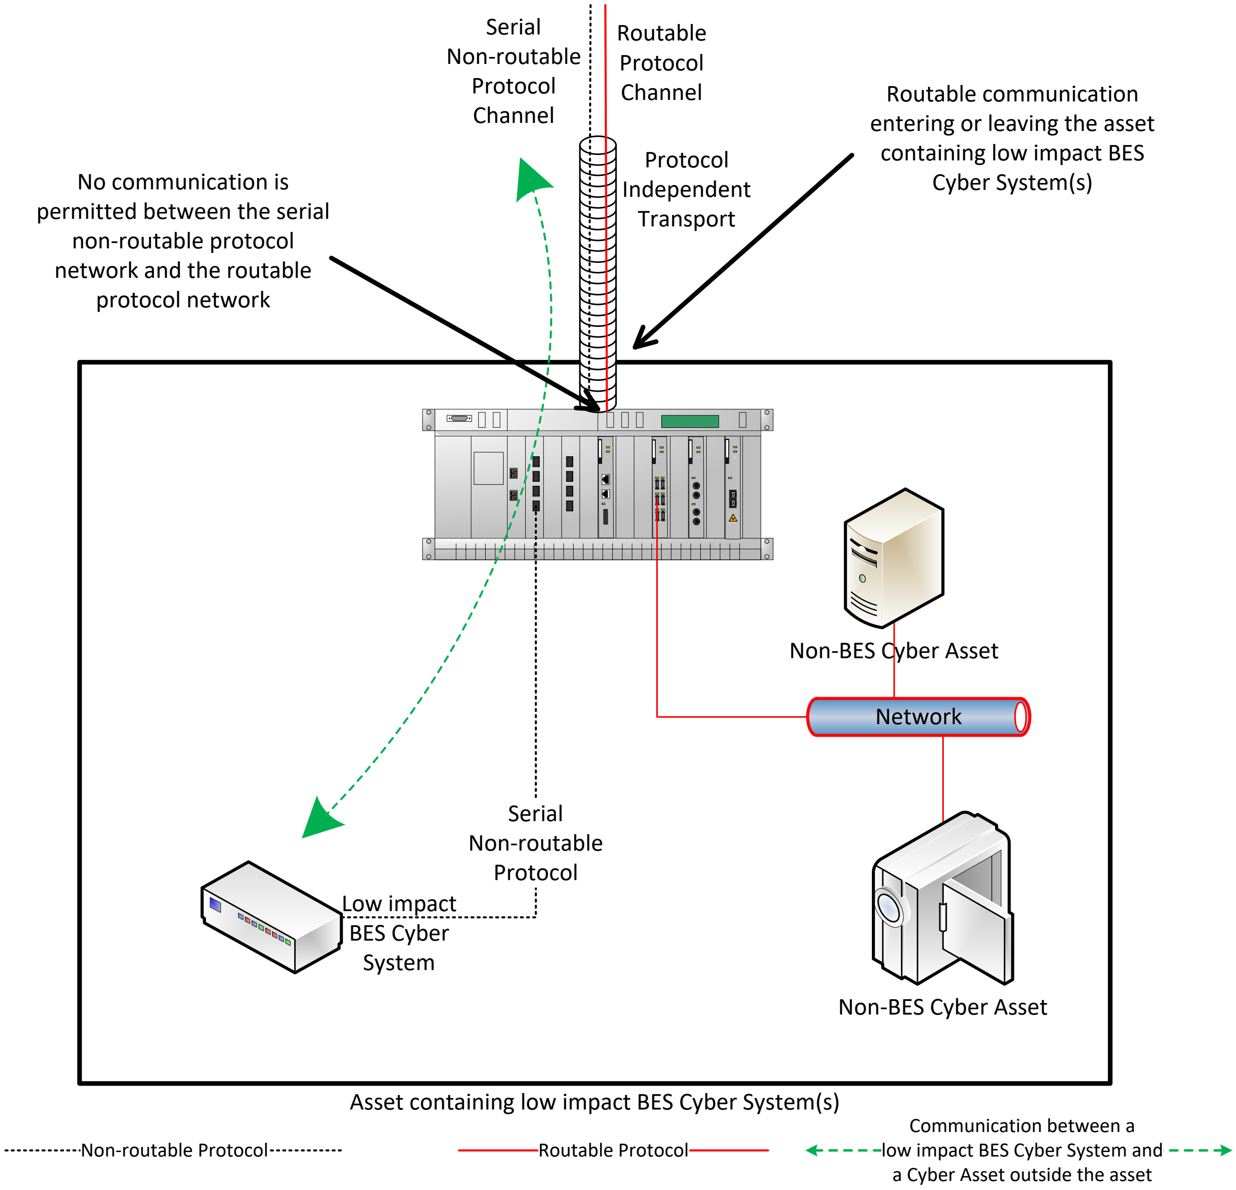
In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. The Responsible Entity has logically isolated the low impact BES Cyber System(s) from the routable protocol communication entering or leaving the asset containing low impact BES Cyber System(s). The logical network segmentation in this reference model permits no communication between a low impact BES Cyber System and a Cyber Asset outside the asset. Additionally, no indirect access exists because those non-BES Cyber Assets that are able to communicate outside the asset are strictly prohibited from communicating to the low impact BES Cyber System(s). The low impact BES Cyber System(s) is on an isolated network segment with logical controls preventing routable protocol communication into or out of the network containing the low impact BES Cyber System(s) and these communications never leave the asset using a routable protocol.



Reference Model 9

Reference Model 10 - Serial Non-routable Communications Traversing an Isolated Channel on a Non-routable Transport Network – No Electronic Access Controls Required

In this reference model, the criteria from Attachment 1, Section 3.1 requiring the implementation of electronic access controls are not met. This reference model depicts communication between a low impact BES Cyber System and a Cyber Asset outside the asset containing the low impact BES Cyber System over a serial non-routable protocol which is transported across a wide-area network using a protocol independent transport that may carry routable and non-routable communication such as a Time-Division Multiplexing (TDM) network, a Synchronous Optical Network (SONET), or a Multiprotocol Label Switching (MPLS) network. While there is routable protocol communication entering or leaving the asset containing low impact BES Cyber Systems(s) and there is communication between a low impact BES Cyber System and a Cyber Asset outside the asset, the communication between the low impact BES Cyber System and the Cyber Asset outside the asset is not using the routable protocol communication. This model is related to Reference Model 9 in that it relies on logical isolation to prohibit the communication between a low impact BES Cyber System and a Cyber Asset outside the asset from using a routable protocol.



Reference Model 10

Dial-up Connectivity

Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Insufficient Access Controls

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has Dial-up Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset that has a default password. There is no practical access control in this instance.
- A low impact BES Cyber System has a wireless card on a public carrier that allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.
- Dual-homing or multiple-network interface cards without disabling IP forwarding in the non-BES Cyber Asset within the DMZ to provide separation between the low impact BES Cyber System(s) and the external network would not meet the intent of “controlling” inbound and outbound electronic access assuming there was no other host-based firewall or other security devices on the non-BES Cyber Asset.

Requirement R2, Attachment 1, Section 4 – Cyber Security Incident Response

The entity should have one or more documented Cyber Security Incident response plan(s) that include each of the topics listed in Section 4. If, in the normal course of business, suspicious activities are noted at an asset containing low impact BES Cyber System(s), the intent is for the entity to implement a Cyber Security Incident response plan that will guide the entity in responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Entities are provided the flexibility to develop their Attachment 1, Section 4 Cyber Security Incident response plan(s) by asset or group of assets. The plans do not need to be on a per asset site or per low impact BES Cyber System basis. Entities can choose to use a single enterprise-wide plan to fulfill the obligations for low impact BES Cyber Systems.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but rather is an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as do other forms of tabletop exercises or drills. NERC-led exercises such as GridEx participation would also count as an exercise provided the entity’s response plan is followed. The intent of the requirement is for entities to keep the Cyber Security Incident response plan(s) current, which includes updating the plan(s), if needed, within 180 days following a test or an actual incident.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, “A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System.” The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

Requirement R2, Attachment 1, Section 5 – Transient Cyber Assets and Removable Media Malicious Code Risk Mitigation

Most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, and therefore Transient Cyber Assets and Removable Media are needed to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. Transient Cyber Assets and Removable Media are a potential means for cyber-attack. To protect the BES Cyber Assets and BES Cyber Systems, CIP-003 Requirement

R2, Attachment 1, Section 5 requires Responsible Entities to document and implement a plan for how they will mitigate the risk of malicious code introduction to low impact BES Cyber Systems from Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code to the BES Cyber Asset(s) or BES Cyber System(s). Note: Cyber Assets connected to a BES Cyber System for less than 30 days due to an unplanned removal, such as premature failure, are not intended to be identified as Transient Cyber Assets. Removable Media subject to this requirement include, among others, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Equipment used for BES Cyber System maintenance; or
- Equipment used for BES Cyber System configuration.

To meet the objective of mitigating risks associated with the introduction of malicious code at low impact BES Cyber Systems, Section 5 specifies the capabilities and possible security methods available to Responsible Entities based upon asset type and ownership.

With the list of options provided in Attachment 1, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset or BES Cyber Asset.

Malicious Code Risk Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in Section 5 in Attachment 1 to address the risks posed by malicious code when connecting Transient Cyber Assets and Removable Media to BES Cyber Systems. Mitigation is intended to mean that entities reduce security risks presented by connecting the Transient Cyber Asset or Removable Media. When determining the method(s) to mitigate the introduction of malicious code, it is not intended for entities to perform and document a formal risk assessment associated with the introduction of malicious code.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R2, Attachment 1, Section 5.1 - Transient Cyber Asset(s) Managed by the Responsible Entity

For Transient Cyber Assets and Removable Media that are connected to both low impact and medium/high impact BES Cyber Systems, entities must be aware of the differing levels of requirements and manage these assets under the program that matches the highest impact level to which they will connect.

Section 5.1: Entities are to document and implement their plan(s) to mitigate malicious code through the use of one or more of the protective measures listed, based on the capability of the Transient Cyber Asset.

The Responsible Entity has the flexibility to apply the selected method(s) to meet the objective of mitigating the introductions of malicious code either in an on-going or in an on-demand manner. An example of managing a device in an on-going manner is having the antivirus solution for the device managed as part of an end-point security solution with current signature or pattern updates, regularly scheduled systems scans, etc. In contrast, for devices that are used infrequently and the signatures or patterns are not kept current, the entity may manage those devices in an on-demand manner by requiring an update to the signatures or patterns and a scan of the device before the device is connected to ensure that it is free of malicious code.

Selecting management in an on-going or on-demand manner is not intended to imply that the control has to be verified at every single connection. For example, if the device is managed in an on-demand manner, but will be used to perform maintenance on several BES Cyber Asset(s), the Responsible Entity may choose to document that the Transient Cyber Asset has been updated before being connected as a Transient Cyber Asset for the first use of that maintenance work. The intent is not to require a log documenting each connection of a Transient Cyber Asset to a BES Cyber Asset.

The following is additional discussion of the methods to mitigate the introduction of malicious code.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to update the signatures or patterns and scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the risk that malicious software could execute on the Transient Cyber Asset and impact the BES Cyber Asset or BES Cyber System.
- When using methods other than those listed, entities need to document how the other method(s) meet the objective of mitigating the risk of the introduction of malicious code.

If malicious code is discovered on the Transient Cyber Asset, it must be mitigated prior to connection to a BES Cyber System to prevent the malicious code from being introduced into the BES Cyber System. An entity may choose to not connect the Transient Cyber Asset to a BES Cyber System to prevent the malicious code from being introduced into the BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Requirement R2, Attachment 1, Section 5.2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

Section 5 also recognizes the lack of direct control over Transient Cyber Assets that are managed by parties other than the Responsible Entity. This lack of control, however, does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to mitigate the introduction of malicious code to low impact BES Cyber System(s) from Transient Cyber Assets it does not manage. Section 5 requires entities to review the other party's security practices with respect to Transient Cyber Assets to help meet the objective of the requirement. The use of "prior to connecting the Transient Cyber Assets" is intended to ensure that the Responsible Entity conducts the review before the first connection of the Transient Cyber Asset to help meet the objective to mitigate the introduction of malicious code. The SDT does not intend for the Responsible Entity to conduct a review for every single connection of that Transient Cyber Asset once the Responsible Entity has established the Transient Cyber Asset is meeting the security objective. The intent is to not require a log documenting each connection of a Transient Cyber Asset to a BES Cyber Asset.

To facilitate these controls, Responsible Entities may execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014.[1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities may consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 5.2.1: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.

---

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This method intends to reduce the attack surface on the Transient Cyber Asset and reduce the avenues by which malicious software could be introduced.

Section 5.2.2: The intent of this section is to ensure that after conducting the selected review from Section 5.2.1, if there are deficiencies identified, actions mitigating the risk of the introduction of malicious code to low impact BES Cyber Systems must be completed prior to connecting the device(s) to an applicable system.

Requirement R2, Attachment 1, Section 5.3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 5.3: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The SDT does not intend to obligate a Responsible Entity to conduct a review for every single connection of Removable Media, but rather to implement its plan(s) in a manner that protects all BES Cyber Systems where Removable Media may be used. The intent is to not require a log documenting each connection of Removable Media to a BES Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 5.3.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System.

Requirement R3:

The intent of CIP-003-8, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Reliability Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-8, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity significant flexibility to adapt this requirement to its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up-to-date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

One or more security policies enable effective implementation of the requirements of the cyber security Reliability Standards. The purpose of policies is to provide a management and governance foundation for all requirements that apply to a Responsible Entity's BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements.

Annual review and approval of the cyber security policies ensures that the policies are kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

Rationale for Requirement R2:

In response to FERC Order No. 791, Requirement R2 requires entities to develop and implement cyber security plans to meet specific security control objectives for assets containing low impact BES Cyber System(s). The cyber security plan(s) covers five subject matter areas: (1) cyber security awareness; (2) physical security controls; (3) electronic access controls; (4) Cyber Security Incident response; and (5) Transient Cyber Asset and Removable Media Malicious Code Risk Mitigation. This plan(s), along with the cyber security policies required under Requirement R1, Part 1.2, provides a framework for operational, procedural, and technical safeguards for low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the BES, Attachment 1 provides Responsible Entities flexibility on how to apply the security controls to meet the security objectives. Additionally, because many Responsible Entities have multiple-impact rated BES Cyber Systems, nothing in the requirement prohibits entities from using their high and medium impact BES Cyber System policies, procedures, and processes to implement security controls required for low impact BES Cyber Systems, as detailed in Requirement R2, Attachment 1.

Responsible Entities will use their identified assets containing low impact BES Cyber System(s) (developed pursuant to CIP-002) to substantiate the sites or locations associated with low impact BES Cyber System(s). However, there is no requirement or compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber System(s) and their associated cyber assets or to maintain a list of authorized users.

Rationale for Modifications to Sections 2 and 3 of Attachment 1 (Requirement R2):

Requirement R2 mandates that entities develop and implement one or more cyber security plan(s) to meet specific security objectives for assets containing low impact BES Cyber System(s). In Paragraph 73 of FERC Order No. 822, the Commission directed NERC to modify "…the Low Impact External Routable Connectivity definition to reflect the commentary in the Guidelines and Technical Basis section of CIP-003-6…to provide needed clarity to the definition and eliminate ambiguity surrounding the term 'direct' as it is used in the proposed definition…within one year of the effective date of this Final Rule."

The revisions to Section 3 incorporate select language from the LERC definition into Attachment 1 and focus the requirement on implementing electronic access controls for asset(s) containing low impact BES Cyber System(s). This change requires the Responsible Entity to permit only necessary inbound and outbound electronic access when using a routable protocol entering or leaving the asset between low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber system(s). When this communication is present, Responsible Entities are required to implement electronic access controls unless that communication meets the following exclusion language (previously in the definition of LERC) contained in romanette (iii): "not used for time-sensitive protection or control functions between intelligent electronic devices (e.g. communications using protocol IEC TR-61850-90-5 R-GOOSE)".

The revisions to Section 2 of Attachment 1 complement the revisions to Section 3; consequently, the requirement now mandates the Responsible Entity control physical access to "the Cyber Asset(s), as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any." The focus on electronic access controls rather than on the Low Impact BES Cyber System Electronic Access Points (LEAPs) eliminates the need for LEAPs.

Given these revisions to Sections 2 and 3, the NERC Glossary terms: Low Impact External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) will be retired.

Rationale for Section 5 of Attachment 1 (Requirement R2):

Requirement R2 mandates that entities develop and implement one or more cyber security plan(s) to meet specific security objectives for assets containing low impact BES Cyber System(s). In Paragraph 32 of FERC Order No. 822, the Commission directed NERC to "…provide mandatory protection for transient devices used at Low Impact BES Cyber Systems based on the risk posed to bulk electric system reliability." Transient devices are potential vehicles for introducing malicious code into low impact BES Cyber Systems. Section 5 of Attachment 1 is intended to mitigate the risk of malware propagation to the BES through low impact BES Cyber Systems by requiring entities to develop and implement one or more plan(s) to address the risk. The cyber security plan(s) along with the cyber security policies required under Requirement R1, Part 1.2, provide a framework for operational, procedural, and technical safeguards for low impact BES Cyber Systems.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the Glossary of Terms used in NERC Reliability Standards so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP Senior Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

Technical Rationale for Reliability Standard CIP-004-8

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-004-8. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-004-8 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the issues identified by the V5TAG was virtualization. The V5TAG Transfer document states, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale." Document for reference when reading the technical rationale that follows.

Requirement R1-R6

General Considerations

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-004-8 to align personnel and training requirements with the virtualization changes.

To enable CIP-004-8 for virtualization, the SDT added "Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part" within the Applicable Systems column of each of the Parts for Requirement R1 – Requirement R6.

Additionally, where the term BES Cyber System (BCS) was used in the requirement language, it is replaced with "Applicable Systems" to align the requirement language of each Requirement Part with the updated applicability for each Requirement Part.

Requirement R3 Part 3.5

Summary of Changes:

A CIP Exceptional Circumstance was added as an exception to “Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 through 3.4 within the last seven years” such that individuals granted authorized electronic access and authorized unescorted physical access have undergone the personnel risk assessment processes.

Change Rationale:

The SDT determined Responsible Entities cannot require personnel risk assessments for first responders prior to granting them authorized unescorted physical access during certain conditions that qualify as CIP Exceptional Circumstances.

Former Background Section from Reliability Standard CIP-004-7

This section contains a "cut and paste" from the **Background** section of the Standard. It was retired and removed, and is provided as-is to preserve any historical references. No modifications have been made.

Background

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of documented processes where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as plans (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.

The following conventions are used in the “Applicable Systems” column as described. High Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

General Considerations for Requirement R1

None

Rationale for Requirement R1

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Requirement R2

General Considerations for Requirement R2

None

Rationale for Requirement R2

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table Requirement R2.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets (TCA) and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, TCA and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3

General Considerations for Requirement R3

None

Rationale for Requirement R3

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new personnel risk assessment (PRA). Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4

General Considerations for Requirement R4

None

Rationale for Requirement R4

Authorization for electronic and unescorted physical access must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5

General Considerations for Requirement R5

None

Rationale for Requirement R5

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked.

The initial revocation required in Requirement R5 Part 5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement R5 Part 5.5 specified that passwords for shared account are to be changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the Bulk Electric System. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Requirement R6

General Considerations for Requirement R6

None

Rationale for Requirement R6

Requirement R6 requires Responsible Entities to implement a BES Cyber System Information (BCSI) access management program to ensure that provisioned access to BCSI is authorized, verified, and promptly revoked. Authorization ensures only individuals who have a need are authorized for provisioned access to BCSI. Prompt revocation of terminated individuals' ability to access BCSI helps prevent inappropriate disclosure or use of BCSI. Periodic verification ensures that what is currently provisioned is authorized and still required, and allows the Responsible Entity the opportunity to correct any errors in provisioning.

The change to "provisioned access" instead of "designated storage locations" enables the use of third-party solutions (e.g., cloud services) for BCSI. The concept of "designated storage locations" is too prescriptive and limiting for entities that want to implement file-level rights and permissions (i.e., policy based credentials or encryption keys that follow the file and the provisioned individual), which provide BCSI access controls regardless of storage location. The concept of provisioned access provides the needed flexibility for entities to use other technologies and approaches instead of or in addition to storage locations as a way to meet the access management requirements for BCSI, especially that which is stored in third-party cloud solutions or is protected at the information/file level no matter where it is located.

According to Requirement R6, Part 6.1, the Responsible Entity must authorize individuals to be given provisioned access to BCSI. First, the Responsible Entity determines who needs the ability to obtain and use BCSI for performing legitimate work functions. Next, a person empowered by the Responsible Entity to do so authorizes—gives permission or approval for—those individuals to be given provisioned access to BCSI. Only then would the Responsible Entity provision access to BCSI as authorized.

Provisioned access is to be considered the result of specific actions taken to provide an individual the means to access BCSI (e.g., physical keys or access cards, user accounts and associated rights and privileges, encryption keys, etc.). In the context of this requirement, an individual is considered to have been provisioned access if they concurrently have the means to both obtain and use the BCSI. To illustrate, an individual who can obtain encrypted BCSI but does not have the encryption keys to be able to use the BCSI has not been provisioned access to the BCSI.

For BCSI in physical format, physical access is provisioned to a physical storage location designated for BCSI and for which access can be provisioned, such as a lockable file cabinet. For BCSI in electronic format, electronic access is provisioned to an electronic system or its contents, or to individual files. Provisioned physical access alone to a physical location housing hardware that contains electronic BCSI is not considered to be provisioned access to the electronic BCSI. Take, for instance, storing BCSI with a cloud service provider. In this case, the cloud service provider's personnel with physical access to the data center is not, by itself, considered provisioned access to the electronic BCSI stored on servers in that data center, as the personnel would also need to be provisioned electronic access to the servers or system. In scenarios like this, the Responsible Entity should implement appropriate information protection controls to help prevent unauthorized access to BCSI per its information protection program, as required in CIP-011-X. The subparts in Requirement R6, Part 6.1 were written to reinforce this concept and clarify access management requirements.

The periodic verification required by Requirement R6 Part 6.2 is to ensure that only authorized individuals have been provisioned access to BCSI and that what is provisioned is what each individual currently needs to perform work functions. For example, by performing the verification, the Responsible Entity might identify individuals who have changed jobs and no longer have a need for provisioned access to BCSI, and would therefore revoke provisioned access.

For Requirement R6 Part 6.3, removal of an individual's ability to use provisioned access to BCSI is considered to mean a process with the result that electronic access to electronic BCSI and physical access to physical BCSI is no longer possible from that point in time onwards using the means the individual had been given to obtain and use BCSI in those circumstances. Either what was specifically provisioned to give an individual access to BCSI (e.g., keys, local user or database accounts and associated privileges, etc.) is taken away, deleted, disabled, revoked, etc. (also known as "deprovisioning"), or some primary access is removed which prevents the individual from using the specifically provisioned means. Requirement R6 Part 6.3 acknowledges that where removing unescorted physical access and Interactive Remote Access, such as is required in Requirement R5 Part 5.1, prevents any further access to BCSI by the individual after termination, then this would constitute removal of an individual's ability to use provisioned access to BCSI. Access can only be revoked or removed where access has been provisioned. The intent is not to have to retrieve individual pieces of BCSI (e.g., documents) that might be in someone's possession (although you should if you can, but the individual cannot un-see what they have already seen).

Where no specific mechanisms are available or feasible for provisioning access to BCSI, these requirements are not applicable. For example, there is no available or feasible mechanism to provision access in instances when an individual is merely given, views, or might see BCSI, such as when the individual is handed a piece of paper during a meeting or sees a whiteboard in a conference room. Likewise, these requirements are not applicable where provisioned electronic or physical access is not specifically intended to provide an individual the means to obtain and use BCSI. There will likely be no specific provisioning of access to BCSI on workstations, laptops, flash drives, portable equipment, offices, vehicles, etc., especially when BCSI is only temporarily or incidentally located or stored there. Another example is the provisioning of access to a substation, the intent of which is to enable an individual to gain access to the substation to perform substation-related work tasks, not to access BCSI that may be located there. However, BCSI in these locations and situations still needs to be protected against unauthorized access per the Responsible Entity's information protection program as required by CIP-011-X.

The change to “provisioned access” to BCSI is backwards compatible with the previous “designated storage locations” concept. Entities have likely designated only those storage locations to which access can be provisioned, rather than any location where BCSI might be found. Both concepts intend to exclude those locations where BCSI is temporarily stored, as explained in the previous paragraph. Provisioned access, like designated storage locations, maintains the scope to a finite and discrete object that is manageable and auditable, rather than trying to manage access to individual pieces of information. The removal of the term “designated storage location” does not preclude an entity from defining storage locations for the entity’s access management program for authorization, verification, and revocation of access to BCSI.

Technical Rationale for Reliability Standard CIP-004-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-004-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

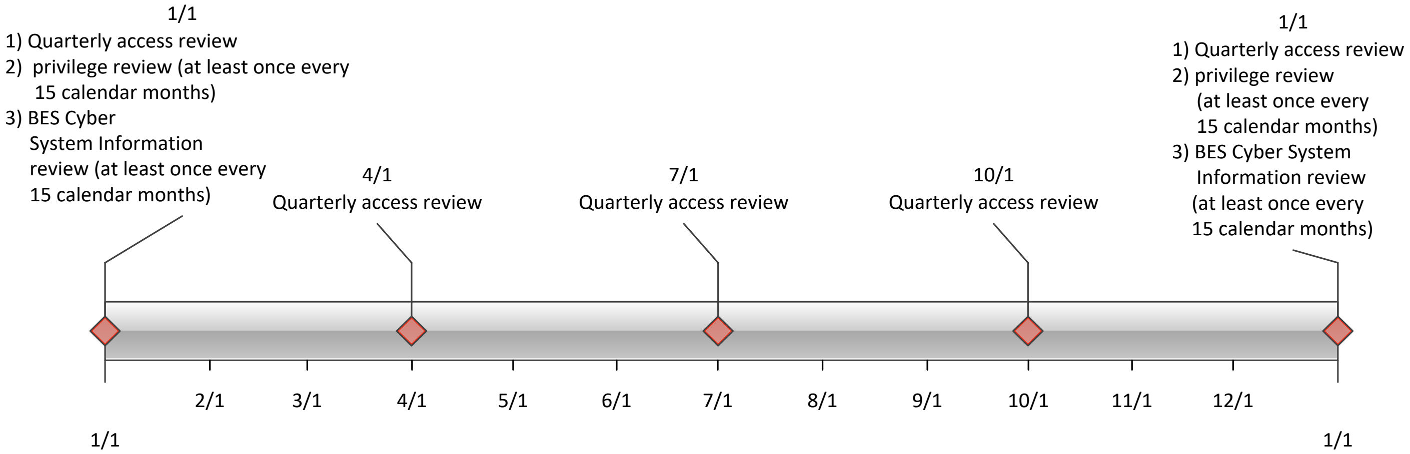
A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.



Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing “immediate” revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

Technical Rationale for Reliability Standard CIP-005-8

Introduction

This document is the technical rationale and justification for Reliability Standard CIP-005. It includes the rationale for changes in the current proposed version (CIP-005-8) as well as previous versions of the standard. The intent of this document is to provide stakeholders and the ERO Enterprise with an understanding of the revisions and the technical concepts of the Reliability Standard as well as the rationale for such revisions, both the currently proposed and historical revisions from previous versions and SDTs.

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-005-8. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-005-8 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition Advisory Group (V5TAG), which consisted of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005-8 and the definitions of Cyber Asset and Electronic Access Point (EAP) that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

Summary

The Project 2016-02 Standard Drafting Team (SDT) proposal accommodates for increasing use of virtualization and other technology innovation. The SDT's purpose of incorporating the virtualization concept into the CIP standards is not to merely augment the current standards, but also to better position the CIP standards to be applicable to additional future technological innovation while, to the extent possible, maintaining backwards compatibility.

CIP-005-8 remains a standard concerned with controlling communications to and from BES Cyber Systems (BCS) by establishing an Electronic Security Perimeter (ESP) with increased security controls for Interactive Remote Access (IRA) and vendor remote access. However, virtualization is enabling models for network security, such as "Zero Trust", that are not network perimeter based. Therefore, in CIP-005-8 the ESP focuses on being a security model rather than a network topology-based perimeter as the only option. Securing the communications to and from BCS is the security objective, but the standard no longer prescribes "where", as in where on a network, the controls must be implemented. Innovations such as Zero Trust models are moving access control from network borders to a session level orientation and eliminating the implicit trust within a local network. Network perimeter-based ESP and EAP implementations remain a valid option and are one method for allowing only necessary communications to the Cyber

Systems within the ESP. The ESP definition now has a two “flavors”, the original ESP definition unchanged as the first “flavor”, and the new boundary based model that enables zero-trust as the second.

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in “CIP Definitions and Exemptions Technical Rationale” document for reference when reading the technical rationale that follows.

Requirement R1 General Considerations

ESP Redefined

Network border-based ESPs and EAPs remain a valid option for controlling the communications to and from BCS. However, virtualization technologies and models such as Zero Trust present equally effective methods that are not network border-based solutions. A Zero Trust model can implement more granular controls throughout a network on a per-access or per-session level.

Shared infrastructure and “Mixed Trust” Risks

For virtualized environments where SCI is used, a risk of side channel attacks exists. Virtualization allows disparate workloads of what could be differing impact to execute on the same CPUs and share the same memory (i.e. RAM). In this case the lower impact systems would become high water marked with the higher impact system through the PCA definition. This would in turn affect what requires protection by any associated ESPs . The risks associated with this scenario is mitigated in CIP-005-8 by either:

- Declaring the VCAs that share CPU or memory or are within the same ESP with a BCS as associated PCAs which will require they meet the security requirements (high water marking) that include ‘associated PCAs’; or
- Configuring the virtualization infrastructure to place VCAs of differing impact or trust levels into differing CPU and memory pools and configuring affinity controls to these pools such that hypervisors do not allow workloads in these differing pools to simultaneously exist or execute on the same hypervisor.

Assets with Multiple Classifications (PCA, EACMS, Intermediate System, SCI, etc.)

The definitions created to categorize Cyber Assets have historically included overlap. The definition of PCA was revised to include VCAs that share CPU or memory with a BCS. Additional definitions such as SCI and VCA will add to the possibility of additional instances of assets or systems meeting multiple definitions, such as SCI that are also EACMS.

These definitions are used in both the Applicable Systems column as well as within the requirement language. The fact that one asset or system may meet multiple definitions and therefor have multiple classifications does not pose a significant challenge as long as the Responsible Entity ensures that all requirements that pertain to ANY of the classifications are applied. In other words, if an asset or system meets both the SCI and the EACMS definition, requirements that apply to either categorization are applicable.

Firewall/Router on a Stick

A “firewall on a stick” or “router on a stick” is a reference to a networking design scenario by which a firewall or router has one single physical connection to a switch, but has access to multiple networks and broadcast domains by utilizing logical interfaces in combination with VLANs (Virtual Local Area Networks).

Devices on different VLANs are not able to communicate by default, so the primary purpose of this design is to allow for inter-VLAN routing enabling communication between devices which reside on different VLANs by way of the firewall or router.

As all traffic between these VLANs passes through the firewall or router it is uniquely positioned to restrict access and log traffic flows between devices on different VLANs facilitating compliance and the enforcement of security requirements.

This design allows an entity additional flexibility with respect to the creation of multiple Electronic Security Perimeters while minimizing the cost and number of physical networking devices required to provide proper levels of protection and isolation to each of the created Electronic Security Perimeters.

An entity may select this design to enable further isolation of distinct applications and systems from each other based on the assessed risk that they pose to the BES or to enhance their ability to control access to these systems.

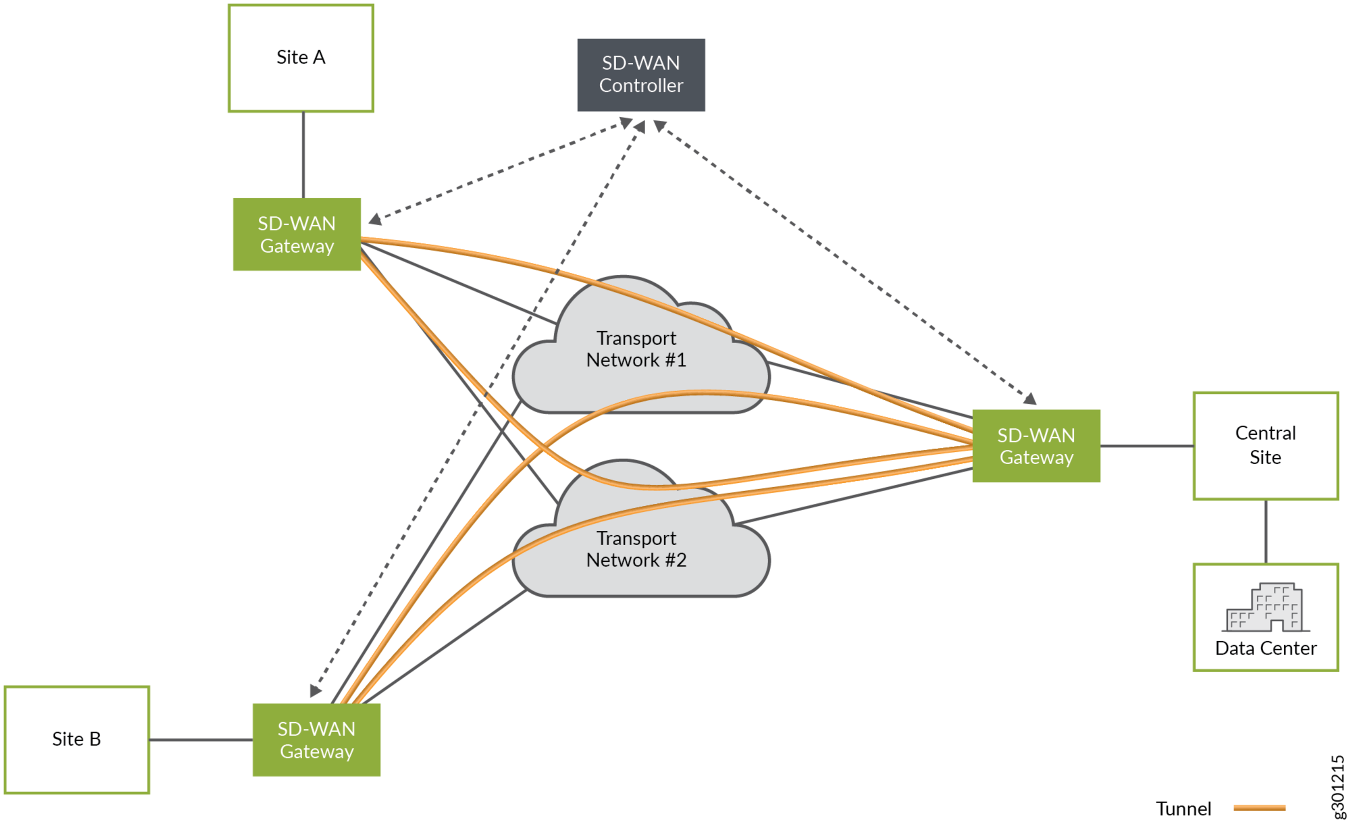
Careful attention should be given to the isolation and access control of management interfaces that support this design as they have the potential to impact multiple Electronic Security Perimeters.

SDWAN

Software-Defined Wide Area Networks (SDWANs) are comprised of an underlay network and an overlay network.

The underlay network is what we traditionally refer to as our Wide Area Networks and is constructed with various telecommunications provider circuits and technologies, including Serial, MPLS, LTE, Cable Modem, DSL, etc.

The overlay network is a virtual network layer created upon the underlay network, generally via encrypted tunnels or other similar mechanisms. An overlay network may utilize one or more underlay networks via load balancing or network policies. The policies governing the overlay network may dictate parameters such as what traffic is permitted, what underlay to utilize based on the application type, what should be utilized as the primary path, and various other parameters.



^^^ Inspiration for Matt, image sourced from Juniper Networks ^^^

SDWAN enables the construction of secured and isolated network paths with enhanced management and monitoring capabilities in addition to enabling additional services to and from the SDWAN such as VPN connectivity, firewall services, traffic inspection, and shared gateways.

This technology provides an increased level of control over Wide Area Networks while enhancing visibility, security, and redundancy, all while offering the potential to reduce the costs associated with providing connectivity between an entity's locations and assets.

VXLAN

VXLAN is similar in concept to SDWAN in that it is a form of a Software Defined Network, but in the case of VXLAN the focus is on networks within the Datacenter as opposed to SDWAN which focuses on networks between Datacenters and other facilities.

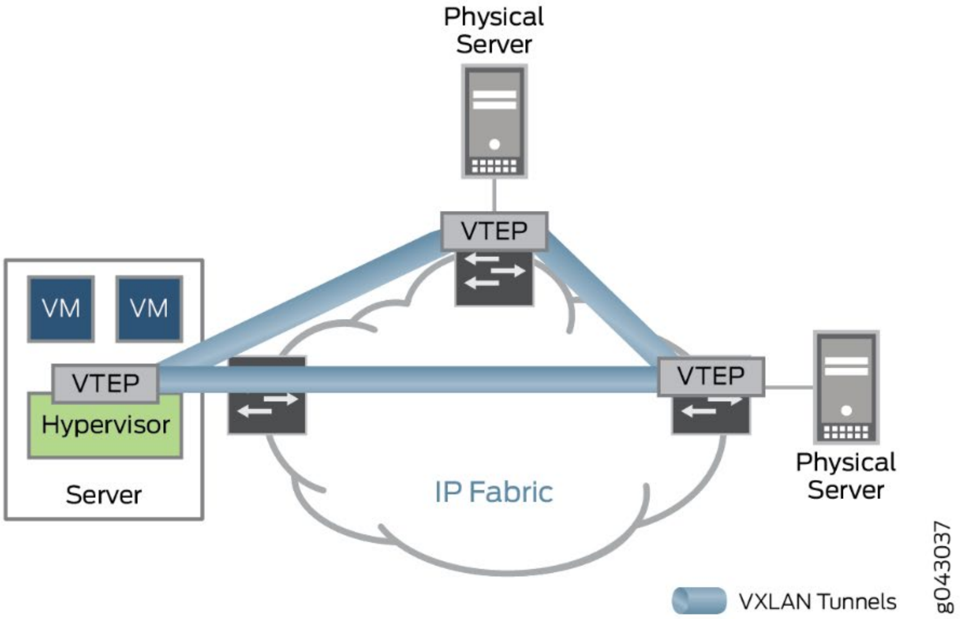
VLXLAN also utilizes the underlay and overlay terminology that we are familiar with given our review of SDWAN. The primary distinction is that VXLAN itself is the name of the overlay protocol utilized in this design and is the most common protocol used for overlay networks within a Datacenter.

The goal of VXLAN is to enhance the ability to segment network resources while also easing the burden of managing, automating, and orchestrating this segmentation by creating a virtual network that is agnostic of the physical network components supporting it.

The VXLAN protocol encapsulates Layer 2 Ethernet frames within Layer 3 UDP packets between devices comprising the design and allows for upwards of 16 million network segments to be created versus the traditional limit of 4094

VLANs. These network segments are identified with a VNI (VXLAN Network Identifier) which is synonymous to a VLAN ID.

The components of the design that are capable of encapsulating and de-encapsulating the VXLAN protocol are referred to as VTEPs (VXLAN Tunnel Endpoints) and are commonly network switches or virtual machine hypervisors. Physical devices and servers rely on switches to act as their VTEP whereas a virtual machine, hosted on VMWare ESX in this example, relies on the hypervisor as its' VTEP.



^^^ Inspiration for Matt, image sourced from Juniper Networks ^^^

VXLAN facilitates increasing the level of network segmentation within and between an entities Datacenters, while also enhancing their ability to automate and orchestrate the deployment of network resources. With this increased network segmentation an entity is granted more granular control over the flow of traffic and is given more opportunities to inspect that traffic to ensure appropriate levels of access control and protection.

Requirement R1

Rationale

Requirement R1 requires implementation of an ESP for BCS permitting only necessary communication through the ESP. However, there are other network security models available (such as zero trust) that can accomplish this security objective by controlling communications end-to-end at a more granular level than a network perimeter-based model. The definitions (ESP and EAP) and the changes to R1 allow entities the flexibility to implement different models that meet the security objective, or retain their current perimeter-based implementation.

Requirement R1 Part 1.1:

Rationale

This Requirement Part requires all high and medium impact BCS and their associated PCAs be protected by an ESP. In recognition of non-perimeter based models, the language changed from “shall reside within” to “must be protected by”. Note, a PCA can now be defined by two different attributes of what they share with a BCS – not only network location, but also the sharing of CPU and memory from the underlying hypervisor(s) for VCAs. In the instance that a VCA becomes an 'associated PCA' from its sharing of CPU or memory with a high or medium impact BCS, that associated PCA must also be protected by an ESP.

Note that this Requirement Part applies to all high and medium impact BCS without regard to external connectivity from the local network to other networks. This allows for the identification of PCAs and the scope of TCA connectivity even on isolated networks.

Requirement R1 Part 1.2:

Rationale

This Requirement Part changed to a security objective, rather than prescribing ERC must be controlled at an EAP. Virtualization technologies introduce additional methods to isolate systems. This requirement part no longer prescribes one method of controlling communications to Applicable Systems, and opens it up for alternative solutions.

This allows for other models such as zero trust architectures. Such models are not based on controlling communications at a Cyber Asset interface located on a network boundary. Communications can be authorized by software defined policy enforcement points throughout the infrastructure. In this model, network security is less topology-based and more policy-based (configurations and settings) and can be used to granularly protect communication at an individual system or even process or resource level.

While pure zero-trust architectures are an emerging model, the objective-based requirement also allows for hybrid models of various combinations of network border-based and zero trust architectures. As technology changes, this requirement and broadened ESP definition are flexible in how the objective is met.

The core security objective, of permitting only needed communications and denying all others by no longer prescribing this must be implemented at a Cyber Asset interface on a network border (an EAP), is retained. The intent of this Requirement Part is to control the 'reachability' of the Applicable Systems; filtering network communications *before* they reach the Applicable Systems and their OS, not as part of it. This is not to discourage the use of integrated host-based firewalls to further filter network traffic to a host.

Time-sensitive communications between Protection Systems (i.e., digital relays) that use routable communication protocols is excluded. Time-sensitive in this context generally means functions that would be negatively impacted by the latency introduced in the communications by inserting an ESP and its controls. This time-sensitivity exclusion does not apply to SCADA communications which typically operate on scan rates of 2 seconds or greater. While technically time-sensitive, SCADA communications over routable protocols can withstand the delay introduced by electronic access controls. Examples of excluded time-sensitive communications are those communications which may necessitate the tripping of a breaker within a few cycles (sub-second response times) to protect BES assets. The SDT intent is a Responsible Entity using this technology is not expected to implement the electronic access controls in a situation where it would prohibit the proper function in the proper timeframe.

Requirement R1 Part 1.3:

Rationale

The purpose of this new Requirement Part is to permit only needed communications to and from the Management Interfaces, denying all other communications, of the systems that are providing protection of BCS; namely SCI that is supporting an Applicable System from Part 1.1 (SCI isolates systems of different impact levels from each other) and EACMS that are enforcing an ESP (This Requirement Part only applies to SCI and EACMS enforcing an ESP, and not to the BCS itself). These are vital controls performing the isolation/segmentation between systems of differing impact levels, and warrant protection of the Management Interface that could be used to compromise them.

For the EACMS portion, a firewall that is enforcing an ESP, as well as a network switch configured with VLANs to isolate and segment traffic are intended to be included and have their Management Interfaces protected.

The 'per system capability' is included in this Part in recognition that some Management Interfaces, such as "ILO" interfaces, may do inbound but not outbound traffic controls.

Requirement R1 Part 1.4:

Rationale

The SDT included "SCI supporting an Applicable System in this Part" to the scope of the requirement part to ensure that controls regarding Dial-up Connectivity are also applicable to VCAs and SCI; and 'technical feasibility' has been replaced with the 'per system capability'.

Additionally, in order to maintain a decipherable Applicable Systems column the SDT replaced the scoping phrase "with Dial-Up Connectivity" from the Applicable Systems column, with a reference to "if any" in the Requirement Language.

Requirement R1 Part 1.5:

Rationale

Known or suspected malicious communication detection is specific to Internet Protocol (IP) based traffic that enters or leaves the required ESP. Products available to implement this malicious communication detection are usually based on IP traffic (as defined in RFC 791 and upon which TCP and UDP reside). Requirement applicability was changed to BCS instead of EAPs; lifting it to an objective level and keeping it from being a prescriptive 'where' that forces certain architecture.

Requirement R1 Part 1.6:

Rationale

Requirement R1 Part 1.6 was written to address the issue of "Super ESPs" with high or medium impact BCS at Control Centers that extend a single ESP beyond one PSP. This often applies to virtualized Control Center environments that implement network adjacency to allow workloads to automatically move from one physical location to another to increase BCS resiliency between primary and backup Control Centers.

The security objective is to protect the confidentiality and integrity of the data traversing communication links used to span a single ESP between multiple PSPs. This is especially important when portions of the transport are not within the Registered Entity's control. Many encryption methods (such as IPSec and TLS) can fulfil this objective, however some encryption methods fall short of providing both confidentiality and integrity controls.

This Requirement Part works in conjunction with the new 4.2.3.3 exemption in the CIP standards that exempts the Cyber Systems associated with such communication links since the data is required to be protected per this requirement. Also, the former CIP-006-6, Requirement R1, Part 1.10 has been removed and incorporated into this new 1.6 requirement part; consolidating the protections of an ESP and its components that extend outside of a PSP within one standard.

Communications equipment associated with communications links (e.g., equipment belonging to carriers) is exempted from the CIP standards with the 4.2.3.2 exemption, however that only applies to equipment between discrete ESPs. However, in this extended ESP situation where a single ESP spans multiple sites or PSPs, that exemption does not apply and the potential exists for data to traverse a connection that uses third-party communications equipment that is unprotected inside an ESP; hence the need to enforce confidentiality and integrity controls (such as encryption) on the data that traverses PSPs while within the same ESP to isolate any protected data from access through the communications equipment.

This consolidation also incorporates cabling and non-programmable communication components that are not PSP-protected, intending to protect data moving across the state as well as data traversing cabling that crosses the hall outside of the PSP. Note: the language specifically exempts the data that falls under CIP-012 Requirements in order to avoid the potential for double jeopardy as well as the time-sensitive protection or control functions as described in CIP-005-8 Requirement R1 Part 1.1 above.

Requirement R2:

General Considerations for Requirement R2.

External Routable Connectivity (ERC) and Interactive Remote Access (IRA)

The ERC and IRA definitions have been updated in order to:

1. Incorporate new models such as Zero Trust where a security perimeter is not necessarily a network perimeter and ESP's become very granular based on policies that can be established at "people to resource" levels rather than IP address levels.
2. Recognize those Cyber Systems that are of an increased risk due to their "reachability" via ERC and that have IRA available to them even if they are serial-only, non-routable devices.
3. Continue to limit scope of Requirement Parts to BCS with ERC and not those that have connectivity such as non-routable serial leased circuits.

The V5TAG transfer document in the SDT's scope include the issue of a BES Cyber Asset (BCA) that only uses non-routable protocols over a serial port. These BCAs are not connected to a network with a routable protocol themselves and therefore can be considered to not be within an ESP and thus not have ERC. However, these BCAs can have interactive user access using those serial connections. The SDT's intent is to clarify that IRA can occur to a device with only a serial, non-routable connection through IP-to-serial conversions and be subject to CIP-005-8 Requirement R2. For example, the intent is to clearly cover situations where a serial-only, non-routable BCA, such as a digital relay in a substation, has its serial communication from a 'console port' converted to IP or other routable protocols thus allowing IRA from users outside the substation to use a routable protocol to interact with the serial device and to require the CIP-005-8 Requirement R2 protection for that IRA.

The SDT removed the requirement-style language "The Intermediate System must not be located inside the Electronic Security Perimeter" from the Intermediate System definition in favor of a clarified objective in CIP-005-8 Requirement R2 that all IRA must be *through* an Intermediate System. Requirement R2 Part 2.6 was added to objectively address the location of the Intermediate System.

See the "*CIP Definitions and Exemptions Technical Rationale*" document for further explanation of the changes to the R2 related definitions.

Requirement R2 Part 2.1:

Rationale

Applicable Systems was updated to include SCI to ensure the same safeguards for remote access methods exist for SCI supporting an Applicable System within the Part as they do for the high and medium impact BCS and associated PCA hosted on that SCI. Backwards compatibility is retained for entities that do not use SCI.

The requirement language was simplified, and definitions for IRA and Intermediate System have been updated. Please note that the definition of IRA was changed to include serial communications that are converted to/from routable protocols by the Responsible Entity. This change maintains backwards compatibility except where serial connectivity and routable protocol conversion is being used for IRA.

Requirement R2 Part 2.2:

Rationale

The "Applicable Systems" scope was changed to "Intermediate Systems used to access Applicable Systems of Part 2.1". This clarifies this requirement is associated with the IRA communications between an Intermediate System and the remote clients, as opposed to between the Intermediate System and the BCS. This is important so that it does not require encryption through the ESP to the BCS which would hinder monitoring and inspection.

The requirement was changed from a specific technical-based requirement for encryption to an objective-based requirement to protect confidentiality and integrity of the IRA session between the Intermediate System and the remote client (with encryption as a primary example). The proposed language accounts for the possibility that other equally effective methods could be developed and deployed. This objective also keeps methods from being used that are merely obfuscation methods (XOR, ROT13, etc.) or deprecated encryption methods (DES with 56-bit keys) that no longer meet the objective to protect the confidentiality and integrity of the IRA session.

The changed requirement is backwards compatible except where deprecated encryption methods are in use.

Requirement R2 Part 2.3:

Rationale

The Applicable Systems was changed to "Intermediate Systems used to access Applicable Systems of Part 2.1". This clarifies this requirement is associated with the Intermediate System itself, and where the requirement for multifactor authentication should be applied (multi-factor authentication to the Intermediate System).

Requirement R2 Part 2.4 – 2.5:

Rationale

The Applicable Systems section of this requirement was updated to include SCI for instances where vendor remote access is allowed to the SCI. The Applicable Systems were also modified such that only those with vendor remote access are in scope and thus need to have one or more methods for CIP-005-8 Requirement R2 Parts 2.4 and 2.5.

The requirements themselves have not changed.

Requirement R2 Part 2.6:

Rationale

This is a new requirement that applies to Intermediate Systems. The intent of this new requirement is to further protect the BCS from the Intermediate System by reducing the attack surface between the two. Intermediate Systems have an externally accessible interface that may be used by external parties such as vendors or entity support staff using IRA across an Internet connection to support a remote site. Since Intermediate Systems by nature provide IRA from a less-trusted network and are accessible from yet-to-be authenticated users (in order to authenticate them), a degree of separation from the higher-trust systems they are protecting is necessary in case the Intermediate System is compromised. Previously, this risk was addressed within the glossary definition of Intermediate System ("…must not be located inside the ESP") instead of within an actual requirement. The SDT removed this from the definition and included a security objective in CIP-005-8 Requirement R2 Part 2.6 to require that routable protocol communications between Intermediate Systems and Applicable Systems of Part 2.1 must be through an ESP.

It is important to note that a virtualized Intermediate System (VCA) hosted in such a way that it can share CPU and memory with a BCS will also meet the definition of PCA and become an 'associated PCA' of the BCS. CIP-005 R1.1 requires that PCA to be within an ESP, in conflict with this requirement. This is by design, and thus a VCA performing the function of an Intermediate System must not share CPU or memory with the BCS it is controlling access for. This is due to the access granted to the less trusted side of the Intermediate System and the risk is has for side-channel attacks to other VCAs sharing the same CPU and memory. Entities must therefore use affinity rules or some other means to keep Intermediate System VCAs from sharing the same CPU and memory as a BCS or its associated PCAs.

Requirement R3

Rationale

The Applicable Systems section of CIP-005-8 Requirement R3 was updated to include SCI to ensure the same safeguards for vendor-initiated remote connections exist for the applicable SCI. Backwards compatibility is retained for entities that do not currently use SCI.

Former Background Section from Reliability Standard CIP-005-7

This section contains a "cut and paste" from the **Background** section of the Standard. It was retired and removed, and is provided as-is to preserve any historical references. No modifications have been made.

Background

Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BCS and require a minimum level of organizational, operational and procedural controls to mitigate risk to BCS.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BCS. For example, a single training program could meet the requirements for training personnel across multiple BCS.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicability Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.

- **High Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to high impact BES Cyber Systems with Dial-up Connectivity.

- **High Impact BES Cyber Systems with External Routable Connectivity** – Only applies to high impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.

- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.

- **Medium Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to medium impact BES Cyber Systems with Dial-up Connectivity.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

- **Electronic Access Points (EAP)** – Applies at Electronic Access Points associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

Technical Rationale for Reliability Standard CIP-005-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-005-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-005-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in this Section that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Furthermore, Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of Bulk Electric System (BES) Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Updates to this document now include the Project 2019-03 – Cyber Security Supply Chain Risks Standard Drafting Team's (SDT's) intent in drafting changes to the requirements.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850 on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards to address Electronic Access Control or Monitoring Systems (EACMS), specifically those system that provide electronic access control or monitoring to high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-005-7 to require Responsible Entities to meet the directives set forth in the Commission's Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

Additionally, the Project 2019-03 SDT removed Interchange Coordinator or Interchange Authority as that registration has been retired.

New and Modified Terms Used in NERC Reliability Standards

CIP-005-7 uses the following definition(s), which are cited below for reference when reading the technical rational that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1

General Considerations for Requirement R1

The ESP serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network-based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R1

CIP-005-5, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP. However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, then each Cyber Asset of the low impact BES Cyber System are "Associated Protected Cyber Assets" of the high impact BES Cyber System and must meet all the requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero-day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communication to that known range. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rouge connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R2

General Considerations for Requirement R2

Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources should only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords.

But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Requirement R3

Requirement Part 3.1 and Part 3.2 Vendor Remote Access Management for EACMS and PACS

The 2019-03 SDT added Requirement R3 to contain the requirements for all types of vendor remote access management for EACMS and PACS (i.e. system to system, user to system). EACMS were added based on FERC order 850 paragraph 5 where FERC ordered NERC to create a drafting team to add these devices. EACMS were added based on the risks FERC noted in paragraph 4, where a Department of Homeland Security Industrial Control System-Cyber Emergency Response Team (DHS ICS-CERT) said firewalls (normally defined as an EACMS) is the “first line of defense within an Industry Control System (ICS) network environment”. The compromise of those devices that control access management could provide an outsider the “keys to the front door” of the ESP where BES Cyber Systems reside. An intruder holding the “keys to the front door” could use those “keys” to enter the ESP or modify the access controls to allow others to bypass authorization.

In Requirement R3 Part 3.1 and Part 3.2, the word "connection" is the mechanism for a user or a system to interact with an EAMCS or PACS for the purpose of authenticating.

In Requirement R3 Part 3.1 and Part 3.2, the word "authenticate" is the mechanism for the EACMS or PACS to identify the user or device. This permits the EACMS or PACS to first perform its function to authenticate the user or device that is connecting, which in turn permits the entity to delineate or differentiate vendor-initiated connections from other remote access connections. This new proposed language is not prescriptive as to how authentication must occur to permit administrative and technical methods.

In Requirement R3 Part 3.2, the word "control" provides the entity flexibility to allow the vendor to reconnect under a specific set of conditions, established by the entity, where the reconnection is necessary to support critical operations of the entity. If the entity determines that they do not want to allow or does not need to allow a reconnection they can employ means to stop any reconnection.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability

Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Since remotely compromised PACS still require physical presence to exploit BES Cyber Systems, the SDT conducted extensive dialogue and considerations for the addition of PACS. The SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warranted their inclusion as an applicable Cyber Asset. Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. addresses the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[1].

NERC's final report on "*Cyber Security Supply Chain Risks"*, states on page 4, "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." PACS are intended to manage physical threats to BES Cyber Systems, thus protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical accesses or monitoring controls that have not been compromised in order to gain access." While a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it could demonstrate a threat Actor's intention to gain fully unauthorized electronic access.

While other Reliability Standards mitigate certain security risks relating to PACS none address supply chain risk. Based on this analysis the SDT included PACS within the applicable section of both Requirement Parts 3.1 and 3.2.

An additional aspect of the NERC Supply Chain Report, the SDT considered was the risk associated with the access control vs. access monitoring functions of both EACMS and PACS. While both types of systems, under the current definitions, have various functional activities they perform, the NERC Supply Chain Report pointed to the increased risk of the access control function beyond the access monitoring function. The SDT considered limiting the scope of the requirements to only those access control functions, however chose to stay with the currently approved definition of both EACMS and PACS. The SDT concluded staying with approved definitions would introduce less confusion. Additionally, an attempt to change the EACMS and PACS definition was outside the 2019-03 SAR.

Entities may or may not allow remote access into any of its systems, (BES Cyber Systems, EACMS or PACS), however if remote access is allowed, options to determine remote access connection(s) and capability to disable remote access connection(s) is required.

Technical Rational for Reliability Standard CIP-005-6

This section contains a "cut and paste" of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-005-6 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Furthermore, Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-5, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP. However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an “Associated Protected Cyber Asset” of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP.

Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually ‘command and control’ hosts on the Internet, or compromised ‘jump hosts’ within the Responsible Entity’s other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT’s intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity’s address space. The SDT’s intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and ‘deny by default’ type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run between two Cyber Assets. Without a clear ‘perimeter type’ security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions (“TFEs”) rather than increased security.

As for dial-up connectivity, the Standard Drafting Team’s intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple

redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale for R2:

Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords.
But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)

This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Change Rationale: (Part 2.4 and 2.5)
Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. This scope covers all remote access sessions with vendors. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement. The objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

Technical Rationale for Reliability Standard CIP-006-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-006-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-006-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-006-7 to shorten applicability statements within the body of CIP standards by replacing some terms with the defined acronym for that term:

"BCS" has replaced "BES Cyber System".

"ERC" has replaced "External Routable Connectivity".

"PSP" has replaced "Physical Security Perimeter".

"PACS" has replaced "Physical Access Control Systems".

Requirement R1

Rationale

The SDT made conforming changes to Applicable Systems for virtualization such that protections must be afforded to SCI for relevant Requirement Parts.

Applicable Systems:

Requirement R1 Part 1.1-1.9: the SDT added "SCI supporting an Applicable System in this Part.

Per System Capability vs Technical Feasibility:

Requirement R1 Part 1.3: The SDT chose to remove the reliance on a Technical Feasibility Exception in favor of the updated term "per system capability."

Consolidation:

Requirement R1 Part 1.10: The SDT deleted Requirement R1 Part 1.10 from CIP-006-7 because requirements to protect the data traversing communication links used to span a single ESP between PSPs is incorporated into CIP-005-8 Requirement R1 Part 1.6.

Requirement R2

Rationale

The SDT has include the CIP Exceptional Circumstances within the main R2 requirement text so that it applies to all requirement parts.

The SDT made conforming changes to Applicable Systems for virtualization such that protections must be afforded to SCI for relevant Requirement Parts.

Applicable Systems:

Requirement R2 Part 2.1-2.3: the SDT added "SCI supporting an Applicable System in this Part"

Former Background Section from Reliability Standard CIP-006-6

This section contains a "cut and paste" from the **Background** section of the Standard. It was retired and removed, and is provided as-is to preserve any historical references. No modifications have been made.

Background

Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rational for Reliability Standard CIP-006-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-006-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the PSP.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.

- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A logbook or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more PSPs, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, controls for a sole perimeter could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System, but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.

The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.

The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an "an equally effective logical protection" in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.

The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity's BES Cyber Systems while not requiring controls to be implemented on third-party components when entities rely on leased third-party communications.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the PSP to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the PSP. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a PSP (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any PSPs protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

Technical Rationale for Reliability Standard CIP-007-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-007-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-007-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The V5TAG, which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale.pdf" for reference when reading the technical rationale that follows.

General Considerations

Requirement R1

General Considerations for Requirement R1

Shared Cyber Infrastructure (SCI) is mutually exclusive from BES Cyber System (BCS) by definition. To enable CIP-007-7 for virtualization, the SDT added "SCI supporting an Applicable System in this Part". This approach keeps the SCI applicability parallel to each existing variant of Applicable Systems in the same Requirement Part (i.e., Medium impact BCS vs. Medium impact BCS with External Routable Connectivity (ERC) vs. Medium impact BCS at Control Centers etc.)

Change Rationale Requirement R1:

The SDT has changed the name of the R1 table to "System Hardening" to more clearly reflect the security objective of the entries in the table which is to harden the applicable systems through limiting access to logical and physical ports, and to control where certain VCAs can instantiate through host affinity rules.

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical

Cyber Asset would remain applicable to the hardware supporting the Virtual Cyber Assets (VCA) used in applicable BCS, EACMS, PACS or PCA.

Change Rationale Requirement R1 Part 1.1: Requirement R1 Part 1.1 requires "disable or prevent unneeded routable protocol network accessibility on each Applicable System, per system capability". The SDT updated the Requirement Part language to be more objective concerning routable protocol network accessibility as opposed to "ports and services". Routable protocol access to a system is through services which open listening logical ports on a local network interface. R1.1 requires that any unneeded access over such be either disabled or prevented. "Accessibility" as used in R1.1 is at the logical, routable protocol network level and does not include physical access, logon to the physical console, code on TCA/RM, etc.

The objective is to reduce the attack surface on an applicable system preventing any unnecessary accessibility to the system using routable protocols. TCP/UDP port numbers are at times the best way to track this accessibility, at other times documenting enabled services is better. For example, hardening network accessibility in the physical underlay of SCI between hypervisors may be performed at a virtualization *services* level; turning off or disabling virtualization services that are not needed, rather than documenting the often proprietary and dynamic port numbers which may be of little value. However, in the overlay where an entity may be hosting a database server VCA on a virtual network, it may be easier to show that network accessibility is limited to two enabled ports and all others are disabled or blocked. The SDT has moved to this objective language to avoid attempts to prescribe the best way to document network accessibility in all the various scenarios and implementations. In addition, it is limited to routable protocol network accessibility such that non routable network communications (e.g., SAN over Fiber Channel) do not fall within scope of the Requirement Part.

The SDT added the clarifier "on each Applicable System" to indicate that the intent of this requirement is for an entity to perform the configuration actions on each Applicable System, hardening the system from its routable protocol network peers (e.g., east/west traffic within an ESP) rather than having a single method such as an EAP network firewall rule that would disable such accessibility for a group of Applicable Systems.

The SDT chose to remove the reliance on a Technical Feasibility Exception (TFE) in favor of the updated term "per system capability". The SDT contends that the term still requires an entity to document the limit to the system's capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE. The 'per system capability' also allows for devices that have no provision for disabling logical ports or services, such as some firmware-based devices with very limited configuration capabilities.

Note that the Measures language has been updated to aid backwards compatibility.

Change Rationale Requirement R1 Part 1.3:

Requirement R1 Part 1.3 is a new requirement intended to apply host affinity controls to SCI that supports the Applicable Systems listed. The risk associated with this SCI is such that it may host VCAs of different impact categorizations and requires additional hardening controls to mitigate the risk for side-channel attacks from VCAs of differing impacts sharing the same CPU and memory.

Note that the SCI definition covers only those portions of entity's virtualization infrastructure that support systems of differing impact levels. As VCAs that share the same CPU or memory with any part of the highest rated BCS are already PCAs (and thus share the same impact categorization), this requirement is only needed to cover instances where different impact categorizations are supported. This may occur when part of the same SCI supports different BCS and the entity does not wish to high watermark all the BCS together.

For example, this requirement would apply where the same SCI supports both a BCS with a high impact categorization on one part of a virtualization cluster, and a different BCS with a low impact categorization on a different part of the virtualization cluster. The proper use of host affinity controls would not require the BCS with the low impact categorization to be considered an “associated PCA” of the high (assuming the low impact BCS is also not in the ESP of the high impact BCS) as long as new controls for SCI are in place, such as affinity controls.

Requirement R2

Change Rationale Requirement R2:

The SDT chose to include the “SCI supporting an Applicable System in this Part” language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA(s) used in applicable BCS, EACMS, PACS or PCA.

The SDT made conforming changes where necessary with Requirement R2 to remove reliance on the Cyber Asset term, choosing to reference the Applicable Systems instead.

Additionally, the SDT chose to insert the word “cyber” as a clarifier to security patches for consistency with the term used in R2.1.

Backward Compatibility

CIP-007-7 Requirement R2 retains backward compatibility for entities that do not utilize SCI.

The SDT intends that entities take full advantage of their virtualization infrastructure in order to ease the overhead associated with patch management. While many of the entity’s existing processes will remain the same, (such as those associated with tracking the source of cyber security patches, evaluation of the applicability of available patches and mitigation plans for those applicable patches that cannot be installed) new or modified processes around the installation of patches can be used (for example, parent images, remediation VLANs, etc.).

Parent Images

One of the interesting nuances of virtualization is the concept of parent/child relationships.

Some VCAs utilize a “parent image” type methodology where the specific VCA software and operating system is merely a child instance of a parent image. In such cases, the application of cyber security patches to the parent image also applies the same changes to any children of that image. As there may be many child instances, the administrative overhead associated with patching of those instances can be greatly reduced.

Dormant Instances

There are times when VCAs are not being used and are idle. Physical instances of the assets are left up and running in order to receive applicable patches, software updates, configuration updates, etc.

Leveraging the built-in virtualization features allows idle resources to be reassigned to tasks at hand without incurring additional overhead of tracking which dormant virtual instances require patching. Dormant virtual instances are just files with the saved state of the VCA. Dormant instances are not VCAs themselves nor Applicable Systems until they become active instances again.

Where a dormant virtual instance is also the child instance of a parent image, the application of security patches to the parent image will also make the same changes automatically when needed to any out of date dormant child virtual instances when they are restarted.

In most cases, a dormant virtual child instance is made active again on a remediation type network where any missing security patches (compared to the parent image) are automatically applied before it is placed back into active service.

Saved Images

Similar to dormant child images, saved child images or snapshots may be also used as functional backups for CIP-009 purposes in order to provide fast restoration and better availability. If an active VCA becomes corrupted, a saved image can be made active where the application of any missing security patches (compared to the parent image) can be automatically applied, through remediation, before being placed back into active service.

Requirement R3

Change Rationale Requirement R3:

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCA.

Requirement R4

Change Rationale Requirement R4:

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCA.

Change Rationale Requirement R4 Part 4.1:

The SDT determined the entire structure of the "at the BCS level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability)" language could be simplified to "per system capability" since the Applicable Systems column clarifies what systems are included.

Additionally, the SDT chose to insert the word "security" as a clarifier to which events are to be logged.

Change Rationale Requirement R4 Part 4.2:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the "Cyber Asset" term, as well as the ambiguity that would have existed if the term "BES Cyber System" were left in place while the Applicability Column included SCI.

Change Rationale Requirement R4 Part 4.3:

The SDT also chose to remove the reliance on a TFE from Part 4.3 in favor of the updated term "per system capability". The SDT contends that the term still requires an entity to document the limit to the system's capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

Requirement R5

Change Rationale Requirement R5:

The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement in order to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the VCA used in applicable BCS, EACMS, PACS or PCAs.

Change Rationale Requirement R5 Parts 5.1, and 5.6 – 5.7:

The SDT chose to remove the reliance on TFE in favor of the updated term "per system capability". The SDT contends that the term still requires an entity to document the limit to the system's capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

Change Rationale Requirement R5 Part 5.4:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the "Cyber Asset" term, replacing it with a per "system" capability.

Change Rationale Requirement R5 Part 5.5:

The SDT applied conforming changes to the Requirement Part language to remove the reliance on the "Cyber Asset" term, replacing it with a reference to the Applicable Systems.

Former Background Section from Reliability Standard CIP-007-6

This section contains a "cut and paste" of the former Section 6. Background which has been retired and removed from the Standard. It is provided to preserve any historical references. No modifications have been made.

Background

Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicability Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rational for Reliability Standard CIP-007-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-007-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration

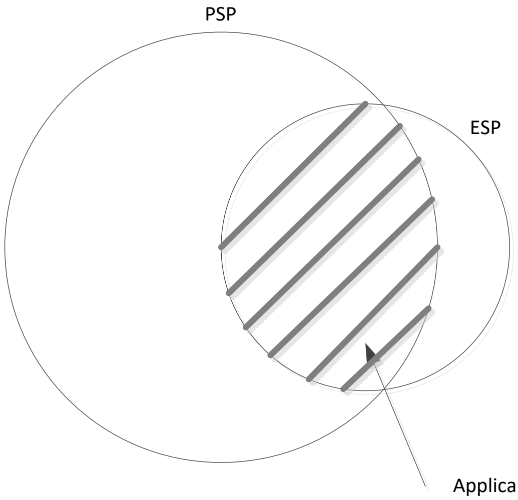
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a ‘defense in depth’ type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to “think before you plug anything into one of these systems” which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include “Nonprogrammable communication components located inside both a PSP and an ESP.” This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:

Location of Nonprogrammable Communication Components



Applicability of CIP-007-6 R1, Part 1.2 for Nonprogrammable Communication Components

Requirement R2:

The SDT’s intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an “install every security patch” requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement, but do not meet, the additional obligations for transient devices.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of Removable Media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.

- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

Technical Rationale for Reliability Standard CIP-008-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-008-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-008-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1 – Requirement R4

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-008-6 to align incident reporting and response planning requirements with the virtualization changes and protections for Shared Cyber Infrastructure (SCI) by adding "SCI supporting an Applicable System in this Part" to each of the Parts in Applicable Systems for Requirement R1 – Requirement R4.

Requirement R4

Rationale

The Project 2016-02 SDT made updates to reflect the change from the National Cybersecurity and Communications integration Center (NCCIC) to its successor organization Cybersecurity & Infrastructure Security Agency (CISA), and deleted the historical footnote in favor of deference to the Requirement language, which already states "or their successors".

Former Background Section from Reliability Standard CIP-008-6

Section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-008 exists as part of a suite of CIP Standards related to cyber security. CIP-002 requires the initial identification and categorization of BES Cyber Systems. CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010, and CIP-011 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a particular subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:
Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.

High Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.

Medium Impact BES Cyber Systems – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.

Technical Rationale for Reliability Standard CIP-008-6

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-008-6. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. It also contains information on the Standard Drafting Team's (SDT's) intent in drafting the requirements. This Technical Rationale and Justification for CIP-008-6 is not a Reliability Standard and should not be considered mandatory and enforceable.

On July 19, 2018, the Federal Energy Regulatory Commission (FERC or Commission) issued Order No. 848. In this Order FERC directed the North American Electric Reliability Corporation (NERC) to "develop and submit modifications to the Reliability Standards to require the reporting of Cyber Security Incidents that compromise, or attempt to compromise, a responsible entity's Electronic Security Perimeter (ESP) or associated Electronic Access and Control or Monitoring System (EACMS)." (Order 848, Paragraph 1)

In response to the directive in Order No. 848, the Project 2018-02 SDT drafted Reliability Standard CIP-008-6 to require Responsible Entities to implement methods augmenting the mandatory reporting of Cyber Security Incidents to include: "(1) responsible entities must report Cyber Security Incidents that compromise, or attempt to compromise, a responsible entity's ESP; (2) required information in Cyber Security Incident reports should include certain minimum information to improve the quality of reporting and allow for ease of comparison by ensuring that each report included specified fields of information; (3) filing deadlines for Cyber Security Incident reports should be established once a compromise or disruption to reliable BES operation, or an attempted compromise or disruption, is identified by a responsible entity; and (4) Cyber Security Incident reports should continue to be sent to the Electricity Information Sharing and Analysis Center (E-ISAC), rather than the Commission, but the reports should also be sent to the Department of Homeland Security (DHS) Industrial Control System Cyber Emergency Response Team (ICS-CERT)." (Order 848, Paragraph 3)[1]

New and Modified Terms Used in NERC Reliability Standards

CIP-006-6 uses the following definition(s), which are cited below for reference when reading the technical rationale that follows.

Proposed Modified Terms:

Cyber Security Incident

A malicious act or suspicious event that:

- *For a high or medium impact BES Cyber System, compromises, or attempts to compromise the, (1) an Electronic Security Perimeter, (2) a Physical Security Perimeter, or (3) an Electronic Access Control or Monitoring System; or*
- *Disrupts, or attempts to disrupt, the operation of a BES Cyber System.*

In response to FERC Order 848, Paragraph 1, the SDT modified the Cyber Security Incident definition to include Electronic Access Control or Monitoring Systems (EACMS) associated with high or medium impact BES Cyber Systems, in response to the Order.

---

[1] The National Cybersecurity and Communications Integration Center (NCCIC) is the successor organization of the Industrial Control Systems Cyber Emergency Response Team (ICS-CERT). In 2017, NCCIC realigned its organizational structure and integrated like functions previously performed independently by the ICS-CERT and the United States Computer Emergency Readiness Team (US-CERT).

The addition of high and medium impact BES Cyber Systems considers the potential unintended consequences with the use of the existing definition in CIP-003-7. It also provides clarity that only low impact BES Cyber Systems are included within the definition. ESP or EACMs that may be defined by an entity for low impact BES Cyber Systems are not part of the definition.

An attempt to disrupt the operation of a BES Cyber System is meant to include, among other things, a compromise of a single BES Cyber Asset within a BES Cyber System. For example, malware discovered on a BES Cyber Asset is an attempt to disrupt the operation of that BES Cyber System.

Reportable Cyber Security Incident
A Cyber Security Incident that compromised or disrupted:

- *A BES Cyber System that performs one or more reliability tasks of a functional entity;*
- *An Electronic Security Perimeter of a high or medium impact BES Cyber System; or*
- *An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber Systems.*

The Reportable Cyber Security Incident definition was modified to comply with FERC Order 848. In response to Paragraph 54 of the Order, the SDT modified the definition to include incidents that compromised or disrupted an ESP or an EACMS. The team also added the qualifying clause for "A BES Cyber System that performs one or more reliability tasks of a functional entity" to clarify what was compromised or disrupted, thus not extending the scope to Protected Cyber Assets (PCAs). In response to comments, the SDT left the entire definition of BES Cyber system in Reportable Cyber Security Incident to provide clarity.

It is also important to understand the relationship between the two definitions, the requirement language, and how they work in concert to classify events and conditions at varied levels of significance as the Registered Entity executes its process and applies its defined criteria to determine if reporting is required.

Electronic Access Control or Monitoring Systems (EACMS)
The drafting team spent significant time discussing this topic among its members, through industry outreach, and with FERC staff. The team believes by not specifically referencing the five functions in Order 848, we have reduced complexity and made compliance with the Standard achievable. The drafting team asserts that the five functions are equivalent to the current definition of EACMS in the NERC Glossary of Terms. If entities have questions about application of the EACMS definition, the drafting team advises entities to discuss those questions directly with NERC.

Requirements R1, R2, and R3

General Considerations for Requirement R1, Requirement R2, and Requirement R3

FERC Order 848, Paragraph 1, directs modifications to Reliability Standards to require reporting of incidents that compromise, or attempt to compromise a responsible entity's ESP or associated EACMS. The intent of the SDT was to minimize the changes within CIP-008 and address the required modifications. To do this, the SDT added "and their associated EACMS" to the "Applicable Systems" column for Requirements R1, R2, and R3.

To add clarity to "attempts to compromise," the drafting team created Part 1.2.1 to require entities to establish and document their process to include criteria to evaluate and define attempts to compromise. This requirement maps to Requirement 4 Part 4.2, which requires entities to use that entity-defined process for determining which incidents entities must report.

The use of the language describing Cyber Security Incident(s) as being "an attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the 'Applicable Systems'" column for the Part is meant to clarify which Cyber Assets are in scope for attempts to compromise reporting by entities. This language is used throughout the standard.

Moving Parts of Requirement R1 to Requirement R4

To minimize the changes to Requirement R1, the SDT created Requirement R4 and consolidated all the CIP-008-6 reporting requirements. The SDT deleted Requirement R1 Part 1.2 reporting requirements from CIP-008-5, and moved them to Requirement R4 for this purpose.

Inclusion of "Successor Organizations" throughout the Requirement Parts

The SDT recognizes that organizations are constantly evolving to meet emerging needs, and may re-organize or change their names over time. The ICS-CERT has completed its name change to the National Cybersecurity and Communications Integration Center (NCCIC) Industrial Control Systems. The E-ISAC previously re-branded its name and may again in the future. By following Requirement R4 references to E-ISAC and NCCIC with "or their successors" the SDT is ensuring that Requirement R4 can be implemented even if the names of E-ISAC and NCCIC change or a different agency takes over their current roles.

Requirement R4

General Considerations for Requirement R4

Requirement R4 is a new requirement focused on mandatory reporting of Reportable Cyber Security Incidents and includes attempts to compromise systems in the "Applicable Systems" column. Previously, CIP-008-5 defined reporting requirements for Reportable Cyber Security Requirements (Requirement R1 Part 1.2) only.

Required Reportable Incident Attributes

Requirement R4.1 specifies that initial notifications and updates must include three attributes: 1) functional impact, 2) attack vector used, and 3) level of intrusion achieved or attempted. These attributes are taken directly from the Order. (FERC Order No. 848, paragraph 89).

The SDT understands that some or all of these attributes may be unknown at time of initial notification. To account for this scenario the SDT included "to the extent known" in the requirement language. There is an expectation that update reporting will be done as new information is determined or unknown attributes become known by the entity. There could be cases, due to operational need, that all the attributes may never be known, if this case presents itself that information should be reported.

Methods for Submitting Notifications

Requirement R4 Part 4.2 allows responsible entities to submit notification using any method supported by E-ISAC and NCCIC. The SDT did not prescribe a particular reporting method or format to allow responsible entities' personnel to focus on incident response itself and not the method or format of reporting. It is important to note the report must contain the three attributes required in Requirement R4 Part 4.1 as they are known, regardless of reporting method or format.

Notification Timing

Requirement R4 Part 4.2 specifies two timelines for initial notification submission; one hour for Reportable Cyber Security Incidents; and end of next calendar day for attempts to compromise systems in the "Applicable Systems" column. Paragraph 3 of FERC Order No 848 directly states that reporting deadlines must be established. Paragraph 89 further states that "timelines that are commensurate with the adverse impact to the BES that loss, compromise, or misuse of those BES Cyber Systems could have on the reliable operation of the BES."

- *Reportable Cyber Security Incidents* – The SDT wrote Requirement R4 Part R4.2 to use a one hour deadline for reporting of these events because incidents in this category include successful compromise of ESP(s), EACMS, or BES Cyber System(s). One hour is referenced directly in FERC Order No 848 paragraph 89 and is also the current reporting requirement in CIP-008-5.

- *Cyber Security Incident that was an attempt to compromise one or more systems identified in the "Applicable Systems" column* - Due to the lower severity of these unsuccessful attempts at compromising ESP(s), EACMS, or BES Cyber System(s), the SDT proposed a longer reporting timeframe. The intent behind the decision to add "By the end of the next calendar day" (11:59 pm local time) was to give responsible entities additional time to gather facts prior to notifications for the less severe attempts to compromise Applicable Systems. It is important to note that compliance timing begins with the entity's determination that attempt to compromise meets the process they defined in Requirement R1 Part 1.2.1.

The SDT understands initial notification may not have all the details when first submitted. It is expected, however, that information that has been determined is reported within the notification deadlines. Additionally, it is important to note the wording in Requirement R4 Part 4.2. The "compliance clock" for the report timing begins when the Responsible Entity executes its process from Requirement R1 Part 1.2.1 and a determination has been made that the type of incident which has occurred qualifies as reportable.

Technical rationale taken from the Guidelines and Technical Basis (GTB) CIP-008-5 Requirement 1 provides additional justification for the SDT to maintain the one hour timeframe for Reportable Cyber Security Incidents.

> *"The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report."*

In 2007, the Electricity Information Sharing and Analysis Center (E-ISAC) was known as the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). Its voluntary procedures required the reporting of a cyber-incident within one hour of an incident. CIP-008-1 required entities to report to the ES-ISAC.

In FERC Order No. 706[2] (July 18, 2008), the Commission concluded that the one-hour reporting limit was reasonable [P 663]. The Commission further stated that it was leaving the details to NERC, but it wanted the reporting timeframe to run from the "**discovery**" of the incident by the entity, and not the actual **"occurrence"** of the incident [P 664].

CIP-008-2 and CIP-008-3 were silent regarding the required timeframe for reporting, but it was specifically addressed in CIP-008-5. In the October 26, 2012, redlined version of CIP-008-5, the proposed language for initial notification originally specified "one hour from **identification**" of an incident. This aligned with the Commission's decision in Order No. 706, for the clock to start with the discovery of an incident. However, the Standard Drafting Team changed "one hour from identification" to "one hour from the **determination** of a Reportable Cyber Security Incident". This language was subsequently approved and incorporated into CIP-008-5.

These changes, from "occurrence" to "discovery" to "determination," provide the additional time needed for the entity to apply its specifically created process(es) for determining whether a Cyber Security Incident rises to the level of required reporting. This determination timeframe may include a preliminary investigation of the incident which will provide useful information to other entities to help defend against similar attacks.

---

[2] 2008, Federal Energy Regulatory Commission, Mandatory Reliability Standards for Critical Infrastructure Protection, Order No. 706.

Notification Updates

Requirement R4 Part 4.3 requires that Responsible Entities submit updates for the required attributes upon determination of new or changed attribute information, if any. The SDT added this language to provide entities sufficient time to determine attribute information, which may be unknown at the time of initial notification, and which may change as more information is gathered. The intent of Requirement R4 Part 4.3 is to provide a method for Responsible Entities to report new information over time as their investigations progress. NOTE: The SDT does not intend updates specified in Requirement R4. Part 4.3 to expose responsible entities to potential violations if, for example, initial and updated notification on the same attribute have different information. This is expected since knowledge of attributes may change as investigations proceed. Rather, the intent of Requirement R4 Part 4.3 is to have a mechanism to report incident information to E-ISAC and NCCIC (and thereby industry) upon determination of each required attribute.

The intent is that the entity report what is known and document the reason not all attributes could become known and ultimately be reported in conditions where, e.g. a Cyber Asset was restored completely, removing all forensic evidence in order to restore operations, which caused the entity to conclude its investigation without having a complete knowledge of the three required attributes.

The SDT asserts that nothing included in the new reporting Requirement R4, precludes the entity from continuing to provide any voluntary sharing they may already be conducting today.

Technical Rationale for Reliability Standard CIP-008-5

This section contains the Guidelines and Technical basis as a "cut and paste" from CIP-008-5 standard to preserve any historical references.

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report.

Requirement R2:

Requirement R2 ensures entities periodically test the Cyber Security Incident response plan. This includes the requirement in Part 2.2 to ensure the plan is actually used when testing. The testing requirements are specifically for Reportable Cyber Security Incidents.

Entities may use an actual response to a Reportable Cyber Security Incident as a substitute for exercising the plan annually. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or full operational exercise.

In addition to the requirements to implement the response plan, Part 2.3 specifies entities must retain relevant records for Reportable Cyber Security Incidents. There are several examples of specific types of evidence listed in the measure.

Requirement R3:

This requirement ensures entities maintain Cyber Security Incident response plans. There are two requirement parts that trigger plan updates: (1) lessons learned from Part 3.1 and (2) organizational or technology changes from Part 3.2.

The documentation of lessons learned from Part 3.1 is associated with each Reportable Cyber Security Incident and involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the incident in recognition that complex incidents on complex systems can take a few days or weeks to complete response activities. It is possible to have a *Reportable Cyber Security Incident* without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the *Reportable Cyber Security Incident*.

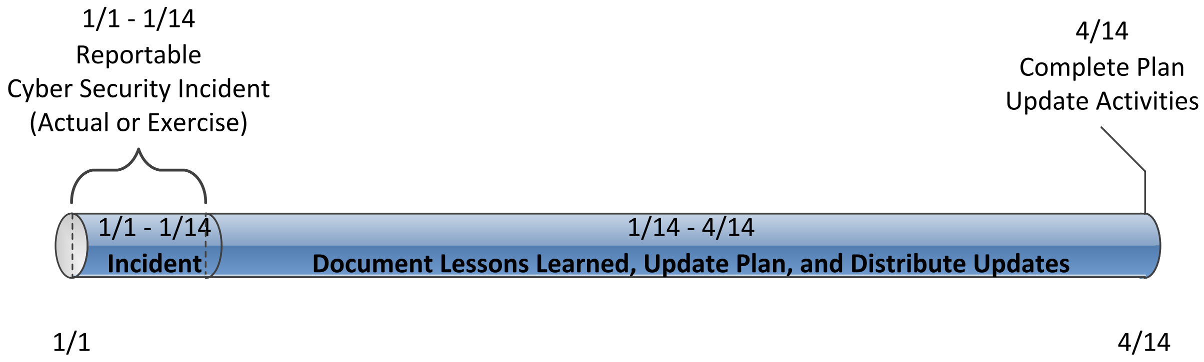

Figure 1: CIP-008-5 R3 Timeline for Reportable Cyber Security Incidents

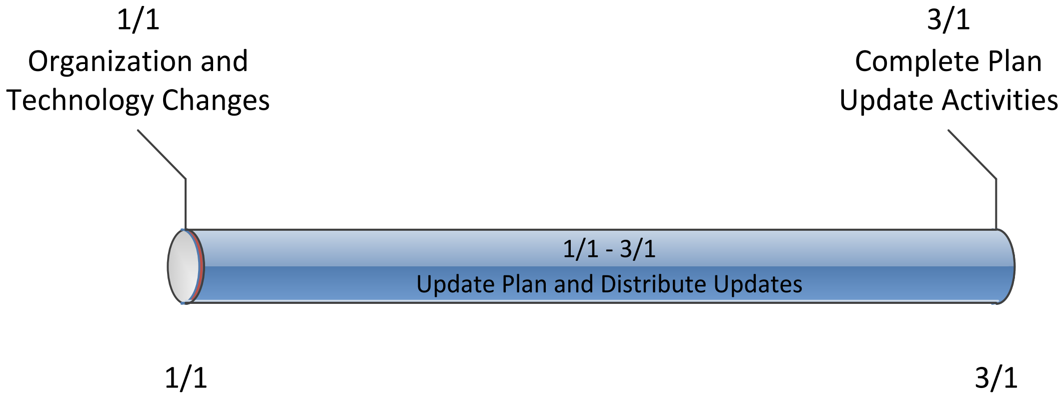
The activities necessary to complete the lessons learned include updating the plan and distributing those updates.

The plan change requirement in Part 3.2 is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals.

Figure 2: Timeline for Plan Changes in 3.2



Rationale for R1:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned incident response capability is therefore necessary for rapidly detecting incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services.

Summary of Changes: Wording changes have been incorporated based primarily on industry feedback to more specifically describe required actions.

Reference to prior version: (Part 1.1) CIP-008, R1.1

Change Description and Justification: (Part 1.1)
"Characterize" has been changed to "identify" for clarity. "Response actions" has been changed to "respond to" for clarity.

Reference to prior version: (Part 1.2) CIP-008, R1.1

Change Description and Justification: (Part 1.2)
Addresses the reporting requirements from previous versions of CIP-008. This requirement part only obligates entities to have a process for determining Reportable Cyber Security Incidents. Also addresses the directive in FERC Order No. 706, paragraphs 673 and 676 to report within one hour (at least preliminarily).

Reference to prior version: (Part 1.3) CIP-008, R1.2

Change Description and Justification: (Part 1.3)
Replaced incident response teams with incident response "groups or individuals" to avoid the interpretation that roles and responsibilities sections must reference specific teams.

Reference to prior version: (Part 1.4) CIP-008, R1.2

Change Description and Justification: (Part 1.4)
Conforming change to reference new defined term Cyber Security Incidents.

Rationale for R2:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. This requirement ensures implementation of the response plans. Requirement Part 2.3 ensures the retention of incident documentation for post event analysis.

This requirement obligates entities to follow the Cyber Security Incident response plan when an incident occurs or when testing, but does not restrict entities from taking needed deviations from the plan. It ensures the plan represents the actual response and does not exist for documentation only.

Summary of Changes: Added testing requirements to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System.

Reference to prior version: (Part 2.1) CIP-008, R1.6

Change Description and Justification: (Part 2.1)
Minor wording changes; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-008, R1.6

Change Description and Justification: (Part 2.2)
Allows deviation from plan(s) during actual events or testing if deviations are recorded for review.

Reference to prior version: (Part 2.3) CIP-008, R2

Change Description and Justification: (Part 2.3)
Removed references to the retention period because the Standard addresses data retention in the Compliance Section.

Rationale for R3:

Conduct sufficient reviews, updates and communications to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System. A separate plan is not required for those requirement parts of the table applicable to High or Medium Impact BES Cyber Systems. If an entity has a single Cyber Security Incident response plan and High or Medium Impact BES Cyber Systems, then the additional requirements would apply to the single plan.

Summary of Changes: Changes here address the FERC Order 706, Paragraph 686, which includes a directive to perform after-action review for tests or actual incidents and update the plan based on lessons learned. Additional changes include specification of what it means to review the plan and specification of changes that would require an update to the plan.

Reference to prior version: (Part 3.1) CIP-008, R1.5

Change Description and Justification: (Part 3.1)
Addresses FERC Order 706, Paragraph 686 to document test or actual incidents and lessons learned.

Reference to prior version: (Part 3.2) CIP-008, R1.4

Change Description and Justification: (Part 3.2)
Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the changes that would require an update

Technical Rationale for Reliability Standard CIP-009-7

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-009-7. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-009-7 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received addressing the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1 – Requirement R3

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-009-7 to align recovery planning requirements with the virtualization changes and Shared Cyber Infrastructure (SCI).

The use of the term BES Cyber System has been replaced with "Applicable System" within the requirement language of Requirement R1 Part 1.3 and Requirement R2 Part 2.2 to align the requirement with the applicability for each Requirement Part.

Requirement R1 Part 1.5 has added 'SCI supporting an Applicable System in this Part' to the applicability. This requires that SCI be included in the process to preserve data, per system capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Having any SCI included in the forensics for a compromised applicable VCA, or the SCI itself, is the reason for the inclusion.

SCI is not specifically included in any other Requirement Parts of CIP-009, because CIP-009 focuses on the ability to recover the BCS functionality, which may or may not require recovery of SCI. The SDT has therefore not included SCI as a direct object of the other recovery plan Requirements and Parts. However, if recovery of the Applicable System's functionality is dependent on recovery of any SCI, then the recovery plan(s) should include such dependencies.

Former Background Section from Reliability Standard CIP-009-6

The section has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements.

An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

Technical Rationale for Reliability Standard CIP-009-6

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-009-6 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Tabletop exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

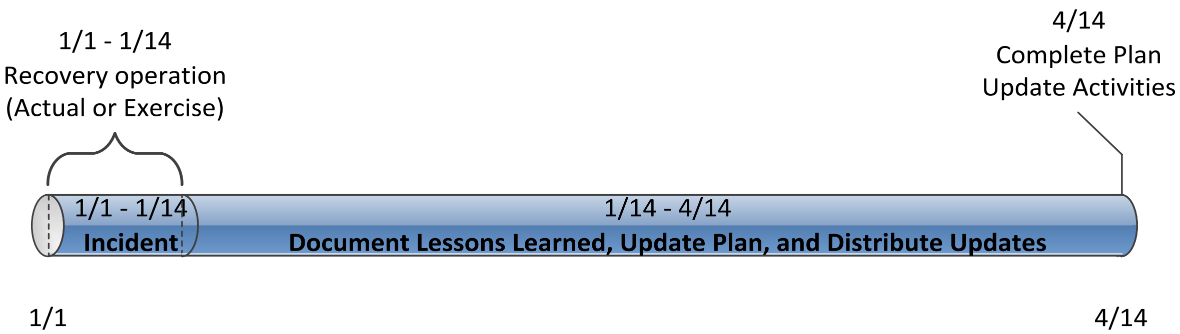

Figure 1: CIP-009-6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

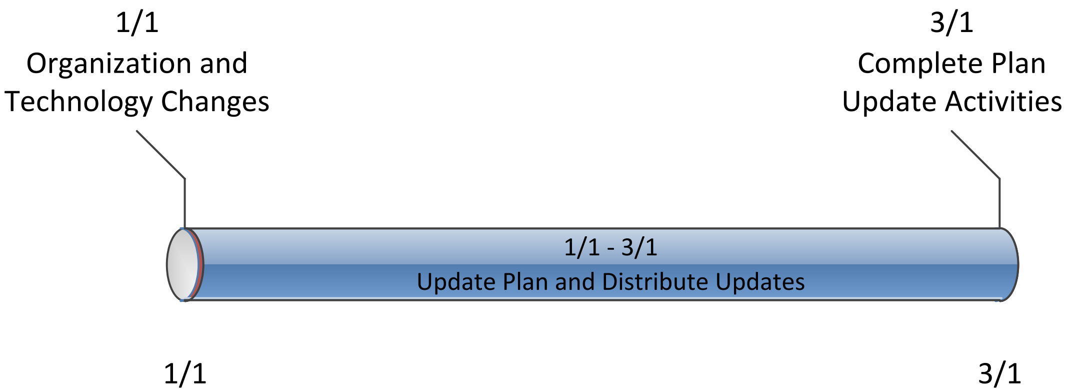

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

Table of Contents

Technical Rationale for Reliability Standard CIP-010-5

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-010-5. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-010-5 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server, and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rational that follows.

The proposed changes in CIP-010-5 from the Project 2016-02 SDT concern the use of several facets of virtualization technologies. Virtualization allows for such technologies as new controls for Shared Cyber Infrastructure (SCI), remediation VLAN, parent/child images, and dormant virtual machines (VMs). Enabling and clarifying the use of these technologies is the basis of the proposed changes in CIP-010-5. A general introduction to each of these technologies follows.

Shared Cyber Infrastructure (SCI)

Where entries elect to utilize "Shared Cyber Infrastructure" (vs. all in), virtualization abstracts the software layers (the OS and applications Shared Cyber Infrastructure) from the underlying hardware to allow for hardware to be shared among several Virtual Cyber Assets (VCAs) that may be of differing impact levels. Hypervisors include security controls to keep these workloads logically isolated from one another and their requirements are within other CIP standards such as CIP-005 and CIP-007. However, with any type of shared infrastructure, the need for change management requirements is elevated for those security controls that allow for the 'shared' in SCI. Such controls are added to the change management requirements in CIP-010-5.

Remediation VLAN

Remediation VLAN is a term used to describe a logical network segment in which a Cyber Asset or VCA can be isolated from having routable connectivity to any BES Cyber Systems while it is examined to ensure the integrity and validity of the configuration and software installed on it. After this examination and subsequent remediation of deficiencies is completed, it is then permitted routable connectivity to BES Cyber Systems.

This examination is policy driven, meaning that the administrator is able to configure what the minimum requirements are for a successful examination. Examples of this might be minimum operating system patch levels or recent anti-virus definitions.

If during the examination of the asset, it is found to not comply with the requirements defined in the policy, an administrator may intervene to manually remediate the deficiencies, or the system which was used to examine the asset may communicate the deficiencies to the asset with instructions on how to remediate itself in an automated fashion. After the remediation actions are taken, the asset can request to be re-examined and if the requirements dictated by the policy are now met, it will be permitted routable connectivity to BES Cyber Systems

Parent/Child Images

When a VCA is ‘powered on’ or begins execution, it instantiates (“boots”) from a disk image file. Since the boot ‘disk’ is a file and not physical disk, many individual VCAs can use the same “parent” image as the basis for their own “child” image. Among other things, this allows for patching of an OS to occur to a parent image and the child images then pick up that patched image upon their next instantiation.

Dormant VMs

A VCA that is not currently executing or instantiated (i.e., not ‘booted up’) is a dormant VM. It exists not as a traditional VCA, but simply as a file. VCA’s can be created for specialized purposes such as to run troubleshooting tools and only executed or instantiated when needed with long periods of times in between, during which they exist as a file. They are not up and running and on the network where they are managed and patched on a regular basis. However, these can go hand-in-hand with remediation VLANs which would bring them up to date as soon as they do begin to start execution or instantiate, but before they have routable connectivity to BES Cyber Systems.

General Considerations

SCI is mutually exclusive from Cyber Assets (CA) by definition. To enable CIP-010-5 for virtualization, the SDT evaluated the existing Applicable Systems and added “SCI that supports an Applicable System in this Part”. This approach keeps the SCI applicability parallel to each existing variant of Medium Impact BCS (i.e. Medium Impact BCS vs. Medium Impact BCS with External Routable Connectivity (ERC) vs. Medium Impact BCS at Control Centers etc.).

Requirement R1

General Considerations for Requirement R1

In prior versions, CIP-010 Requirement R1 has required developing a baseline configuration that consisted of five (5) items (OS, installed and custom software, ports, patches). The baseline configuration was then used in the remainder of Requirement R1 and R2 as the basis of change management including testing. At a high level, the CIP-010-4 Requirement Part 1.1 was to develop a baseline configuration, Requirement R1 Part 1.2 was to authorize and document changes to the items in the baseline configuration, and Requirement R1 Part 1.3 was to update the baseline configuration within a specific timeframe after a change. This tended to focus the requirement on documenting past changes.

In CIP-010-5, as the SDT considered the more policy-based and automated virtualization technologies discussed in the previous section, the SDT determined to change the focus of Requirement R1 towards a security objective of controlling the implementation of intended changes to software, or intended changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007, rather than mandating the maintenance of a baseline configuration. Maintaining baseline configurations remains one possible "how", but it is no longer the only prescribed method. The phrase "baseline configuration" has been removed from CIP-010-5 as a result. The items found in the CIP-010-4 baseline are now included in the Measures column within CIP-010-5.

In order to maintain backwards compatibility with CIP-010-4, an entity should document the reasoning of how maintaining of their existing "baseline configuration" meets the stated security objective of controlling the implementation of intended changes to software or intended changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007. Entities may wish to reference NIST SP 800-128 "Guide for Security-Focused Configuration Management of Information Systems" as a guide for additional information.

This change allows the ability to have some backwards compatibility with CIP-010-4 while allowing flexibility for virtualization technologies that automate changes and provide new items (i.e., remediation policies, parent images, etc.) that require change management that were not enumerated in CIP-010-4. This also ensures the focus is not on documenting past changes but the authorization of intended changes, thus making the requirement forward looking with a clearer security objective.

Rationale for Requirement R1 Part 1.1

Conforming changes to Applicable Systems (see General Considerations above).

The original CIP-010 Requirement R1 Part 1.1 included establishing a baseline configuration for assets that included a set of items that would then be monitored for changes in the remaining parts of Requirement R1. Requirement R1 Part 1.1 is similar to what used to be Requirement 1 Part 1.1 - 1.4, and now serves as the focus of the R1 controls.

Requirement R1 Part 1.1 is focused on controlling the implementation of intended changes to software, or intended changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007. The authorization of those changes (Part 1.1.1) and verifying that the controls are not adversely impacted (Part 1.1.2).

Note that the scope of intended changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.

While a Responsible Entity can benefit from documenting the configuration or the various elements of the previous "baseline", this is no longer a requirement on its own. Maintaining this documentation is now one possible control to use to ensure changes to those elements are managed as required.

Dormant VMs were a challenge with the CIP-010-4 focus on baseline documentation, since the dormant VM is really just a file on disk, and as such cannot impact the BCS until it begins execution or is instantiated, at which time it must be compliant with the requirement. In many cases dormant VMs are patched to current prior to being allowed routable connectivity to BES Cyber Systems. By focusing the Part 1.1 requirement on change management as opposed to documentation of a current configuration, the challenge is mitigated. The Registered Entity must still know what is current, in order to know what security controls are impacted, but the obligation to keep documentation up to date for a dormant VM is removed.

Rationale for Requirement R1 Part 1.2

Requirement R1 Part 1.2 is where CIP-010-4 Requirement R1 Part 1.5 now lands in CIP-010-5, with minor modifications to Part 1.2.1, and conforming changes to remove the 'baseline configuration' terminology to enable for virtualization.

The SDT chose to remove the reliance on a “Technical Feasibility Exception” in favor of permitting “CIP Exceptional Circumstances” in Pat 1.2.1. The SDT contends testing in a test environment prior to implementing any change in production, and documenting test results may impede Responsible Entities' efforts to recover from events or conditions that qualify as CIP Exceptional Circumstances, and that term still requires an entity to document when that condition occurs with regards to the requirement language, while not incurring the additional documentation overhead of a Technical Feasibility Exception (TFE).

Additionally, the SDT chose to add to the phrase “that minimizes differences with the production environment” to eliminate the dependency on baseline configuration.

Rationale for Requirement R1 Part 1.3

Conforming changes to Applicable Systems (see General Considerations above).

Requirement R1 Part 1.3 is where CIP-010-4 Requirement R1 Part 1.6 now lands in CIP-010-5, with conforming changes to remove the ‘baseline configuration’ terminology and instead referring to operating systems, firmware, software, or software patches changes as the trigger for the Requirement Part.

The SDT acknowledges virtualization vendors may provide a “golden image” to clone multiple other Virtual Cyber Assets as described in the “Parent/Child Images” section above. The SDT intent is for entities that use the golden image technology to account for the software source and integrity of the golden image which covers any unmodified clones derived from it.

Requirement R2

General Considerations for Requirement R2

Conforming changes to Applicable Systems (see General Considerations above).

The SDT has added the term “unauthorized” into Requirement R2 Part 2.1 to focus it on the risk of unauthorized changes. Many implementations will perform this task by monitoring all changes and looking for unauthorized changes within that population. However, if a way to filter out authorized changes can be implemented, and an entity is able then to have methods to monitor just unauthorized changes the SDT’s intent is that should fulfill the requirement. The scope of this requirement is tied back to Requirement 1 Part 1.1 and is limited to unauthorized changes to software, or unauthorized changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007.

The SDT also added “per system capability” in recognition that not all changes in scope can be monitored

Requirement R3

Rationale for Requirement R3 Part 3.1

Conforming changes only to Applicable Systems (see General Considerations above).

Rationale for Requirement R3 Part 3.2

Conforming changes to Applicable Systems (see General Considerations above).

The SDT chose to remove the reliance on a “Technical Feasibility Exception” in favor of the updated term “per system capability”. The SDT contends that the term still requires an entity to document the limit to the system’s capability with regards to the requirement language, while not incurring the additional documentation overhead of a TFE.

In Requirement R3 Part 3.2.1, conforming changes have been made to remove the baseline configuration dependency. Additionally, the SDT chose to add to the phrase "that minimizes differences with the production environment" to eliminate the dependency on baseline configuration.

Rationale for Requirement R3 Part 3.3

The timing of when to enforce this Requirement Part has been an interesting chicken and egg problem. With the inclusion of the language "Prior to becoming a new Applicable System…" the SDT contends that it has resolved this issue, and established that before the new system has applicability, i.e. it has an impact to the BES, this requirement part must be fulfilled.

The SDT's intent is to mirror the changes to the Protected Cyber Asset (PCA) definition, and the proposed change mentioned above to the requirement part language to enable the use of remediation VLANs. The concept of "before connecting to a production environment…" is no longer part if this requirement language.

Conforming changes have been made to remove the baseline configuration dependency. The exceptions are "Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System; or CIP Exceptional Circumstances".

Conforming changes made to Applicable Systems (see General Considerations above).

Rationale for Requirement R3 Part 3.4

Conforming changes made only to Applicable Systems (see General Considerations above).

Requirement R4

General Considerations for Requirement R4

The SDT updated Requirement R4 to include associated SCI into the scope of the required plans for Transient Cyber Assets (TCA) and Removable Media. The SDT also updated Attachment 1, such that the scope is clarified once within Requirement R4, and applies throughout Attachment 1.

Former Background Section from Reliability Standard CIP-010-4

The section has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

“Applicable Systems” Columns in Tables:

Each table has an “Applicable Systems” column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicability Systems” column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rationale for Reliability Standard CIP-010-4

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-010-4. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for CIP-010-4 is not a Reliability Standard and should not be considered mandatory and enforceable.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850[1] on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards, in which the summary on page 1 states, "…the Commission directs NERC to develop and submit modifications to the supply chain risk management Reliability Standards so that the scope of the Reliability Standards include Electronic Access Control and Monitoring Systems." In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report, Staff Report and Recommended Actions[2], to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-010-4 to require responsible entities to meet the directives set forth in the Commission's Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

New and Modified Terms Used on NERC Reliability Standards

CIP-010-4 uses the following definition(s), which are cited below for reference when reading the technical rational that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1

General Considerations for Requirement R1

FERC Order 850, Paragraph 5 and Paragraph 30 directed modifications to Reliability Standard CIP-010-3 Requirement R1 to address supply chain risk management for Electronic Access Control or Monitoring Systems (EACMS) for high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards to address PACS that provide physical access control (excluding alarming and logging) to high and medium impact BES Cyber Systems, and modifications were addressed by the 2019-03 SDT.

Rationale for Requirement R1

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48). The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

---

[1] https://www.ferc.gov/whats-new/comm-meet/2018/101818/E-1.pdf

[2] https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

Requirement R1 Part 1.6 addresses directives in Order No. 850 for verifying software integrity and authenticity prior to installation of an EACMS (P. 5 and P.30), and PACS from the NERC Cyber Security Supply Chain Risk Report[3] recommendation. The objective of verifying software integrity and authenticity is to ensure that the software being installed on EACMS and PACS was not modified without the awareness of the software supplier and is not counterfeit.

Due to the nature of PACS and the potential need for physical presence, the SDT conducted extensive dialogue and consideration for the addition of PACS to the requirements, the SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warrants the inclusion of PACS as an applicable Cyber Asset category for supply chain risk management controls. Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. is consistent with the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[4].

In further support of the SDT's decision to include PACS, as cited on page 4 of NERC's final report on "*Cyber Security Supply Chain Risks*", "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." While this statement appears in the context of EACMS, it acknowledges physical security threats equally; therefore, the concept is transferable and applicable to PACS, which serve as an integral component to a strategy involving layers of detective and preventive security controls. PACS are intended to manage physical access to BES Cyber Systems in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES and are implemented with that specific intention to protect the BES Cyber System.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical access or monitoring controls that have not been compromised in order to gain access." While it might be a fair point that a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it stands to reason that a threat actor's intention to gain unauthorized electronic access to a PACS does so 1) with the knowledge of it being an initial deliberate action to facilitate undetected reconnaissance, and 2) further undetected methodical compromise and intentional harm to the BES Cyber Systems the PACS is intended to protect.

Furthermore, a precedent is set in CIP-006-6 Requirement R1 Part 1.5 that recognizes the importance of PACS, its functions, and the timeliness of information provided by these systems by requiring issuance of an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter (PSP) to incident response personnel within 15 minutes of detection. This strict timeline suggests that compromised physical security poses an imminent threat to the associated BES Cyber System and the reliable operation of the BES Facilities it serves.

---

[3] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

[4] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

The SDT agrees that NERC correctly refers to various Reliability Standards that mitigate certain security risks relating to PACS; however, the SDT asserts that these existing requirements do not address risk associated to the supply chain and therefore do not sufficiently mitigate that risk.

An additional aspect of the NERC Supply Chain Report, the SDT risks associated with the different aspects of both EACMS and PACS. The NERC Supply Chain Report pointed to the increased risk of the control portion of both EACMS and PACS, and the SDT considered limiting the scope of the requirements to only those EACMS and PACS that perform the control functions. However, since the current approved definitions includes both control and monitoring for EACMS and control, logging and alerting for PACS, the SDT concluded it would introduce less confusion by referring to the authoritative term. The SDT did not attempt a change in definition due to the wide spread use of both EACMS and PACS within all the standards, and did not have authorization within its SAR to modify all of those standards.

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The language for use of a testing environment for deviations from baseline configuration was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly.

Software Verification

The concept of verifying the identity of the software source and the integrity of the software obtained from the software source helps prevent the introduction of malware or counterfeit software. This reduces the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The SDT intends for Responsible Entities to provide controls for verifying the baseline elements updated by vendors. It is important to note that this is not limited to only security patches.

Requirement R2

Rationale for Requirement R2

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Baseline Monitoring

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible

Requirement R3

Rationale for Requirement R3

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Vulnerability Assessments

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement R4

Rationale for Requirement R4

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.
- Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-2 and CIP-007-6 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes

All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

Transient Cyber Assets and Removable Media

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.
With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Attachment 1

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity’s responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity’s security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity’s plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Technical Rationale for Reliability Standard CIP-010-3

This section contains a "cut and paste" of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-010-3 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Section 4 – Scope of Applicability of the CIP Cyber Security Standards:

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to “model” the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly.

Software Verification

The concept of software verification (verifying the identity of the software source and the integrity of the software obtained from the software source) is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is for Responsible Entities to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches.

Requirement R2:

The SDT’s intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible. For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining

a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example,, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.

- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.

- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.

- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.

- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48). The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for Requirement R4:

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.
- Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-2 and CIP-007-6 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes:

All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes

Technical Rationale for Reliability Standard CIP-011-4

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-011-4 . It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-011-4 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rational that follows.

General Considerations

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-011-4 to align information protection requirements with the virtualization changes.

Requirement R1 and R2

Rationale

To enable CIP-011-4 for virtualization, the SDT added “Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part” within the Applicable Systems column of each of the Parts for Requirement R1 – Requirement R2.

Requirement R2 Part 2.1

Requirement R2 Part 2.1 is an objective level requirement focused on protecting BES Cyber System Information (BCSI) rather than ‘Cyber Assets’ and ‘storage media’, and modified to include Requirement R2 Part 2.2. This consolidation creates necessary flexibility, allowing for cryptographic erasure in scenarios where BCSI cannot be mapped to particular disks within virtualized storage, and where BCSI is stored on SCI employing deduplication. This adjustment is also future-looking to better position CIP-011 for the enablement of cloud type scenarios where the disks are owned and/or managed by a third-party as a service to the entity for its BCSI storage, analysis, or use.

Requirement R2 Part 2.2

Requirement R2 Part 2.2 has been deleted because it was consolidated into Requirement R2 Part 2.1.

Former Background Section from Reliability Standard CIP-011-3

The section **6. Background** has been retired and removed from the Standard, and preserved by cutting and pasting as-is below.

Background

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

Technical Rational for Reliability Standard CIP-011-3

Requirement R1

General Considerations for Requirement R1
None

Rationale for Modifications to Requirement R1:
Requirement R1 still specifies the need to implement one or more documented information protection program(s). The SDT does not intend that this requirement cover publicly available information, such as vendor manuals or information that is deemed to be publicly releasable. Information protection pertains to both digital and hardcopy information.

The SDT clarified the intent of protecting BCSI as opposed to protecting the BES Cyber System(s) and associated applicable systems which may contain BCSI. This was achieved by modifying the parent CIP-011-X R1 requirement language to include “for BES Cyber System Information (BCSI) pertaining to Applicable Systems”.

Rationale for Modifications to Requirement R1, Part 1.1
Requirement R1, Part 1.1, is an objective level requirement focused on identifying BES Cyber System Information (BCSI). The intent of the SDT was to simplify the requirement language from CIP-011-2 Part 1.1.

Rationale for Modifications to Requirement R1, Part 1.2
Requirement R1, Part 1.2, is an objective level requirement focused on protecting and securely handling BES Cyber System Information (BCSI) in order to mitigate risks of compromising confidentiality. The reference to different states of information such as “transit” or “storage” or “use” was removed. The intent is to reduce confusion of Responsible Entities attempting to interpret controls specific to different states of information, limiting controls to said states, overlapping controls between states, and reduce confusion from an enforcement perspective. By removing this language, methods to protect BCSI becomes explicitly comprehensive.

Requirement language revisions reflect consistency with other CIP requirements.

Requirement R2

General Considerations for Requirement R2
None

Rationale for Requirement R2:
The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BCSI upon reuse or disposal.

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

Requirement 2 has remained unchanged. The requirements are focused more on the reuse and disposal of BCS rather than BCSI. While acknowledging that such BCS and other applicable systems may have BCSI residing on them, the original intent of the requirement is broader than addressing BCSI. This is a lifecycle issue concerning the applicable systems. CIP-002 focuses on the beginning of the BCS lifecycle but not an end. The potential end of the applicable systems lifecycle is absent from CIP-011 to reduce confusion with reuse and disposal of BCSI. The 2019 BCSI Access Management project did not include modification of CIP-002 in the scope of the SAR. This concern has been communicated for future evaluation.

Technical Rational for Reliability Standard CIP-011-2

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-011-2 standard to preserve any historical references. No modifications have been made.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section.

However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the Responsible Entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.
>
> Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.
>
> In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

Technical Rationale for Reliability Standard CIP-013-3

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-013-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-013-3 to align supply chain risk management requirements with the virtualization changes.

To enable CIP-013-3 for virtualization, the SDT added "and Shared Cyber Infrastructure (SCI)" to the parent Requirement R1. Additionally, the SDT simplified the applicability in Requirement R1 Parts 1.1 and 1.2 by replacing the long list of applicable systems with a reference to the list in the parent Requirement R1 through the use of this language, "applicable systems listed in Requirement R1". Note: Because CIP-013-3 does not contain the "Table" construct with an "Applicable Systems" column, this term is not defined within Section 4 Applicability; Therefore, where used, "applicable systems" is intentionally not capitalized within the requirement language of Requirement R1 Parts 1.1 and 1.2.

Technical Rationale for Reliability Standard CIP-013-2

This section contains a “cut and paste” of the Technical Rationale for CIP-013-2 standard to preserve any historical references.

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-2. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. It also contains information on Project 2019-03 Cyber Security Supply Chain Risks Standard Drafting Team’s (SDT’s) intent in drafting the requirements. This Technical Rationale and Justification for CIP-013-2 is not a Reliability Standard and should not be considered mandatory and enforceable.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850 on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards to address Electronic Access Control or Monitoring Systems (EACMS), specifically those systems that provide electronic access control or monitoring to high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-013-2 to require responsible entities to meet the directives set forth in the Commission’s Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

New and Modified Terms Used on NERC Reliability Standards

CIP-013-2 uses the following definition(s), which are cited below for reference when reading the technical rationale that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1 and R2

General Considerations for Requirements R1 and R2

The Requirement addresses Order No. 829 directives for entities to develop and implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;

(2) Vendor remote access;

(3) Information system planning; and

(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems. FERC Order 850, Paragraph 5 and Paragraph 30, directs modifications to Reliability Standards to include EACMS associated with medium and high impact BES Cyber Systems within the scope of the Supply Chain Risk Management Standards. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report [1](Chapter 3, pages 12-15) to address PACS that provide physical access control to high and medium impact BES Cyber Systems.

---

[1] NERC, “Cyber Security Supply Chain Risks, Staff Report and Recommended Actions”, May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Due to the nature of PACS and the potential need for physical presence, the SDT conducted extensive dialogue and consideration for the addition of PACS to the requirements. The SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warrants the inclusion of PACS as an applicable Cyber Asset category for supply chain risk management controls.

Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. addresses the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[2].

In further support of the SDT's decision to include PACS, as cited on page 4 of NERC's final report on "*Cyber Security Supply Chain Risks*", "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." While this statement appears in the context of EACMS, it acknowledges physical security threats equally; therefore, the concept is transferable and applicable to PACS, which serve as an integral component to a strategy involving layers of detective and preventive security controls. PACS are intended to manage physical access to BES Cyber Systems in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES and are implemented with that specific intention to protect the BES Cyber System.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical access or monitoring controls that have not been compromised in order to gain access." While a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it could demonstrate a threat Actor's intention to gain fully unauthorized electronic access. With electronic access to the PACS an initial deliberate action to facilitate reconnaissance and intentional harm to the BES Cyber Systems.

Furthermore, there is precedent set in CIP-006-6 Requirement R1 Part 1.5 that speaks to a recognized importance of PACS, its functions, and the timeliness of information provided by these systems by requiring issuance of an alarm or alert in response to detected unauthorized access through a physical access point into a PSP to incident response personnel within 15 minutes of detection. This strict timeline suggests imminent threat that compromised physical security poses to the associated BES Cyber System and the reliable operation of the BES Facilities it serves.

The SDT agrees that NERC correctly refers to various Reliability Standards that mitigate certain security risks relating to PACS; however, the SDT asserts that these existing requirements do not address risk associated to the supply chain and therefore do not sufficiently mitigate that risk.

---

[2] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

An additional aspect of the NERC Supply Chain Report the SDT considered was around the risk associated with the different aspects of both EACMS and PACS. While both types of systems, under the current definitions, have various functional activities they perform, the NERC Supply Chain Report pointed to the increased risk of the control function. The SDT considered limiting the scope of the requirements to only control functions, however, chose to stay with the currently approved definitions of both EACMS and PACS. The SDT concluded staying with approved definitions would introduce less confusion. Additionally an attempt to change the EACMS and PACS definitions was outside the 2019-03 SAR.

Rational for Requirement 1 and Requirement 2

Requirement R1 Part 1.1 addresses the directive in Order No. 829 (P.56) and Order 850 (P.5) for identification and documentation of cyber security risks in the planning and development processes related to the procurement of medium and high impact BES Cyber Systems, and their associated EACMS and PACS. The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

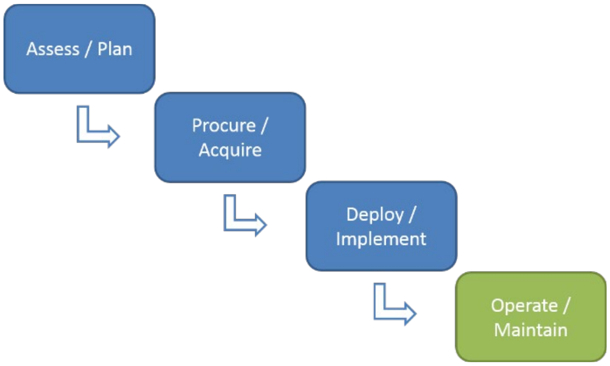
The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The use of remote access in Part 1.2.6 includes vendor-initiated authenticated remote connections and system to system remote connections for EACMS and PACS; and vendor-initiated IRA and system to system access to BCS and PCAs.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-2 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R3

General Considerations for Requirement R3

The requirement addresses Order No. 829 directives for entities periodically to reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

Technical Rational for Reliability Standard CIP-013-1

This section contains a "cut and paste" of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-013-1 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Rationale

Requirement R1:

The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;

(2) Vendor remote access;

(3) Information system planning; and

(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

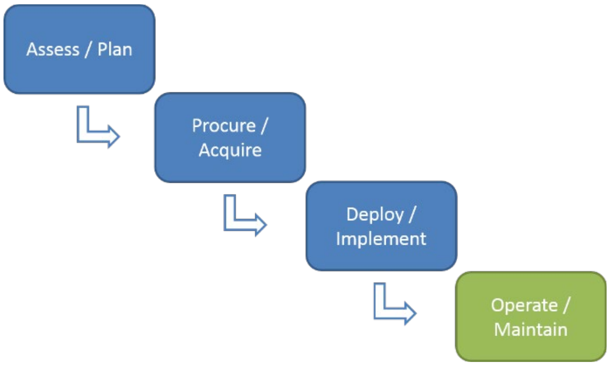
Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R2:

The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

Project 2016-02 Modifications to CIP Standards | Virtualization

Additional Ballots and Non-binding Polls Open through October 7, 2022

Now Available

The additional ballots and associated Violation Risk Factors and Violation Severity Level non-binding polls for the **CIP Virtualization suite of standards (outlined below)** are open through **8 p.m. Eastern, Friday, October 7, 2022**.

The standard drafting team's considerations of the responses received from the previous comment period are reflected in these drafts of the standards.

- CIP-002-7 - Cyber Security – BES Cyber System Categorization
- CIP-003-Y - Cyber Security – Security Management Controls
- CIP-004-8 - Cyber Security – Personnel & Training
- CIP-005-8 - Cyber Security – BES Cyber System Logical Isolation
- CIP-006-7 - Cyber Security – Physical Security of BES Cyber Systems
- CIP-007-7 - Cyber Security – Systems Security Management
- CIP-008-7 - Cyber Security – Incident Reporting and Response Planning
- CIP-009-7 - Cyber Security – Recovery Plans for BES Cyber Systems
- CIP-010-5 - Cyber Security – Configuration Change Management and Vulnerability Assessments
- CIP-011-Y - Cyber Security – Information Protection
- CIP-013-3 - Cyber Security – Supply Chain Risk Management

Balloting
Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in the previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pool to vote again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at (404) 446-2589. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2016-02 Modifications to CIP Standards Observer List” in the Description Box.

UPDATED

Standards Announcement

Project 2016-02 Modifications to CIP Standards | Virtualization

Formal Comment Period Now Open through October 7, 2022

Now Available

The formal comment period for draft 4 of the **CIP Virtualization suite of standards (outlined below)** has been extended and is now open through **8 p.m. Eastern, Friday, October 7, 2022**.

- CIP-002-7 - Cyber Security – BES Cyber System Categorization
- CIP-003-Y - Cyber Security – Security Management Controls
- CIP-004-8 - Cyber Security – Personnel & Training
- CIP-005-8 - Cyber Security – BES Cyber System Logical Isolation
- CIP-006-7 - Cyber Security – Physical Security of BES Cyber Systems
- CIP-007-7 - Cyber Security – Systems Security Management
- CIP-008-7 - Cyber Security – Incident Reporting and Response Planning
- CIP-009-7 - Cyber Security – Recovery Plans for BES Cyber Systems
- CIP-010-5 - Cyber Security – Configuration Change Management and Vulnerability Assessments
- CIP-011-Y - Cyber Security – Information Protection
- CIP-013-3 - Cyber Security – Supply Chain Risk Management

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **September 28 – October 7, 2022**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **September 28 – October 7, 2022**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at (404) 446-2589. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify "Project 2016-02 Modifications to CIP Standards Observer List" in the Description Box.

There were 72 sets of responses, including comments from approximately 188 different people from approximately 121 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. The SDT has modified the IRA definition to simplify it, primarily in regards to the routable protocol to serial conversion scenario. Do you agree with the proposed change? If not, please provide the basis for your disagreement and an alternate proposal.

2. The SDT modified other definitions used in the CIP standards based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

3. The SDT revised CIP-005 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

4. The SDT revised CIP-007 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

5. The SDT has used phrasing such as "SCI supporting an Applicable System from this Part" in the Applicable Systems column across many of the standards. Is it clear that this scopes the requirements for SCI to match the system(s) it hosts?

6. The SDT made numerous clarifying changes to CIP-010 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

7. The SDT revised CIP-003, CIP-004, CIP-006, CIP-008, CIP-009, CIP-011, and CIP-013 mostly with conforming changes or scoping clarifications related to SCI. Do you agree with the proposed changes to these Reliability Standards? If not, please provide the basis for your disagreement and an alternate proposal.

8. The SDT has revised the Implementation Plan to include 3 defined early adoption dates as options should Responsible Entities choose to do so. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

9. Please provide any additional comments for the standard drafting team to consider, if desired.

Roger Fradenburgh - Roger Fradenburgh On Behalf of: Nicholas Lauriat, Network and Security Technologies, 1; - Roger Fradenburgh

Answer	No
Document Name	

Comment

NST sees no reason to change the existing definition's use of "remote access client or other remote access technology." The second part of the proposed definition would, as written, apply to any remote connection using a communications path that included routable to serial conversion, regardless of where that conversion took place (e.g., remote location vs. "local," or "inside the BES asset" location). NST is aware of concerns that using phrases such as "outside the asset" in this context might cause confusion about its relationship to electronic access control requirements for BES assets containing low impact BCS, but we nonetheless recommend using it to avoid overly broad application of "IRA" to communications using both routable and serial wide-area connections.

Comment

The term “Cyber System” is too broad in scoping IRA. Suggest revise to clarify that the target of IRA is BES Cyber System rather than “Cyber System” to avoid including EACMS, SCI, PCA, etc.

Comment

Under the new definition of IRA, bullet 5 that excludes “Communication that originates from an Intermediate System; or,” should not be excluded from the definition. Excluding it would be confusing as IRA to a BCS should come from an Intermediate System.

The new definition of IRA conflicts with the existing definition of ERC. ERC is the ability to access a BCS through its ESP via a “bi-directional” routable protocol connection.

In the new IRA definition, the second bullet addressing serial Cyber Assets states that IRA is “User-initiated electronic access by a person using a routable protocol” (*not necessarily bi-directional*), “that is converted by the Responsible Entity to a non-routable protocol….,” is in direct conflict with the existing definition of ERC. This is not a concern over serial end points being in scope or not, we all agree that they are in scope, but the term “bi-directional” does nothing to help bring serial devices into scope, in fact it implies that serial devices that do not establish TCP/IP connections are out of scope.

Our recommendation to the SDT is to modify the definition of ERC as follows. First, remove the words “bi-directional” since there is no such thing as bi-directional routable protocol. Changing the ERC definition to simply “routable protocol” would create consistency throughout the requirements. Second, remove the word “connection” as this term implies that there has been a TCP handshake and a connection is established while excluding connectionless protocols such as UDP. Consider using “routable protocol communication” or just “routable protocol”. In CIP-005 R1.2, reference is made to routable protocol communication instead of connection, so the SDT may want to align with that if they are using the term routable protocol is not enough.

Response

Gail Golden - Entergy - Entergy Services, Inc. - 5

Answer	No
Document Name	

Comment

Should “or” be added to the end of the first bullet to more clearly define the need to continue dropping through the bullets like a decision tree to identify if any of the points are true instead of exiting after the first question? It is unclear if after the first bullet is an “and” or an “or” to identify IRA.

Comment

Changes to the IRA definition adds conversion from routable to non-routable (serial) communications to remote BCS that was previously omitted. Further clarifications in the definition of IRA removes some gray areas and further delineates IRA from system-to-system communications. However, there remains a gap between what is system-to-system and what is Interactive Remote Access (IRA) with the new IRA definition. Entities often rely on IRA ports for system-to-system communication but have not enforced protections to ensure that malicious actors do not use the ports – regardless of whether a remote access client is available or used. Additional technical measures or controls should be added to the definition to ensure validity of communications to Applicable Systems regardless of source or intent. In addition, approval of CIP-005-8 would be conditional, based upon approval of the entire suite of new standards associated with virtualization and approval of SCI terminology and other definitions associated with virtualization.

The SDT has added rationale but not defined whether user-created scripts and programs that can be modified and scheduled to run independently are considered IRA – even though an unauthorized user could modify it to their benefit. Both scripts and programs can be user-initiated, and with no definition of system-to-system communications there are still lingering issues regarding what system-to-system communications is comprised. Further, user-created scripts and programs may not be capable of reading multi-factor tokens or their displayed codes, but additional security for these connections can be implemented through certificates and the use of secure connections via SSH or SSL.

Response

JT Kuehne - AEP - 6

Answer	No
Document Name	

Comment

The revised definition of IRA provides more clarity than the earlier version. With that said, AEP recommends removing second bullet under what “IRA does not include” list, as IRA should include “communication that originates from an Intermediate System”.

Response

Jodirah Green - ACES Power Marketing - 6

Answer No

Document Name

Comment

The IRA definition contains “To a Manangement Interface of Shared Cyber Infrastructure”. We feel this should read “To a Management Interface”. Adding SCI to the definition restricts the scope to just Management Interfaces on SCI. Management Interface’s definition contains SCI, so it is unnecessary to put SCI into the requirement as well.

Comment

WECC suggests that the CIP-005-8 R2.4 use of ‘vendor remote access’ in the applicable system is not consistent with ‘active vendor remote access sessions’ and causes confusion considering neither term is defined. WECC suggests removing ‘vendor remote access’ from the applicable systems and have the scope of ‘active vendor remote access sessions’ stand on its own.

Suggest change to ¨To a Management Interface of Shared Cyber Infrastructure protected by an ESP¨. As management interface of target SCI should be located inside ESP and SCI outside ESP should not be in scope.

Request confirmation that entities should re-evaluate serial connections because they may now be in scope . . . due to the updated definitions of IRA and ERC

Comment	
The phrase “actively remediated in an environement” in the PCA and VCA definitions needs to be clarified; additional information on the meaning of that phrase that was included in the technical rationale could be utilized to clarify the definitions. For CIP-003, Attachment 1, Section 4, request confirmation that, while this Section has no updates, this Section’s scope is being expanded because of changes to the definitions of Cyber Security Incident and Reportable Cyber Security Incident.

JT Kuehne - AEP - 6

Answer No

Document Name

Comment

AEP supports all proposed definitions with the exceptions of “Cyber Assets” and
“Interactive Remote Access (IRA)”. Our comments are specified below:

- **Cyber Assets**: The SDT added “*Application containers are considered software of Virtual Cyber Assets (VCAs) or Cyber Assets. VCAs are not considered software or data of Cyber Assets*” to the definition of Cyber Asset. AEP suggests deleting the added sentence since it adds more confusion to the definition and it is included in the VCA definition.
- **Interactive Remove Access (IRA)**: Please see our response under Question #1.

Since the Glossary modifications are the foundation to all Standard changes, NERC should seek approval of the new terms prior to any changes being introduced in the Standards to reduce potential misunderstanding or misinterpretation of both the new definitions and modified Standards. This will also allow NERC, and industry, time to determine additional courses of action, reduce confusion, and reduce additional risk associated with such wholesale changes. Further, introducing Shared Cyber Infrastructure (SCI) and Management Interface increases the number of Requirements and Parts that a Responsible Entity needs to track compared to simply identifying the hypervisor and associated hardware and “high-water marking” them with the highest identified impact rating BCA/VCA, EACMS, or PACS, and creating a BCS.

Further, the ideology surrounding “remediation VLANS” should be revisited to understand the risks posed by implementing such an environment. The complexity required to balance these pooled resources using affinity rules or logical boundaries to disallow different impact levels of VM guests from running on the same physical resources could be high. RF believes that the rationale put forth by the Standards Drafting Team for a “remediation VLAN” and the use of automation of security controls poses additional risks that can be mitigated through the use of Transient Cyber Assets (TCAs) in CIP-010 to accomplish the same vulnerability assessments and updates (OS patches, AV updates, etc.) without the complexity or risk associated with having to identify and unidentify PCAs as they are taken out and placed into service in the production network.

Patricia Lynch - NRG - NRG Energy, Inc. - 5

Answer	No
Document Name	

Comment

The current definition of “Management Interface” still appears to be a bit unclear. It seems to exclude the management interface of a switch inside the Electronic Security Perimeter. NRG recommend changing the third bullet of the definition from “Configures an Electronic Security Perimeter” to “Configures a network device.”

Additionally, the proposed “Protected Cyber Assets” definition could be read to include any Virtual Cyber Asset that shares physical CPU or memory, despite the addition of “resources”. We believe the intent of the drafting team to be sharing virtual CPU or memory. If so, the definition should be clarified to read, “any Virtual Cyber Asset sharing the same CPU or memory allocation.”

Comment

AWS agrees with the following proposed definition changes but asks the SDT to consider including the items suggested below in implementation guidance to support entities in adopting the revised definitions:

Interactive Remote Access (IRA): AWS asks the SDT to consider including the meaning of system-to-system communications in implementation guidance to support entities with implementing the revised IRA definition. We suggest including elements such as where the system-to-system communication originates – inside or outside of the Electronic Security Perimeter (ESP).

Management Interface: AWS asks the drafting team to consider clarifying the meaning of “administrative interface.” For example, the SDT could clarify if “administrative interface” is intended to include Graphical User Interfaces (GUIs), Command Line Interfaces (CLIs), Software Development Kits (SDKs), and/or Application Programming Interfaces (APIs).

Virtual Cyber Asset (VCA): AWS asks the SDT to consider including the meaning of “dormant file-based images” in implementation guidance to support entities with implementing the revised VCA definition. Additionally, AWS suggests including guidance to ensure that security controls are in place for dormant file-based images to mitigate vulnerabilities. For example, guidance that includes verification that required cyber security controls are in place prior to using the file-based image in production.

AWS does not agree with the following proposed definition:

Transient Cyber Asset (TCA): The modification to the Transient Cyber Asset definition that allows virtual machines running on a physical TCA to be treated as software on the device should be reconsidered. As written, an entity may not apply the appropriate security controls to the virtual machines running on physical TCAs. Entities should be monitoring the state of the virtual machines running on their physical hardware for security issues. We propose removing the language “Virtual machines hosted on a physical TCA can be treated as software on that physical TCA” from the TCA definition. By removing this language, entities would be required to apply security controls to the virtual machines hosted on their physical TCAs in alignment with CIP-010 R4.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name PUD No. 1 of Chelan County

Answer	No
Document Name	

Comment

The definition of Protected Cyber Asset carries with it an implicit requirement with the CPU and memory clause. The implication of the requirement is that a VM that is not a Protected BES Cyber Asset may not share CPU and memory with a BES Cyber System. If out-of-scope VM inadvertently shares CPU and memory with a BES Cyber System, then it suddenly becomes a PCA by definition and has instantly violated the majority of the CIP requirements. This is similar to the issue with Intermediate System that was corrected in this draft.

Chelan recommends removing the CPU and memory sharing clause and adopt the suggested language in Q4 for CIP-007 R1.3, a requirement that a BCS/PCA may not share CPU and memory with non-BCS/PCA of the same impact level. That would change an inadvertent resource sharing incident into a single violation of CIP-007 R1.3 rather than violating all the requirements that have PCA as an Applicable System. Please see the response to question 4 for suggested language.

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group

Answer	No
Document Name	

Comment

WEC Energy Group has a continued concern with the newly defined term "Management Interface". Based on the rationale, it is understood why the need to define these interfaces exists. However, this definition differs from the virtual concept and extends to application functionality tools which, in our opinion, is outside of the intended scope of the Project. Thus bringing additional devices into scope even for those entities that are not using virtual machines. Proposing the SDT remove the 3rd bullet from the definition.

Comment

While updating the definition of EAP for virtualization and to accommodate zero trust architectures, it would be good to also not refer to a “Cyber Asset interface,” as the EAP could be a zone-based implementation, transparent firewall, a single physical interface, multiple physical interfaces, sub interfaces (virtual SVI) or a port channel/group. The term Cyber Asset “interface” is too restrictive.

We recommend the SDT change the definition to “An electronic access or policy enforcement point on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.”

Response

Jay Sethi - Manitoba Hydro - 1,3,5,6 - MRO

Answer	No

Document Name	

Comment

Manitoba Hydro thanks the drafting team for considering all comments and implementing changes to the definitions. Manitoba Hydro is in support of the changes to most definitions and the new definitions. For the updated definition of **Electronic Access Control or Monitoring Systems (EACMS)** it appears that the scope has inadvertently been increased with the “SCI” wording. The definition includes Cyber Assets… that perform electronic access control or electronic access monitoring of… SCI. The definition for SCI includes systems that host EACMS and PACS and systems that provide storage resources to EACMS and PACS. The scope of an EACMS would therefore increase to include systems that provide electronic access control and monitoring for SCI supporting EACMS and PACS, however systems providing electronic access control and monitoring directly for EACMS and PACS are not in scope. The definition is the only place where the scope of EACMS is set.

The following wording is suggested:

Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure (SCI) that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s), BES Cyber Systems or SCI supporting applicable Cyber Assets. This includes Intermediate Systems.

Manitoba Hydro also notes a minor clarification in the new definition of Management Interface. It referest to deploying “SCI”, this should actually refer to the VCA hosted on the SCI:

An administrative interface that:

• Controls the processes of initializing or deploying VCA hosted on SCI or

Controls the process of configuring Shared Cyber Infrastructure; or

• Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or

• Configures an Electronic Security Perimeter.

Additionally the definition for VCA includes the term “virtual machine”. This is a technology specific term and excludes some potential instances of VCA such as virtualization used in the CISCO Nexus platform. This can be resolved by removing the following wording: “currently executing on a virtual machine”

Comment

In the proposed definition of “Cyber Asset”, the definition of “application container” versus VCA is unclear. The term “container” used in this definition needs further clarification.

In the proposed definition of “Management Interface”, the definition of “administrative interface” is unclear. The term “administrative interface” used in this definition needs further clarification.

In the proposed definition of TCA, removal of the qualifier “directly” may inappropriately expand the scope of the requirement to include devices connecting via IRA or Intermediate System.

Roger Fradenburgh - Roger Fradenburgh On Behalf of: Nicholas Lauriat, Network and Security Technologies, 1; - Roger Fradenburgh

Answer	No
Document Name	

Comment

Definition of VCA: NST believes the proposed definition of VCA should more closely resemble the existing definition of "Cyber Asset" or, better still, be eliminated altogether. The existing definition of "Cyber Asset" could be easily "unbound" from "hardware" with this or a similar modification:

Change from, "Programmable electronic devices, including the hardware, software, and data in those devices" to, "Hardware-based or virtual programmable electronic devices, including the software and data in those devices."

Definition of TCA: NST considers the statement in the proposed definition of TCA, "Virtual machines hosted on a physical TCA are treated as software on that physical TCA" to be oddly inconsistent with the proposed definition of VCA. Furthermore, we disagree with the SDT's opinion that if a physical TCA hosts one or more virtual TCAs, there should be no need to track and manage each individual physical and virtual device.

Definition of ESP: NST believes the proposed new part of the current ESP definition, “or a logical boundary defined by one or more EAPs” is redundant and unnecessary. We therefore recommend maintaining the currently approved ESP definition.

Definition of ERC: NST believes the use of the word, "through (an ESP)" has the potential to cause confusion over what kind of routable communications qualify as ERC. ERC to or from a Cyber Asset should be clearly defined as "through" an ESP boundary or access point, not "through" an ESP (the online Merriam Webster dictionary defines "through" as "a function word to indicate movement into at one side or point and out at another and especially the opposite side of // 'drove a nail through the board'"). NST believes the existing definition of ERC can and should be retained as-is.

Definition of EAP: NST believes the proposed definition of EAP is problematic in two respects. First, we believe it could be interpreted to mean an EAP should control all routable communication between a BCS and any other Cyber Asset regardless of whether that "other" device is within or outside of

the same ESP protecting the BCS. Second, we believe the SDT should better define "policy enforcement point," lest Responsible Entities, Regional Entities, and NERC develop their own conflicting definitions.

Comment

Texas RE is concerned the proposed definition of Electronic Access Point (EAP) is ambiguous. Texas RE believes the SDT's intent was to write a definition that applied to communications between BES Cyber Systems and PCAs and Cyber Assets not protected by the same ESP. The proposed definition as written, however, could be interpreted to mean that EAPs are only applicable when controlling communication between a BCS and its PCAs. The proposed language as written could also be interpreted to mean "An electronic policy enforcement point" or "a Cyber Asset interface on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs."

It could also be interpreted to mean "An electronic policy enforcement point" or "a Cyber Asset interface on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.

For clarification, Texas RE recommends the following definition:

An EAP is:

- A Cyber Asset interface on an EACMS; or
- An electronic policy enforcement point

that controls routable communications between Cyber Systems protected by an ESP and:

- one or more Cyber Systems that are not protected by an ESP; or
- one or more Cyber Systems that are protected by a different ESP.

Nicolas Turcotte - Hydro-Qu?bec TransEnergie - 1 - NPCC

Answer	
Document Name	

Comment

For definition of Transient Cyber Asset (TCA): Reconsider the wording of the sentence ¨ Virtual machines hosted on a physical TCA are treated as software on that physical TCA¨. The language used leaves room for misinterpretation and allows entities to use VM on physical TCA to bypass implementing security controls in the VM. VM image security should be verified prior to execution on TCA.

For CIP-003, Attachment 1, Section 4, request confirmation that while this Section has no updates, this Section's scope is bigger because of changes to the definitions of Cyber Security Incident and Reportable Cyber Security Incident.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment

Southern does not agree with the proposed change in Part 1.3. The way EACMS is written, it suggests that it includes all forms of EACMS and is too broad. The term “EACMS that enforce an ESP” is not bound to firewalls and switches with VLANs, in other words EACMS that enforce network segmentation. Domain Controllers for example can help “enforce” an ESP in determining who can and can’t cross the ESP. It is not clear, in that case, what the “Management Interface” of a domain controller EACMS is, nor can routable protocol be restricted to it if its used to authenticate users. The original approved standard lists Electronic Access Points for High and Medium BCS which more aligns with equipment within an ESP. Southern suggests considering the use of EAP as the object of this requirement to clarify the scope.

BPA does not support the expansion of R1, Part 1.6 to include the protection of data traversing communications links. Expansion to communications links does not consider devices that cannot meet this criterion. Putting communication links in scope would increase costs and maintenance activities, and would require re-architecture of links. Additionally, Exemption 4.2.3.3 maintains the communications exemption for the equipment on the communications link in a ‘super-ESP’, whereas an encryption requirement when traversing multiple geographic locations would increase security for these super-ESPs. BPA suggests reverting to the Draft 3 language for R1, Part 1.6.

BPA does not agree with the requirement to mitigate risk represented by sharing memory resources in R2, Part 2.6.1. The theoretical risk represented by CPU-sharing is not high enough to mandate the significant re-architecture required to adequately separate CPU usage as specified in Part 2.6.1. BPA recommends allowing the continued use of shared resources to allow entities the flexibility to balance risk mitigation with resources, maintenance and cost of maintaining the grid.

Comment

CIP-005 R1.2 does not state that there must be a justification for the need of routable protocol communication except for in the Measures column.

We recommend the SDT change the wording from permit only needed routable protocol communications, and deny all other routable protocol communications “through the ESP” to “into identified ESP(s).”

ERC is defined as external routable ***connectivity***, but the requirement is for external routable ***communications***. This is another instance of the inconsistent use of routable protocol qualifiers.

In the Measures column of CIP-005 R1.2, the Measure “Physical isolation of an ESP,” is confusing.

The need to use routable “protocol” communications in the CIP-005 requirements is confusing. It makes it sound like routable ***protocol*** communications is something different than routable communications. You cannot have routable communications without a routable protocol unless you encapsulate the non-routable protocol. This current wording may support excluding serial communications that are encapsulated and transported via a routable protocol. It would be less ambiguous if the SDT drops the word “protocol” from routable protocol communications and just used “routable communications.”

For CIP-005 R1.5, we recommend the SDT add a “except during CIP Exceptional Circumstances” clause to the requirement (similar to the clause added to CIP-004 R3.5). There can be multiple single points of failure impacting the ability to detect known or suspected malicious IP communications. A logging server, line card, power source, management console or SIEM could fail resulting in an immediate potential instance of non-compliance. Many of these solutions require port mirroring and there are limitations to mirroring the same source networks to multiple destination interfaces. This creates a scenario where a failed patch or unexpected hardware failure would immediately result in a potential instance of non-compliance creating unnecessary administrative burden. One solution to solve this would be to use a SPAN aggregator that splits the SPANS to two different security devices (like an IDP), but this too creates a single point of failure that during a patch, reboot or any system failure, would automatically result in a potential instance of non-compliance.

For CIP-005 R2.1, the SDT should change the requirement so that the Interactive Remote Access is only initiated ***from*** an intermediate System instead of ***through*** an Intermediate System so that it’s clear that encrypted communication stops at the Intermediate System and new communication is then established from the Intermediate System.

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group

Answer	No
Document Name	

Comment

WEC Energy Group does not agree with the proposed edits in R1 as it references the new "Management Interface" definition of which we do not agree (see #2 response). We also note that the reference to the Electronic Access Point has been removed from the Applicable Systems column. The Electronic Access Point modified definition is suitable for referencing physical and virtual assets. Proposing the SDT leaves Electronic Access Point in the Applicable Systems column.

WEC Energy Group can support the proposed edits in R2 and R3.

Kristine Martz - Amazon Web Services - 7

Answer	No
Document Name	

Comment

Regarding CIP-005 Part 1.4, AWS suggests not limiting authentication requirements to dial-up connections. The SDT should broaden this requirement to include other technologies (i.e. 4G, 5G, etc.). Limiting this requirement to dial-up only may inadvertently create a security gap where alternative connection methods are not required to authenticate.

Comment

There is still a gap between what is system-to-system and what is Interactive Remote Access (IRA) with the new IRA definition. Entities often rely on IRA ports for system-to-system communication but have not enforced protections to ensure that malicious actors do not use the ports – regardless of whether a remote access client is available or used. Additional technical measures or controls should be added to the Standard to ensure validity of communications to Applicable Systems.

CIP-005-8 depends upon approved SCI terminology and other definitions associated with virtualization. Approval of CIP-005-8 would be conditional, based upon approval of the entire suite of new standards associated with virtualization.

There is a significant concern is that an entity could implement “logical isolation” using only a host-based firewall on essential systems that are directly connected to the internet. Thus, exposing them to greater risk as compared the requirements in place today using defense-in-depth.

Further, introducing Shared Cyber Infrastructure (SCI) increases the number of Requirements and Parts that a Responsible Entity needs to track compared to simply identifying the hypervisor and associated hardware and “high-water-marking” them with the highest identified impact rating and creating a BCS. Allowing “mixed-trust” environments within the same SCI (hypervisor) increases the complexity and management of the environment as the SDT relaxes the “high-water-marking” required to this point. In addition, complex environments are permitted where both ESP and non-ESP Cyber Assets can be commingled on the same hardware using nothing more than affinity rules and virtual networking to segregate these systems. The complexity surrounding these installations could allow for increased risks from configuration mistakes such that ESPs could contain Intermediate Systems.

Finally, there is no NERC definition of “Remediation VLAN” so therefore the Responsible Entity could keep VMs spun up and within the Remediation network for extended periods of time – without the benefit of protections from the other CIP Standards. Accidental connection to production networks before these VMs has been properly remediated could lead to security issues and introduction of malicious communications.

CIP-005 Requirement R1 Part 1.6 – to protect the confidentiality and integrity of data traversing communication links that span multiple Physical Security Perimeters, does not carry a minimum level of encryption to be required. This could result in older less secure methods being used for connections leaving the data at risk. References to NIST documentation regarding minimum encryption is suggested. Further, dependence on third-party carriers to create the “super ESP” could allow encrypt-decrypt-encrypt situations that could jeopardize the required protections for confidentiality and integrity of the data.

Benjamin Winslett - Georgia System Operations Corporation - 4

Answer	No
Document Name	2016-02_Virtualization_Unofficial_Comment_Form.docx

Comment

GSOC requests the SDT remove references to previous requirements regarding applicable systems and instead include the content in directly with regards to applicable systems in parts 2.2, 2.3, and 2.6.

In requirement 1.6, GSOC recommends allowing for the use of a combination of both physical and encryption controls at the discretion of the responsible entity for protections in the same manner as is allowed in CIP-012 standards. {C}[TK1]{C} This inclusion of physically security controls will provide more latitude for the entity to increase security while still remaining compliant rather than relying solely upon either physical or confidentiality and integrity controls. GSOC recommends using "Confidentiality and integrity controls, and/or", or an additional bullet point specifically allowing for a combination of confidentiality and integrity controls along with physical controls.

In requirement 2.1, specifying 'authorized IRA' implies that all IRA must be authorized, i.e. enumerated and documented. Additionally, the 2.1 measures then require all IRA be routed through an Intermediate System, suggesting even unauthorized IRA must do so as well. This issue persists in 2.3.

Requirement 2.5, 3.1, and 3.2 language on applicability should explicitly specify it applies to only SCI having vendor remote access, rather than every SCI.

Manitoba Hydro agrees with the direction of the standard drafting team. Additional clarity could be added to sub-requirement R2.4 and R2.5. The term “with vendor remote access” has been added to the “applicable system” column. The addition of “SCI supporting an Applicable System in this Part” could mean that vendor remote access to the SCI is not in scope if there is no vendor remote access to BCS, since there are two qualifiers. Manitoba Hydro suggests adding a the qualifier “Where vendor remote access is implemented,” to the “requirements” column similar to the change done for R1.4 for Dial Up access.

Comment

Part 1.5 – SCI is not afforded malicious communications protections like the other CA types. While we understand the desire to avoid monitoring heavy traffic like fiber-channel, there is still a real risk of malicious code over the network to/from hypervisors (and likely other SCI)

Part 1.6 – Communication between geographically dispersed SCI is not applicable, thus not necessarily afforded similar protections.

Part 1.6 - Including the 'Internet Protocol' qualification in the requirement could inhibit malicious communication detection for future technologies and implementations that may not use a traditional firewall and IP routing. In particular with the change from firewalls as the outer perimeter to a zero-trust implementation, there will likely be more configuration points that aren't also acting as routers, so the inherent protection from non-IP protocols offered by the separation of subnets will no longer be there and other protocols could pass.

BC Hydro agrres with the proposed changes; however, clarification is needed as follows: In CIP-005-8 Requirement 2.1 which is, "Permit authorized....". The use of the word "authorized" is creating confusion. Typically IRA through the Intermediate System is already authorized through CIP-004. SCI was already added into CIP-004 scope therefore SCI access is authorized. IRA is applicable to all asset classifications on top of SCI which is also authorized through the CIP-004 process and not at the intermediate system. BC Hydro kindly requests that the drafting clarifies the use of the term "authorized" and recommends that the drafting team consider removing the word "authorized" from the wording of Requirement 2.1.

Texas RE is concerned the definitions of Cyber Asset and PCA introduce security risks in CIP-005. The definition of Cyber Asset explicitly excludes SCI from its definition, which means SCI cannot be a Cyber Asset. The definition of PCA explicitly includes Cyber Assets or Virtual Cyber Assets in the definition. SCI cannot meet either definition, which means a hypervisor cannot be dual categorized as SCI and PCA. Therefore, an SCI placed within a network protected by an ESP arguably would not be subject to CIP-005 R1.1, R1.2, R1.5, or R1.6 despite being a PCA in all but definition.

In addition, Texas RE notes that SCI supporting high and medium impact BCS have fewer network-based protections than high and medium impact BCS. CIP-005 R1.2 is applicable to high and medium impact BCS with ERC. The requirement requires that only needed routable protocol communications are permitted through the ESP. CIP-005 R1.3 is applicable to SCI supporting medium and high impact BCS. The requirement requires that only needed routable protocol communications to and from the Management Interfaces are permitted.

Additionally, Texas RE is concerned there may be means of communicating with SCI outside of the narrow scope of the Management Interface definition. For example, an FTP server would not control the process of initializing, deploying, or configuring SCI. An FTP server is not an autonomous subsystem that provides access to the console independently of the host system’s CPU, firmware, or OS. Finally, an FTP server does not configure an ESP. As such, an FTP server running on SCI would be out of scope for CIP-005 R1.3. An FTP server in this scenario could be used to exfiltrate sensitive data, such as the disk images for the BCS that the SCI is hosting. Additionally, since SCI is out of scope for CIP-005 R1.5 entities would not be required to monitor this FTP server for malicious communications between the SCI and other systems. Texas RE suggests this issue would be mitigated by implementing high watermarking practices as described in Texas RE’s response in #9.

Lastly, Texas RE continues to be concerned the security objective for CIP-005-6 R1 Part 1.5 is now limited to IP malicious communications with the proposed changes. With the proposed changes this would not only reduce the compliance obligations but also create a gap in security by only focusing IP malicious communications versus all malicious communications.

4. The SDT revised CIP-007 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC) 2016-02 Virtualization (Draft 4)

Answer	No
Document Name	

Comment

The SRC agrees with the concept of per system capability.

For Part 1.3, we recommend changing “prevention” to “risk mitigation”. “Preventing” is absolute. “Risk mitigation” is flexible.

For Part 4.3, we request adding “security” to “applicable events” for consistency with Parts of R4. Update would read “Retain applicable security event logs identified in Part 4.1 for at least the last 90 consecutive calendar days, per system capability, except under CIP Exceptional Circumstances.”

For Part 4.4, please consider rewording this requirement to accommodate entities that use the current SIEM technology which has this type of functionality built-in and no longer requires a manual review of such data sources while also addressing those that do not have this technology.

For Part 5.1 and 5.4, leaving the scope of the term “system” up to the entity, requires effort to supply a definition and document compliance with the definition. This could lead to a misunderstanding of the intent of that term. We recommend that SDT update the technical rationale to include what is meant by “system”.

Answer	No
Document Name	

Comment

No, 1.3 requirement is written more like measure with the word prevent. Would suggest rewording it to "Mitigate VCA's from CPU or memory vulnerabilities that share these resources with other VCA's that are not associated with the same impact categorization." Then prevention could be one of the measures.

In R1.1, Ameren believes that the phrase "routable protocol network accessibility" is unclear and there should be more clarity as to what this phrase means. We are concerned an auditor might think of this phrase differently than Ameren does, so we believe more clarity around this phrase will ensure that auditors and Ameren have the same understanding as to what the phrase means.

In R4.3, the phrase "per system capability" was added. Does any paperwork need to be filled out and provided to the regional entity for devices that fall into the "per system capability" classification? For example, paperwork needs to be filled out for TFEs.

Recommend removing EACMS and PACS from the applicability section. If EACMS or PACS were to reside inside an ESP they are also categorized as PCAs so they will be covered. This change will exclude other CAs in a DMZ virtual system that do not perform EACMS or PACS functions and will thus retain the backward compatibility of the standard while allow greater protection for BCAs and PCAs.

Response

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name PUD No. 1 of Chelan County

Answer	No
Document Name	

Comment

Chelan believes the proposed language for CIP-007 R1.3 is overly burdensome and the required control does not reflect the actual risk of a VM escape attack. The intended controls (DRS affinity rules) listed in the measures are not intended for security control purposes, but are instead intended for resource control purposes. Because of this and the very broad applicability, they will have overly complex rulesets that introduce reliability risks where, in the event of a failure or during maintenance activities, a crucial VM may not be able to find a suitable host and crash. Given there are few if any demonstrated attacks along this threat axis, this seems to be an overreach.

Additionally, this requirement is not backwards compatible with the existing requirements. The currently effective requirements allow the mixing of EACMS and PACS VMs with out-of-scope VMs so long as the hosts themselves are classified as EACMS and PACS.

Finally, Chelan believes there is a Low Impact problem in the proposed requirement. The Applicable System is an SCI that hosts High or Medium Impact VCAs, not the actual High or Medium Impact VCAs themselves. The text of the requirement itself does not restrict itself to High and Medium and simply refers to “same impact classification”. If an SCI that hosts High or Medium Impact VCAs also hosts Low Impact BCS, the requirement is on the SCI to prevent sharing of CPU and memory between devices that are not of the same impact categorization, regardless of what that impact categorization might be. Low Impact is a different impact category from no impact, so the requirement would force the SCI to segregate Low Impact VCAs from no impact VCAs. That essentially places a requirement on Low Impact devices to not share CPU and memory with no-impact devices, so long as they are on the same SCI as a High and Medium impact VCA.

All that said, Chelan does recognize the risk of a zero day exploit along this vector and therefore, Chelan recommends this requirement should be restricted to BCAs and PCAs, and left EACMS and PACS out, which would be backwards compatible with the existing requirements and guidance. The suggested language below would prevent devices that are within the ESP from sharing CPU and memory with devices outside the ESP or in different impact level ESPs. This would accomplish the goal of protecting BES Cyber Systems and would simplify implementation by creating three categories of devices that may not share CPU and memory, rather than potentially six.

Chelan suggests the following language for CIP-007 R1.3:

Applicable Systems: SCI supporting: High Impact BCS and their associated PCA; Medium Impact BCS and their associated PCA

Requirement: Mitigate the risk of CPU or memory vulnerabilities by preventing the sharing of CPU and memory resources, excluding storage resources, between High and Medium Impact BCS and their associated PCA, and VCAs that are not BCS or PCAs of the same impact categorization.

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group

Answer	No
Document Name	

Comment

WEC Energy Group does not agree with the proposed edits and retitling of R1. Changing the title of R1 to System Hardening implies the potential for more than just the management/monitoring of ports and services. Although "system hardening" is a best practice, it is at this time self defined and is too broad of a term to be used for CIP-007 R1 and in our opinion beyond the virtualization intent of the Project. Additionally, Part 1.1 implies ports and services in the Requirement, we understand it was rewritten in an attempt to address SCI supporting the Applicable System, however the rewrite is too broad and looses its intent of ports and services. Also note, the Measures for Part 1.1 describes the aspects of ports and services, why not use those same terms (ports and services) in the Requirement itself. Proposing the SDT leaves the title of the R1 as Ports and Services, leave R1 Part 1.1 and Part 1.2 as written and separate the SCI references included in current draft Part 1.3 into its own Requirment or Part.

WEC Energy Group can support the proposed edits in R2-R5.

Comment

As it pertains to CIP-007 R4.2, the use of the term system in the statement “per system capability” leads to subjectivity. We recommend the use of “per Cyber Asset or BSC capability” as it defines the scope of capability.

Additionally, our comment from the last comment period of “If a firewall has VLANs on it for medium and low, or high and low, does that pull low impact network connection into scope because it shares the same firewall?” was not addressed by SDT as far as we know.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment	
Southern disagrees with the proposed changes to CIP-007 R1.3 Applicable Systems. Adding EACMS and PACS in both High and Medium Impact BCS increases the requirements for associated virtual assets. Southern agrees that for hypervisors which ALSO host BCS, the scope is appropriate, but for hypervisors that ONLY host EACMS outside of an ESP, with no BCS, it is an "anti-virtualization" incentive to dedicate hypervisors to a domain controller for example. Suggest changing the language to High/Medium Impact BCS and their associated PCA, which will keep this affinity requirement scoped to hypervisors that host BCS and anything else.

Texas RE is concerned the language: “logical network accessible ports… including port ranges or services where needed to handle dynamic ports” was removed. Both ports and services are required to gain a better understanding of where vulnerabilities can exist whether in a physical or virtualized environment. Ports and services are often used for malicious reconnaissance and lateral movement within networks. Registered Entities should understand and document why ports and services are needed for many reasons (defense in depth, zero trust, etc. concepts).

Texas RE is concerned the phrase “CPU and memory resources” in CIP-007-7 Requirement R1.3 is written could be interpreted as (CPU and memory) resources or as CPU and (memory resources). Texas RE recommends rewording the sentence so it is clear that the CPU resources and memory resources should not be shared: “the sharing of CPU resources and memory resources.”

Additionally, in order to make the language of Requirement 1.3 more consistent with other requirements in CIP-007-7, Texas RE recommends revising the existing language Requirement R1.3 to “Prevent the sharing of CPU resources and memory resources, excluding storage resources, between Virtual Cyber Assets (VCAs) that are not of, or associated with, the same impact categorization.” The technical rationale for this requirement can then explain that the requirement is needed in order to mitigate the risk of CPU or memory vulnerabilities.

Lastly, Texas RE noticed inconsistent redlining between the “redline_to_last_approved” and “clean” copies of the standard for CIP-007-7 R4.1. In the “clean” version of the standards the following language, which Texas RE agrees with reads as:

Log security events, per system capability, for identification of, and after-the-fact investigations of, Cyber Security Incidents that include, at a minimum, each of the following types of events

In the “Redline to Last Approved” version the phrase “and after-the-fact investigations of” has been marked for removal. Texas RE does not agree with removing this phrase from the requirement.

5. The SDT has used phrasing such as "SCI supporting an Applicable System from this Part" in the Applicable Systems column across many of the standards. Is it clear that this scopes the requirements for SCI to match the system(s) it hosts?

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA believes the phrase needs to be more specific. "Supporting" an Applicable System is too broad. BPA proposes adding SCI under the Applicable Systems column in the Requirements/Parts tables, grouping it with each appropriate impact rating similar to the way EACMS, PACS, and PCA are scoped. Additionally, the definitions for EACMS and PACS include SCI so these do not need to be accounted for. Alternatively, since the term "and their associated" is widely used in the standards, replacing the word supporting with "associated with" may be more clear.

Response

Todd Bennett - Associated Electric Cooperative, Inc. - 3, Group Name AECI

Answer	No
Document Name	

Comment

"Part" is not a defined term, for additional clarity the drafting team could replace this phrase with "SCI supporting an Applicable System".

Lastly, "Applicable System" is used multiple times in the draft CIP standards and is not a defined term or a proposed defined term. The standard drafting team may consider defining this term in the NERC Glossary of Defined Terms.

Xcel Energy believes there is some lack of understanding at our company and throughout the industry on how SCI should be categorized when they are supporting EACMS or PACS and so, Xcel Energy supports the comments of the MRO NSRF. While Xcel Energy supports clarifications, our concerns do not rise to the level of requiring us to vote no on proposed Standards with SCI as an applicable system.

This is fairly clear. However it would be better to see some verbiage/examples in the technical rationale related to the inclusion of “storage resources required for system functionality of one or more Cyber Assets or VCAs….” found in the second bullet of the SCI definition to limit the scope of applicability. It’s not quite clear what exactly may be pulled into scope by the wording in the second bullet and there may be an unintentional increase in applicability. CIP-007 R1.3 specifically excludes storage resources in the requirement, but in the definition of SCI, the second bullet specifically includes storage resources in the definition of SCI.

Comment

ecommending maintaining the CIP-010-4 requirement to establish and maintain the baseline.

Justification:

While the TR does allude to the use of the baseline configuration as the “how” this requirement can be met, it is followed by stating the entity would be required to document how the baseline meets the stated security objective and references NIST SP 800-128 as a guide.

Throughout NIST SP 800-128 the baseline configuration is referenced as the “secure state”, specifically “…*baseline configuration for a system and associated components represents the most secure state consistent with operational requirements and constraints*” (NIST.SP.800-128, Section 2.2.2, pp. 21). Establishment and maintenance of a baseline configuration provides the entity with a secure starting point from which each modification can build upon.

Removing the requirement for a baseline configuration and/or requiring the entity to justify the use of the baseline appears to go against the guidance provided in NIST 800-128.

R1 Response

Part 1.1

R1.1 Document and maintain system configurations (to include at a minimum software addressing the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.)

R1.1.1 Manage changes which alter the system configuration

R1.1.2 Authorize changes to the system configuration

R1.1.3 Validate implementation of changes to the system configuration

Part 1.2

1.2.1. Prior to implementing a change to system configurations from Part 1.1 in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects to ensure that the configuration of required cyber security controls in CIP-005 andCIP-007 remain implemented as required; and

1.2.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.

Part 1.3

For a change that deviates from the existing system configuration, update the system configuration documentation as necessary within 30 calendar days of completing the change.

R2 – Security Configuration Monitoring

Considering the changes made to R1 and the proposal to maintain the baseline configuration documentation requirements the following is a proposed adjustment to R1.

Response

Part 2.1

Methods to monitor at least once every 35 calendar days for unauthorized changes to the system configuration. Document and investigate detected unauthorized changes.

1 – The language used in the requirement, specifically “settings”, will force a significant and increasing administrative burden on the Entities. The control which applies to the requirement for each of the items within CIP-005 and CIP-007 will typically contain a multitude of “settings” which enforces the configuration of the control as a collective. There is a concern that the Entity will be ‘too far in the weeds’ focusing on the numerous settings that contribute to a control thereby diverting attention from the security posture of the environment.

2 – Confirmation after implementation of the authorized/documented change of the controls which enforces the requirement in CIP-005 and CIP-007 ensures the security configuration of the applicable system was not impacted in a manner that would weaken the security posture of the applicable system.

Comment

The proposed changes to CIP-010 are SRC’s gravest concern as we believe the proposed changes go beyond what was previously in the CIP standards such that they would no longer be backwards compatible. In particular, the addition of the concept of “settings changes” is overly broad; whereas the prior standard focused on changes to the baseline configuration. SRC proposes “settings changes” be modified to “configuration changes” or eliminated altogether.

For consistency, please add the term “Cyber” to security patches.

The SRC requests clarification of Part 1.1 since meeting the Measures may not meet the Objectives. Entity may need to document that baselines (from previously approved Standard) track or show any changes made to applicable CIP-005 and CIP-007 security controls

The SRC requests that consistent language be used when addressing the same subject in different parts of the standard within the Requirements of Parts 1.1 and 1.3. Examples of this include the following:

- *Part 1.1 provides what is included in software*
- *Part 1.3 distinguishes some of 1.1 apart from software*
- *Part 1.1 starts with “Control the implementation of intended changes to software, or intended changes to settings . . .”*
- *Part 1.1 also says “Changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.*
- *Part 1.3 starts with “Prior to the installation of operating systems, firmware, software, or software patches . . .”*

While we recommend that that CIP-010 R1 needs to be left “as is” as changing the requirement may present a greater compliance burden on the entity with a less clear objective/goal. The proposed changes do not increase the level of security that are currently afforded by the existing standard.

For Part 2.1, we recommend this requirement is also left “as is”. The proposed requirement is overly burdensome and may require the monitoring of the entire asset, including its filesystem, registry, miscellaneous settings, accounts, etc. and is above and beyond what is currently required with little added security benefit.

R1.3 – consistency of phrases among the requirements is necessary, For instance, in Requirement 1 part 3, the phrase used is "Prior to installation." In other sections, however, the phrase used is "prior to the intended change" One of the two phrases should be used throughout.

Request clarification of Part 1.1 since meeting the Measures may not meet the Objectives. Entity may need to document their baselines (from previously approved Standard) when addressing their CIP-005 and CIP-007 security controls.

Part 1.1 provides what is included in software. Part 1.3 distinguishes some of 1.1 apart from software. Part 1.1 starts with "Control the implementation of intended changes to software, or intended changes to settings . . ." Part 1.1 also says "Changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches." Part 1.3 starts with "Prior to the installation of operating systems, firmware, software, or software patches . . ."

For Part 3.3, request clarification on the first Requirement bullet – "Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System." The term "like replacement" is an undefined term. Does the SDT intend for the entity to define this term? "Configuration of the previous" implies a baseline that was not specified. As written, the entity's interpretation may be different than the auditor's.

For Part 3.3, request removing "any" from the first Measures bullet because "any" is a scope concern where "any" is interpreted as "all."

For 1.3 in Attachment 1, recommend changing this new bullet from "Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;" to "provide valid mitigation" since there may be newer software vulnerabilities that the earlier state has not addressed.

SPP would like to understand how the significant proposed changes in CIP-010-5, specifically Requirement R1, relate to what was requested in the Project 2016-02 SAR. SPP believes that the verbiage related to SCI, containerization, and ESPs between systems with different impact ratings can be added without having to change the way that entities have to comply with CIP-010 today.

The new proposed language greatly expands the scope for CIP-010 and raises concerns for backwards compatibility with existing baseline methods, adds unnecessary complexity, and significantly increases cost with minimal security benefit. The current baseline configuration

requirements have been moved to the Measures column along with additional verbiage to address virtualization. However, the control language is very broad and can lead to different interpretations depending on the auditor and uncertainty in tracking changes. Responsible Entities have demonstrated that both physical and virtual systems are capable of developing, documenting, approving, tracking, updating, and monitoring baseline configurations. For these reasons, SPP believes that the prescribed baseline configuration requirements should remain in place with the addition of specific verbiage related to virtual architecture and containerization. The baseline language supports a secure baseline configuration and represents industry best security practices.

The NIST 800-128 guidelines refer to applying the security configuration management practices that include "monitoring the configuration of systems to ensure that configurations are not inadvertently altered from the approved baseline", thus implying that baseline configuration management is key to securing a system. These guidelines further define a Baseline Configuration as, "A set of specifications for a system, or CI within a system, that has been formally reviewed and agreed on at a given point in time, and which can be changed only through change control procedures. The baseline configuration is used as a basis for future builds, releases, and/or changes." This definition fits well with the currently approved verbiage in CIP-010-4 where the "set of specifications for a system" was clearly defined for the baseline and approved through change control methods. The baseline is an understanding of what the approved system configuration should be so that there is an understanding of what has changed. According to NIST, the baseline configuration should represent a secure state of the system while also maintaining a "cost-effective and functional support of mission and business processes". The updated control verbiage does not reference a baseline configuration and does not adhere to a cost-effective support of security best practices, therefore creating a risk to demonstrate compliance.

The following proposed language for CIP-010-5, Requirement R1, Part 1.1, could address virtualization while also maximizing backwards compatibility:

Develop a baseline configuration, individually or by group, which shall include the following items:

1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists;

1.1.2. Any commercially available or open-source application software (including version)

intentionally installed including application containers;

1.1.3. Any custom software installed, including application containers;

1.1.4. Configuration that modifies network accessible logical ports or network accessible services on an Applicable System;

1.1.5. Any security patches applied;

1.1.6. SCI configuration of host affinity control between systems with different impact ratings;

1.1.7. Changes to configurations or settings for an ESP between systems with different impact ratings; and

1.1.8. Changes to parent images from which individual child images are derived, such as in virtual desktop infrastructure (VDI) implementations.

While we appreciate the thoughtful proposal of a less prescriptive requirement for CIP-010, there are many unintended consequences with the expansion of scope in the currently proposed language. The word “settings” scopes too many possible features into CIP-010 that do not necessarily have a compelling security value. Additionally, the concept of a baseline is foundational in NIST SP 800-128 . It is possible to have less prescriptive requirements that advance the intention of CIP-010 and its security objectives,while maintaining true backward compatiability.Here is our alternate proposal that we have worked with Exelon to craft:

R1.1 Document and maintain system configurations (to include at a minimum software addressing the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.)

R1.1.1 Manage changes which alter the system configuration

R1.1.2 Authorize changes to the system configuration

R1.1.3 Validate implementation of changes to the system configuration

R1.2.1. Prior to implementing a change to system configurations from Part 1.1 in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects to ensure that the configuration of required cyber security controls in CIP-005 andCIP-007 remain implemented as required; and

R1.2.2. Document the results of the testing, and if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.

R1.3 For a change that deviates from the existing system configuration, update the system configuration documentation as necessary within 30 calendar days of completing the change.

R2.1 Methods to monitor at least once every 35 calendar days for unauthorized changes to the system configuration. Document and investigate detected unauthorized changes.

Request clarification of Part 1.1 since meeting the Measures may not meet the Objectives. The entity may need to document its baselines (from previously approved standards) when addressing its CIP-005 and CIP-007 security controls.

Request consistent language in the Requirements of Parts 1.1 and 1.3. Part 1.1 provides what is included in the software. Part 1.3 distinguishes some of 1.1 apart from software. Part 1.1 starts with “Control the implementation of intended changes to the software or intended changes to settings . . .” Part 1.1 also says “Changes to the software include the installation, removal, or update of the operating system, firmware, commercial and custom software, and security patches.” Part 1.3 starts with “Prior to the installation of operating systems, firmware, software, or software patches . . .”

For Part 3.3, request clarification on the first Requirement bullet – “Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System.” The term “like replacement” is an undefined term. Does the SDT intend for the entity to define this term? “Configuration of the previous” implies a baseline that was not specified. As written, the entity’s interpretation may be different than the auditor’s.

For Part 3.3, request removing “any” from the first Measures bullet because any is a scope concern . . . where any is interpreted as “all.”

For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.

Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro

Answer No

Document Name

Comment

BC Hydro appreciates the opportunity to review and offers the following comments:

1. CIP-007 and CIP-005 Standards were modified to explicitly call out specific controls related to SCI (e.g. CIP-007 R1.3 / CIP-005 R1.3) but in CIP-010 R1 it is not written with the same clarity. For example, in CIP-010-3 R1.1 measures provided are not truly applicable to non SCI CIP-007 and CIP-005 controls. Operationally they differ greatly from non-SCI classified assets. Similar to the pattern followed in CIP-005 and CIP-007 changes, BC Hydro proposes to call out in a separate requirement SCI controls that need to be evaluated.

2. The inclusion of the following "... or intended changes to settings that could weaken configured cyber security controls required by CIP005 and CIP-007" makes the Requirement R1.1 of CIP-010-3 unclear. It is indicative that this Requirement will only apply if the change in settings has an effect on the configured CIP-007 and CIP-005 controls. However the expected scope of changes in settings need clear direction and guidance. Some pertinent use case examples and clear direction is needed here.

Concerns regarding backward compatibility. And how compliance on existing practices will be assessed following the proposed change. Specifically how current practices related to “Live operating system and software executable only from read-only Media” can still need the intent of Section 1.3 without subjectivity inherent in the “other mitigation methods” option. Request adding of technical rationale (i.e. the intent of the change) for Attachment 1 Section 1.3. in particular explanation on the bullet that was added, i.e. “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution”.

Support comment from NPCC RSC. Reiterated here: “For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.”

Comment

In the proposed language, the term “could weaken” as it applies to changes requiring configuration management controls is vague and, as undefined, leaves the determination unsupported by existing definitions. GSOC suggests either substituting “alters” or adding “ . . . as determined by the responsible entity”. As proposed, change management controls would only need to be utilized for a type of change that undermines existing security and not for all changes.

Additionally, as proposed, the language of 1.1.2 could subject the responsible entity to double jeopardy violationof CIP-010 as well as the underlying violations of CIP-005 and CIP-007.. Additionally, as written, every control must be reviewed for every applicable change regardless of whether it is technical, procedural, or impacted by the change. GSOC recommends the removal of 1.1.2 as a separate requirement and inclusion in measures.

AEP appreciates SDT’s efforts in making requirements more clear. However, AEP does not support R1.2 and R2.1 and states recommendations below.

- **R 1.2.1**: SDT added **“the configuration of”** as in “…where the test is performed in a manner that minimizes adverse effects to ensure **that the configuration of** required cyber security controls in CIP-005 and CIP-007 reamin implemented as required”. AEP suggests removing this added language as it is too prescriptive.
- **R2.1**: AEP questions the statement "*unauthorized changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007*" and recommend SDT to revert the requirement languages as proposed in Draft #3, i.e., “Methods to monitor for unauthorized changes at least once every 35 calendar days. Document and investigate detected unauthorized changes.”.

R1-Removing baseline configuration does not change what needs to be done in practice. Entities will still need to retain a baseline configuration as evidence from which to establish the changes that were authorized. · For Part 1.1 an entity will still need to show the baseline configuration prior to the change to show required cyber security controls in CIP-005 and CIP-007 are not adversely affected. · For Part 2.1 an entity will still need to provide baseline configurations for evidence that they monitor at least once every 35 calendar days for unauthorized changes to the items listed Parts 1.1 and 1.2. For R3-the concern is that Remediation VLANs should be properly defined in the technical rational or Glossary as it may introduce situations where an entity could inadvertently place production Cyber Assets in this VLAN.

Comment

In large part, the proposed changes are fine. However, there is an implication by virtue of the new veribiage and removal of “baseline configurations” that additional configuration items (outside of the original “baseline configuration”) need to be included within change management. Such additional configuration items are not explicitly included in the Measures section, thus leaving this aspect of the requirement wholly subjective. Additionally, the third bullet on slide 39 from the Project 2016-02 Webinar seems to implicitly add a documentation requirement for the analysis/comparison of baseline configurations to security controls. This ask is not in the requirement. Including it in the Webinar presentation empowers Regional auditors to ask for evidence of requirements that are not included in the standard or measures sections.

Kristine Martz - Amazon Web Services - 7

Answer	No
Document Name	

Comment

AWS agrees with changes to CIP-010 R1, R2, and R3. However, AWS remains concerned that CIP-010 R4 does not address security risks associated with virtual machines (VM) hosted on physical Transient Cyber Assets (TCAs) because the standard language states that a VM running on a physical TCA can be treated as software. We acknowledge the SDT response to the previous comments in the consideration of comments, but we still see security risks and have provided our previous comment below for context.

The Standard allows an entity to choose one or a combination of security controls that may not extend cyber security protections to the VM itself leaving VMs potentially vulnerable to security threats undetected by the physical host. We propose removing the language “Virtual machines hosted on a physical TCA can be treated as software on that physical TCA” from the TCA definition. By removing this language, entities would be required to apply security controls to the virtual machines hosted on their physical TCAs in alignment with CIP-010 R4.

Response

Gail Golden - Entergy - Entergy Services, Inc. - 5	
Answer	No
Document Name	
Comment	

The current phrasing of Part 1.1.2 implies that entities must verify all “required cyber security controls remain implemented as required” for any change to software or security settings even if the change itself does not impact a certain control (e.g. a windows patch typically doesn’t modify an ESP/EAP for CIP-005, updating a FW Policy does not impact CIP-007 R2, etc.). This new language removes entities abilities to identify potential impacts and verify/test those impacts as allowed by the in-effect standard and the previous revision. Entergy is concerned that this language as written would require entities an undue burden to re-verify non-impacted controls for every change. While the Measures section implies that an entity has latitude to identify which cyber security controls should be verified (“ a list of cyber security controls verified”) this is not clearly aligned with the language of the standard.

Entergy recommends adding clarifying language to CIP-010 R1 Part 1.1 that entities verify potentially impacted cyber security controls, such as “Verify the required cyber security controls ***identified by the Responsible Entity that could be weakened*** remain implemented as required as part of the change.” This would allow entities to focus verification efforts on potentially impacted controls based on the nature of the change, instead of a one-size fits all approach of re-verifying every CIP-005 and CIP-007 control for every change.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name PUD No. 1 of Chelan County	
Answer	No

Document Name	

Comment

CIP-010 R2.1 as written would require an audit of every setting that could impact a CIP-005 or CIP-007 security control every 35 calendar days on High Impact devices. For some devices, this could be hundreds of individual settings, and Cyber Assets may not provide these settings in a way that audit of those settings could be automated. This would also effectively be a baseline configuration, though a more rigorous one than required by the currently effective requirements, as each setting would have a “baseline” to ensure the effectiveness of the security control it implements.

Chelan finds it difficult to develop a requirement that accomplishes the same security objective CIP-010 R2.1 of auditing that unauthorized changes have not occurred without the development of a baseline configuration to compare against. By definition, auditing changes requires you to have a known good state, essentially a baseline configuration. If the SDT wishes to eliminate baseline configurations, it should eliminate the periodic monitoring for unauthorized changes, or change the security objective.

Response

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group

Answer	No
Document Name	

Comment

Similar to the MRO-NSRFs response, WEC Energy Group wishes to bring attention to the added phrase in CIP-010 Requirement 1 Part R1.1, “…or intended changes to settings that could weaken configured cyber security controls required by CIP005 and CIP-007.” We also would raise concerns with the current proposed Measures for R1.1.

This language raises questions. On applicable systems, are entities expected to authorize/monitor for both software changes AND settings that could weaken cyber security controls. Or does the ‘or’ indicate that choosing one of those would fulfill the obligations? For instance, consider a password change on a service account/agent which unintentionally breaks logging capabilities on an unspecified BCA. While an entity would be in violation of CIP-007 R4, with this new CIP-010 language, would the password change constitute a “change to settings” which weakened a CIP-007 control (R4.2) and therefore have been required to navigate the change management process? Would simply changing an applicable password from 10 characters to 9 characters constitute a weakening of CIP-005/CIP-007 cyber security controls?

There are many configuration changes that currently don’t affect one of the baseline items but could be considered in scope in the new version of the standard (for example, modification of anti-virus settings or any configuration settings on a firewall). This addition, combined with one of the statements made during the September 12, 2022 webinar that entities may have more compliance work to perform under the revised CIP-010, indicates that the scope of change management is broadened under the proposed revisions. This directly contradicts other statements that have stressed how the revisions are to be backwards compatible. The idea being that any entity that is in compliance today with current technologies and processes will be compliant under the revised standards, even if they do not seek to employ or utilize virtualization technologies.

We recommend the SDT to revisit the proposed CIP-010 R1.1 language and undertake any further revision needed to ensure that the scope of CIP-010 R1 is not expanded any more than necessary. One recommendation would be to separate both R1.1 into two parts, one addressing BCAs only, which would mirror existing CIP-010-3 R1.1 language, and one addressing SCI specifically which would further clarify “settings” (this would also necessitate splitting the proposed R2.1 into two different requirements as well).

Secondly, it seems that there continues to be confusion in the industry over whether or not to baseline and what are the best methods by which to demonstrate compliance with CIP-010 R1.1. We note that, while the Measures for R1.1 are quite lengthy, all the detail is about what the “documented process" should address or include, without suggesting examples of what the documented process could actually be documented as. We approve of providing options for entities to comply with CIP-010 R1.1 without necessarily having to maintain and demonstrate a documented baseline but it's also true that many utilities wish to continue using precisely that approach for their compliance – yet the word baseline is missing entirely from the Measures section of CIP-010 R1.1. We understand that "documented process" that includes the various items listed implies a baseline, but there is no reason we see not to just then come out and say "baseline" is an example of an acceptable option.

Comment

The new proposed wording is challenging to navigate and subjective. For example, what does it mean to weaken the configured cybersecurity controls and settings?

We recommend changing CIP-010 R1.1 back to the previous wording, and restore previous requirement parts through R2.1, and add "SCI supporting an Applicable System in this Part". This change is out of scope to support virtualization other than adding SCI to the applicability column. The proposed changes do nothing to support virtualization but do add significant ambiguity to the requirement. Also, a baseline MUST be established if there is going to be a requirement to monitor for unauthorized changes.

Kendra Buesgens - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF

Answer	No
Document Name	

Comment

The MRO NSRF wish to bring attention to the added phrase in CIP-010 Requirement 1 Part R1.1, "…or intended changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007." The MRO NSRF also would raise concerns with the current proposed Measures for R1.1.

This language raises questions. On applicable systems, are entities expected to authorize/monitor for both software changes AND settings that could weaken cyber security controls. or does the 'or' indicate that choosing one of those would fulfill the obligations? For instance, consider a password change on a service account/agent which unintentionally breaks logging capabilities on an unspecified BCA. While an entity would be in violation of CIP-007 R4, with this new CIP-010 language, would the password change constitute a "change to settings" which weakened a CIP-007 control (R4.2)

and therefore have been required to navigate the change management process? Would simply changing an applicable password from 10 characters to 9 characters constitute a weakening of CIP-005/CIP-007 cyber security controls?
There are many configuration changes that currently don't affect one of the baseline items but could be considered in scope in the new version of the standard (for example, modification of anti-virus settings or any configuration settings on a firewall). This addition, combined with one of the statements made during the September 12, 2022 webinar that entities may have more compliance work to perform under the revised CIP-010, indicates that the scope of change management is broadened under the proposed revisions. This flies in the face of other statements that have stressed how the revisions are to be backwards compatible and that any entity that is in compliance today with current technologies and processes will be compliant under the revised standards even if they do not seek to employ or utilize virtualization technologies.

Secondly, it seems that there continues to be confusion in the industry over whether or not to baseline and what are the best methods by which to demonstrate compliance with CIP-010 R1.1. The MRO NSRF note that, while the Measures for R1.1 are quite lengthy, all the detail is about what the "documented process" should address or include, without suggesting examples of what the documented process could actually be documented as. The MRO NSRF approve of providing options for entities to comply with CIP-010 R1.1 without necessarily having to maintain and demonstrate a documented baseline but it's also true that many utilities wish to continue using precisely that approach for their compliance – yet the word baseline is missing entirely from the Measures section of CIP-010 R1.1. The MRO NSRF understand that "documented process" that includes the various items listed implies a baseline, but there is no reason the MRO NSRF see not to just then come out and say "baseline" is an example of an acceptable option.

The MRO NSRF recommend that the first paragraph of R1.1 Requirement be rewritten to read, "Control the implementation of intended changes to Applicable Systems that could weaken configured cyber security controls required by CIP-005 and CIP-007." The MRO NSRF also recommend the inclusion of the word "baseline" as an example in the R1.1 Measures of a type of documented process that Registered Entities may employ to demonstrate their compliance with R1.1. Alternatively, if this recommendation is not acceptable, then some other change in verbiage that provides Entities the option of either continuing to comply using current baseline and baseline deviation tracking methods, or allowing a different approach per the new requirement and measure language, to ensure for the allowance of backward compatibility.

In Measures to revised R1.1.2, the only example given of a tool used to verify required security controls [required by CIP-005 and CIP-007] remain implemented is a vulnerability scanner. It is unlikely that this will be the tool used to verify these controls, and that guidance may be misleading to Regional Entity auditors. It is more likely that a configuration management database will be used to verify that software is installed and that controls such as listening ports, disabled accounts, password controls, antimalware settings, and applied security patches are unchanged. CEHE recommends that the SDT add "configuration management database" as an example in the Measures in R1.1.2.

In R3.3, the exception for replacement of the same type of Cyber System with a configuration of the previous or other existing Cyber System should be revised to include additions of the same type, not only replacements. An example is adding a console from an identical known good image as existing consoles. This is not a replacement, but from a security and reliability perspective, has the same effect. Language should be revised to say "Like replacements or additions of the same type of Cyber System with a configuration of the previous or other existing Cyber System".

For R2 Dominion Energy recommends reverting back to the previous language and include verbiage excluding password changes. The term “settings” is too subjective and can be interpreted inconsistently. Additionally, for the Severity Level for R1, Dominion believes the SAR was intended to address virtualization and arbitrarily changing the VSL for R1 is not in scope. Dominion recommends reverting back to the previous language

We still have concerns on CIP-010-5 because the draft does not include the Guidelines and Technical Basis section where it defines what must be included in a vulnerability assessment. It is understood that the Standards Drafting team emphasizes backwards compatibility, but, the proposed changes to CIP-007 R1 and CIP-010 R1.1 could affect what is required in the vulnerability assessments. At the very least, we would like to know and comment on what additional items will be required for SCI in a vulnerability assessment as there is nothing found in the current proposed changes.

Lastly, under CIP-010 R3.3 BES Cyber System is shortened to BCS. However, this is different than the other parts of CIP-010 R3. We recommend consistency.

Comment

Southern disagrees with Part 1.1 Requirements that includes the phrase “settings that could weaken cyber security controls required by CIP-005 and CIP-007”. Southern finds this phrase overly broad, questioning if full compliance could ever be proven out of the universe of “settings” (registry settings, configuration paramenters, per application settings, etc.). Added to the complexity of knowing all settings is the phrase “could weaken” adding in the idea of ‘potential’ to this already elusive scope. Southern suggests the SDT reconsider the concept used in draft 3 of the entity defining the higher level types of changes they have in their change management programs. In addition, to provide further clarity of scope, Southern suggests the SDT go through CIP-005 and CIP-007 and list the areas that should be under CIP-010 change management. Since these requirements are the same for every entity, that list should be the same for every entity.

The language "…changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007" is subjective. There could be any number of "settings" that "could weaken" the security controls. Can guidance be given such as some exapmples of these settings that could be used to weaken the security controls? Also, is "software patches" synonymous with "security patches" or are these two (2) different entities of their own?

Comment

We feel using "could" in parts of CIP-010-5 is very subjective and is not necessary. Further the measures uses "may" instead of "could". A change either does or doesn't affect cybersecurity controls required by CIP-005 and CIP-007. We are fine with the language, but feel it would be cleaner and less ambiguous without "could".

Comment

NV Energy supports the revisions for CIP-010-5, but harbors some concern regarding unclear language in Requirement R1, subpart 1.1. The word "settings" does not enjoy the same clarifying language as does the word "software". We believe this creates a risk for unpredicatble interpretation without any additional technical rationale defining the intent of the word. NV Energy suggests "settings" receive a definition complementary to "software" to better assist entities reach compliance, but ultimately feels the language in its current state is workable although not ideal.

AZPS agrees with the proposed changes to CIP-010 but feel the following "weaken" statement introduced in part R1.1, without an official definition, leads to uncertainty and lack of clarity around the items that may fall into change management. This will result in re-examination of existing systems and baselining methodologies that threaten the intended backwards compatibility of the new requirements. In addition, we agree with EEI stance that which "settings" are in scope requires additional clarification.

Texas RE continues to be concerned security obligations will be reduced by removing an explicit requirement for Registered Entities to create and maintain baseline configuration documentation.

Establishing and maintaining baseline configurations represent best practices for system hardening. Texas RE recommends adhering to NIST Special Publication 800-53 (Rev. 5), CM-2 Baseline Configuration, which states, "Maintaining baseline configurations requires creating new baselines as organizational information systems change over time. Baseline configurations of information systems reflect the current enterprise architecture."

NIST Special Publication 800-53 (Rev. 5) provides additional information, such as using tools to track version numbers on operating systems, applications, types of software installed, and current patch levels in order to maintain the currency, completeness, accuracy, and availability of the baseline configurations of systems. This is information that is currently captured within existing baseline documentation requirements.

If the drafting team has concerns that maintaining baseline documentation of dynamic VMs is not technically feasible, Texas RE suggests adding the verbiage “per system capability” to CIP-010 R1’s baseline requirements. Registered Entities have demonstrated that the vast majority of systems, both physical and virtual, are capable of having baseline documentation created, tracked, and updated as necessary. As such, this requirement should remain in place for those systems where it is technically feasible to perform this industry best security practice.

Answer	No
Document Name	

Comment

NST disagrees with proposed changes to CIP-003 and CIP-011 due to the fact proposed changes go beyond conforming changes.

NST disagrees with proposed changes to CIP-009, as omitting SCI from all Requirements and Parts except for R1 Part 1.5 it would establish “implied requirements,” as discussed in our comments on Question 9, below. NST acknowledges that in some recovery situations, it might only be necessary to recover a virtual BES Cyber System and not its supporting SCI. However, given that failure or destruction of an SCI could, in some scenarios, wipe out an entire Control Center, NST believes that inclusion of SCI in a Responsible Entity’s recovery plan(s) should be mandatory rather than a suggested best practice.

NST agrees with proposed conforming changes to CIP-004, CIP-006, CIP-008 and CIP-013.

Since the Glossary modifications are the foundation to all Standard changes, NERC should seek approval of the new terms prior to any changes being introduced in the Standards to reduce potential misunderstanding or misinterpretation of both the new definitions and modified Standards. This will also allow NERC, and industry, time to determine additional courses of action, reduce confusion, and reduce additional risk associated with such wholesale changes.

For CIP-003, Attachment 1, Section 4, request confirmation that while this Section has no updates, this Section’s scope is bigger because of changes to the definitions of Cyber Security Incident and Reportable Cyber Security Incident

For CIP-003, Attachment 1, 5.1, request clarification of the new bullet which says “Controls that maintain the state of the operating system and software such that they are in a known state prior to execution that mitigates the risk of introduction of malicious code;” Request clarification on execution of what? Perhaps “execution” should be changed to “entity use”

For CIP-004, R5 request confirmation that entities should re-evaluate serial connections because they may now be in scope for incidents . . . due to the updated definitions of IRA and ERC

For CIP-006, Part 1.3 consider changing from “per system capability” because “per system capability” is an inadvertent get-out-of-jail.

For CIP-011, request clarification on the double jeopardy between R2 and Part 1.2

For CIP-013, Part 1.2.5 consider including the mention of the applicable systems referenced in R1. This update avoids audit scope creep. Concerned with “all” in the new language. The new Part 1.2.5 says “ Verification of software integrity and authenticity of all software and patches provided by the vendor . . .” The R1 applicable systems language is “for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), and Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI).” We suggest that the scope should be “applicable systems,” not all software and patches by the vendor.

For the proposed CIP-008, the Applicability would include, “An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber System; or Shared Cyber Infrastructure supporting a BES Cyber System.” Note that by a literal reading of this, an SCI supporting EACMS would not be in scope for CIP-008 whereas a traditional EACMS would be.

For the proposed CIP-008, the Applicability would include, “An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber System; or Shared Cyber Infrastructure supporting a BES Cyber System.” Note that by a literal reading of this, an SCI supporting EACMS would not be in scope for CIP-008 whereas a traditional EACMS would be.

(1) The proposed language in in CIP-006-7, R1, Part 1.3, points to system capability, but there are concerns with situations where the PACS is capable, but there is a limitation with a particular physical access device. It seems as thought that may present a gap in the proposed language. As an example, an entity currently has a TFE for a limited physical access device where two factor cannot be applied, such as a roof hatch where it is not possible to install a locking mechanism controlled by the PACS system. Under the approved TFE, additional measures are taken to secure that physical access point. The concern with the proposed language is that the roof hatch may be seen as a physical access device rather than a system. In this instance, the PACS is capable of two-factor authentication, but two-factor authentication cannot be applied to that particular physical access device. Because of this potential and unintended gap, we recommend using the language “per system or device capability.” **(2) For CIP 009-7, Requirement R1, Part 1.1, please consider adding the language SCI supporting an Applicable System” in the Applicable Systems column**.

8. The SDT has revised the Implementation Plan to include 3 defined early adoption dates as options should Responsible Entities choose to do so. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

Lynn Goldstein - PNM Resources - Public Service Company of New Mexico - 1,3

Answer	No
Document Name	

Comment

PNMR believes early adoption of the revised CIP standards and definitions is beneficial but proposes that Responsible Entities are not tied to only three early adoption choices (6, 12, or 18 months) after approval of the new standards. PNMR proposes that Responsible Entities still follow notifying their Regional Entities of their early adoption choice within fifteen calendar days of making that decision, but that Responsible Entities have the ability to early adopt at any time between 6 months and 24 months. If, for example, a Responsible Entity is not able to early adopt at the 6-month mark but would be able to 8 months after the approval of the new standards, the Responsible Entity should be able to early adopt and not have to wait an additional 4 months until the 12-month mark.

An alternate proposal would be for the Responsible Entity to notify the Regional Entity of its 6, 12, or 18-month early adoption date but have the ability to change its early adoption date if it is realized before the agreed-upon early adoption date that the Responsible Entity would not be able to be compliant with the new standards by that date. In this case, the Responsible Entity could move its early adoption from 6 months to 12 months, for example.

Comment

With the implementation of compliance oversight plans (COP)s, many entities, particularlylarger entities, are experiencing more frequent audits. 36 months may be more appropriate for an implmentation period based on the scope of the changes being proposed under this project.

Comment

Texas RE continues to be concerned there is conflicting language in the planned changes section of the implementation plan, as well as language in the unplanned changes section in the proposed implementation plan that could result in a reliability gap.

Regarding the conflicting language addressing planned changes, Texas RE notes that the second paragraph in the proposed implementation plan states: “For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-7, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change, and must, therefore, be in compliance with the CIP Cyber Security Standards upon the commissioning of the modernized transmission substation.”

Texas RE understands this language to mean the BCS at the substation must be compliant upon the commissioning of the substation. Texas RE agrees with this position.

However, the first and third paragraphs in the proposed implementation plan appears to conflict with this reading. Specifically, the first paragraph states: “Planned changes refer to any changes of the electric system or BES Cyber System which were planned and implemented by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2.” Furthermore, the proposed implementation plan’s third paragraph states: “For planned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable

requirements in the CIP Cyber Security Standards on the update of the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan." Texas RE understands this language to mean the BCS at the substation is not required to be compliant until the Registered Entity has performed its annual assessment under CIP-002 R2. This introduces a reliability gap as assets that were commissioned shortly after the entity has completed a CIP-002 R2 evaluation will not be required to be evaluated for up to 15 calendar months, and therefore would not be required to be compliant with the applicable cyber security requirements. Texas RE does not agree with this position. Additionally, there are no requirements to identify PACS, EACMS, or PCAs. Regarding the proposed implementation plan's concerning unplanned changes, Texas RE is concerned the language could be read to result in a reliability gap. Specifically, the first paragraph of the implementation plan states "Unplanned changes refer to any changes of the electric system or BES Cyber System which were not planned by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2." Texas RE notes that while it is true that during a CIP-002 R2 review an entity may discover that a BCS now meets a higher BCS threshold than it previously held, this is not the only situation in which an entity may become aware of the need for a higher categorization. For example, if an entity is informed by their RC, PC, or TP that an asset is critical to the derivation of an IROL then the knowledge that the systems must meet the medium impact criteria is immediate and as such the 12-month timer to implement medium impact controls should begin immediately. As written, the language in the implementation plan could result in a situation where a Registered Entity could delay the implementation of medium impact controls at such a substation or power plant for up to 27 calendar months, if the IROL notification arrived immediately after a CIP-002 R2 evaluation. Texas RE recommends the SDT revise the proposed implementation plan language around "unplanned changes" to preclude this result.

NST disagrees with the SDT decision to not compel Responsible Entities to identify and maintain a list of SCI that support BES Cyber Systems in CIP-002. In order to demonstrate compliance with various CIP-003 – CIP-013 requirements for SCI, a Responsible Entity would surely have to demonstrate that all its SCI were accounted for. NST is aware of the fact there is no existing CIP requirement to maintain an inventory of “associated” devices including PCAs, EACMS, and PACS, but doing so was some years ago memorably characterized by a well-known representative of a Regional Entity as an "implied requirement." NST believes an SDT goal should be to avoid adding to the list of "implied requirements."

NST believes the proposed “Exemption” statement in every CIP Standard, 4.2.3.3, “Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an Electronic Security Perimeter (ESP) that extends to one or more geographic locations” is both confusing and inaccurate. One provides for the confidentiality and integrity of data, not ESPs. N&ST suggests rewording that’s consistent with the language of proposed CIP-005 Requirement R1 Part 1.4, such as “Cyber Systems associated with communication links used to span a single ESP among two or more geographic locations.”

NST notes the second of two proposed "Measures" for CIP-007 R1 Part 1.3 suggests evidence of compliance with the "non-sharing" of SCI CPU and memory requirement could include "Hardware partitioning of physical Cyber Assets." If our understanding of "hardware partitioning" is correct (that it means, for example, all the Medium Impact BCS that co-reside with High Impact BCS on a single hardware platform are moved to different hardware), then according to the proposed definition of SCI, the end result of "hardware partitioning" would be one or more hardware platforms that are no longer SCI, which would render all proposed requirements for SCI, including CIP-007 R1 Part 1.3, inoperable.

We still have concerns on CIP-010-5 because the draft does not include the Guidelines and Technical Basis section where it defines what must be included in a vulnerability assessment. It is understood that the Standards Drafting team emphasizes backwards compatibility, but, the proposed changes to CIP-007 R1 and CIP-010 R1.1 could affect what is required in the vulnerability assessments. At the very least, we would like to know and comment on what additional items will be required for SCI in a vulnerability assessment as there is nothing found in the current proposed changes.

Lastly, under CIP-010 R3.3 BES Cyber System is shortened to BCS. However, this is different than the other parts of CIP-010 R3. We recommend consistency.

Comment

Although not directly revised in this draft, two issues in CIP-007 deserve mention. Requirement 3.3 obstructs smooth updates of antimalware signatures with large administrative cost and compliance risk, for very little, if any, reliability benefit, and is actually impossible with many automated systems today. The requirement should be revised to remove the testing of signatures. Additionally, CIP-007 R5 language inherited from earlier versions requiring at least 8 character passwords is outdated. SIGE suggests requiring at least 15 character passwords, where capable.

Comment

The proposed revised definition for EACMS would add the phrase, “Shared Cyber Infrastructure (SCI)” to the definition. The term “SCI” can refer to a system that is supporting PACS or EACMS. If the definition is read in terms of this type of SCI as it pertains to the EACMS definition, that opens the possibility that the scope of an EACMS could be read as applicable to Cyber Assets that perform electronic access control or monitoring of SCI “EACMS/PACS,” thus potentially creating a hall of mirrors effect. The MRO NSRF are not certain how probable or not such an interpretation may be, but prefer that this be addressed here rather than when it’s too late to do so. The MRO NSRF ask that the SDT consider this issue and make any edits necessary to address.

Comment

The use of the terms routable protocol communications, bi-directional routable protocol connection and IP Protocol communications, throughout the standards and the definitions is inconsistent and should be evaluated to determine the necessity of using this different language. If providing the consistency through the standards is not an option, it would be better to put these into the definitions so that entities can differentiate one from the other.

The language in CIP-010 R1.1 appears to be getting further away from acceptable language with each iteration of the requirement. Moving requirements to the Measures column does not make the changes any more security objective focused.

Same comments for CIP-005 R1.2 in that the requirements to document a reason for routable protocol communications should be in the Requirements and not the Measures. Examples of the justification/reason are fine in the Measures, but the requirements should be in the Requirements column.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name PUD No. 1 of Chelan County

Answer	
Document Name	

Comment

Chelan asks the SDT to consider the real risks and the goals of the CIP standards. CIP has always been about the protection of BES Cyber Assets/Systems and reducing the risk of a compromise or failure of a BES Cyber System which would adversely impact the BES. By definition, BES Cyber Systems are systems that will have direct impact on the BES, so it makes sense to protect those devices most stringently. Protected Cyber Assets also represent a significant risk since there is no network separation between PCAs and their associated BES Cyber System. A VM escape attack executed against a BES Cyber System would be a single exploit to potentially adversely impact the BES.

However, EACMS and PACS devices do not have a direct impact on the reliability of the BES, and are segregated from BES Cyber Systems and Protected Cyber Assets by protections required by CIP-005. A successful VM escape against a EACMS or PACS device would require a second attack for there to be an adverse impact to the BES.

The new affinity requirements increase both the risk of an adverse impact, by reducing the availability of the in-scope VMs and increase the risk of non-compliance, by forcing the use of a control not meant for this purpose. The requirements proposed essentially create six groups of devices that potentially may not share CPU or memory:

1) High Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)

2) High Impact EACMS/PACS (outside the ESP)

3) Medium Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)

4) Medium Impact EACMS/PACS (outside the ESP)

5) Potentially Low Impact BCS

6) Out-of-Scope Devices

This means that a RE would have to establish up to 6 separate resource pools to comply with the definition of PCA and the text of CIP-007 R1.3. Assuming you can group devices in the affinity rule sets you create (this may not be possible on all platforms), this would require 15 separate anti-affinity rules, in addition any existing rules required for resource management purposes.

With the updated language suggested in Question 4, there would only be 3 resource pools needed:

1) High Impact BCS/PCAs (including EACMS and PACS classified as PCAs, excluding Intermediate Systems

2) Medium Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)

3) All other devices.

Only 3 anti-affinity rules are needed here to satisfy the suggested requirements. This greatly reduces the complexity of the DRS rules needed to satisfy the security objective to protect the BES from the threat of VM escape attacks and decreases the risk of that a BES Cyber System is unable to find a host to run in the event of a failure of one or more SCI hosts.

Conflating support for both High-, Medium-, and Low-Impact Cyber Assets within a single Virtualization Cluster will create additional questions and interpretations between Responsible Entities and ERO Enterprise staff. Clusters by their very nature include pools of shared SCI to include CPU, Memory, Disk, and network resources that are shared between all Cluster members to allow for balancing resources, recovery from failed hardware, and maintaining high availability. The complexity required to balance these pooled resources using affinity rules or logical boundaries to disallow different impact levels of VM guests from running on the same physical resources could be high. Moving VM guests can take place without the need for clustering and would allow for segregated siloing of different impact Cyber Assets without the requirement of determining high-water marking every time a VM guest is moved. Communications play a key role in determining the current health and configuration of clusters – especially with heartbeats and SCSI data requests. Responsible Entities have a high bar to assure that these communications are not to the point that they create common networking connections that would start to include additional VM Guests as PCA.

Marrying both ESP and zero-trust within an overall ESP would better serve our Responsible Entities and create a more secure environment as zero-trust Cyber Assets would not be internet-facing while simplifying the management of the environment. Maintaining the ESP, and fully incorporating virtualization and zero trust paradigms within an identified ESP allows Responsible Entities to leverage another layer of defense (defense-in-depth) for BCS by limiting ingress/egress points and access to these Cyber Assets.

Texas RE recommends clear and concise language on the categorization and impact rating the hosting virtualization infrastructure should have. Specifically, Texas RE recommends eliminating the Shared Cyber Infrastructure definition. Virtualization infrastructure should inherit the highest impact rating and categorizations of the VCAs that the virtualization infrastructure is hosting. For example, if virtualization infrastructure is hosting two	

high impact BCS, three PCAs associated with high impact BCS, and an EACMS associated with high impact BCS, then the virtualization infrastructure should be categorized as a high impact BCS. Implementing high watermarking practices would ensure that the virtualization infrastructure is more reliable and secure.

Texas RE continues to note that no matter how many controls are applied there will always be a parent and child relationship between host and VM's. If the hypervisor is compromised, then all VM's can be. Additionally, if a VM is compromised the same can be true, other VM's and the Hypervisor can be impacted. The Hypervisor should be high watermarked to whatever VMs are on it. Any VMs on the hypervisor should also be marked at the highest impact rating. Different applicable systems with varying impact level lends itself to mixed-trust concepts. This change potential opens the door to allow more corporate based systems (payroll, custom software, etc.) to be on the same hypervisor as CIP applicable systems. CPU and memory segregation only may not protect from vulnerabilities such as hyperjacking, VM escape, Denial of Service, etc.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC) 2016-02 Virtualization (Draft 4)

Answer	
Document Name	

Comment

In future postings, for definitions, it would be helpful if the table for the definitions could include each standard where the definition appears.

In closing, SRC reiterates that our gravest concern is with proposed changes to CIP-010, Part 1.1 and Part 2.1 which do away with the concept of "baseline changes." The proposed language of "settings changes" goes beyond what was previously in the CIP standards such that we believe they are no longer backwards compatible. SRC proposes "settings changes" be modified to "configuration changes" or eliminated altogether.

Additionally, the SRC would like for the SDT to consider that the standards process has taken very long and there are newer technologies that are not being addressed with these changes.

There were 72 sets of responses, including comments from approximately 188 different people from approximately 121 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Director, Standards Development Latrice Harkness (via email) or at (404) 858-8088..

Questions

1. The SDT has modified the IRA definition to simplify it, primarily in regards to the routable protocol to serial conversion scenario. Do you agree with the proposed change? If not, please provide the basis for your disagreement and an alternate proposal.

2. The SDT modified other definitions used in the CIP standards based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

3. The SDT revised CIP-005 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

4. The SDT revised CIP-007 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

5. The SDT has used phrasing such as “SCI supporting an Applicable System from this Part” in the Applicable Systems column across many of the standards. Is it clear that this scopes the requirements for SCI to match the system(s) it hosts?

6. The SDT made numerous clarifying changes to CIP-010 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

7. The SDT revised CIP-003, CIP-004, CIP-006, CIP-008, CIP-009, CIP-011, and CIP-013 mostly with conforming changes or scoping clarifications related to SCI. Do you agree with the proposed changes to these Reliability Standards? If not, please provide the basis for your disagreement and an alternate proposal.

8. The SDT has revised the Implementation Plan to include 3 defined early adoption dates as options should Responsible Entities choose to do so. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

9. Please provide any additional comments for the standard drafting team to consider, if desired.

1. The SDT has modified the IRA definition to simplify it, primarily in regards to the routable protocol to serial conversion scenario. Do you agree with the proposed change? If not, please provide the basis for your disagreement and an alternate proposal.

Roger Fradenburgh - Roger Fradenburgh On Behalf of: Nicholas Lauriat, Network and Security Technologies, 1; - Roger Fradenburgh

Answer	No
Document Name	

Comment

NST sees no reason to change the existing definition's use of "remote access client or other remote access technology." The second part of the proposed definition would, as written, apply to any remote connection using a communications path that included routable to serial conversion, regardless of where that conversion took place (e.g., remote location vs. "local," or "inside the BES asset" location). NST is aware of concerns that using phrases such as "outside the asset" in this context might cause confusion about its relationship to electronic access control requirements for BES assets containing low impact BCS, but we nonetheless recommend using it to avoid overly broad application of "IRA" to communications using both routable and serial wide-area connections.

Response

Thank you for your comments. The SDT asserts that the scenario must meet the definition of IRA in order to be in scope of the requirement. The current definition is not clear as to whether a device that is serial only, and thus has no "associated ESP", can have IRA at all. The SDT is making this scenario clear in scope of the definition, so that the requirements in CIP-005 R2 are applied. The SDT also removed phrases such as "outside the asset" and "remote access client or other remote access technology." in response to previous comments concerning what those terms mean, especially now with the use of SSL VPNs and other methods that require no client "remote access" software.

Comment

The term “Cyber System” is too broad in scoping IRA. Suggest revise to clarify that the target of IRA is BES Cyber System rather than “Cyber System” to avoid including EACMS, SCI, PCA, etc.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. Definitions and scoping are separate, therefore, do not scope requirements. The SDT, by defining the glossary term IRA, is describing a type of access. Similarly, in defining Cyber System, the SDT is describing a collection of Applicable System types that are collectively referred to as the defined term. The Glossary of Terms is the dictionary for what each term means. The scoping of CIP requirements is achieved through requirement language where the term is used, in combination with the Applicable Systems column for each corresponding Requirement Part.

Tim Kelley - Tim Kelley On Behalf of: Charles Norton, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Foung Mua, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Kevin Smith, Balancing Authority of Northern California, 1; Nicole Goi, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Nicole Looney, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Wei Shao, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; - Tim Kelley, Group Name SMUD / BANC

Comment

Under the new definition of IRA, bullet 5 that excludes “Communication that originates from an Intermediate System; or,” should not be excluded from the definition. Excluding it would be confusing as IRA to a BCS should come from an Intermediate System.

The new definition of IRA conflicts with the existing definition of ERC. ERC is the ability to access a BCS through its ESP via a “bi-directional” routable protocol connection.

In the new IRA definition, the second bullet addressing serial Cyber Assets states that IRA is “User-initiated electronic access by a person using a routable protocol” (*not necessarily bi-directional*), “that is converted by the Responsible Entity to a non-routable protocol….,” is in direct conflict with the existing definition of ERC. This is not a concern over serial end points being in scope or not, we all agree that they are in scope, but the term “bi-directional” does nothing to help bring serial devices into scope, in fact it implies that serial devices that do not establish TCP/IP connections are out of scope.

Our recommendation to the SDT is to modify the definition of ERC as follows. First, remove the words “bi-directional” since there is no such thing as bi-directional routable protocol. Changing the ERC definition to simply “routable protocol” would create consistency throughout the

requirements. Second, remove the word “connection” as this term implies that there has been a TCP handshake and a connection is established while excluding connectionless protocols such as UDP. Consider using “routable protocol communication” or just “routable protocol”. In CIP-005 R1.2, reference is made to routable protocol communication instead of connection, so the SDT may want to align with that if they are using the term routable protocol is not enough.

Response	
Thank you for your comments. The SDT agrees “Communication that originates from an Intermediate System; or,” should not be excluded from the IRA definition and has removed that phrasing. The SDT decided to retain the proposed language in the ERC definition. The SDT asserts IRA describes a particular access type, whereas ERC describes a transport mechanism for which the access type of IRA is accomplished. The ERC definition is used as a scoping mechanism within the Applicable Systems of Requirement Parts, whereas IRA itself is an access type for which particular controls defined in CIP-005 R2 must be implemented. The SDT addressed the concern about directionality of the routable protocol connection within the IRA definition by clarifying IRA, including "...using a routable protocol • That is converted by the Responsible Entity to non-routable protocol "that allows access" to a Cyber System;...".	
Gail Golden - Entergy - Entergy Services, Inc. - 5

Comment	
Should “or” be added to the end of the first bullet to more clearly define the need to continue dropping through the bullets like a decision tree to identify if any of the points are true instead of exiting after the first question? It is unclear if after the first bullet is an “and” or an “or” to identify IRA.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Reference the word version of the Results-based Standard template (link) on the NERC Resource page. Numbered lists indicate an “and” and bulleted lists indicate an “or.” The location of the “or” means that each bullet would read with an “or” as you move to the next bullet.

Comment	
Changes to the IRA definition adds conversion from routable to non-routable (serial) communications to remote BCS that was previously omitted. Further clarifications in the definition of IRA removes some gray areas and further delineates IRA from system-to-system communications. However, there remains a gap between what is system-to-system and what is Interactive Remote Access (IRA) with the new IRA definition. Entities often rely on IRA ports for system-to-system communication but have not enforced protections to ensure that malicious actors do not use the ports – regardless of whether a remote access client is available or used. Additional technical measures or controls should be added to the definition to ensure validity of communications to Applicable Systems regardless of source or intent. In addition, approval of CIP-005-8 would be conditional, based upon approval of the entire suite of new standards associated with virtualization and approval of SCI terminology and other definitions associated with virtualization. The SDT has added rationale but not defined whether user-created scripts and programs that can be modified and scheduled to run independently are considered IRA – even though an unauthorized user could modify it to their benefit. Both scripts and programs can be user-initiated, and with no definition of system-to-system communications there are still lingering issues regarding what system-to-system communications is comprised. Further, user-created scripts and programs may not be capable of reading multi-factor tokens or their displayed codes, but additional security for these connections can be implemented through certificates and the use of secure connections via SSH or SSL.

Response	
Thank you for your comments. The SDT maintains there is a long standing issue where "system to system" communications (covered by CIP-005 R1) could need and use protocols/ports that can also be used for IRA. The SDT asserts that IRA is focused on the human interaction with the Applicable System and the associated capability for a human to access and remotely interact with an Appliable System. Not the interactive capability of a given protocol/port that may also be needed for process-based system-to-system communication, relying on other CIP-005 and CIP-007 requirements to restrict communications and secure the Applicable System. If a protocol is used for IRA, then CIP-005 R2 controls must be applied to that access. However, the R2 controls are designed for interactive users only; Applying those controls to non-user interactive sessions (system-to-system) would break automated system-to-system data transfers and the like that may be needed for reliable operation of the BCS. Therefore, the SDT cannot apply R2 controls in a mandatory manner to these protocols/ports that have multiple uses, such as secure batch file transfers between processes and interactive user logon. The SDT is concerned with how a mandatory requirement preventing IRA (or considering system-to-system communication using certain IRA capable protocols/ports) in these specific situations could be constructed, as in some cases entities may use the protocol/port to	

perform both, while also having the proper controls on both. The SDT has not defined scripts and programs scheduled to run independently as IRA for the reasons noted - the R2 controls would break such functionality.	
JT Kuehne - AEP - 6	
Answer	No

Comment	
The revised definition of IRA provides more clarity than the earlier version. With that said, AEP recommends removing second bullet under what “IRA does not include” list, as IRA should include “communication that originates from an Intermediate System”.

Request confirmation that entities should re-evaluate serial connections because they may now be in scope . . . due to the updated definitions of IRA and ERC	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. It is up to each Registered Entity to determine which serial connections meet the updated IRA definition and proposed requirement language, and an entity would need to know what Applicable Systems a user can initiate remote access (IRA) to even if the device is serial only. For example, a serial cable from a terminal server connected to the console port of an Applicable System that can be accessed remotely benefits	

from re-evaluation to see if it meets the new definition of IRA and would need CIP-005 R2 controls on the routable protocol part of the overall path. Thus, this is not an evaluation of all serial, but an evaluation where a user can remotely access on the serial side of IP-serial converters/terminal servers only.

The IRA definition contains “To a Manangement Interface of Shared Cyber Infrastructure”. We feel this should read “To a Management Interface”. Adding SCI to the definition restricts the scope to just Management Interfaces on SCI. Management Interface’s definition contains SCI, so it is unnecessary to put SCI into the requirement as well.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The SDT agrees and changed the definition to "To a Management Interface" and moved all scoping to the standard within the Applicable Systems and Requirement Parts. CIP-005 R1.3 was rewritten to incorporate the security objective of protection of the configuration of ESPs and SCI, leaving the method to the entity.

Dislikes 0	
Response	
Thank you for your comments. The SDT added the phrase in response to comments on previous drafts. For circuits that go between different entities, such as between a BA and a GO/GOP, the generator may only have a serial connection they connect to their system. They do not know whether the serial is converted to IP at any point along the path to the BA. To make this clear, the entity that does the conversion from IP to serial is the one that will need, if IRA is allowed over the path, to implement CIP-005 R2 controls on the IP side of the conversion. The generator cannot do that in this scenario. The SDT asserts that the entity that performs the conversion needs to be concerned, not the entity that simply has a serial cable to connect to. The TR was be modified to address the concern.

JT Kuehne - AEP - 6

Answer	No
Document Name	

Comment

AEP supports all proposed definitions with the exceptions of “Cyber Assets” and
“Interactive Remote Access (IRA)”. Our comments are specified below:

- **Cyber Assets**: The SDT added “*Application containers are considered software of Virtual Cyber Assets (VCAs) or Cyber Assets. VCAs are not considered software or data of Cyber Assets*” to the definition of Cyber Asset. AEP suggests deleting the added sentence since it adds more confusion to the definition and it is included in the VCA definition.
- **Interactive Remove Access (IRA)**: Please see our response under Question #1.

Since the Glossary modifications are the foundation to all Standard changes, NERC should seek approval of the new terms prior to any changes being introduced in the Standards to reduce potential misunderstanding or misinterpretation of both the new definitions and modified Standards. This will also allow NERC, and industry, time to determine additional courses of action, reduce confusion, and reduce additional risk associated with such wholesale changes. Further, introducing Shared Cyber Infrastructure (SCI) and Management Interface increases the number of Requirements and Parts that a Responsible Entity needs to track compared to simply identifying the hypervisor and associated hardware and “high-water marking” them with the highest identified impact rating BCA/VCA, EACMS, or PACS, and creating a BCS. Further, the ideology surrounding “remediation VLANS” should be revisited to understand the risks posed by implementing such an environment. The complexity required to balance these pooled resources using affinity rules or logical boundaries to disallow different impact levels of VM guests from running on the same physical resources could be high. RF believes that the rationale put forth by the Standards Drafting Team for a “remediation VLAN” and the use of automation of security controls poses additional risks that can be mitigated through the use of Transient Cyber Assets (TCAs) in CIP-010 to accomplish the same vulnerability assessments and updates (OS patches, AV updates, etc.) without the complexity or risk associated with having to identify and unidentify PCAs as they are taken out and placed into service in the production network.

Response	
Thank you for your comment. The SDT disagrees as many will not vote to approve terms (particularly technology terms) and definitions in a vacuum with no context as to how those definitions will be used. Also, at times terms are created to match the requirements, such as IRA. Many may say that the IRA definition is too restrictive. However, it is defined so that it matches scenarios where the CIP-005 R2 requirements can be met without affecting functionality or reliability of systems. The inclusion of "remediation VLAN" language is an attempt to address a current risk, based on the order of operations in the use of these tools. See the CIP Definitions and Exemptions Technical Rationale document posted with Draft 5 for clarification of the treatment of "remediation VLANS."

The current definition of “Management Interface” still appears to be a bit unclear. It seems to exclude the management interface of a switch inside the Electronic Security Perimeter. NRG recommend changing the third bullet of the definition from “Configures an Electronic Security Perimeter” to “Configures a network device.” Additionally, the proposed “Protected Cyber Assets” definition could be read to include any Virtual Cyber Asset that shares physical CPU or memory, despite the addition of “resources”. We believe the intent of the drafting team to be sharing virtual CPU or memory. If so, the definition should be clarified to read, “any Virtual Cyber Asset sharing the same CPU or memory allocation.”

AWS agrees with the following proposed definition changes but asks the SDT to consider including the items suggested below in implementation guidance to support entities in adopting the revised definitions: **Interactive Remote Access (IRA):** AWS asks the SDT to consider including the meaning of system-to-system communications in implementation guidance to support entities with implementing the revised IRA definition. We suggest including elements such as where the system-to-system communication originates – inside or outside of the Electronic Security Perimeter (ESP). **Management Interface:** AWS asks the drafting team to consider clarifying the meaning of “administrative interface.” For example, the SDT could clarify if “administrative interface” is intended to include Graphical User Interfaces (GUIs), Command Line Interfaces (CLIs), Software Development Kits (SDKs), and/or Application Programming Interfaces (APIs). **Virtual Cyber Asset (VCA)**: AWS asks the SDT to consider including the meaning of “dormant file-based images” in implementation guidance to support entities with implementing the revised VCA definition. Additionally, AWS suggests including guidance to ensure that security controls are in	

place for dormant file-based images to mitigate vulnerabilities. For example, guidance that includes verification that required cyber security controls are in place prior to using the file-based image in production.

AWS does not agree with the following proposed definition:

Transient Cyber Asset (TCA): The modification to the Transient Cyber Asset definition that allows virtual machines running on a physical TCA to be treated as software on the device should be reconsidered. As written, an entity may not apply the appropriate security controls to the virtual machines running on physical TCAs. Entities should be monitoring the state of the virtual machines running on their physical hardware for security issues. We propose removing the language “Virtual machines hosted on a physical TCA can be treated as software on that physical TCA” from the TCA definition. By removing this language, entities would be required to apply security controls to the virtual machines hosted on their physical TCAs in alignment with CIP-010 R4.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name PUD No. 1 of Chelan County	
Answer	No
Document Name	
Comment	
The definition of Protected Cyber Asset carries with it an implicit requirement with the CPU and memory clause. The implication of the requirement is that a VM that is not a Protected BES Cyber Asset may not share CPU and memory with a BES Cyber System. If out-of-scope VM inadvertently shares CPU and memory with a BES Cyber System, then it suddenly becomes a PCA by definition and has instantly violated the majority of the CIP requirements. This is similar to the issue with Intermediate System that was corrected in this draft. Chelan recommends removing the CPU and memory sharing clause and adopt the suggested language in Q4 for CIP-007 R1.3, a requirement that a BCS/PCA may not share CPU and memory with non-BCS/PCA of the same impact level. That would change an inadvertent resource sharing incident into a single violation of CIP-007 R1.3 rather than violating all the requirements that have PCA as an Applicable System. Please see the response to question 4 for suggested language.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The SDT does not agree that the PCA definition imposes implicit requirements, but rather that there are consequences on the placement of VMs. The interaction of the PCA definition with the CIP Requirements has consequences for any item that meets the PCA definition, and this is intentional.	
Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group	
Answer	No
Document Name	
Comment	

WEC Energy Group has a continued concern with the newly defined term "Management Interface". Based on the rationale, it is understood why the need to define these interfaces exists. However, this definition differs from the virtual concept and extends to application functionality tools which, in our opinion, is outside of the intended scope of the Project. Thus bringing additional devices into scope even for those entities that are not using virtual machines. Proposing the SDT remove the 3rd bullet from the definition.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. The SDT modified the third bullet of the definition of a management Interface to provide additional clarity. The third bullet of the Management Interface definition, "• Configures an EAP", includes physical devices that can create Virtual Local Area Networks (VLANs) which applies virtualization techniques to the network infrastructure. Further, the SDT contends that the third bullet is necessary to deal with the additional complexity that Zero-Trust architectures bring to the concept of an ESP and EAP.

Tim Kelley - Tim Kelley On Behalf of: Charles Norton, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Foung Mua, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Kevin Smith, Balancing Authority of Northern California, 1; Nicole Goi, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Nicole Looney, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; Wei Shao, Sacramento Municipal Utility District, 3, 5, 6, 4, 1; - Tim Kelley, Group Name
SMUD / BANC

Answer	No
Document Name	

Comment

While updating the definition of EAP for virtualization and to accommodate zero trust architectures, it would be good to also not refer to a “Cyber Asset interface,” as the EAP could be a zone-based implementation, transparent firewall, a single physical interface, multiple physical interfaces, sub interfaces (virtual SVI) or a port channel/group. The term Cyber Asset “interface” is too restrictive.

We recommend the SDT change the definition to “An electronic access or policy enforcement point on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.”

Likes 0	
Dislikes 0	

Response

Thank you for your comments. The EAP definition is created with two ways to meet the definition. Either as a Cyber Asset Interface, for backwards compatibility, or as a policy enforcement point to accommodate Zero-Trust.

Jay Sethi - Manitoba Hydro - 1,3,5,6 - MRO

Answer	No
Document Name	

Comment

Manitoba Hydro thanks the drafting team for considering all comments and implementing changes to the definitions. Manitoba Hydro is in support of the changes to most definitions and the new definitions. For the updated definition of **Electronic Access Control or Monitoring Systems (EACMS)** it appears that the scope has inadvertently been increased with the “SCI” wording. The definition includes Cyber Assets… that perform electronic access control or electronic access monitoring of… SCI. The definition for SCI includes systems that host EACMS and PACS and systems that provide storage resources to EACMS and PACS. The scope of an EACMS would therefore increase to include systems that provide electronic access control and monitoring for SCI supporting EACMS and PACS, however systems providing electronic access control and monitoring directly for EACMS and PACS are not in scope. The definition is the only place where the scope of EACMS is set.

The following wording is suggested:

Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure (SCI) that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s), BES Cyber Systems or SCI supporting applicable Cyber Assets. This includes Intermediate Systems.

Manitoba Hydro also notes a minor clarification in the new definition of Management Interface. It referest to deploying “SCI”, this should actually refer to the VCA hosted on the SCI:

An administrative interface that:

• Controls the processes of initializing or deploying VCA hosted on SCI or

Controls the process of configuring Shared Cyber Infrastructure; or

• Is an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, and operating system; or

• Configures an Electronic Security Perimeter.

Additionally the definition for VCA includes the term "virtual machine". This is a technology specific term and excludes some potential instances of VCA such as virtualization used in the CISCO Nexus platform. This can be resolved by removing the following wording: "currently executing on a virtual machine"

Answer	No
Document Name	
Comment	
In the proposed definition of "Cyber Asset", the definition of "application container" versus VCA is unclear. The term "container" used in this definition needs further clarification. In the proposed definition of "Management Interface", the definition of "administrative interface" is unclear. The term "administrative interface" used in this definition needs further clarification. In the proposed definition of TCA, removal of the qualifier "directly" may inappropriately expand the scope of the requirement to include devices connecting via IRA or Intermediate System.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. See the CIP Definitions and Exemptions Technical Rationale document posted with Draft 5 for clarification on the reasoning behind treatment of application containers as software of a VCA or CA. The SDT contends the bullets following the term "administrative interface" in the Management Interface definition are the clarifying qualities that define the term, without requiring a formal definition for "administrative interface", which could cause more confusion than clarity for industry.	

Additionally, the TCA definition was modified in regards to network connectivity for clarity that applies to the removal of the term "directly".

Comment	
Definition of VCA: NST believes the proposed definition of VCA should more closely resemble the existing definition of "Cyber Asset" or, better still, be eliminated altogether. The existing definition of "Cyber Asset" could be easily "unbound" from "hardware" with this or a similar modification: Change from, "Programmable electronic devices, including the hardware, software, and data in those devices" to, "Hardware-based or virtual programmable electronic devices, including the software and data in those devices." Definition of TCA: NST considers the statement in the proposed definition of TCA, "Virtual machines hosted on a physical TCA are treated as software on that physical TCA" to be oddly inconsistent with the proposed definition of VCA. Furthermore, we disagree with the SDT's opinion that if a physical TCA hosts one or more virtual TCAs, there should be no need to track and manage each individual physical and virtual device. Definition of ESP: NST believes the proposed new part of the current ESP definition, “or a logical boundary defined by one or more EAPs” is redundant and unnecessary. We therefore recommend maintaining the currently approved ESP definition. Definition of ERC: NST believes the use of the word, "through (an ESP)" has the potential to cause confusion over what kind of routable communications qualify as ERC. ERC to or from a Cyber Asset should be clearly defined as "through" an ESP boundary or access point, not "through" an ESP (the online Merriam Webster dictionary defines "through" as "a function word to indicate movement into at one side or point and out at another and especially the opposite side of // 'drove a nail through the board'"). NST believes the existing definition of ERC can and should be retained as-is. Definition of EAP: NST believes the proposed definition of EAP is problematic in two respects. First, we believe it could be interpreted to mean an EAP should control all routable communication between a BCS and any other Cyber Asset regardless of whether that "other" device is within or outside of the same ESP protecting the BCS. Second, we believe the SDT should better define "policy enforcement point," lest Responsible Entities, Regional Entities, and NERC develop their own conflicting definitions.

Response	

Thank you for your comments. The SDT looked at combining the CA and VCA concepts in the early stages of this project and determined that there were challenges with that approach. First, if virtual based, then the hardware would not be included. Second, the inability to target controls specifically at the virtual versions of things. See the CIP Definitions and Exemptions Technical Rationale document posted with Draft 5 for clarification on the reasoning behind treatment of a VCA on a TCA as software, explanations for ESP, and EAP.	
Donald Lock - Talen Generation, LLC - 5

Thank you for your comments. The definition of IRA was updated to include “bi-directional” in the latest draft after the SDT determined the concept was no longer included by way of the reliance on the External Routable Connectivity definition and is an integral part of Interactivity.

The only disagreement with the proposed defintions is for the CIP Senior Manager. The updated definition for CIP Senior Manager could cause some confusion because it is broad and appears to apply to all the CIP Standards, even though CIP-012 and CIP-014 do not have CIP Senior Manager requirements or responsibilities. An alternate wording could be “.... continuing adherence to the requirements within the NERC Critical Infrastructure Protection Standards in which the CIP Senior Manager has responsibilities"

Texas RE is concerned the proposed definition of Electronic Access Point (EAP) is ambiguous. Texas RE believes the SDT’s intent was to write a definition that applied to communications between BES Cyber Systems and PCAs and Cyber Assets not protected by the same ESP. The proposed definition as written, however, could be interpreted to mean that EAPs are only applicable when controlling communication between a BCS and its PCAs. The proposed language as written could also be interpreted to mean “An electronic policy enforcement point” or “a Cyber Asset interface on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.”

It could also be interpreted to mean “An electronic policy enforcement point” or “a Cyber Asset interface on an EACMS that controls routable communication to and from one or more BES Cyber Systems and their associated PCAs.

For clarification, Texas RE recommends the following definition:

An EAP is:

- A Cyber Asset interface on an EACMS; or
- An electronic policy enforcement point

that controls routable communications between Cyber Systems protected by an ESP and:

- one or more Cyber Systems that are not protected by an ESP; or
- one or more Cyber Systems that are protected by a different ESP.

Answer	
Document Name	
Comment	
For definition of Transient Cyber Asset (TCA): Reconsider the wording of the sentence ¨ Virtual machines hosted on a physical TCA are treated as software on that physical TCA¨. The language used leaves room for misinterpretation and allows entities to use VM on physical TCA to bypass implementing security controls in the VM. VM image security should be verified prior to execution on TCA. For CIP-003, Attachment 1, Section 4, request confirmation that while this Section has no updates, this Section’s scope is bigger because of changes to the definitions of Cyber Security Incident and Reportable Cyber Security Incident.

Southern does not agree with the proposed change in Part 1.3. The way EACMS is written, it suggests that it includes all forms of EACMS and is too broad. The term “EACMS that enforce an ESP” is not bound to firewalls and switches with VLANs, in other words EACMS that enforce network segmentation. Domain Controllers for example can help “enforce” an ESP in determining who can and can’t cross the ESP. It is not clear, in that case, what the “Management Interface” of a domain controller EACMS is, nor can routable protocol be restricted to it if its used to authenticate users. The original approved standard lists Electronic Access Points for High and Medium BCS which more aligns with equipment within an ESP. Southern suggests considering the use of EAP as the object of this requirement to clarify the scope.

NST believes modifications to CIP-005 should be limited to conforming changes only.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The SDT maintains modifications are necessary for CIP-010 and has not limited proposed modifications to conforming changes. The SDT focused more on objective type language versus a prescriptive list. At this time, the SDT does not plan to separate virtualization requirements from the existing requirements. Project 2016-02 is not just about enabling the CIP Standards for virtualization and opening the toolbox for this option, but rather to remove encumbrances while maintaining security and backwards compatibility as key objectives. The existing baseline attributes are administratively burdensome and serve as a disincentive to virtualize, even where virtualized solutions may be more secure. Additionally, the existing construct does not lend well to a virtualized environment. The proposed modifications shift the focus from a documentation burden to security value by requiring the authorization of change instead of the update of documentation 30 calendar days after a change. The order of operations may also be different in a virtualized environment, requiring adjustments to Requirement R1, which seems to prescribe an order of 1) identify security risk, 2) authorize, 3) implement, 4) verify, remediate, reverify. For example, in a virtualized environment using Remediation VLANs the order might be 1) authorize, 2) identify security risk, 3) remediate and verify, 4) implement; without modifications entities may not be able to use features like Remediation VLANs. The prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement with 'baselines' as one means to achieve the objective. The SDT determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. To maintain backwards compatibility, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. The purpose is to add clarity that an entity can continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007...". The changes then require authorization per Requirement R1 Part 1.1, and which changes to high impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA, and SCI supporting an Applicable System in Requirement R2 Part 2.1 are then subject to the monitoring requirements in Requirement R2 Part 2.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way how an entity can choose to demonstrate compliance. The TR was reviewed to ensure the baseline part is clear. Additional rationale and use case examples for these changes can also be found in the TR.

BPA does not support the expansion of R1, Part 1.6 to include the protection of data traversing communications links. Expansion to communications links does not consider devices that cannot meet this criterion. Putting communication links in scope would increase costs and maintenance activities, and would require re-architecture of links. Additionally, Exemption 4.2.3.3 maintains the communications exemption for the equipment on the communications link in a ‘super-ESP’, whereas an encryption requirement when traversing multiple geographic locations would increase security for these super-ESPs. BPA suggests reverting to the Draft 3 language for R1, Part 1.6. BPA does not agree with the requirement to mitigate risk represented by sharing memory resources in R2, Part 2.6.1. The theoretical risk represented by CPU-sharing is not high enough to mandate the significant re-architecture required to adequately separate CPU usage as specified in Part 2.6.1. BPA recommends allowing the continued use of shared resources to allow entities the flexibility to balance risk mitigation with resources, maintenance and cost of maintaining the grid.

Response
Thank you for your response. 1.6 The SDT feels the objective for the level of protection in the requirement is appropriate. This covers expansion of an ESP outside of a PSP or between sites (Super ESP). The requirement language is worded to be backwards compatible with approved versions of CIP-006 R1.10. The proposed Exemption 4.2.3.3 is for equipment "between" the devices providing encryption, not for the devices themselves. 2.6.1 Now 2.6 -The SDT modified the Intermediate System affinity requirement to "Not share CPU or memory resources with any part of a high or medium impact BCS."

Comment
CIP-005 R1.2 does not state that there must be a justification for the need of routable protocol communication except for in the Measures column. We recommend the SDT change the wording from permit only needed routable protocol communications, and deny all other routable protocol communications “through the ESP” to “into identified ESP(s).” ERC is defined as external routable ***connectivity***, but the requirement is for external routable ***communications***. This is another instance of the inconsistent use of routable protocol qualifiers. In the Measures column of CIP-005 R1.2, the Measure “Physical isolation of an ESP,” is confusing. The need to use routable “protocol” communications in the CIP-005 requirements is confusing. It makes it sound like routable ***protocol*** communications is something different than routable communications. You cannot have routable communications without a routable protocol unless you encapsulate the non-routable protocol. This current wording may support excluding serial communications that are encapsulated and transported via a routable protocol. It would be less ambiguous if the SDT drops the word “protocol” from routable protocol communications and just used “routable communications.”

For CIP-005 R1.5, we recommend the SDT add a “except during CIP Exceptional Circumstances” clause to the requirement (similar to the clause added to CIP-004 R3.5). There can be multiple single points of failure impacting the ability to detect known or suspected malicious IP communications. A logging server, line card, power source, management console or SIEM could fail resulting in an immediate potential instance of non-compliance. Many of these solutions require port mirroring and there are limitations to mirroring the same source networks to multiple destination interfaces. This creates a scenario where a failed patch or unexpected hardware failure would immediately result in a potential instance of non-compliance creating unnecessary administrative burden. One solution to solve this would be to use a SPAN aggregator that splits the SPANS to two different security devices (like an IDP), but this too creates a single point of failure that during a patch, reboot or any system failure, would automatically result in a potential instance of non-compliance. For CIP-005 R2.1, the SDT should change the requirement so that the Interactive Remote Access is only initiated ***from*** an intermediate System instead of ***through*** an Intermediate System so that it’s clear that encrypted communication stops at the Intermediate System and new communication is then established from the Intermediate System.

Response	
Thank you for your comments. R1.2 The SDT agrees and changed the requirement wording to add justification of need. The SDT cleaned up the use of "routable protocol" to be more consistent. Refer to Technical Rationale for further explanations. R1.2 The SDT agrees and removed "physical isolation" from the measures. R1.5 The proposed change is not within the SAR for this project. R2.1 The SDT feels that "through" an Intermediate System is more appropriate than "from" an Intermediate System as the latter implies that IRA can originate from the Intermediate System itself.	
Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group	
Answer	No
Document Name	
Comment	

WEC Energy Group does not agree with the proposed edits in R1 as it references the new "Management Interface" definition of which we do not agree (see #2 response). We also note that the reference to the Electronic Access Point has been removed from the Applicable Systems column. The Electronic Access Point modified definition is suitable for referencing physical and virtual assets. Proposing the SDT leaves Electronic Access Point in the Applicable Systems column.

WEC Energy Group can support the proposed edits in R2 and R3.

Comment

Regarding CIP-005 Part 1.4, AWS suggests not limiting authentication requirements to dial-up connections. The SDT should broaden this requirement to include other technologies (i.e. 4G, 5G, etc.). Limiting this requirement to dial-up only may inadvertently create a security gap where alternative connection methods are not required to authenticate.

Comment

There is still a gap between what is system-to-system and what is Interactive Remote Access (IRA) with the new IRA definition. Entities often rely on IRA ports for system-to-system communication but have not enforced protections to ensure that malicious actors do not use the ports – regardless of whether a remote access client is available or used. Additional technical measures or controls should be added to the Standard to ensure validity of communications to Applicable Systems.

CIP-005-8 depends upon approved SCI terminology and other definitions associated with virtualization. Approval of CIP-005-8 would be conditional, based upon approval of the entire suite of new standards associated with virtualization.

There is a significant concern is that an entity could implement "logical isolation" using only a host-based firewall on essential systems that are directly connected to the internet. Thus, exposing them to greater risk as compared the requirements in place today using defense-in-depth.

Further, introducing Shared Cyber Infrastructure (SCI) increases the number of Requirements and Parts that a Responsible Entity needs to track compared to simply identifying the hypervisor and associated hardware and "high-water-marking" them with the highest identified impact rating and creating a BCS. Allowing "mixed-trust" environments within the same SCI (hypervisor) increases the complexity and management of the environment as the SDT relaxes the "high-water-marking" required to this point. In addition, complex environments are permitted where both ESP and non-ESP Cyber Assets can be commingled on the same hardware using nothing more than affinity rules and virtual networking to segregate these systems. The complexity surrounding these installations could allow for increased risks from configuration mistakes such that ESPs could contain Intermediate Systems.

Finally, there is no NERC definition of "Remediation VLAN" so therefore the Responsible Entity could keep VMs spun up and within the Remediation network for extended periods of time – without the benefit of protections from the other CIP Standards. Accidental connection to production networks before these VMs has been properly remediated could lead to security issues and introduction of malicious communications.

CIP-005 Requirement R1 Part 1.6 – to protect the confidentiality and integrity of data traversing communication links that span multiple Physical Security Perimeters, does not carry a minimum level of encryption to be required. This could result in older less secure methods being used for connections leaving the data at risk. References to NIST documentation regarding minimum encryption is suggested. Further, dependence on third-party carriers to create the "super ESP" could allow encrypt-decrypt-encrypt situations that could jeopardize the required protections for confidentiality and integrity of the data.

Response

Thank you for your comments.

R2.1 The SDT feels the proposed IRA definition has enough content to clearly show that IRA must be user initiated and is not part of system to system process communications. Any system to system process communications utilizing the same network ports as IRA would not fall within the definition of IRA. The word "authorize" has been removed.

Definitions vs. Standards - The SDT has determined that for draft 5, changes made to the definitions from draft 4 will only affect the standards being re-balloted in draft 5. This concern will be addressed during the next webinar.

Logical isolation and Host based firewalls - The SDT crafted the language in such a way that the requirements are compatible with zero-trust type implementations, which implies all external type communications is untrusted. It will be difficult for an entity to meet all the requirements using traditional host based firewalls as they which are not centrally controlled / administered.

Remediation VLAN - The SDT crafted the requirements to be compatible with additional other methods than solely remediation VLANs.

SCI / Mixed usage - The SDT feels that the methodology around the requirements for SCI are crafted in order to be flexible as technology evolves such as zero trust.

R1.6 The SDT crafted a technical objective requirement to protect confidentiality and integrity and feels that using outdated encryption methods does not meet the objective. Also, exemption 4.2.3.3 is crafted so that R1.6 must be under an entity’s control even if a third party is being used.

Comment	
GSOC requests the SDT remove references to previous requirements regarding applicable systems and instead include the content in directly with regards to applicable systems in parts 2.2, 2.3, and 2.6. In requirement 1.6, GSOC recommends allowing for the use of a combination of both physical and encryption controls at the discretion of the responsible entity for protections in the same manner as is allowed in CIP-012 standards. {C}[TK1]{C} This inclusion of physically security controls will provide more latitude for the entity to increase security while still remaining compliant rather than relying solely upon either physical or confidentiality and integrity controls. GSOC recommends using “Confidentiality and integrity controls, and/or”, or an additional bullet point specifically allowing for a combination of confidentiality and integrity controls along with physical controls. In requirement 2.1, specifying ‘authorized IRA’ implies that all IRA must be authorized, i.e. enumerated and documented. Additionally, the 2.1 measures then require all IRA be routed through an Intermediate System, suggesting even unauthorized IRA must do so as well. This issue persists in 2.3. Requirement 2.5, 3.1, and 3.2 language on applicability should explicitly specify it applies to only SCI having vendor remote access, rather than every SCI.

Response	
Thank you for your response. R1.6 The SDT feels that the first bullet is objective and allows for either physical or logical protection. The second bullet for backwards compatibility purposes with the previous CIP-006 standards has been added. This gives the entity the option of using either bullet.	

R2.1 The SDT removed "authorized". R2.4/2.5/3.1/3.2 The SDT agrees to restore the approved applicability. 2.6.1 – Now 2.6 -The SDT modified the Intermediate System affinity requirement to “Not share CPU or memory resources with any part of a high or medium impact BCS.”

Answer	Yes
Document Name	
Comment	
Manitoba Hydro agrees with the direction of the standard drafting team. Additional clarity could be added to sub-requirement R2.4 and R2.5. The term “with vendor remote access” has been added to the “applicable system” column. The addition of “SCI supporting an Applicable System in this Part” could mean that vendor remote access to the SCI is not in scope if there is no vendor remote access to BCS, since there are two qualifiers. Manitoba Hydro suggests adding a the qualifier “Where vendor remote access is implemented,” to the “requirements” column similar to the change done for R1.4 for Dial Up access.

Part 1.5 – SCI is not afforded malicious communications protections like the other CA types. While we understand the desire to avoid monitoring heavy traffic like fiber-channel, there is still a real risk of malicious code over the network to/from hypervisors (and likely other SCI)

Part 1.6 – Communication between geographically dispersed SCI is not applicable, thus not necessarily afforded similar protections.

Part 1.6 - Including the 'Internet Protocol' qualification in the requirement could inhibit malicious communication detection for future technologies and implementations that may not use a traditional firewall and IP routing. In particular with the change from firewalls as the outer perimeter to a zero-trust implementation, there will likely be more configuration points that aren't also acting as routers, so the inherent protection from non-IP protocols offered by the separation of subnets will no longer be there and other protocols could pass.

Response	

Thank you for your comments.

R1.5 The SDT has not included SCI in the Applicable Systems as it will likely be used to meet this requirement and could result in a "hall of mirrors".

R1.5 The SDT made this requirement more consistent by specifying "routable protocol" and will limit communications to routable protocol at this time so that other data center protocols currently in use are not inadvertently included.

R1.6 The SDT chose not to include SCI within the Applicable Systems as SCI itself may be used to provide the required protections . This may result in a gap in protection is certain situations, however the SDT feels that a majority of situations will be covered.

Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	Yes
Document Name	
Comment	
BC Hydro agrres with the proposed changes; however, clarification is needed as follows: In CIP-005-8 Requirement 2.1 which is, "Permit authorized....". The use of the word "authorized" is creating confusion. Typically IRA through the Intermediate System is already authorized through CIP-004. SCI was already added into CIP-004 scope therefore SCI access is authorized. IRA is applicable to all asset classifications on top of SCI which is also authorized through the CIP-004 process and not at the intermediate system. BC Hydro kindly requests that the drafting clarifies the use of the term "authorized" and recommends that the drafting team consider removing the word "authorized" from the wording of Requirement 2.1.

Texas RE is concerned the definitions of Cyber Asset and PCA introduce security risks in CIP-005. The definition of Cyber Asset explicitly excludes SCI from its definition, which means SCI cannot be a Cyber Asset. The definition of PCA explicitly includes Cyber Assets or Virtual Cyber Assets in the definition. SCI cannot meet either definition, which means a hypervisor cannot be dual categorized as SCI and PCA. Therefore, an SCI placed within a network protected by an ESP arguably would not be subject to CIP-005 R1.1, R1.2, R1.5, or R1.6 despite being a PCA in all but definition.

In addition, Texas RE notes that SCI supporting high and medium impact BCS have fewer network-based protections than high and medium impact BCS. CIP-005 R1.2 is applicable to high and medium impact BCS with ERC. The requirement requires that only needed routable protocol communications are permitted through the ESP. CIP-005 R1.3 is applicable to SCI supporting medium and high impact BCS. The requirement requires that only needed routable protocol communications to and from the Management Interfaces are permitted.

Additionally, Texas RE is concerned there may be means of communicating with SCI outside of the narrow scope of the Management Interface definition. For example, an FTP server would not control the process of initializing, deploying, or configuring SCI. An FTP server is not an autonomous subsystem that provides access to the console independently of the host system's CPU, firmware, or OS. Finally, an FTP server does not configure an ESP. As such, an FTP server running on SCI would be out of scope for CIP-005 R1.3. An FTP server in this scenario could be used to exfiltrate sensitive data, such as the disk images for the BCS that the SCI is hosting. Additionally, since SCI is out of scope for CIP-005 R1.5 entities would not be required to monitor this FTP server for malicious communications between the SCI and other systems. Texas RE suggests this issue would be mitigated by implementing high watermarking practices as described in Texas RE's response in #9.

Lastly, Texas RE continues to be concerned the security objective for CIP-005-6 R1 Part 1.5 is now limited to IP malicious communications with the proposed changes. With the proposed changes this would not only reduce the compliance obligations but also create a gap in security by only focusing IP malicious communications versus all malicious communications.

Likes 0	
Dislikes 0	

Response

Thank you for your response.

The SDT feels the option of mixed trust usage of SCI should be allowed as long as the appropriate protections are in place.

Definitions - The SDT chose to separate SCI from the definitions of CA, VCA, PCA and target separate specific protections on the SCI itself. This ensures the appropriate protections are placed for the applicable CA, VCA and PCA that are running on the applicable SCI, while allowing mixed trust to exist.

R1.1/1.2 - SCI may be utilized to provide network controls for the applicable systems in a zero trust environment, thus making SCI an applicable system would introduce a "hall of mirrors" issue.

R1.3 The requirement language around Management Interface was updated to be more objective.

R1.5 The SDT feels that limiting malicious communications monitoring to IP communications is appropriate. IT is including other internal data center communications currently in use such as high fiber channel SAN cannot be monitored.

R1.5/1.6 The SDT reviewed whether it was appropriate to add SCI to R1.5 or 1.6, however SCI could be used to meet both these requirements, thus a "hall of mirrors" issue would be introduced.

FTP/BCSI - Disk images of applicable systems are considered BCSI and should be protected as such. BCSI storage is currently allowed outside of an ESP. The SDT notes that some issues around FTP could currently exist and are not SCI related. FTP remote user interactive communications are covered by the requirements around IRA and non-user interactive communications are covered under system to system process communications.

4. The SDT revised CIP-007 based on industry comments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.
Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC) 2016-02 Virtualization (Draft 4)

Answer	No
Document Name	

Comment

The SRC agrees with the concept of per system capability.

For Part 1.3, we recommend changing "prevention" to "risk mitigation". "Preventing" is absolute. "Risk mitigation" is flexible.

For Part 4.3, we request adding "security" to "applicable events" for consistency with Parts of R4. Update would read "Retain applicable security event logs identified in Part 4.1 for at least the last 90 consecutive calendar days, per system capability, except under CIP Exceptional Circumstances."

For Part 4.4, please consider rewording this requirement to accommodate entities that use the current SIEM technology which has this type of functionality built-in and no longer requires a manual review of such data sources while also addressing those that do not have this technology.

For Part 5.1 and 5.4, leaving the scope of the term "system" up to the entity, requires effort to supply a definition and document compliance with the definition. This could lead to a misunderstanding of the intent of that term. We recommend that SDT update the technical rationale to include what is meant by "system".

Likes 0	
Dislikes 0	

Response

Thank you for your comment. The SDT updated the wording of the requirement and added more clarification to the technical rationale. Additionally, the terminology was made more consistent and 4.3 was clarified to reflect application security events. The change to 4.4 is out of scope of the SAR for Project 2016-02.

Chris Carnesi - Chris Carnesi On Behalf of: Dennis Sismaet, Northern California Power Agency, 4, 6, 3, 5; Jeremy Lawson, Northern California Power Agency, 4, 6, 3, 5; Michael Whitney, Northern California Power Agency, 4, 6, 3, 5; - Chris Carnesi

Answer	No

No, 1.3 requirement is written more like measure with the word prevent. Would suggest rewording it to "Mitigate VCA's from CPU or memory vulnerabilities that share these resources with other VCA's that are not associated with the same impact categorization." Then prevention could be one of the measures.

David Jendras - Ameren - Ameren Services - 3

Answer	No
Document Name	
Comment	

In R1.1, Ameren believes that the phrase "routable protocol network accessibility" is unclear and there should be more clarity as to what this phrase means. We are concerned an auditor might think of this phrase differently than Ameren does, so we believe more clarity around this phrase will ensure that auditors and Ameren have the same understanding as to what the phrase means.

In R4.3, the phrase "per system capability" was added. Does any paperwork need to be filled out and provided to the regional entity for devices that fall into the "per system capability" classification? For example, paperwork needs to be filled out for TFEs.

For Part 1.3, recommend changing “prevention” to “risk mitigation”. “Preventing” is absolute. “Risk mitigation” is flexible. Perhaps prevention can be moved to the Measures as a suggestion. Request consistent phrasing in CIP-007. There is a mix of “cyber security patch” and “security patch” in the Parts, Requirements, and titles. For Part 4.3, request adding “security” to “applicable events” for consistency with Parts of R4. Update would read “Retain applicable security event logs identified in Part 4.1 for at least the last 90 consecutive calendar days, per system capability, except under CIP Exceptional Circumstances.”

Comment	

Recommend removing EACMS and PACS from the applicability section. If EACMS or PACS were to reside inside an ESP they are also categorized as PCAs so they will be covered. This change will exclude other CAs in a DMZ virtual system that do not perform EACMS or PACS functions and will thus retain the backward compatibility of the standard while allow greater protection for BCAs and PCAs.

Comment	
Chelan believes the proposed language for CIP-007 R1.3 is overly burdensome and the required control does not reflect the actual risk of a VM escape attack. The intended controls (DRS affinity rules) listed in the measures are not intended for security control purposes, but are instead intended for resource control purposes. Because of this and the very broad applicability, they will have overly complex rulesets that introduce reliability risks where, in the event of a failure or during maintenance activities, a crucial VM may not be able to find a suitable host and crash. Given there are few if any demonstrated attacks along this threat axis, this seems to be an overreach. Additionally, this requirement is not backwards compatible with the existing requirements. The currently effective requirements allow the mixing of EACMS and PACS VMs with out-of-scope VMs so long as the hosts themselves are classified as EACMS and PACS. Finally, Chelan believes there is a Low Impact problem in the proposed requirement. The Applicable System is an SCI that hosts High or Medium Impact VCAs, not the actual High or Medium Impact VCAs themselves. The text of the requirement itself does not restrict itself to High and Medium and simply refers to “same impact classification”. If an SCI that hosts High or Medium Impact VCAs also hosts Low Impact BCS, the requirement is on the SCI to prevent sharing of CPU and memory between devices that are not of the same impact categorization, regardless of what that impact categorization might be. Low Impact is a different impact category from no impact, so the requirement would force the SCI to segregate Low Impact VCAs from no impact VCAs. That essentially places a requirement on Low Impact devices to not share CPU and memory with no-impact devices, so long as they are on the same SCI as a High and Medium impact VCA. All that said, Chelan does recognize the risk of a zero day exploit along this vector and therefore, Chelan recommends this requirement should be restricted to BCAs and PCAs, and left EACMS and PACS out, which would be backwards compatible with the existing requirements and guidance. The	

suggested language below would prevent devices that are within the ESP from sharing CPU and memory with devices outside the ESP or in different impact level ESPs. This would accomplish the goal of protecting BES Cyber Systems and would simplify implementation by creating three categories of devices that may not share CPU and memory, rather than potentially six. Chelan suggests the following language for CIP-007 R1.3: Applicable Systems: SCI supporting: High Impact BCS and their associated PCA; Medium Impact BCS and their associated PCA Requirement: Mitigate the risk of CPU or memory vulnerabilities by preventing the sharing of CPU and memory resources, excluding storage resources, between High and Medium Impact BCS and their associated PCA, and VCAs that are not BCS or PCAs of the same impact categorization.

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group	
Answer	No
Document Name	
Comment	
WEC Energy Group does not agree with the proposed edits and retitling of R1. Changing the title of R1 to System Hardening implies the potential for more than just the management/monitoring of ports and services. Although "system hardening" is a best practice, it is at this time self defined and is too broad of a term to be used for CIP-007 R1 and in our opinion beyond the virtualization intent of the Project. Additionally, Part 1.1 implies ports and services in the Requirement, we understand it was rewritten in an attempt to address SCI supporting the Applicable System, however the rewrite is too broad and looses its intent of ports and services. Also note, the Measures for Part 1.1 describes the aspects of ports and services, why not use those same terms (ports and services) in the Requirement itself. Proposing the SDT leaves the title of the R1 as Ports and Services, leave R1 Part 1.1 and Part 1.2 as written and separate the SCI references included in current draft Part 1.3 into its own Requirment or Part. WEC Energy Group can support the proposed edits in R2-R5.

Response	
Thank you for your comments. The reasoning behind the name change is to reflect the security objective of the entries more clearly in the table, which is to reduce a systems' attack surface. The SDT chose to include "SCI supporting an Applicable System in this Part" language in the Applicable Systems column of the requirement to ensure that controls which are applicable to the hardware portion of a physical Cyber Asset would remain applicable to the hardware supporting the Virtual Cyber Assets (VCA) used in applicable BCS, EACMS, PACS or PCA.	
Sean Bodkin - Dominion - Dominion Resources, Inc. - 6, Group Name Dominion	
Answer	No

Comment	
As it pertains to CIP-007 R4.2, the use of the term system in the statement "per system capability" leads to subjectivity. We recommend the use of "per Cyber Asset or BSC capability" as it defines the scope of capability. Additionally, our comment from the last comment period of "If a firewall has VLANs on it for medium and low, or high and low, does that pull low impact network connection into scope because it shares the same firewall?" was not addressed by SDT as far as we know.

Thank you for your comment. The SDT is changing R1.1 so that it can incorporate newer security models, such as zero trust. The addition of R1.3 addresses the possibility of VM escape. Refer to the CIP-007-7 TR for more information	
Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	
Comment	
Southern disagrees with the proposed changes to CIP-007 R1.3 Applicable Systems. Adding EACMS and PACS in both High and Medium Impact BCS increases the requirements for associated virtual assets. Southern agrees that for hypervisors which ALSO host BCS, the scope is appropriate, but for hypervisors that ONLY host EACMS outside of an ESP, with no BCS, it is an “anti-virtualization” incentive to dedicate hypervisors to a domain controller for example. Suggest changing the language to High/Medium Impact BCS and their associated PCA, which will keep this affinity requirement scoped to hypervisors that host BCS and anything else.

Texas RE is concerned the language: “logical network accessible ports… including port ranges or services where needed to handle dynamic ports” was removed. Both ports and services are required to gain a better understanding of where vulnerabilities can exist whether in a physical or virtualized environment. Ports and services are often used for malicious reconnaissance and lateral movement within networks. Registered Entities should understand and document why ports and services are needed for many reasons (defense in depth, zero trust, etc. concepts). Texas RE is concerned the phrase “CPU and memory resources” in CIP-007-7 Requirement R1.3 is written could be interpreted as (CPU and memory) resources or as CPU and (memory resources). Texas RE recommends rewording the sentence so it is clear that the CPU resources and memory resources should not be shared: “the sharing of CPU resources and memory resources.” Additionally, in order to make the language of Requirement 1.3 more consistent with other requirements in CIP-007-7, Texas RE recommends revising the existing language Requirement R1.3 to “Prevent the sharing of CPU resources and memory resources, excluding storage resources, between Virtual Cyber Assets (VCAs) that are not of, or associated with, the same impact categorization.” The technical rationale for this requirement can then explain that the requirement is needed in order to mitigate the risk of CPU or memory vulnerabilities. Lastly, Texas RE noticed inconsistent redlining between the “redline_to_last_approved” and “clean” copies of the standard for CIP-007-7 R4.1. In the “clean” version of the standards the following language, which Texas RE agrees with reads as: Log security events, per system capability, for identification of, and after-the-fact investigations of, Cyber Security Incidents that include, at a minimum, each of the following types of events In the “Redline to Last Approved” version the phrase “and after-the-fact investigations of” has been marked for removal. Texas RE does not agree with removing this phrase from the requirement.

Thank you for your comment. The SDT clarified the wording in 1.3 and 4.1. The phrase "after-the-fact investigations of" has not been removed.	

5. The SDT has used phrasing such as "SCI supporting an Applicable System from this Part" in the Applicable Systems column across many of the standards. Is it clear that this scopes the requirements for SCI to match the system(s) it hosts?	
Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
BPA believes the phrase needs to be more specific. "Supporting" an Applicable System is too broad. BPA proposes adding SCI under the Applicable Systems column in the Requirements/Parts tables, grouping it with each appropriate impact rating similar to the way EACMS, PACS, and PCA are scoped. Additionally, the definitions for EACMS and PACS include SCI so these do not need to be accounted for. Alternatively, since the term "and their associated" is widely used in the standards, replacing the word supporting with "associated with" may be more clear.

Todd Bennett - Associated Electric Cooperative, Inc. - 3, Group Name AECI	
Answer	No
Document Name	
Comment	
"Part" is not a defined term, for additional clarity the drafting team could replace this phrase with "SCI supporting an Applicable System". Lastly, "Applicable System" is used multiple times in the draft CIP standards and is not a defined term or a proposed defined term. The standard drafting team may consider defining this term in the NERC Glossary of Defined Terms.

Xcel Energy believes there is some lack of understanding at our company and throughout the industry on how SCI should be categorized when they are supporting EACMS or PACS and so, Xcel Energy supports the comments of the MRO NSRF. While Xcel Energy supports clarifications, our concerns do not rise to the level of requiring us to vote no on proposed Standards with SCI as an applicable system.

Dislikes 0	
Response	
Thank you for your comments and support. SCI is much like EACMS and PACS in that these categories of Cyber Assets do not technically have a direct impact rating, making their categorization less conducive to ‘high watermarking concepts.’ Where SCI supports EACMS and PACS (and not BCS or PCA), the SCI inherits the requirements for the collective impact ratings of each associated BCS for each of the EACMS and PACS that SCI supports. Registered Entities implementing SCI that supports both EACMS and PACS should approach categorization holistically and apply multiple categorizations and collective coverage of that supporting SCI under all applicable Requirement Parts. Registered Entities run the risk of security/compliance gaps if attempting to ‘high watermark’ to a single categorization where SCI supports both EACMS and PACS associated to varied impact levels of BCS. The applicable requirements are an aggregate of the requirements of the hosted	

Applicable Systems. See the TR for a more comprehensive explanation, including an example of a specific use case.

This is fairly clear. However it would be better to see some verbiage/examples in the technical rationale related to the inclusion of “storage resources required for system functionality of one or more Cyber Assets or VCAs….” found in the second bullet of the SCI definition to limit the scope of applicability. It’s not quite clear what exactly may be pulled into scope by the wording in the second bullet and there may be an unintentional increase in applicability. CIP-007 R1.3 specifically excludes storage resources in the requirement, but in the definition of SCI, the second bullet specifically includes storage resources in the definition of SCI.

Comment

ecommending maintaining the CIP-010-4 requirement to establish and maintain the baseline.

Justification:

While the TR does allude to the use of the baseline configuration as the "how" this requirement can be met, it is followed by stating the entity would be required to document how the baseline meets the stated security objective and references NIST SP 800-128 as a guide.

Throughout NIST SP 800-128 the baseline configuration is referenced as the "secure state", specifically "…*baseline configuration for a system and associated components represents the most secure state consistent with operational requirements and constraints*" (NIST.SP.800-128, Section 2.2.2, pp. 21). Establishment and maintenance of a baseline configuration provides the entity with a secure starting point from which each modification can build upon.

Removing the requirement for a baseline configuration and/or requiring the entity to justify the use of the baseline appears to go against the guidance provided in NIST 800-128.

R1 Response

Part 1.1

R1.1 Document and maintain system configurations (to include at a minimum software addressing the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.)

R1.1.1 Manage changes which alter the system configuration

R1.1.2 Authorize changes to the system configuration

R1.1.3 Validate implementation of changes to the system configuration

Part 1.2

1.2.1. Prior to implementing a change to system configurations from Part 1.1 in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects to ensure that the configuration of required cyber security controls in CIP-005 andCIP-007 remain implemented as required; and

1.2.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.

Part 1.3

For a change that deviates from the existing system configuration, update the system configuration documentation as necessary within 30 calendar days of completing the change.

R2 – Security Configuration Monitoring

Considering the changes made to R1 and the proposal to maintain the baseline configuration documentation requirements the following is a proposed adjustment to R1.

Response

Part 2.1

Methods to monitor at least once every 35 calendar days for unauthorized changes to the system configuration. Document and investigate detected unauthorized changes.

1 – The language used in the requirement, specifically “settings”, will force a significant and increasing administrative burden on the Entities. The control which applies to the requirement for each of the items within CIP-005 and CIP-007 will typically contain a multitude of “settings” which enforces the configuration of the control as a collective. There is a concern that the Entity will be ‘too far in the weeds’ focusing on the numerous settings that contribute to a control thereby diverting attention from the security posture of the environment.

2 – Confirmation after implementation of the authorized/documented change of the controls which enforces the requirement in CIP-005 and CIP-007 ensures the security configuration of the applicable system was not impacted in a manner that would weaken the security posture of the applicable system.

Response

Thank you for your comments. The SDT considered the suggestion to reintroduce the word 'baseline' so R1 would provide clarity on 'how' to meet the requirement using a 'baseline'. It was determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. The SDT also maintains that the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement. To maintain backwards compatibility and provide clarity, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to demonstrate an entity can continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007...", and then require authorization per Requirement R1 Part 1.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance. The TR was reviewed to ensure the baseline part is clear.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC) 2016-02 Virtualization (Draft 4)

Answer	No
Document Name	

Comment

The proposed changes to CIP-010 are SRC's gravest concern as we believe the proposed changes go beyond what was previously in the CIP standards such that they would no longer be backwards compatible. In particular, the addition of the concept of "settings changes" is overly broad; whereas the prior standard focused on changes to the baseline configuration. SRC proposes "settings changes" be modified to "configuration changes" or eliminated altogether.

For consistency, please add the term "Cyber" to security patches.

The SRC requests clarification of Part 1.1 since meeting the Measures may not meet the Objectives. Entity may need to document that baselines (from previously approved Standard) track or show any changes made to applicable CIP-005 and CIP-007 security controls

The SRC requests that consistent language be used when addressing the same subject in different parts of the standard within the Requirements of Parts 1.1 and 1.3. Examples of this include the following:

- *Part 1.1 provides what is included in software*
- *Part 1.3 distinguishes some of 1.1 apart from software*
- *Part 1.1 starts with "Control the implementation of intended changes to software, or intended changes to settings . . ."*
- *Part 1.1 also says "Changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.*
- *Part 1.3 starts with "Prior to the installation of operating systems, firmware, software, or software patches . . ."*

While we recommend that that CIP-010 R1 needs to be left "as is" as changing the requirement may present a greater compliance burden on the entity with a less clear objective/goal. The proposed changes do not increase the level of security that are currently afforded by the existing standard.

For Part 2.1, we recommend this requirement is also left "as is". The proposed requirement is overly burdensome and may require the monitoring of the entire asset, including its filesystem, registry, miscellaneous settings, accounts, etc. and is above and beyond what is currently required with little added security benefit.

Response

Thank you for your comments. The SDT considered comments regarding the potential for confusion, perceived scope increase, or misinterpretation by use of terms like "settings". This phrasing was removed to prevent it from being interpreted as too prescriptive.

The SDT agreed with suggestions to add the word "cyber' in front of "security patches", and updated the term throughout the standards.

Regarding the need for Measures to meet the Objectives and consistency of terms, and when modifying Requirement R1, the SDT focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain a choice for an entity to demonstrate compliance, as well as assure the virtualization components are aligned. The TR was reviewed to ensure the baseline part is clear.

The SDT maintains Project 2016-02 is not just about enabling the CIP Standards for virtualization and opening the toolbox for this option, but rather the intention to remove encumbrances, while maintaining security and backwards compatibility as key objectives. The existing baseline attributes are administratively burdensome and serve as a disincentive to virtualize, even where virtualized solutions may be more secure. Additionally, the existing construct does not lend well to a virtualized environment. The proposed modifications shift the focus from a documentation burden to security value by requiring the authorization of change instead of the update of documentation 30 calendar days after a change. The order of operations may also be different in a virtualized environment, necessitating adjustments to Requirement R1, which seems to prescribe an order of 1) identify security risk, 2) authorize, 3) implement, 4) verify, remediate, reverify. For example, in a virtualized environment using Remediation VLANs, the order might be 1) authorize, 2) identify security risk, 3) remediate and verify, 4) implement; without modifications entities may not be able to use features like Remediation VLANs. The SDT maintains the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement with 'baselines' as one means to achieve the objective. The focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. To maintain backwards compatibility and clarity, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. This demonstrates an entity can continue to use baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement part(s) in CIP-005 or CIP-007...", which changes then require authorization per Requirement R1 Part 1.1, and which changes to high impact BES Cyber Systems and their associated 1. EACMS; and 2. PCA, and SCI supporting an Applicable System in Requirement R2 Part 2.1 are then subject to the monitoring requirements in Requirement R2 Part 2.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance.

Comment

R1.1 The phrase "...could weaken configured cyber security controls.." is very general and expands the original baseline scope widely to include endless settings that could be under the review of an audit.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. The SDT considered your perspective, agrees it carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed this language and refocused Requirement R1 Part 1.1 on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."

Kinte Whitehead - Exelon - 3

Comment

R1.3 – consistency of phrases among the requirements is necessary, For instance, in Requirement 1 part 3, the phrase used is “Prior to installation.” In other sections, however, the phrase used is “prior to the intended change” One of the two phrases should be used throughout.

Request clarification of Part 1.1 since meeting the Measures may not meet the Objectives. Entity may need to document their baselines (from previously approved Standard) when addressing their CIP-005 and CIP-007 security controls.

Part 1.1 provides what is included in software. Part 1.3 distinguishes some of 1.1 apart from software. Part 1.1 starts with “Control the implementation of intended changes to software, or intended changes to settings . . .” Part 1.1 also says “Changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.” Part 1.3 starts with “Prior to the installation of operating systems, firmware, software, or software patches . . .”

For Part 3.3, request clarification on the first Requirement bullet – “Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System.” The term “like replacement” is an undefined term. Does the SDT intend for the entity to define this term? “Configuration of the previous” implies a baseline that was not specified. As written, the entity’s interpretation may be different than the auditor’s.

For Part 3.3, request removing “any” from the first Measures bullet because “any” is a scope concern where “any” is interpreted as “all.”

For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.

Response

Thank you for your comments. The SDT was mindful to assure alignment of terms.

The SDT revisited the Measures when making modifications to Requirement R1 Part 1.1 to assure the Measures meet the Objectives of the requirements as suggested.

Also considered were comments regarding Requirement R3 Part 3.3, the phrasing 'Like replacements', and defining the term. Rather than introduce a new definition, the SDT made modifications to shift the focus on "previously assessed configuration" as the reason why an active vulnerability assessment need not be reperformed. The intent is to require assessments to reduce the risk of introducing vulnerabilities to an existing environment when new Cyber Assets are being implemented, or when failures occur and existing Cyber Assets need to be replaced. The risk is associated with unassessed configurations for these Cyber Assets. A 1-for-1 replacement of an existing Cyber Asset with another, configured like the one being replaced, suggests the security posture is known as a function of the reconstruction process to build the replacement. Since the existing Cyber Asset had been previously assessed, the performance of the requirement part is not warranted. Entities can still choose to define the term ‘like replacements’ within their own programs and processes if the Registered Entity deems that necessary or a value add.

The SDT removed the word "any" from the Measures for Requirement R3 Part 3.3 as requested.

Regarding Requirement R4, Attachment 1, Section 1, Part 1.3 and the risk associated with the new bullet that reads, “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;”, the SDT agrees with the unintended consequence that this may leave a gap where newer software vulnerabilities could exist for an earlier known state that have not been addressed. The bullet was removed in response to this industry concern.

SPP would like to understand how the significant proposed changes in CIP-010-5, specifically Requirement R1, relate to what was requested in the Project 2016-02 SAR. SPP believes that the verbiage related to SCI, containerization, and ESPs between systems with different impact ratings can be added without having to change the way that entities have to comply with CIP-010 today.

The new proposed language greatly expands the scope for CIP-010 and raises concerns for backwards compatibility with existing baseline methods, adds unnecessary complexity, and significantly increases cost with minimal security benefit. The current baseline configuration requirements have been moved to the Measures column along with additional verbiage to address virtualization. However, the control language is very broad and can lead to different interpretations depending on the auditor and uncertainty in tracking changes. Responsible Entities have demonstrated that both physical and virtual systems are capable of developing, documenting, approving, tracking, updating, and monitoring baseline configurations. For these reasons, SPP believes that the prescribed baseline configuration requirements should remain in place with the addition of specific verbiage related to virtual architecture and containerization. The baseline language supports a secure baseline configuration and represents industry best security practices.

The NIST 800-128 guidelines refer to applying the security configuration management practices that include “monitoring the configuration of systems to ensure that configurations are not inadvertently altered from the approved baseline”, thus implying that baseline configuration management is key to securing a system. These guidelines further define a Baseline Configuration as, “A set of specifications for a system, or CI

within a system, that has been formally reviewed and agreed on at a given point in time, and which can be changed only through change control procedures. The baseline configuration is used as a basis for future builds, releases, and/or changes." This definition fits well with the currently approved verbiage in CIP-010-4 where the "set of specifications for a system" was clearly defined for the baseline and approved through change control methods. The baseline is an understanding of what the approved system configuration should be so that there is an understanding of what has changed. According to NIST, the baseline configuration should represent a secure state of the system while also maintaining a "cost-effective and functional support of mission and business processes". The updated control verbiage does not reference a baseline configuration and does not adhere to a cost-effective support of security best practices, therefore creating a risk to demonstrate compliance.

The following proposed language for CIP-010-5, Requirement R1, Part 1.1, could address virtualization while also maximizing backwards compatibility:

Develop a baseline configuration, individually or by group, which shall include the following items:

1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists;

1.1.2. Any commercially available or open-source application software (including version)

intentionally installed including application containers;

1.1.3. Any custom software installed, including application containers;

1.1.4. Configuration that modifies network accessible logical ports or network accessible services on an Applicable System;

1.1.5. Any security patches applied;

1.1.6. SCI configuration of host affinity control between systems with different impact ratings;

1.1.7. Changes to configurations or settings for an ESP between systems with different impact ratings; and

1.1.8. Changes to parent images from which individual child images are derived, such as in virtual desktop infrastructure (VDI) implementations.

Thank you for your comments. The SDT maintains Project 2016-02 is not just about enabling the CIP Standards for virtualization and opening the toolbox for this option, but rather the intention to remove encumbrances, while maintaining security and backwards compatibility as key objectives. The existing baseline attributes are administratively burdensome and serve as a disincentive to virtualize, even where virtualized solutions may be more secure. Additionally, the existing construct does not lend well to a virtualized environment. The proposed modifications shift the focus from a documentation burden to security value by requiring the authorization of change instead of the update of documentation 30 calendar days after a change. The order of operations may also be different in a virtualized environment, requiring adjustments to Requirement R1, which seems to prescribe an order of 1) identify security risk, 2) authorize, 3) implement, 4) verify, remediate, reverify. For example, in a virtualized environment using Remediation VLANs, the order might be 1) authorize, 2) identify security risk, 3) remediate and verify, 4) implement; without modifications entities may not be able to use features like Remediation VLANs. The SDT maintains the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement with 'baselines' as one means to achieve the objective. The SDT determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. To maintain backwards compatibility and clarity, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to demonstrate an entity can continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement part(s) in CIP-005 or CIP-007...", which changes then require authorization per Requirement R1 Part 1.1, and which changes to high impact BES Cyber Systems and their associated 1. EACMS; and 2. PCA, and SCI supporting an Applicable System in Requirement R2 Part 2.1 are then subject to the monitoring requirements in Requirement R2 Part 2.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one an entity can choose to demonstrate compliance. The TR was reviewed to ensure the baseline part is clear, and additional examples of these changes can be found in the TR.

While we appreciate the thoughtful proposal of a less prescriptive requirement for CIP-010, there are many unintended consequences with the expansion of scope in the currently proposed language. The word “settings” scopes too many possible features into CIP-010 that do not necessarily have a compelling security value. Additionally, the concept of a baseline is foundational in NIST SP 800-128 . It is possible to have less prescriptive requirements that advance the intention of CIP-010 and its security objectives,while maintaining true backward compatiability.Here is our alternate proposal that we have worked with Exelon to craft:

R1.1 Document and maintain system configurations (to include at a minimum software addressing the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.)

R1.1.1 Manage changes which alter the system configuration

R1.1.2 Authorize changes to the system configuration

R1.1.3 Validate implementation of changes to the system configuration

R1.2.1. Prior to implementing a change to system configurations from Part 1.1 in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects to ensure that the configuration of required cyber security controls in CIP-005 andCIP-007 remain implemented as required; and *R1.2.2. Document the results of the testing, and if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.* *R1.3 For a change that deviates from the existing system configuration, update the system configuration documentation as necessary within 30 calendar days of completing the change.* *R2.1 Methods to monitor at least once every 35 calendar days for unauthorized changes to the system configuration. Document and investigate detected unauthorized changes.*

Thank you for your comments. Regarding the potential for confusion, or perceived scope increase or misinterpretation by use of terms like "settings", the SDT agreed this would be interpreted as too prescriptive and the phrasing was removed. The SDT considered the suggestion to reintroduce the word 'baseline' so R1 would provide clarity on 'how' to meet the requirement using a 'baseline'. The SDT determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. Additionally, the SDT maintains the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement. To maintain backwards compatibility and clarity, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to demonstrate an entity can continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007...", and which changes then require authorization per Requirement R1 Part 1.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance. The TR was reviewed to ensure the baseline part is clear.

Request clarification of Part 1.1 since meeting the Measures may not meet the Objectives. The entity may need to document its baselines (from previously approved standards) when addressing its CIP-005 and CIP-007 security controls. Request consistent language in the Requirements of Parts 1.1 and 1.3. Part 1.1 provides what is included in the software. Part 1.3 distinguishes some of 1.1 apart from software. Part 1.1 starts with “Control the implementation of intended changes to the software or intended changes to settings . . .” Part 1.1 also says “Changes to the software include the installation, removal, or update of the operating system, firmware, commercial and custom software, and security patches.” Part 1.3 starts with “Prior to the installation of operating systems, firmware, software, or software patches . . .” For Part 3.3, request clarification on the first Requirement bullet – “Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System.” The term “like replacement” is an undefined term. Does the SDT intend for the entity to define this term? “Configuration of the previous” implies a baseline that was not specified. As written, the entity’s interpretation may be different than the auditor’s. For Part 3.3, request removing “any” from the first Measures bullet because any is a scope concern . . . where any is interpreted as “all.” For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.

Thank you for your comments. Regarding the need for Measures to meet the Objectives and consistency of terms, and when modifying Requirement R1, the SDT focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance, as well as to assure the virtualization components are aligned. The TR was reviewed to ensure the baseline part is clear. The SDT made modifications to assure consistent use of terms instead of the use of similar terms like “software patches” and “security patches” to further remove any concerns of unintended nuances from using synonymous terms interchangeably; cyber security patches is now the term used throughout.	

Also considered were comments regarding Requirement R3 Part 3.3, the phrasing 'Like replacements', and defining the term. Rather than introduce a new definition, the SDT made modifications to shift the focus on "previously assessed configuration" as the reason why an active vulnerability assessment need not be reperformed. The intent is to require assessments to reduce the risk of introducing vulnerabilities to an existing environment when new Cyber Assets are being implemented, or when failures occur and existing Cyber Assets need to be replaced. The risk is associated with unassessed configurations for these Cyber Assets. A 1-for-1 replacement of an existing Cyber Asset with another, configured like the one being replaced, suggests the security posture is known as a function of the reconstruction process to build the replacement. Since the existing Cyber Asset had been previously assessed, the performance of the requirement part is not warranted. Entities can still choose to define the term ‘like replacements’ within their own programs and processes if the Registered Entity deems that necessary or a value add. The SDT removed the word "any" from the Measures for Requirement R3 Part 3.3 as requested. Regarding Requirement R4, Attachment 1, Section 1, Part 1.3 and the risk associated with the new bullet that reads, “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;”, the SDT agrees with the unintended consequence that this may leave a gap where newer software vulnerabilities could exist for an earlier known state that have not been addressed. The bullet was removed in response to this industry concern.

BC Hydro appreciates the opportunity to review and offers the following comments: 1. CIP-007 and CIP-005 Standards were modified to explicitly call out specific controls related to SCI (e.g. CIP-007 R1.3 / CIP-005 R1.3) but in CIP-010 R1 it is not written with the same clarity. For example, in CIP-010-3 R1.1 measures provided are not truly applicable to non SCI CIP-007 and CIP-005 controls. Operationally they differ greatly from non-SCI classified assets. Similar to the pattern followed in CIP-005 and CIP-007 changes, BC Hydro proposes to call out in a separate requirement SCI controls that need to be evaluated. 2. The inclusion of the following "... or intended changes to settings that could weaken configured cyber security controls required by CIP005 and CIP-007" makes the Requirement R1.1 of CIP-010-3 unclear. It is indicative that this Requirement will only apply if the change in settings has an effect on the configured CIP-007 and CIP-005 controls. However the expected scope of changes in settings need clear direction and guidance. Some pertinent use case examples and clear direction is needed here.

Thank you for your comments. The SDT focused more on objective type language versus a prescriptive list and does not plan to separate virtualization requirements from the existing requirements at this time. The SDT considered your perspective, agreed it carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed this language and refocused Requirement R1 Part 1.1 on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."	
David Jendras - Ameren - Ameren Services - 3

Thank you for your comments. The SDT believes splitting R1.1 into multiple requirements could potentially create double jeopardy across requirements. However, the Part for verification of security controls was separated from Part 1.1 back into Part 1.4 to regain clarity on required actions that must occur as a part of the change authorized in Part 1.1. The SDT also considered your perspective the terminology "could weaken" carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed the language and refocused the requirement on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."

Concerns regarding backward compatibility. And how compliance on existing practices will be assessed following the proposed change. Specifically how current practices related to “Live operating system and software executable only from read-only Media” can still need the intent of Section 1.3 without subjectivity inherent in the “other mitigation methods” option. Request adding of technical rationale (i.e. the intent of the change) for Attachment 1 Section 1.3. in particular explanation on the bullet that was added, i.e. “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution”. Support comment from NPCC RSC. Reiterated here: “For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.”

For requirement 1.1.2, we suggest to simply write, “Verify the required cyber security controls remain implemented”. There is confusion as to why “…as required as a part of the change” adds to the requirement.

However, the newest version is closer to what is done by industries. Old version address the case when a plan made its own programs in assembly language. Now, it’s more representative of the real world when third-party software executables are buy and install in systems.

1) It is unclear if Management Interface of Cyber System is in scope for CIP-010

Request clarification of Part 1.1 since meeting the Measures may not meet the Objectives. Entity may need to document that their baselines (from previously approved Standard) when addressing their CIP-005 and CIP-007 security controls.

Request consistent language in the Requirements of Parts 1.1 and 1.3. Part 1.1 provides what is included in software. Part 1.3 distinguishes some of 1.1 apart from software. Part 1.1 starts with “Control the implementation of intended changes to software, or intended changes to settings . . .” Part 1.1 also says “Changes to software include the installation, removal, or update of operating system, firmware, commercial and custom software, and security patches.” Part 1.3 starts with “Prior to the installation of operating systems, firmware, software, or software patches . . .”

For Part 3,3, request clarification on the first Requirement bullet – “Like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System.” The term “like replacement” is an undefined term. Does the SDT intend for the entity to define this term. “Configuration of the previous” implies a baseline that was not specified. As written, the entity’s interpretation may be different than the auditor’s.

For Part 3.3, request removing “any” from the first Measures bullet because any is a scope concern . . . where any is interpreted as “all.”

For 1.3 in Attachment 1, recommend changing this new bullet from “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;” to “provide valid mitigation” since there may be newer software vulnerabilities that the earlier state has not addressed.

Thank you for your comment. Regarding Part 1.1.2, and the unintended implication that that entities must verify all “required cyber security controls remain implemented as required”, the SDT separated the requirement for verification of security controls from Part 1.1 back into Part 1.4 to regain clarity on required actions that must occur 'as a part of the change' authorized in Part 1.1, and scoped those verification actions to what was relevant to the changes so a complete compliance check for CIP-005 and CIP-007 is not required.

Yes, the Management Interface of a Cyber System is in scope for CIP-010. CIP-005 contains specific requirements for the controls that must be implemented for a Management Interface where the Glossary term is used within the Requirement or Requirement Part in CIP-005. A Management Interface is a component of a Cyber System, so where changes to the Management Interface's implemented cyber security controls serving the requirements in CIP-005 occur, those changes would be subject to CIP-010 requirements.

The SDT focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance. The SDT agrees the use of "AND" vs "OR" in relation to the terminology "could weaken" carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed this language and refocused Requirement R1 Part 1.1 on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."

Also considered were comments for Requirement R3 Part 3.3, the phrasing 'Like replacements', and defining the term. Rather than introduce a new definition, modifications were made to shift the focus on “previously assessed configuration” as the reason why an active vulnerability assessment need not be reperformed. The intent is to require active vulnerability assessments to reduce the risk of introducing vulnerabilities to an existing environment when new Cyber Assets are being implemented or when failures occur, and existing Cyber Assets need to be replaced. The risk is associated with unassessed configurations for these Cyber Assets. A 1-for-1 replacement of an existing Cyber Asset with another Cyber Asset that has been configured like the one being replaced suggests the security posture is known as a function of the reconstruction process to build the replacement, and because the existing Cyber Asset had been previously assessed, thereby not warranting the performance of the requirement part. Entities can still choose to define the term ‘like replacements’ within their own programs and processes if the Registered Entity deems that necessary or a value add. The word "any" was removed from the measure per your comment.

Regarding Requirement R4, Attachment 1, Section 1, Part 1.3 and the risk associated with the new bullet that reads “Controls that maintain the state of the operating system and software such that it is in a known state prior to execution;”, the SDT agrees this may leave a gap where newer software vulnerabilities could exist for an earlier known state that have not been addressed. This bullet was removed in response to this industry concern.

Comment	

In the proposed language, the term “could weaken” as it applies to changes requiring configuration management controls is vague and, as undefined, leaves the determination unsupported by existing definitions. GSOC suggests either substituting “alters” or adding “ . . . as determined by the responsible entity”. As proposed, change management controls would only need to be utilized for a type of change that undermines existing security and not for all changes.

Additionally, as proposed, the language of 1.1.2 could subject the responsible entity to double jeopardy violationof CIP-010 as well as the underlying violations of CIP-005 and CIP-007.. Additionally, as written, every control must be reviewed for every applicable change regardless of whether it is technical, procedural, or impacted by the change. GSOC recommends the removal of 1.1.2 as a separate requirement and inclusion in measures.

AEP appreciates SDT’’s efforts in making requirements more clear. However, AEP does not support R1.2 and R2.1 and states recommendations below. • **R 1.2.1**: SDT added **“the configuration of”** as in “…where the test is performed in a manner that minimizes adverse effects to ensure **that the configuration of** required cyber security controls in CIP-005 and CIP-007 reamin implemented as required”. AEP suggests removing this added language as it is too prescriptive. • **R2.1**: AEP questions the statement "*unauthorized changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007*" and recommend SDT to revert the requirement languages as proposed in Draft #3, i.e., “Methods to monitor for unauthorized changes at least once every 35 calendar days. Document and investigate detected unauthorized changes.”.

Response	
Thank you for your comments. The SDT agrees with your comments about the prescriptive nature of the language "the configuration of" in proposed Part 1.2.2 and removed that language. The SDT agrees the terminology "could weaken" carried unintended consequences and did not appropriately scope Requirement R2 Part2.1. The SDT removed this language and refocused Requirement R2 Part 2.1 on methods to monitor for "...unauthorized changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement part CIP-007, as defined by the Responsible Entity."

R1-Removing baseline configuration does not change what needs to be done in practice. Entities will still need to retain a baseline configuration as evidence from which to establish the changes that were authorized. · For Part 1.1 an entity will still need to show the baseline configuration prior to the change to show required cyber security controls in CIP-005 and CIP-007 are not adversely affected. · For Part 2.1 an entity will still need to provide baseline configurations for evidence that they monitor at least once every 35 calendar days for unauthorized changes to the items listed Parts 1.1 and 1.2. For R3-the concern is that Remediation VLANs should be properly defined in the technical rational or Glossary as it may introduce situations where an entity could inadvertently place production Cyber Assets in this VLAN.

Response	
Thank you for your comments. The SDT agrees entities will need a means to demonstrate changes that alter the behavior of one or more cyber security controls serving one or more requirement parts in CIP-005 or CIP-007 were authorized in accordance with Requirement R1 Part 1.1, and maintaining a baseline is one method an entity can choose to demonstrate their practices. The SDT considered your comments regarding Remediation VLANs and reviewed TR related to this functionality. The SDT did not create a new Glossary of Terms definition.

In large part, the proposed changes are fine. However, there is an implication by virtue of the new veribiage and removal of “baseline configurations” that additional configuration items (outside of the original “baseline configuration”) need to be included within change management. Such additional configuration items are not explicitly included in the Measures section, thus leaving this aspect of the requirement wholly subjective. Additionally, the third bullet on slide 39 from the Project 2016-02 Webinar seems to implicitly add a documentation requirement for the analysis/comparison of baseline configurations to security controls. This ask is not in the requirement. Including it in the Webinar presentation empowers Regional auditors to ask for evidence of requirements that are not included in the standard or measures sections.

Thank you for your comments. The SDT considered the suggestion to reintroduce the word 'baseline' so R1 would provide clarity on 'how' to meet the requirement using a 'baseline'. The SDT determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. Additionally, the SDT maintains the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement. To maintain backwards compatibility, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to add clarity that an entity can continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007...", and which changes then require authorization per Requirement R1 Part 1.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way how an entity can choose to demonstrate compliance. The SDT reviewed TR based on comments provided to ensure the baseline part is clear and understood. Lastly, the SDT agrees Requirement R1 does NOT include a documentation requirement for the analysis/comparison of baseline configurations to security controls.

AWS agrees with changes to CIP-010 R1, R2, and R3. However, AWS remains concerned that CIP-010 R4 does not address security risks associated with virtual machines (VM) hosted on physical Transient Cyber Assets (TCAs) because the standard language states that a VM running on a physical TCA can be treated as software. We acknowledge the SDT response to the previous comments in the consideration of comments, but we still see security risks and have provided our previous comment below for context.

The Standard allows an entity to choose one or a combination of security controls that may not extend cyber security protections to the VM itself leaving VMs potentially vulnerable to security threats undetected by the physical host. We propose removing the language “Virtual machines hosted on a physical TCA can be treated as software on that physical TCA” from the TCA definition. By removing this language, entities would be required to apply security controls to the virtual machines hosted on their physical TCAs in alignment with CIP-010 R4.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. The SDT considered your concerns and concluded that a VM on a TCA would be considered software on the TCA and subject to Requirement R4, Attachment 1 from that perspective. Additional information can be found in the TR.

Gail Golden - Entergy - Entergy Services, Inc. - 5

Comment

The current phrasing of Part 1.1.2 implies that entities must verify all “required cyber security controls remain implemented as required” for any change to software or security settings even if the change itself does not impact a certain control (e.g. a windows patch typically doesn’t modify an ESP/EAP for CIP-005, updating a FW Policy does not impact CIP-007 R2, etc.). This new language removes entities abilities to identify potential impacts and verify/test those impacts as allowed by the in-effect standard and the previous revision. Entergy is concerned that this language as written would require entities an undue burden to re-verify non-impacted controls for every change. While the Measures section implies that an entity has latitude to identify which cyber security controls should be verified (“ a list of cyber security controls verified”) this is not clearly aligned with the language of the standard.

Entergy recommends adding clarifying language to CIP-010 R1 Part 1.1 that entities verify potentially impacted cyber security controls, such as “Verify the required cyber security controls ***identified by the Responsible Entity that could be weakened*** remain implemented as required as part of the

change.” This would allow entities to focus verification efforts on potentially impacted controls based on the nature of the change, instead of a one-size fits all approach of re-verifying every CIP-005 and CIP-007 control for every change.

Response	
Thank you for your comments. Regarding Part 1.1.2 and the unintended implication that that entities must verify all “required cyber security controls remain implemented as required”, the SDT separated the requirement for verification of security controls from Part 1.1 back into Part 1.4 to regain clarity on required actions that must occur as a part of the change authorized in Part 1.1 and scoped those verification actions to what was relevant to the changes so a complete compliance check of CIP-005 and CIP-007 is not required. The SDT agrees the terminology "could weaken" carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed this language and refocused Requirement R1 Part 1.1 on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."

Comment

CIP-010 R2.1 as written would require an audit of every setting that could impact a CIP-005 or CIP-007 security control every 35 calendar days on High Impact devices. For some devices, this could be hundreds of individual settings, and Cyber Assets may not provide these settings in a way that audit of those settings could be automated. This would also effectively be a baseline configuration, though a more rigorous one than required by the currently effective requirements, as each setting would have a “baseline” to ensure the effectiveness of the security control it implements.

Chelan finds it difficult to develop a requirement that accomplishes the same security objective CIP-010 R2.1 of auditing that unauthorized changes have not occurred without the development of a baseline configuration to compare against. By definition, auditing changes requires you to have a known good state, essentially a baseline configuration. If the SDT wishes to eliminate baseline configurations, it should eliminate the periodic monitoring for unauthorized changes, or change the security objective.

Dislikes 0	

Response

Thank you for your comments. The SDT agrees there is potential for confusion, or perceived scope increase or misinterpretation by use of terms like "settings" would be interpreted as too prescriptive, so this phrasing was removed.

After careful consideration, the SDT chose not to reintroduce the word 'baseline', and chose to keep the monitoring component in Requirement R2 by providing greater clarity on the scope and objectives of each requirement. The prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement with 'baselines' as one means to achieve the objective. The focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. To maintain backwards compatibility, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to add clarity that an entity can choose to continue using baselines as the method to determine which changes "...alter the behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007..." require authorization per Requirement R1 Part 1.1. Changes to high impact BES Cyber Systems and their associated 1. EACMS; and 2. PCA, and SCI supporting an Applicable System in Requirement R2 Part 2.1 are then subject to the monitoring requirements in Requirement R2 Part 2.1. The SDT focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance. The TR was reviewed to ensure the baseline part is clear. Additionally, The SDT refocused Requirement R2 Part 2.1 on methods to monitor for "...unauthorized changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement part CIP-007, as defined by the Responsible Entity." to further ensure this requirement is not misinterpreted as a mini audit of CIP-005 and CIP-007.

Christine Kane - WEC Energy Group, Inc. - 3, Group Name WEC Energy Group

Answer	No

Comment

Similar to the MRO-NSRFs response, WEC Energy Group wishes to bring attention to the added phrase in CIP-010 Requirement 1 Part R1.1, "…or intended changes to settings that could weaken configured cyber security controls required by CIP005 and CIP-007." We also would raise concerns with the current proposed Measures for R1.1.

This language raises questions. On applicable systems, are entities expected to authorize/monitor for both software changes AND settings that could weaken cyber security controls. Or does the 'or' indicate that choosing one of those would fulfill the obligations? For instance, consider a password change on a service account/agent which unintentionally breaks logging capabilities on an unspecified BCA. While an entity would be in violation of CIP-007 R4, with this new CIP-010 language, would the password change constitute a "change to settings" which weakened a CIP-007 control (R4.2) and therefore have been required to navigate the change management process? Would simply changing an applicable password from 10 characters to 9 characters constitute a weakening of CIP-005/CIP-007 cyber security controls?

There are many configuration changes that currently don't affect one of the baseline items but could be considered in scope in the new version of the standard (for example, modification of anti-virus settings or any configuration settings on a firewall). This addition, combined with one of the statements made during the September 12, 2022 webinar that entities may have more compliance work to perform under the revised CIP-010, indicates that the scope of change management is broadened under the proposed revisions. This directly contradicts other statements that have

stressed how the revisions are to be backwards compatible. The idea being that any entity that is in compliance today with current technologies and processes will be compliant under the revised standards, even if they do not seek to employ or utilize virtualization technologies. We recommend the SDT to revisit the proposed CIP-010 R1.1 language and undertake any further revision needed to ensure that the scope of CIP-010 R1 is not expanded any more than necessary. One recommendation would be to separate both R1.1 into two parts, one addressing BCAs only, which would mirror existing CIP-010-3 R1.1 language, and one addressing SCI specifically which would further clarify “settings” (this would also necessitate splitting the proposed R2.1 into two different requirements as well). Secondly, it seems that there continues to be confusion in the industry over whether or not to baseline and what are the best methods by which to demonstrate compliance with CIP-010 R1.1. We note that, while the Measures for R1.1 are quite lengthy, all the detail is about what the “documented process” should address or include, without suggesting examples of what the documented process could actually be documented as. We approve of providing options for entities to comply with CIP-010 R1.1 without necessarily having to maintain and demonstrate a documented baseline but it’s also true that many utilities wish to continue using precisely that approach for their compliance – yet the word baseline is missing entirely from the Measures section of CIP-010 R1.1. We understand that “documented process” that includes the various items listed implies a baseline, but there is no reason we see not to just then come out and say “baseline” is an example of an acceptable option.

Comment	
The new proposed wording is challenging to navigate and subjective. For example, what does it mean to weaken the configured cybersecurity controls and settings? We recommend changing CIP-010 R1.1 back to the previous wording, and restore previous requirement parts through R2.1, and add “SCI supporting an Applicable System in this Part”. This change is out of scope to support virtualization other than adding SCI to the applicability column. The proposed changes do nothing to support virtualization but do add significant ambiguity to the requirement. Also, a baseline MUST be established if there is going to be a requirement to monitor for unauthorized changes.

The MRO NSRF wish to bring attention to the added phrase in CIP-010 Requirement 1 Part R1.1, "…or intended changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007." The MRO NSRF also would raise concerns with the current proposed Measures for R1.1.
This language raises questions. On applicable systems, are entities expected to authorize/monitor for both software changes AND settings that could weaken cyber security controls. or does the 'or' indicate that choosing one of those would fulfill the obligations? For instance, consider a password change on a service account/agent which unintentionally breaks logging capabilities on an unspecified BCA. While an entity would be in violation of CIP-007 R4, with this new CIP-010 language, would the password change constitute a "change to settings" which weakened a CIP-007 control (R4.2) and therefore have been required to navigate the change management process? Would simply changing an applicable password from 10 characters to 9 characters constitute a weakening of CIP-005/CIP-007 cyber security controls?
There are many configuration changes that currently don't affect one of the baseline items but could be considered in scope in the new version of the standard (for example, modification of anti-virus settings or any configuration settings on a firewall). This addition, combined with one of the statements made during the September 12, 2022 webinar that entities may have more compliance work to perform under the revised CIP-010, indicates that the scope of change management is broadened under the proposed revisions. This flies in the face of other statements that have stressed how the revisions are to be backwards compatible and that any entity that is in compliance today with current technologies and processes will be compliant under the revised standards even if they do not seek to employ or utilize virtualization technologies.

Secondly, it seems that there continues to be confusion in the industry over whether or not to baseline and what are the best methods by which to demonstrate compliance with CIP-010 R1.1. The MRO NSRF note that, while the Measures for R1.1 are quite lengthy, all the detail is about what the "documented process" should address or include, without suggesting examples of what the documented process could actually be documented as. The MRO NSRF approve of providing options for entities to comply with CIP-010 R1.1 without necessarily having to maintain and demonstrate a documented baseline but it's also true that many utilities wish to continue using precisely that approach for their compliance – yet the word baseline is missing entirely from the Measures section of CIP-010 R1.1. The MRO NSRF understand that "documented process" that includes the various items listed implies a baseline, but there is no reason the MRO NSRF see not to just then come out and say "baseline" is an example of an acceptable option.

The MRO NSRF recommend that the first paragraph of R1.1 Requirement be rewritten to read, "Control the implementation of intended changes to Applicable Systems that could weaken configured cyber security controls required by CIP-005 and CIP-007." The MRO NSRF also recommend the inclusion of the word "baseline" as an example in the R1.1 Measures of a type of documented process that Registered Entities may employ to

demonstrate their compliance with R1.1. Alternatively, if this recommendation is not acceptable, then some other change in verbiage that provides Entities the option of either continuing to comply using current baseline and baseline deviation tracking methods, or allowing a different approach per the new requirement and measure language, to ensure for the allowance of backward compatibility.

In Measures to revised R1.1.2, the only example given of a tool used to verify required security controls [required by CIP-005 and CIP-007] remain implemented is a vulnerability scanner. It is unlikely that this will be the tool used to verify these controls, and that guidance may be misleading to Regional Entity auditors. It is more likely that a configuration management database will be used to verify that software is installed and that controls	

such as listening ports, disabled accounts, password controls, antimalware settings, and applied security patches are unchanged. CEHE recommends that the SDT add "configuration management database" as an example in the Measures in R1.1.2.

In R3.3, the exception for replacement of the same type of Cyber System with a configuration of the previous or other existing Cyber System should be revised to include additions of the same type, not only replacements. An example is adding a console from an identical known good image as existing consoles. This is not a replacement, but from a security and reliability perspective, has the same effect. Language should be revised to say "Like replacements or additions of the same type of Cyber System with a configuration of the previous or other existing Cyber System".

Response

Thank you for your comments. The SDT chose to split Requirement R1 Part 1.1.2 back out into Part 1.4 and made modifications to enable virtualization. The measures were rewritten to align with the reinstated Part 1.4.

The SDT agrees and made modifications to shift the focus on "previously assessed configuration" as the reason why an active vulnerability assessment need not be reperformed.

Comment	
We still have concerns on CIP-010-5 because the draft does not include the Guidelines and Technical Basis section where it defines what must be included in a vulnerability assessment. It is understood that the Standards Drafting team emphasizes backwards compatibility, but, the proposed	

changes to CIP-007 R1 and CIP-010 R1.1 could affect what is required in the vulnerability assessments. At the very least, we would like to know and comment on what additional items will be required for SCI in a vulnerability assessment as there is nothing found in the current proposed changes. Lastly, under CIP-010 R3.3 BES Cyber System is shortened to BCS. However, this is different than the other parts of CIP-010 R3. We recommend consistency.

Response	
Thank you for your comments. The reinstatement of Guidelines and Technical Basis (GTB) is out of scope for the project 2016-02 SAR. The Technical Rationale Transition Plan to revise the Reliability Standards template to eliminate the GTB section and allow for the creation of a separate document containing the TR was endorsed by the NERC Standards Committee on January 17, 2018. The use of the term “guideline” in GTB has created confusion for some stakeholders on the use of information in this section for guidance in developing compliance approaches, and the TR for Reliability Standards team was formed to clarify the intended use of information in this section, and to address that confusion. The purpose of this project was to further clarify the principles, development, and use of GTB (historically) and TR. The ERO continues to assess compliance based on the language of the Reliability Standard and the facts and circumstances presented. With the enactment of the Compliance Guidance Policy, it appears helpful to further clarify the distinction between Implementation Guidance and GTB (or TR, as explained below). GTB should focus on TR that assists technical understanding of a requirement and/or Reliability Standard. GTB should not include compliance examples or compliance language. Such information, if needed, should be developed as Implementation Guidance under the Compliance Guidance Policy. As a result, the SDT established a separate TR document. Any Implementation Guidance proposed by the SDT must go through the ERO endorsement process. Additionally, the SDT took another pass through the draft to assure consistency with the use of the acronym BCS for BES Cyber System throughout.

Southern disagrees with Part 1.1 Requirements that includes the phrase “settings that could weaken cyber security controls required by CIP-005 and CIP-007”. Southern finds this phrase overly broad, questioning if full compliance could ever be proven out of the universe of “settings” (registry settings, configuration paramenters, per application settings, etc.). Added to the complexity of knowing all settings is the phrase “could weaken” adding in the idea of ‘potential’ to this already elusive scope. Southern suggests the SDT reconsider the concept used in draft 3 of the entity defining the higher level types of changes they have in their change management programs. In addition, to provide further clarity of scope, Southern suggests the SDT go through CIP-005 and CIP-007 and list the areas that should be under CIP-010 change management. Since these requirements are the same for every entity, that list should be the same for every entity.

The SDT agrees the terminology "could weaken" carried unintended consequences and did not appropriately scope Requirement R1. The SDT removed this language and refocused Requirement R1 Part 1.1 on authorization for "...changes that alter the behavior of one or more cyber security controls, excluding procedural and physical controls, serving one or more requirement parts in CIP-005 or CIP-007, as defined by the Responsible Entity."

The language “…changes to settings that could weaken configured cyber security controls required by CIP-005 and CIP-007” is subjective. There could be any number of “settings” that “could weaken” the security controls. Can guidance be given such as some exapmples of these settings that could be	

used to weaken the security controls? Also, is “software patches” synonymous with “security patches” or are these two (2) different entities of their own?

We feel using “could” in parts of CIP-010-5 is very subjective and is not necessary. Further the measures uses “may” instead of “could”. A change either does or doesn’t affect cybersecurity controls required by CIP-005 and CIP-007. We are fine with the language, but feel it would be cleaner and less ambiguous without “could”.

Dislikes 0	
Response	
Thank you for your comments. The SDT agrees the requirement language must be clear and unambiguous as to ‘what’ is required and removed the word "could". The SDT chose to keep the word "may" within the Measures because the data in this column is intended to provide examples of possible ways an entity can demonstrate compliance, but it is not the only way nor is it a requirement. The flexibility of 'how' through the use of "may" in the Measures is appropriate.

Response

Thank you for your comments. The SDT agrees the potential for confusion, perceived scope increase or misinterpretation by use of terms like "settings" would be interpreted as too prescriptive, so this phrasing was removed.

Dwanique Spiller - Berkshire Hathaway - NV Energy - 5

Answer	Yes
Document Name	

Comment

NV Energy supports the revisions for CIP-010-5, but harbors some concern regarding unclear language in Requirement R1, subpart 1.1. The word "settings" does not enjoy the same clarifying language as does the word "software". We believe this creates a risk for unpredicatble interpretation without any additional technical rationale defining the intent of the word. NV Energy suggests "settings" receive a definition complementary to "software" to better assist entities reach compliance, but ultimately feels the language in its current state is workable although not ideal.

AZPS agrees with the proposed changes to CIP-010 but feel the following "weaken" statement introduced in part R1.1, without an official definition, leads to uncertainty and lack of clarity around the items that may fall into change management. This will result in re-examination of existing systems and baselining methodologies that threaten the intended backwards compatibility of the new requirements. In addition, we agree with EEI stance that which “settings” are in scope requires additional clarification.

Comment

Texas RE continues to be concerned security obligations will be reduced by removing an explicit requirement for Registered Entities to create and maintain baseline configuration documentation.

Establishing and maintaining baseline configurations represent best practices for system hardening. Texas RE recommends adhering to NIST Special Publication 800-53 (Rev. 5), CM-2 Baseline Configuration, which states, “Maintaining baseline configurations requires creating new baselines as organizational information systems change over time. Baseline configurations of information systems reflect the current enterprise architecture.”

NIST Special Publication 800-53 (Rev. 5) provides additional information, such as using tools to track version numbers on operating systems, applications, types of software installed, and current patch levels in order to maintain the currency, completeness, accuracy, and availability of the baseline configurations of systems. This is information that is currently captured within existing baseline documentation requirements.

If the drafting team has concerns that maintaining baseline documentation of dynamic VMs is not technically feasible, Texas RE suggests adding the verbiage “per system capability” to CIP-010 R1’s baseline requirements. Registered Entities have demonstrated that the vast majority of systems, both physical and virtual, are capable of having baseline documentation created, tracked, and updated as necessary. As such, this requirement should remain in place for those systems where it is technically feasible to perform this industry best security practice.

Dislikes 0

Response

Thank you for your comments. The SDT determined the focus of the requirements should remain at an objective level of 'what' is required, instead of getting into 'how'. The SDT maintains the prescriptive 'baseline' concept defeats the key objective to enable the standards for virtualization through greater flexibility in the requirement. To maintain backwards compatibility, the SDT introduced the terminology, "as defined by the Responsible Entity." within Requirement R1 Part 1.1. to confirm an entity can continue using baselines as the method to determine which changes "...alter the

behavior of one or more cyber security controls... ...serving one or more requirement parts in CIP-005 or CIP-007...", then require authorization per Requirement R1 Part 1.1. The SDT also focused on aligning the Measures by mapping the updated concept to the former 'baseline' attributes to further demonstrate 'baselines' remain one way an entity can choose to demonstrate compliance. The TR was reviewed TR to ensure the baseline part is clear.

NST disagrees with proposed changes to CIP-003 and CIP-011 due to the fact proposed changes go beyond conforming changes.

NST disagrees with proposed changes to CIP-009, as omitting SCI from all Requirements and Parts except for R1 Part 1.5 it would establish “implied requirements,” as discussed in our comments on Question 9, below. NST acknowledges that in some recovery situations, it might only be necessary to recover a virtual BES Cyber System and not its supporting SCI. However, given that failure or destruction of an SCI could, in some scenarios, wipe out an entire Control Center, NST believes that inclusion of SCI in a Responsible Entity’s recovery plan(s) should be mandatory rather than a suggested best practice.

NST agrees with proposed conforming changes to CIP-004, CIP-006, CIP-008 and CIP-013.

Dislikes 0	
Response	
Thank you for your comments. CIP-009's focus is to ensure that the BCS can be recovered. An Entity can choose to recover that functionality of the BVCS in any manner that restores that functionality, potentially without the use of SCI, even if the original BCS included the use of SCI. Additionally, the majority of organizations making use of virtualization today will choose the All-In model where the underlay is classed as a part of the BCS itself. In this instance the underlay (not technically SCI) would be subject to the recovery requirements.

Since the Glossary modifications are the foundation to all Standard changes, NERC should seek approval of the new terms prior to any changes being introduced in the Standards to reduce potential misunderstanding or misinterpretation of both the new definitions and modified Standards. This will also allow NERC, and industry, time to determine additional courses of action, reduce confusion, and reduce additional risk associated with such wholesale changes.

Response	
Thank you for your comment. The SDT disagrees as many will not vote to approve terms (particularly technology terms) and definitions in a vacuum with no context as to how those definitions will be used. At times terms are created to match the requirements, such as IRA. Many may say that the IRA definition is too restrictive. However it is defined so that it matches scenarios where the CIP-005 R2 requirements can be met without affecting functionality or reliability of systems.

Response	
Thank you for your comments. The scope of CIP-003 Requirement 2 applies to all Sections of Attachment 1, so the scope has been changed to include SCI as a conforming change. CIP-003 Attachment 1 references to the bullet that started with "Controls that maintain the state of the operating system and software such that..." have been removed. This option did not perform the security objective that it was designed to fulfill. The SDT chose to modify the Applicable Systems found in CIP-004 R2 through R6 to include references to Medium impact BCS with IRA in order to align the CIP-004 requirements with the new definition of IRA which includes electronic access without ERC.	

The SDT chose not to modify the "per system capability" statement in CIP-006 R1 Part 1.3. The burden is now to document that the system is truly not capable, and if so, the Entity is not forced to perform the requirement. However, it does not offer a get-out-of-jail option. The burden is on the entity to prove that the system is not capable as a system. If a component can be replaced within the system in order to perform the required function, then the system is capable. The SDT asserts that CIP-011 R1.2 & R2.1 represent different control sets on different targets. R1 targets the BCSI associated with the Applicable Systems, and R2 targets the Applicable Systems themselves. The SDT included a reference to the applicable systems from R1 within the CIP-013 R 1.2.5 Requirement Part to provide additional clarity.

For CIP-003, Attachment 1, Section 4, request confirmation that, while this Section has no updates, this Section's scope is being expanded because of changes to the definitions of Cyber Security Incident and Reportable Cyber Security Incident .

For CIP-003, Attachment 1, 5.1, request clarification of the new bullet which says "Controls that maintain the state of the operating system and software such that they are in a known state prior to execution that mitigates the risk of introduction of malicious code;" The language should be clarified to explain the word "execution" (i.e., on execution of what?) Perhaps "execution" should be changed to "entity use".

For CIP-004, R5 request confirmation that entities should re-evaluate serial connections because they may now be in scope for incidents due to the updated definitions of IRA and ERC.

For CIP-006, Part 1.3 consider changing from "per system capability" because "per system capability" is an inadvertent "get-out-of-jail free card.

For CIP-011, the double jeopardy between R2 and Part 1.2 should be clarified.

For CIP-013, Part 1.2.5 consider including the mention of the applicable systems referenced in R1. This update avoids audit scope creep. The use of the word "all" in the new language is of concern. The new Part 1.2.5 says " Verification of software integrity and authenticity of all software and patches provided by the vendor . . ." The R1 applicable systems language is "for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), and Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI)." The scope should be "applicable systems," not all software and patches by the vendor.

Response

Thank you for your comments. The scope of CIP-003 Requirement 2 applies to all Sections of Attachment 1, so the scope has been changed to include SCI as a conforming change.

CIP-003 Attachment 1 references to the bullet that started with "Controls that maintain the state of the operating system and software such that..." have been removed. This option did not perform the security objective that it was designed to fulfill.

The SDT chose to modify the Applicable Systems found in CIP-004 R2 through R6 to include references to Medium impact BCS with IRA in order to align the CIP-004 requirements with the new definition of IRA which includes electronic access without ERC.

The SDT chose not to modify the "per system capability" statement in CIP-006 R1 Part 1.3. The burden is now to document that the system is truly not capable, and if so, the Entity is not forced to perform the requirement. However, it does not offer a get-out-of-jail option. The burden is on the entity to prove that the system is not capable, as a system. If a component can be replaced within the system in order to perform the required function, then the system is capable.

The SDT asserts that CIP-011 R1.2 & R2.1 represent different control sets on different targets. R1 targets the BCSI associated with the Applicable Systems, and R2 targets the Applicable Systems themselves.

The SDT included a reference to the applicable systems from R1 within the CIP-013 R 1.2.5 Requirement Part to provide additional clarity.

Answer	No
Document Name	

Comment

For CIP-006, Part 1.3, consider changing from "per system capability" to "if technically feasible" because "per system capability" is an inadvertent get-out-of-jail.

For CIP-011, the SRC requests clarification on the double jeopardy between R2 and Part 1.2. Both sections apply to the handling and use of BCSI. If you violate R2, you will have mishandled or misused R1.2.

*For CIP-013, Part 1.2.5, consider including the mention of the applicable systems referenced in R1. This update avoids audit scope creep. Concerned with "all" in the new language. The new Part 1.2.5 says " Verification of software integrity and authenticity of all software and patches provided by the vendor . . ." The R1 applicable systems language is "for high and medium impact BCS and their associated Electronic Access Control or Monitoring Systems (EACMS), and Physical Access Control Systems (PACS), and Shared Cyber Infrastructure (SCI)." We suggest that the scope should be "applicable systems," not **"all"** software and patches by the vendor.*

For the proposed CIP-008, the Applicability would include, "An Electronic Access Control or Monitoring System of a high or medium impact BES Cyber System; or Shared Cyber Infrastructure supporting a BES Cyber System." Note that by a literal reading of this, an SCI supporting EACMS would not be in scope for CIP-008 whereas a traditional EACMS would be.

(1) The proposed language in in CIP-006-7, R1, Part 1.3, points to system capability, but there are concerns with situations where the PACS is capable, but there is a limitation with a particular physical access device. It seems as thought that may present a gap in the proposed language. As an example, an entity currently has a TFE for a limited physical access device where two factor cannot be applied, such as a roof hatch where it is not possible to install a locking mechanism controlled by the PACS system. Under the approved TFE, additional measures are taken to secure that physical access point. The concern with the proposed language is that the roof hatch may be seen as a physical access device rather than a system. In this instance, the PACS is capable of two-factor authentication, but two-factor authentication cannot be applied to that particular physical access device. Because of this potential and unintended gap, we recommend using the language “per system or device capability.” **(2) For CIP 009-7, Requirement R1, Part 1.1, please consider adding the language SCI supporting an Applicable System” in the Applicable Systems column**.

Response	
Thank you for your comment. CIP-006 R1.3 has been discussed extensively, and the SDT position is that the per system capability does apply at the system level, and the system is capable in the instance you present. However, there are components of the system that may not be, and the intent is to enforce the additional authentication method wherever components of the system support this capability.	

CIP-009's focus is to ensure that the BCS can be recovered. An Entity can choose to recover that functionality of the BCS in any manner that restores that functionality, potentially without the use of SCI, even if the original BCS included the use of SCI. Additionally, the majority of organizations making use of virtualization today will choose the All-In model where the underlay is classed as a part of the BCS itself. In this instance the underlay (not technically SCI) would be subject to the recovery requirements.

8. The SDT has revised the Implementation Plan to include 3 defined early adoption dates as options should Responsible Entities choose to do so. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

Lynn Goldstein - PNM Resources - Public Service Company of New Mexico - 1,3	
Answer	No
Document Name	
Comment	
PNMR believes early adoption of the revised CIP standards and definitions is beneficial but proposes that Responsible Entities are not tied to only three early adoption choices (6, 12, or 18 months) after approval of the new standards. PNMR proposes that Responsible Entities still follow notifying their Regional Entities of their early adoption choice within fifteen calendar days of making that decision, but that Responsible Entities have the ability to early adopt at any time between 6 months and 24 months. If, for example, a Responsible Entity is not able to early adopt at the 6-month mark but would be able to 8 months after the approval of the new standards, the Responsible Entity should be able to early adopt and not have to wait an additional 4 months until the 12-month mark. An alternate proposal would be for the Responsible Entity to notify the Regional Entity of its 6, 12, or 18-month early adoption date but have the ability to change its early adoption date if it is realized before the agreed-upon early adoption date that the Responsible Entity would not be able to be compliant with the new standards by that date. In this case, the Responsible Entity could move its early adoption from 6 months to 12 months, for example.

Response	
Thank you for your comment. The implementation plan allows for 3 specific early adoption dates that will be set to ensure that all entities are being held to the same date to reduce any confusion that may occur during any audits that may cross those periods. The SDT will add a clarifying note in the implementation plan.	
Sean Bodkin - Dominion - Dominion Resources, Inc. - 6, Group Name Dominion	
Answer	No
Document Name	

Comment	
With the implementation of compliance oversight plans (COP)s, many entities, particularlylarger entities, are experiencing more frequent audits. 36 months may be more appropriate for an implmentation period based on the scope of the changes being proposed under this project.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The SDT asserts that the existing 24 month time period is sufficient while considering the level of the backward compatible language that exists for most requirements. No changes were made to this longstanding portion of the language. It will carry forward from previously and currently approved versions of the implementation plan.

Texas RE continues to be concerned there is conflicting language in the planned changes section of the implementation plan, as well as language in the unplanned changes section in the proposed implementation plan that could result in a reliability gap.

Regarding the conflicting language addressing planned changes, Texas RE notes that the second paragraph in the proposed implementation plan states: "For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-7, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change, and must, therefore, be in compliance with the CIP Cyber Security Standards upon the commissioning of the modernized transmission substation."

Texas RE understands this language to mean the BCS at the substation must be compliant upon the commissioning of the substation. Texas RE agrees with this position.

However, the first and third paragraphs in the proposed implementation plan appears to conflict with this reading. Specifically, the first paragraph states: "Planned changes refer to any changes of the electric system or BES Cyber System which were planned and implemented by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2." Furthermore, the proposed implementation plan's third paragraph states: "For planned changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the CIP Cyber Security Standards on the update of the identification and categorization of the affected BES Cyber System and any applicable and associated Physical Access Control Systems, Electronic Access Control and Monitoring Systems and Protected Cyber Assets, with additional time to comply for requirements in the same manner as those timelines specified in the section Initial Performance of Certain Periodic Requirements of the CIP-002-7 Implementation Plan."

Texas RE understands this language to mean the BCS at the substation is not required to be compliant until the Registered Entity has performed its annual assessment under CIP-002 R2. This introduces a reliability gap as assets that were commissioned shortly after the entity has completed a CIP-002 R2 evaluation will not be required to be evaluated for up to 15 calendar months, and therefore would not be required to be compliant with the applicable cyber security requirements. Texas RE does not agree with this position. Additionally, there are no requirements to identify PACS, EACMS, or PCAs.

Regarding the proposed implementation plan's concerning unplanned changes, Texas RE is concerned the language could be read to result in a reliability gap. Specifically, the first paragraph of the implementation plan states "Unplanned changes refer to any changes of the electric system or BES Cyber System which were not planned by the Responsible Entity and subsequently identified through the annual assessment under CIP-002-7, Requirement R2." Texas RE notes that while it is true that during a CIP-002 R2 review an entity may discover that a BCS now meets a higher BCS threshold than it previously held, this is not the only situation in which an entity may become aware of the need for a higher categorization. For example, if an entity is informed by their RC, PC, or TP that an asset is critical to the derivation of an IROL then the knowledge that the systems must meet the medium impact criteria is immediate and as such the 12-month timer to implement medium impact controls should begin immediately. As written, the language in the implementation plan could result in a situation where a Registered Entity could delay the implementation of medium impact controls at such a substation or power plant for up to 27 calendar months, if the IROL notification arrived immediately after a CIP-002 R2 evaluation. Texas RE recommends the SDT revise the proposed implementation plan language around "unplanned changes" to preclude this result.

Response	
Thank you for your comments. No changes have been made to this longstanding portion of the language. It will carry forward from previously and currently approved versions of the implementation plan. These changes are considered out of scope for the current 2016-02 project as it relates to Virtualization, IRA, or the remaining V5TAG items.	

9. Please provide any additional comments for the standard drafting team to consider, if desired.

NST disagrees with the SDT decision to not compel Responsible Entities to identify and maintain a list of SCI that support BES Cyber Systems in CIP-002. In order to demonstrate compliance with various CIP-003 – CIP-013 requirements for SCI, a Responsible Entity would surely have to demonstrate that all its SCI were accounted for. NST is aware of the fact there is no existing CIP requirement to maintain an inventory of “associated” devices including PCAs, EACMS, and PACS, but doing so was some years ago memorably characterized by a well-known representative of a Regional Entity as an "implied requirement." NST believes an SDT goal should be to avoid adding to the list of "implied requirements."

NST believes the proposed “Exemption” statement in every CIP Standard, 4.2.3.3, “Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an Electronic Security Perimeter (ESP) that extends to one or more geographic locations” is both confusing and inaccurate. One provides for the confidentiality and integrity of data, not ESPs. N&ST suggests rewording that’s consistent with the language of proposed CIP-005 Requirement R1 Part 1.4, such as “Cyber Systems associated with communication links used to span a single ESP among two or more geographic locations.”

NST notes the second of two proposed "Measures" for CIP-007 R1 Part 1.3 suggests evidence of compliance with the "non-sharing" of SCI CPU and memory requirement could include "Hardware partitioning of physical Cyber Assets." If our understanding of "hardware partitioning" is correct (that it means, for example, all the Medium Impact BCS that co-reside with High Impact BCS on a single hardware platform are moved to different hardware), then according to the proposed definition of SCI, the end result of "hardware partitioning" would be one or more hardware platforms that are no longer SCI, which would render all proposed requirements for SCI, including CIP-007 R1 Part 1.3, inoperable.

Response

Thank you for your comments. Project 2021-03 Group B will look into the inclusion of the identification and maintenance of a list of SCI (and EACMS, PACS, and PCAs) that support BES Cyber Systems.

Exemption 4.2.3.3 intends to exclude the devices that may not be owned/operated by the Registered Entity, but carry the data between relevant locations which are all treated as a single ESP. This is necessary because the entity may have no ability to perform the required controls for these assets that would otherwise be considered in the same ESP as an applicable BCS. The control objective of the associated CIP-005 R1 Requirement is to ensure that this exclusion does not compromise the integrity or confidentiality of the data that traverses this link.

The Measures of CIP-007 R1 Part 1.3 second bullet inclusion of "Hardware Partitioning of physical Cyber Assets" may result in an entity creating an architecture that does not meet the new definition of SCI. It was included to cover the capabilities that systems like LPARs bring to the virtualization discussion, which offer advanced hardware partitioning capabilities initially implemented in the mainframe environment.

We still have concerns on CIP-010-5 because the draft does not include the Guidelines and Technical Basis section where it defines what must be included in a vulnerability assessment. It is understood that the Standards Drafting team emphasizes backwards compatibility, but, the proposed changes to CIP-007 R1 and CIP-010 R1.1 could affect what is required in the vulnerability assessments. At the very least, we would like to know and comment on what additional items will be required for SCI in a vulnerability assessment as there is nothing found in the current proposed changes.

Lastly, under CIP-010 R3.3 BES Cyber System is shortened to BCS. However, this is different than the other parts of CIP-010 R3. We recommend consistency.

Response

Thank you for your comments.

The SDT investigated the option of re-introducing the guidance from the previous GTB section of CIP-010-3. This guidance section is in a CIP-010-4 Implementation Guidance document that was been submitted to the ERO for endorsement by the Project 2019-03 Drafting Team: https://www.nerc.com/pa/Stand/Project201903_Cyber%20Security%20Supply%20Chain%20Risks/2019-03_CIP-010-4_Implementation_Guidance_Redline_07282020.pdf

The SDT also addressed the inconsistency of acronym use within the Applicable Systems column within the Standard.

Although not directly revised in this draft, two issues in CIP-007 deserve mention. Requirement 3.3 obstructs smooth updates of antimalware signatures with large administrative cost and compliance risk, for very little, if any, reliability benefit, and is actually impossible with many automated systems today. The requirement should be revised to remove the testing of signatures. Additionally, CIP-007 R5 language inherited from earlier versions requiring at least 8 character passwords is outdated. SIGE suggests requiring at least 15 character passwords, where capable.

The proposed revised definition for EACMS would add the phrase, “Shared Cyber Infrastructure (SCI)” to the definition. The term “SCI” can refer to a system that is supporting PACS or EACMS. If the definition is read in terms of this type of SCI as it pertains to the EACMS definition, that opens the possibility that the scope of an EACMS could be read as applicable to Cyber Assets that perform electronic access control or monitoring of SCI “EACMS/PACS,” thus potentially creating a hall of mirrors effect. The MRO NSRF are not certain how probable or not such an interpretation may be,	

but prefer that this be addressed here rather than when it's too late to do so. The MRO NSRF ask that the SDT consider this issue and make any edits necessary to address.

The use of the terms routable protocol communications, bi-directional routable protocol connection and IP Protocol communications, throughout the standards and the definitions is inconsistent and should be evaluated to determine the necessity of using this different language. If providing the	

consistency through the standards is not an option, it would be better to put these into the definitions so that entities can differentiate one from the other.

The language in CIP-010 R1.1 appears to be getting further away from acceptable language with each iteration of the requirement. Moving requirements to the Measures column does not make the changes any more security objective focused.

Same comments for CIP-005 R1.2 in that the requirements to document a reason for routable protocol communications should be in the Requirements and not the Measures. Examples of the justification/reason are fine in the Measures, but the requirements should be in the Requirements column.

Likes 0	
Dislikes 0	

Response

Thank you for your comments.

The SDT was intentional in each use of the communications phrases, as each has a distinct implementation and impact based on the language used. There are some modifications to language in the applicable Requirements that may provide more clarity to the intended use. Additionally, the definition of IRA has been updated to include “bi-directional” in the latest draft as a result of this input. The SDT included this after determining that the concept was no longer included by way of the reliance on the External Routable Connectivity definition and is an integral part of Interactivity.

CIP-010 was the main focus of the Draft 5 changes, and working through the appropriate scoping of the change management processes was a key part of this. The SDT asserts that with the recent changes, the scoping is now at a valuable level to include those items that it should, and avoid those items appropriately. This language was drafted using input from many entities through outreach efforts and discussions with Trade Groups.

Thank you for your input on CIP-005 R1 Part 1.2. The SDT modified the Requirement language to clarify the need to include the reason for granting access.

WEC Energy Group is in agreement with the MRO NSRFs comment - "We also wish to raise attention to the proposed change of using the phrase “per system capability,” in place of the previous phrasing “where technically feasible.” While we do not wish for TFE to remain part of the compliance

paradigm any longer than necessary, we seek assurance that the phrase “per system capability” will indeed be used as an avenue for Registered Entities to demonstrate compliance instead of an opportunity for auditors to find fault with acceptable security and reliability practices."	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. See response to MRO NSRF. The concept of "per system capability" is not new. See CIP-007-6 R4 Part 4.1 references to "per BES Cyber System" and "per Cyber Asset capability". The use remains the same, and the burden is on the Entity to document that the system is not capable of performing the required function, the same way the use is mentioned above from CIP-007-6 R4 Part 4.1.

Chelan asks the SDT to consider the real risks and the goals of the CIP standards. CIP has always been about the protection of BES Cyber Assets/Systems and reducing the risk of a compromise or failure of a BES Cyber System which would adversely impact the BES. By definition, BES Cyber Systems are systems that will have direct impact on the BES, so it makes sense to protect those devices most stringently. Protected Cyber Assets also represent a significant risk since there is no network separation between PCAs and their associated BES Cyber System. A VM escape attack executed against a BES Cyber System would be a single exploit to potentially adversely impact the BES. However, EACMS and PACS devices do not have a direct impact on the reliability of the BES, and are segregated from BES Cyber Systems and Protected Cyber Assets by protections required by CIP-005. A successful VM escape against a EACMS or PACS device would require a second attack for there to be an adverse impact to the BES. The new affinity requirements increase both the risk of an adverse impact, by reducing the availability of the in-scope VMs and increase the risk of non-compliance, by forcing the use of a control not meant for this purpose. The requirements proposed essentially create six groups of devices that potentially may not share CPU or memory: 1) High Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)	

2) High Impact EACMS/PACS (outside the ESP)

3) Medium Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)

4) Medium Impact EACMS/PACS (outside the ESP)

5) Potentially Low Impact BCS

6) Out-of-Scope Devices

This means that a RE would have to establish up to 6 separate resource pools to comply with the definition of PCA and the text of CIP-007 R1.3. Assuming you can group devices in the affinity rule sets you create (this may not be possible on all platforms), this would require 15 separate anti-affinity rules, in addition any existing rules required for resource management purposes.

With the updated language suggested in Question 4, there would only be 3 resource pools needed:

1) High Impact BCS/PCAs (including EACMS and PACS classified as PCAs, excluding Intermediate Systems

2) Medium Impact BCS/PCA (including EACMS and PACS classified as PCAs, excluding Intermediate Systems)

3) All other devices.

Only 3 anti-affinity rules are needed here to satisfy the suggested requirements. This greatly reduces the complexity of the DRS rules needed to satisfy the security objective to protect the BES from the threat of VM escape attacks and decreases the risk of that a BES Cyber System is unable to find a host to run in the event of a failure of one or more SCI hosts.

Dislikes 0	

Response

Thank you for your comments.

The SDT made changes to the affinity requirements with the intent to create two pools of resources that should not cross where mixed trust exists without high watermarking. Specifically, resources associated with High or Medium Impact BCS or their associated EACMS, PACS or PCA, would be in one pool and Low Impact BCS and non-CIP systems would be in another resource pool. This should simplify the implementation, while maintaining the security benefit that isolating our most critical systems from those less trusted.

The SDT is clear that this project SAR focuses on on-premise virtualization, however, many virtualization concepts convey use of cloud. AWS suggests explicitly stating whether these new terms/requirements, specifically SCI, will apply to cloud or not. If these terms/requirements do not apply to cloud, it should be obvious to the reader.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The SAR does not include an overall look at CIP standards for situations where Cyber Systems are owned/operated by non-registered entities. The SDT is simply defining what SCI is. There is a possibility the definition will apply to infrastructure not owned/operated by the registered entity, when the Standards are modified to provide for this capability in the future.	
Lindsey Mannion - ReliabilityFirst - 10	
Answer	

Document Name	
Comment	

Conflating support for both High-, Medium-, and Low-Impact Cyber Assets within a single Virtualization Cluster will create additional questions and interpretations between Responsible Entities and ERO Enterprise staff. Clusters by their very nature include pools of shared SCI to include CPU, Memory, Disk, and network resources that are shared between all Cluster members to allow for balancing resources, recovery from failed hardware, and maintaining high availability. The complexity required to balance these pooled resources using affinity rules or logical boundaries to disallow different impact levels of VM guests from running on the same physical resources could be high. Moving VM guests can take place without the need for clustering and would allow for segregated siloing of different impact Cyber Assets without the requirement of determining high-water marking every time a VM guest is moved. Communications play a key role in determining the current health and configuration of clusters – especially with heartbeats and SCSI data requests. Responsible Entities have a high bar to assure that these communications are not to the point that they create common networking connections that would start to include additional VM Guests as PCA.

Marrying both ESP and zero-trust within an overall ESP would better serve our Responsible Entities and create a more secure environment as zero-trust Cyber Assets would not be internet-facing while simplifying the management of the environment. Maintaining the ESP, and fully incorporating virtualization and zero trust paradigms within an identified ESP allows Responsible Entities to leverage another layer of defense (defense-in-depth) for BCS by limiting ingress/egress points and access to these Cyber Assets.

Response

Thank you for your comments.

The SDT made changes to the affinity requirements with the intent to create two pools of resources that should not cross where mixed trust exists without high watermarking. Specifically, resources associated with High or Medium Impact BCS or their associated EACMS, PACS or PCA, would be in one pool and Low Impact BCS and non-CIP systems would be in another resource pool. This should simplify the implementation, while maintaining the security benefit that isolating our most critical systems from those less trusted.

The current definition and requirement language in Draft 5 is meant to allow both the old boundary based ESP and modern zero-trust architectures, without precluding one or the other. Requiring a boundary based ESP is counter to zero-trust, since it is applied as close to the affected processes as possible, and everywhere there is an enforcement point in between.

Todd Bennett – Associated Electric Cooperative, Inc. – 3, Group Name AECI

"Responsible Entity" is used multiple times in the CIP standards and is not a defined term or a proposed defined term. The standard drafting team may consider defining this term in the NERC Glossary of Defined Terms. AECI supports the efforts and commitment of the standards drafting team to 296industry when soliciting feedback and proposing solutions to identified gaps in the draft standards.

Texas RE recommends clear and concise language on the categorization and impact rating the hosting virtualization infrastructure should have. Specifically, Texas RE recommends eliminating the Shared Cyber Infrastructure definition. Virtualization infrastructure should inherit the highest impact rating and categorizations of the VCAs that the virtualization infrastructure is hosting. For example, if virtualization infrastructure is hosting two high impact BCS, three PCAs associated with high impact BCS, and an EACMS associated with high impact BCS, then the virtualization	

infrastructure should be categorized as a high impact BCS. Implementing high watermarking practices would ensure that the virtualization infrastructure is more reliable and secure. Texas RE continues to note that no matter how many controls are applied there will always be a parent and child relationship between host and VM's. If the hypervisor is compromised, then all VM's can be. Additionally, if a VM is compromised the same can be true, other VM's and the Hypervisor can be impacted. The Hypervisor should be high watermarked to whatever VMs are on it. Any VMs on the hypervisor should also be marked at the highest impact rating. Different applicable systems with varying impact level lends itself to mixed-trust concepts. This change potential opens the door to allow more corporate based systems (payroll, custom software, etc.) to be on the same hypervisor as CIP applicable systems. CPU and memory segregation only may not protect from vulnerabilities such as hyperjacking, VM escape, Denial of Service, etc.

Thank you for your comments. The Applicable Systems insertion of "SCI supporting an Applicable System in this Part" enforces a High Watermark for the SCI itself. This SCI statement is cascaded throughout the CIP Standards with only a few exceptions, where the requirement language does not support the inclusion. If there are significant deviations in treatment which do not support this, the SDT would like to be made aware of them.

It is unclear in the draft CIP-002-7 how the classification hierarchy is impacted. What is the hierarchy of the SCI classification? Is dual classification with SCI expected??	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. See the CIP-002 TR and Definitions Rationale for how the hierarchy is applied to SCI. In essence this is applied through the inclusion of "SCI supporting an Applicable System in this Part".

LCRA would like to seek clarification regarding virtualization of EACMS outside of an ESP. If the host has in-scope EACMS as well as out of scope virtualized machines, would the same rules apply as SCI within a the ESP? There would be SCI associated with an EACMS. There would be an EACMS that is a virtual machine. Are affinity rules the only compliance obligation associated with the out of scope VM?	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Referring to the Applicable System column within the CIP Standards where the phrase "SCI supporting an Applicable System in this Part" exists and an SCI supports an EACMS associated with either the HIBCS, or some form of MIBCS, the requirements apply to both the EACMS and SCI that support it. This applies to the Affinity requirement as well as Applicable Systems, not the out of scope VM. However, applying an affinity rule to Applicable VMs would enforce an anti-affinity rule for out of scope VMs by practice.

In future postings, for definitions, it would be helpful if the table for the definitions could include each standard where the definition appears. *In closing, SRC reiterates that our gravest concern is with proposed changes to CIP-010, Part 1.1 and Part 2.1 which do away with the concept of "baseline changes." The proposed language of "settings changes" goes beyond what was previously in the CIP standards such that we believe they are no longer backwards compatible. SRC proposes "settings changes" be modified to "configuration changes" or eliminated altogether.* *Additionally, the SRC would like for the SDT to consider that the standards process has taken very long and there are newer technologies that are not being addressed with these changes.*

Response	
Thank you for your comments. The Definitions Table has been modified to include references to where the definition is used. The language of CIP-010 R1 was the main focus of the Draft 5 changes. See the revised language which makes use of the "configuration changes" concept.

Agenda Item 6
Standards Committee
October 19, 2022

Project 2016-02 Modifications to CIP Standards

Action

Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2016-02 Modifications to CIP Standards:

- Additional formal comment and ballot period(s) reduced from 45 days to as few as 20 calendar days with ballot(s) conducted during the last 5 days of the comment period. (Sections 4.9 and 4.12)
- Final ballot period reduced from 10 days to as few as 5 calendar days. (Section 4.9)

Background

Section 16.0 of the SPM allows the Standards Committee to waive any provision in the SPM for good cause, including for the following reason:

> *Where the Standards Committee determines that a modification to a proposed Reliability Standard or its Requirement(s), a modification to a defined term, a modification to an Interpretation, or a modification to a Variance has already been vetted by the industry through the standards development process or is so insubstantial that developing the modification through the processes contained in this manual will add significant time delay.*

NERC Project 2016-02 Modifications to CIP Standards has completed four ballots to date. Each ballot consisted of CIP-002 through CIP-011 and CIP-013 Reliability Standards, the associated definitions for inclusion in the *NERC Glossary of Terms used in Reliability Standards*, and the associated Implementation Plan. Prior to these formal comment periods, the Standard Drafting Team (SDT) conducted significant informal outreach since the inception of the project to gather industry feedback.

Given the stage of development and the content of the comments, the SDT anticipates only making targeted revisions based on comments received over the course of these comment periods. As such, the future proposed changes will have received significant vetting through the comment periods and informal outreach by the team and the waivers will permit the SDT and industry to complete this project without further delay.

As background, the initial comment period and ballot was conducted January 22 – March 22, 2021, which failed to achieve the necessary consensus for approval. The second comment period and ballot was conducted from June 30 – September 1, 2021, which similarly failed to achieve the necessary consensus for approval. The third comment period and ballot was conducted from February 18 – April 12, 2022, in which CIP-002, CIP-003, CIP-004, CIP-006, CIP-008, CIP-009, CIP-011, and CIP-013 passed ballot and CIP-005, CIP-007, and CIP-010 failed ballot. The fourth comment period and ballot was conducted from August 17 – October 7, 2022, in which CIP-002, CIP-003, CIP-004, CIP-006, CIP-007, CIP-008, CIP-009, CIP-011, and CIP-013 passed ballot and CIP-005 and CIP-010 failed ballot.

Minutes
Standards Committee Meeting

October 19, 2022 | 1:00—3:00 p.m. Eastern

Amy Casuscelli, chair, called to order the meeting of the Standards Committee (SC or the Committee) on October 19 at 1:00 p.m. Eastern. A. Oswald, secretary, called roll and determined the meeting had quorum. The SC member attendance and proxy sheets are attached as Attachment 1.

NERC Antitrust Compliance Guidelines and Public Announcement
The Committee secretary called attention to the NERC Antitrust Compliance Guidelines and the public meeting notice and directed questions to NERC's General Counsel, Sonia C. Mendonça.

Introduction and Chair's Remarks
Amy Casuscelli welcomed the committee, guests, and proxies to the meeting. S. Kelly remarked that the NERC Board of Trustees has an open meeting on October 26, 2022 to consider the draft cold weather standards from Project 2021-07. In addition, the Board of Trustees is seeking policy input on the standards process improvements to help streamline the pace of development without sacrificing ANSI standards for open development.

Review October 19, 2022 Agenda (agenda item 1)
The committee approved the October 19 meeting agenda.

Consent Agenda (agenda item 2)
The committee approved the September 21, 2022 SC Meeting Minutes.

Projects Under Development (agenda item 3)
C. Yeung reviewed the Project Tracking Spreadsheet. L. Harkness reviewed the Projected Posting Schedule.

Project 2021-06 Modifications to IRO-010 and TOP-003 (agenda item 4)
J. Mallory provided an overview. S. Rueckert made a motion to authorize initial posting of proposed Reliability Standards IRO-010-5 and TOP-003-6 and the associated Implementation Plan for a 45-day formal comment period, with ballot pool formed in the first 30 days, and parallel initial ballots and non-binding polls on the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs), conducted during the last 10 days of the comment period.

The committee approved the motion with no objections or abstentions.

Project 2021-02 Modifications to VAR-002-4.1 (agenda item 5)
L. Harkness provided an overview. P. Winston made a motion to authorize initial posting of proposed Reliability Standard VAR-002-5 and the associated Implementation Plan for a 45-day formal comment

period, with ballot pool formed in the first 30 days, and parallel initial ballot and non-binding polls for the Violation Risk Factors and Violation Severity Levels, conducted during the last 10 days of the comment period.

The committee approved the motion with no objections or abstentions.

Project 2016-02 Modifications to CIP Standards (agenda item 6)
L. Harkness provided an overview. S. Rueckert stated that the reduced final ballot could end on a weekend. L. Harkness stated that NERC staff does not allow ballots to end on a weekend and if the schedule fell like that it would be extended to end the following week. L. Oelker asked what the need was for the reduced comment periods. L. Harkness stated that this project has had four ballots with an improved approval rate on each ballot with much industry vetting. The team is making targeted changes based on industry feedback and therefore NERC believes that industry could review those changes in a shorter time period allowing the project to complete and allocate NERC and industry resources to other projects. C. Yeung and P. Winston state that they do not see this explanation as a reason to shorten the comment and ballot periods as stated in the waiver. J. Johnson stated a concern that a shortened comment period could actually result in more negative votes. M. Jones stated he shared these concerns, but thinks the SC should trust the team and NERC developers as this is the course of action that is being recommended. He also states he does not believe that the team would go as low as a 20-day comment period but advocates for approving the waiver and letting the team make that decision. P. Winston stated he could support a reduced additional comment and ballot period, but does not support the reduced final ballot period. P Winston made a motion to approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2016-02 Modifications to CIP Standards: additional formal comment and ballot period(s) reduced from 45 days to no less than 20 calendar days with ballot(s) conducted during the last 10 days of the comment period. M. Hostler stated his primary concern is with CIP-010 and asked what changes are going to be made to that standard. In addition, he asked if final ballots for the standards would occur together or separate. L. Harkness stated that each standard has been balloted individually thus far and they will continue to be balloted individually for final ballot. In addition she stated that the changes being made to CIP-010 by the drafting team are a technical issue and not a subject the SC should be discussing. M. Hostler asks if this waiver will shorten the time the drafting team has to do revisions to prepare for the next comment and ballot. L. Harkness stated it will not.

The committee approved the motion. J. Johnson objected and C. Yeung abstained.

2023-2024 Term Elections (agenda item 7)
A. Oswald notified the committee that the nomination period for the 2023-2024 SC term elections are currently open. Anyone interested in submitting a nomination should do so before the end of the of the nomination period.

Registered Ballot Body Update (agenda item 8)
M. Hecht provided an overview on the changes to the Registered Ballot Body.

Legal Update and Upcoming Standards Filings (agenda item 9)
M. Hecht provided the legal update regarding recent and upcoming filings.

Adjournment

A. Casuscelli adjourned the meeting at 1:55 p.m. Eastern.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	November 2023
Board adoption	December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled “Project 2016-02 Draft 5 Definitions”.

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-10

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. Balancing Authority

    4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-10:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;

1.2.6. Vendor electronic remote access security controls; and

1.2.7. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that

include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with mandatory and enforceable Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not address one of the nine topics required by Requirement R1. Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

Version	Date	Action	Change Tracking
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
9	11/16/2022	Adopted by the NERC Board of Trustees.	Revisions to address NERC Board Resolution and the Supply Chain Report
9	3/16/2023	FERC Order issued approving CIP-003-9. Docket No. RD23-3-000.	
9	3/22/2023	Effective Date	April 1, 2026
10	TBD	Modified by Project 2016-02	

Attachment 1

Required Sections for Cyber Security Plan(s)

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, and (2) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. Between:

- a low impact BCS; or
- An SCI that supports a low impact BCS

and a Cyber System(s) outside the asset containing:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or SCI that supports a low impact BCS; and

iii. not used for time-sensitive communications of Protection Systems.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or SCI that supports a low impact BCS, per system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

6.3 One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s)

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact BCS within the asset; and
  b. The Cyber System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets, the routable protocol communication as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communications are used for time-sensitive communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).
2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process

documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. <u>TCA and Removable Media Malicious Code Risk Mitigation</u>:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity’s acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
   - steps to preauthorize access;
   - alerts generated by vendor log on;
   - session monitoring;
   - security information management logging alerts;
   - time-of-need session initiation;
   - session recording;
   - system logs; or
   - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
   - disabling vendor electronic remote access user or system accounts;
   - disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
   - disabling communications protocols (such as IP) used for systems which establish and/or maintain vendor electronic remote access;

    - Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
    - administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
    - other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:
    - Anti-malware technologies;
    - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
    - Automated or manual log reviews;
    - alerting; or
    - other operational, procedural, or technical controls.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	November 2023
Board adoption	December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled "Project 2016-02 Draft 5 Definitions".

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-10

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. Balancing Authority

    4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-10:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates: See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;

1.2.6. Vendor electronic remote access security controls; and

1.2.7. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that

include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with mandatory and enforceable Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not address one of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager	The Responsible Entity did not address two of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 16 calendar months but did complete this review in less than or equal to 17 calendar months of the previous review. Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

Version	Date	Action	Change Tracking
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
9	11/16/2022	Adopted by the NERC Board of Trustees.	Revisions to address NERC Board Resolution and the Supply Chain Report
9	3/16/2023	FERC Order issued approving CIP-003-9. Docket No. RD23-3-000.	
9	3/22/2023	Effective Date	April 1, 2026
10	TBD	Modified by Project 2016-02	

Attachment 1

Required Sections for Cyber Security Plan(s)

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, and (2) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. Between:

- a low impact BCS; or
- An SCI that supports a low impact BCS

and a Cyber System(s) outside the asset containing:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or SCI that supports a low impact BCS; and

iii. not used for time-sensitive communications of Protection Systems.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or SCI that supports a low impact BCS, per system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

6.3 One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s)

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact BCS within the asset; and
  b. The Cyber System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets, the routable protocol communication as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communications are used for time-sensitive communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).
2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process

documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity’s acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
    - steps to preauthorize access;
    - alerts generated by vendor log on;
    - session monitoring;
    - security information management logging alerts;
    - time-of-need session initiation;
    - session recording;
    - system logs; or
    - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
    - disabling vendor electronic remote access user or system accounts;
    - disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
    - disabling communications protocols (such as IP) used for systems which establish and/or maintain vendor electronic remote access;

  - Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
  - administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
  - other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:
    - Anti-malware technologies;
    - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
    - Automated or manual log reviews;
    - alerting; or
    - other operational, procedural, or technical controls.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~fourth~~fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – ~~September 30~~October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	~~October 2022~~November 2023
Board adoption	~~November 2022~~December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled “Project 2016-02 Draft ~~4~~5 Definitions”.

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-~~Y~~10

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. Balancing Authority

    4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.
~~All BES Facilities.~~

4.2.3. Exemptions: The following are exempt from Standard CIP-003-~~Y~~10:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links~~,~~ between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;~~ and~~

1.2.6. Vendor electronic remote access security controls; and

~~**1.2.6.**~~**1.2.7.** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that

include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with mandatory and enforceable Reliability Standards~~ in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-~~Y~~10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not address one of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager	The Responsible Entity did not address two of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 within 16 calendar months but did complete this review in less than or equal to 17 calendar months of the previous review. Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

Version	Date	Action	Change Tracking
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
9	11/16/2022	Adopted by the NERC Board of Trustees.	Revisions to address NERC Board Resolution and the Supply Chain Report
9	3/16/2023	FERC Order issued approving CIP-003-9. Docket No. RD23-3-000.	
9	3/22/2023	Effective Date	April 1, 2026
10	TBD	Modified by Project 2016-02	

Attachment 1

Required Sections for Cyber Security Plan(s)

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, and (2) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. Between:

- a low impact BCS; or
- An SCI that supports a low impact BCS

and a Cyber System(s) outside the asset containing:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or SCI that supports a low impact BCS; and

iii. not used for time-sensitive communications of Protection Systems.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or SCI that supports a low impact BCS, per system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For ~~TTCA~~TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- ~~Controls that maintain the state of the operating system and software such that they are in a known state prior to execution that mitigates the risk of introduction of malicious code;~~
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;

- ~~Review of controls that maintain the state of the operating system and software such that they are in a known state prior to execution that mitigates the risk of introduction of malicious code;~~
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

6.3 One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s)

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
    a. The asset, if any, or the locations of the low impact BCS within the asset; and
    b. The Cyber System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets, the routable protocol communication as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communications are used for time-sensitive communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).
2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process

documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, ~~controls to maintain the known good state of the OS and software,~~ application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of ~~controls to maintain the known good state of the OS and software, or~~ system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the

party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
   - steps to preauthorize access;
   - alerts generated by vendor log on;
   - session monitoring;
   - security information management logging alerts;
   - time-of-need session initiation;
   - session recording;
   - system logs; or
   - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
   - disabling vendor electronic remote access user or system accounts;
   - disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
   - disabling communications protocols (such as IP) used for

systems which establish and/or maintain vendor electronic remote access;

- Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
- administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
- other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:

   - Anti-malware technologies;
   - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
   - Automated or manual log reviews;
   - alerting; or
   - other operational, procedural, or technical controls.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	November 2023
Board adoption	December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled “Project 2016-02 Draft 5 Definitions”.

A. Introduction

1. **Title:** Cyber Security — Security Management Controls
2. **Number:** CIP-003~~-9~~-10
3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).
4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

~~**1.1.**~~

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003~~-9~~-10:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (~~ESPs~~ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3.~~4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~5.~~ **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan ~~for CIP-003-9~~

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact ~~BES Cyber Systems~~BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of ~~BES Cyber Systems~~BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for ~~BES Cyber Systems~~BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact ~~BES Cyber Systems~~BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation;

1.2.6. Vendor electronic remote access security controls; and

1.2.7. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP~~-~~-002 containing low impact ~~BES Cyber Systems~~BCS shall implement one or more documented cyber security plan(s) for its low impact ~~BES Cyber Systems~~ BCS, and Shared Cyber Infrastructure (SCI) that supports a low impact BCS, that include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact ~~BES Cyber Systems~~BCS or their BES Cyber Assets (BCA) is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with ~~the NERC~~mandatory and enforceable Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non~~-~~-compliant, it shall keep information related to the non~~-~~-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records~~,~~ and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-003-~~9~~10)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Responsible Entity did not address one of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact ~~BES Cyber Systems~~BCS as required by Requirement R1 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as	The Responsible Entity did not address two of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact ~~BES Cyber Systems~~BCS as required by Requirement R1 within 16 calendar months but did complete this review in less than or equal to 17 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1 by the CIP Senior Manager within 16 calendar months but	The Responsible Entity did not address three of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact ~~BES Cyber Systems~~BCS as required by Requirement R1 within 17 calendar months but did complete this review in less than or equal to 18 calendar months of the previous review. (Part 1.1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BCS as	The Responsible Entity did not address four or more of the nine topics required by Requirement R1. (Part 1.1) OR The Responsible Entity did not have any documented cyber security policies for its high impact and medium impact BCS as required by Requirement R1. (Part 1.1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies as required by Requirement R1 within 18 calendar months of the previous review. (Requirement R1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BES Cyber

E. Interpretations

None.

F. Associated Documents

None.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from ~~–~~-2 to ~~–~~-3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP~~–~~-003~~–~~-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~
			~~Order No. 791 related to identify, assess, and correct language and communication networks.~~
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC Order issued approving CIP~~-~~-003~~-~~-6. Docket No. RM15~~-~~-14~~-~~-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP~~-~~-003~~-~~-7. Docket No. RM17~~-~~-11~~-~~-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP~~-~~-003~~-~~-8. Docket No. RD19~~-~~-5~~-~~-000.

Attachment 1

Required Sections for Cyber Security Plan(s) ~~for Assets Containing Low Impact BES Cyber Systems~~

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple~~-~~-impact ~~BES Cyber Systems~~BCS ratings can utilize policies, procedures, and processes for their high or medium impact ~~BES Cyber Systems~~BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. ~~Section 1.~~ Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. ~~Section 2.~~ Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact ~~BES Cyber Systems~~BCS within the asset, and (2) the Cyber Asset(s~~),~~) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. ~~Section 3.~~ Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP~~-~~-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. ~~between~~Between:

- a low impact ~~BES Cyber System(s)~~ BCS; or
- An SCI that supports a low impact BCS

and a Cyber ~~Asset~~System(s) outside the asset containing ~~low impact BES Cyber System(s);~~:

- the low impact BCS(s); or
- the SCI that supports a low impact BCS;

~~i.~~ii. using a routable protocol when entering or leaving the asset containing the low impact ~~BES Cyber System(s);~~BCS or SCI that supports a low impact BCS; and

~~ii.~~iii. not used for time~~-~~-sensitive ~~protection or control functions between intelligent electronic devices (e.g.,~~ communications ~~using protocol IEC TR-61850-90-5 R-GOOSE).~~of Protection Systems.

3.2 Authenticate all Dial~~-~~-up Connectivity, if any, that provides access to low impact ~~BES Cyber System(s),~~BCS or SCI that supports a low impact BCS, per ~~Cyber Asset~~system capability.

Section 4. ~~Section 4.~~ Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E~~-~~-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. ~~Transient Cyber Asset~~ TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact ~~BES Cyber Systems~~BCS, through the use of ~~Transient Cyber Assets~~TCA or Removable Media. The plan(s) shall include:

5.1 For ~~Transient Cyber Asset(s)~~TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on~~-~~-demand manner (per ~~Transient Cyber Asset~~TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For ~~Transient Cyber Asset(s)~~TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting ~~the Transient Cyber Asset to a low impact BES Cyber System (per Transient Cyber Asset~~(per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;

Commented [A1]: Rejected deletion.

- Review of system hardening used by the party; or
- ~~Other~~Review of other method(s) to mitigate the risk of introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the ~~Transient Cyber Asset.~~TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a ~~BES Cyber System~~BCS or SCI that supports a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code on the Removable Media prior to connecting Removable Media to a low impact ~~BES Cyber System~~BCS or SCI that supports a low impact BCS.

Section 6. Vendor Electronic Remote Access Security Controls: For assets containing low impact BES Cyber System(s) identified pursuant to CIP-002, that allow vendor electronic remote access, the Responsible Entity shall implement a process to mitigate risks associated with vendor electronic remote access, where such access has been established under Section 3.1. These processes shall include:

6.1 One or more method(s) for determining vendor electronic remote access;

6.2 One or more method(s) for disabling vendor electronic remote access; and

~~6.1~~ **6.3** One or more method(s) for detecting known or suspected inbound and outbound malicious communications for vendor electronic remote access.

Attachment 2

Examples of Evidence for Cyber Security Plan(s) ~~for Assets Containing Low Impact BES Cyber Systems~~

Section 1. ~~Section 1.~~ Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e~~-~~-mails, memos, or computer~~-~~-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. ~~Section 2.~~ Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact ~~BES Cyber Systems~~BCS within the asset; and
  b. The Cyber ~~Asset~~System(s) specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. ~~Section 3.~~ Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets ~~containing low impact BES Cyber Systems,~~ , the routable protocol communication ~~between a low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset~~as outlined in Section 3 is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that ~~communication is~~communications are used for time~~-~~-sensitive ~~protection or control functions between intelligent electronic devices~~communications of Protection Systems. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) ~~between the low impact BES Cyber System(s) and a Cyber Asset(s) outside the asset containing low impact BES Cyber System(s)~~ or lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).

2. Documentation of authentication for Dial~~-~~-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial~~-~~-back modems, modems that must be remotely controlled by the control center or control room, or access control on the ~~BES Cyber System~~BCS).

Section 4. ~~Section 4.~~ Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E~~-~~-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. ~~Section 5.~~ ~~Transient Cyber Asset~~TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

   Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of ~~live operating systems or~~ system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for ~~Transient Cyber Asset(s)~~TCA managed by a party other than the Responsible Entity. If a ~~Transient Cyber Asset~~TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the ~~Transient Cyber Asset~~TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the ~~Transient Cyber Asset~~TCA managed by a party other than the Responsible Entity.

2. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on~~-~~-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code~~.~~

Section 6. Vendor Electronic Remote Access Security Controls**:** Examples of evidence showing the implementation of the process for Section 6 may include, but are not limited to:

1. For Section 6.1, documentation showing:
    - steps to preauthorize access;
    - alerts generated by vendor log on;
    - session monitoring;
    - security information management logging alerts;
    - time-of-need session initiation;
    - session recording;
    - system logs; or
    - other operational, procedural, or technical controls.
2. For Section 6.2, documentation showing:
    - disabling vendor electronic remote access user or system accounts;

  - disabling inbound and/or outbound hardware or software ports, services, or access permissions on applications, firewall, IDS/IPS, router, switch, VPN, Remote Desktop, remote control, or other hardware or software used for providing vendor electronic remote access;
  - disabling communications protocols (such as IP) used for systems which establish and/or maintain vendor electronic remote access;
  - Removing physical layer connectivity (e.g., disconnect an Ethernet cable, power down equipment);
  - administrative control documentation listing the methods, steps, or systems used to disable vendor electronic remote access; or
  - other operational, procedural, or technical controls.

3. For Section 6.3, documentation showing implementation of processes or technologies which have the ability to detect malicious communications such as:
    - Anti-malware technologies;
    - Intrusion Detection System (IDS)/Intrusion Prevention System (IPS);
    - Automated or manual log reviews;
    - alerting; or
    - other operational, procedural, or technical controls.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	November 2023
Board adoption	December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled “Project 2016-02 Draft 5 Definitions”.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-8

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting BCS.

4. **Applicability:**

    4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

        4.1.1. **Balancing Authority**

        4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

            4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

                4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

                4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

            4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

            4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

            4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

        4.1.3. **Generator Operator**

        4.1.4. **Generator Owner**

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. **Responsible Entities listed in 4.1 other than Distribution Providers**: All BES Facilities.

4.2.3. **Exemptions:** The following are exempt from Standard CIP-004-8:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High impact BCS Medium impact BCS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part.	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-8 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS Medium impact BCS with Interactive Remote Access (IRA) SCI supporting an Applicable System in this Part	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information (BCSI) and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BCS electronic interconnectivity and interoperability with other Cyber Systems, including Transient Cyber Assets (TCA), and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-8 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 at least once every 15 calendar months (except for medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to Applicable Systems that collectively include each of the applicable requirement parts in *CIP-004-8 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-8 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-8 Table R3 – Personnel Risk Assessment Program

Part	Applicable Systems	Requirements	Measures
3.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.
3.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

3.5	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed, except during CIP Exceptional Circumstances, according to Parts 3.1 through 3.4 within the last seven years.	Examples of evidence may include, but are not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-8 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-8 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; and 4.1.2. Unescorted physical access into a Physical Security Perimeter (PSP) (except for medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, dated documentation of the process to authorize electronic access, and unescorted physical access in a PSP.
4.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the

CIP-004-8 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).
4.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	Examples of evidence may include, but are not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-8 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-8 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	A process to initiate removal of an individual’s ability for unescorted physical access (except for Medium impact BCS without ERC) and Interactive Remote Access (IRA) upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.
5.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For reassignments or transfers, revoke the individual’s authorized electronic access to individual accounts; and authorized unescorted physical access (except for Medium impact BCS without ERC) that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	Examples of evidence may include, but are not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-8 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	Examples of evidence may include, but are not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.
5.4	High impact BCS and their associated EACMS SCI supporting an Applicable System in this Part.	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination action; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the Applicable Systems identified in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Prior to provisioning, authorize (unless already authorized according to Part 4.1) based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 6.1.1. Provisioned electronic access to electronic BCSI; and 6.1.2. Provisioned physical access to physical BCSI (except for BCSI at a medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, individual records or lists that include who is authorized, the date of the authorization, and the justification of business need for the provisioned access.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Verify at least once every 15 calendar months that all individuals with provisioned access to BCSI: 6.2.1. have an authorization record; and 6.2.2. still need the provisioned access to perform their current work functions, as determined by the Responsible Entity.	Examples of evidence may include, but are not limited to, the documentation of the review that includes all of the following: - List of authorized individuals; - List of individuals who have been provisioned access; - Verification that provisioned access is appropriate based on need; and - Documented reconciliation actions, if any.
6.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) (except for BCSI at a Medium impact BCS without ERC) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-004-8)			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (Part 1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (Requirement R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (Part 1.1)
R2	The Responsible Entity did not include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (Requirement R2) OR The Responsible Entity did not include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct

Version	Date	Action	Change Tracking
			language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-004-6. Docket No. RM15-14-000	
7	8/12/21	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.
8	TBD	Modified by Project 2016-02.	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~fourth~~fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – ~~September 30~~October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	~~October 2022~~November 2023
Board adoption	~~November 2022~~December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled "Project 2016-02 Draft ~~4~~5 Definitions".

A.- Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-8

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting BCS.

4. **Applicability:**

    4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” -For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. **Balancing Authority**

    4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3. **Generator Operator**

    4.1.4. **Generator Owner**

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. **Responsible Entities listed in 4.1 other than Distribution Providers**: All BES Facilities.

4.2.3. **Exemptions:** The following are exempt from Standard CIP-004-8:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems”:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modifications to CIP Standards Implementation Plan.”

B.- Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R1 – Security Awareness Program

Part	Applicable Systems	Requirements	Measures
1.1	High impact BCS Medium impact BCS Shared Cyber Infrastructure (SCI) supporting an Applicable System in this Part.	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. -Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-8 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-8 Table R2 – Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
2.1	High impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS Medium impact BCS with Interactive Remote Access (IRA) SCI supporting an Applicable System in this Part	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information (BCSI) and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BCS electronic interconnectivity and interoperability with other Cyber Systems, including Transient Cyber Assets (TCA), and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-8 Table R2 – Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
2.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 at least once every 15 calendar months~~.~~ (except for medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to Applicable Systems that collectively include each of the applicable requirement parts in *CIP-004-8 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-8 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-8 Table R3 – Personnel Risk Assessment Program

Part	Applicable Systems	Requirements	Measures
3.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.
3.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-8 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium impact BCS with IRA SCI supporting an Applicable System in this Part	months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	
3.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity’s criteria or process to evaluate criminal history records checks.
3.4	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	Examples of evidence may include, but are not limited to, documentation of the Responsible Entity’s criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-8 Table R3 – ~~-~~Personnel Risk Assessment Program

Part	Applicable Systems	Requirements	Measures
	Medium impact BCS with IRA SCI supporting an Applicable System in this Part		
3.5	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed, except during CIP Exceptional Circumstances, according to Parts 3.1 through 3.4 within the last seven years.	Examples of evidence may include, but are not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-8 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-8 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-8 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; and 4.1.2. Unescorted physical access into a Physical Security Perimeter (PSP~~).~~) (except for medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, dated documentation of the process to authorize electronic access, and unescorted physical access in a PSP.
4.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the

CIP-004-8 Table R4 – Access Management Program

Part	Applicable Systems	Requirements	Measures
			verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).
4.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	Examples of evidence may include, but are not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-8 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-8 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R5 – Access Revocation

Part	Applicable Systems	Requirements	Measures
5.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	A process to initiate removal of an individual's ability for unescorted physical access (except for Medium impact BCS without ERC) and Interactive Remote Access (IRA) upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.
5.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts; and authorized unescorted physical access (except for Medium impact BCS without ERC) that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	Examples of evidence may include, but are not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-8 Table R5 – ~~-~~Access Revocation

Part	Applicable Systems	Requirements	Measures
5.3	High impact BCS and their associated EACMS SCI supporting an Applicable System in this Part	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	Examples of evidence may include, but are not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.
5.4	High impact BCS and their associated EACMS SCI supporting an Applicable System in this Part.	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination action; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the Applicable Systems identified in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-8 Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.1	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Prior to provisioning, authorize (unless already authorized according to Part 4.1) based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 6.1.1. Provisioned electronic access to electronic BCSI; and 6.1.2. Provisioned physical access to physical BCSI~~.~~ (except for BCSI at a medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, individual records or lists that include who is authorized, the date of the authorization, and the justification of business need for the provisioned access.

CIP-004-8 Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.2	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Verify at least once every 15 calendar months that all individuals with provisioned access to BCSI: 6.2.1. have an authorization record; and 6.2.2. still need the provisioned access to perform their current work functions, as determined by the Responsible Entity.	Examples of evidence may include, but are not limited to, the documentation of the review that includes all of the following: - List of authorized individuals; - List of individuals who have been provisioned access; - Verification that provisioned access is appropriate based on need; and - Documented reconciliation actions, if any.
6.3	High impact BCS and their associated: 1. EACMS; and 2. PACS Medium impact BCS with ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) (except for BCSI at a Medium impact BCS without ERC) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C.- Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance.- For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-004-8)			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (Part 1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (Part 1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (Requirement R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (Part 1.1)
R2	The Responsible Entity did not include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (Part 2.2) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (Requirement R2) OR The Responsible Entity did not include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (Part 2.1) OR The Responsible Entity did not train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct

Version	Date	Action	Change Tracking
			language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-004-6. Docket No. RM15-14-000	
7	8/12/21	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.
8	TBD	Modified by Project 2016-02.	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fifth draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with initial ballot	January 21–March 22, 2021
63-day formal comment period with additional ballot	June 30 –September 1, 2021
53-day formal comment period with additional ballot	February 18 – April 12, 2022
45-day formal comment period with additional ballot	August 17 – October 3, 2022

Anticipated Actions	Date
45-day formal comment period with additional ballot	October – November 2023
Final Ballot	November 2023
Board adoption	December 2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): See Separate document containing all proposed new or modified terms titled "Project 2016-02 Draft 5 Definitions".

A. Introduction

1. **Title:** Cyber Security — Personnel & Training
2. **Number:** CIP-004-~~7~~8
3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting ~~BES Cyber Systems~~BCS.
4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. **Balancing Authority**

4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. **Generator Operator**

4.1.4. **Generator Owner**

4.1.5. **Reliability Coordinator**

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~7~~8:

4.2.3.1. Cyber ~~Assets~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~Systems associated with communication networks and data communication links between discrete Electronic Security Perimeters~~.~~ (ESP).

4.2.3.3. Cyber Systems, associated with communication networks and data communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~4.2.3.3.~~4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

~~4.2.3.5.~~4.2.3.6. Responsible Entities that identify that they have no ~~BES Cyber Systems~~BCS categorized as high impact or medium impact according to the CIP-002~~-5.1a~~ identification and categorization processes.

5. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan" ~~for CIP-004-7~~.

~~6. **Background:** Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, *"Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference]."* The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could~~

~~meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

“Applicable Systems~~**” Columns in Tables:**~~

~~6.1.~~5.1. **”:** Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~part applies. ~~The CSO706 SDT adapted this concept from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the “Applicable Systems” column as described.~~

- ~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1a identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.~~
- ~~**Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~
- ~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~

- ~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.~~

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~7~~8 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~7~~8 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High ~~Impact BES~~impact BCS Medium impact BCS Shared Cyber ~~Systems~~Infrastructure (SCI) supporting an Applicable System in this Part. ~~Medium Impact BES Cyber Systems~~	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to ~~BES Cyber~~Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. ~~-~~Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~7~~8 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~7~~8 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~7~~8 Table R2 – Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
2.1	High ~~Impact BES Cyber Systems~~ impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS~~;~~); and 2. Physical Access Control Systems (PACS)~~PACS~~ Medium ~~Impact BES Cyber Systems~~ impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS Medium impact BCS with Interactive Remote Access (IRA) SCI supporting an Applicable System in this Part	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information (BCSI) and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for ~~BES Cyber Systems~~BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a ~~BES Cyber System's~~BCS electronic interconnectivity and interoperability with other Cyber ~~Assets~~Systems, including Transient Cyber Assets~~,~~ (TCA), and	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~7~~8 Table R2 – ~~-~~Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
		with Removable Media.	
2.2	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS Medium impact BCS with IRA SCI supporting an Applicable System in this Part	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to ~~applicable Cyber Assets~~Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High ~~Impact BES Cyber Systems~~impact BCS and their associated: 1. EACMS; and 2. PACS Medium ~~Impact BES Cyber Systems~~impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months~~.~~ (except for medium impact BCS without ERC).	Examples of evidence may include, but are not limited to, dated individual training records.
