Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1’s categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity’s information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity’s BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the Responsible Entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

The SDT’s intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

Technical Rationale for Reliability Standard CIP-013-3

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justifications for CIP-013-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Updates to this document now include the Project 2016-02 – Modifications to CIP Standards Drafting Team's (SDT's) intent in drafting changes to the requirements.

Background

The Version 5 Transition advisory Group (V5TAG), which consists of representatives from NERC, Regional Entities, and industry stakeholders, was formed to issue guidance regarding possible methods to achieve compliance with the CIP V5 standards and to support industry's implementation activities. During the course of the V5TAG's activities, the V5TAG identified certain issues with the CIP Reliability Standards that were more appropriately addressed by a standard drafting team (SDT). The V5TAG developed the V5TAG Transfer Document to explain the issues and recommend that they be considered in future development activity. As Project 2016-02 was formed to address the directives in FERC Order 822 issued on January 21, 2016, that team also received the V5TAG issues as part of its Standard Authorization Request (SAR).

One of the areas of issue was virtualization. The V5TAG Transfer document said, "The CIP Version 5 standards do not specifically address virtualization. However, because of the increasing use of virtualization in industrial control system environments, questions around treatment of virtualization within the CIP Standards are due for consideration. The SDT should consider revisions to CIP-005 and the definitions of Cyber Asset and Electronic Access Point that make clear the permitted architecture and address the security risks of network, server and storage virtualization technologies."

New and Modified Terms and Applicability

This standard uses new or modified terms and contains new or modified exemptions in Section 4 Applicability. The rationale for this global content can be found in "CIP Definitions and Exemptions Technical Rationale" document for reference when reading the technical rationale that follows.

Requirement R1

Rationale

The Project 2016-02 SDT made conforming changes to Reliability Standard CIP-013-3 to align supply chain risk management requirements with the virtualization changes.

Shared Cyber Infrastructure (SCI) is mutually exclusive from BES Cyber System (BCS) by definition. To enable CIP-013-3 for virtualization, the SDT added SCI as applicable in Requirement R1. Note that Management Modules of SCI are not added as these are included components that are already covered under of the procurement of the SCI.

Technical Rationale for Reliability Standard CIP-013-2

This section contains a "cut and paste" of the Technical Rationale for CIP-013-2 standard to preserve any historical references.

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard CIP-013-2. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. It also contains information on Project 2019-03 Cyber Security Supply Chain Risks Standard Drafting Team's (SDT's) intent in drafting the requirements. This Technical Rationale and Justification for CIP-013-2 is not a Reliability Standard and should not be considered mandatory and enforceable.

The Federal Energy Regulatory Commission (the Commission) issued Order No. 850 on October 18, 2018, calling for modifications to the Supply Chain Suite of Standards to address Electronic Access Control or Monitoring Systems (EACMS), specifically those systems that provide electronic access control or monitoring to high and medium impact BES Cyber Systems. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report to address Physical Access Control Systems (PACS) that provide physical access control to high and medium impact BES Cyber Systems.

The Project 2019-03 SDT drafted Reliability Standard CIP-013-2 to require responsible entities to meet the directives set forth in the Commission's Order No. 850 and the NERC Cyber Security Supply Chain Risk Report.

New and Modified Terms Used on NERC Reliability Standards

CIP-013-2 uses the following definition(s), which are cited below for reference when reading the technical rationale that follows.

Proposed Modified Terms: None

Proposed New Terms: None

Requirement R1 and R2

General Considerations for Requirements R1 and R2

The Requirement addresses Order No. 829 directives for entities to develop and implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;
(2) Vendor remote access;
(3) Information system planning; and
(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems. FERC Order 850, Paragraph 5 and Paragraph 30, directs modifications to Reliability Standards to include EACMS associated with medium and high impact BES Cyber Systems within the scope of the Supply Chain Risk Management Standards. In addition, NERC also recommended revising the Supply Chain Standards in its May 17, 2019 NERC Cyber Security Supply Chain Risk Report [1](Chapter 3, pages 12-15) to address PACS that provide physical access control to high and medium impact BES Cyber Systems.

---

[1] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Due to the nature of PACS and the potential need for physical presence, the SDT conducted extensive dialogue and consideration for the addition of PACS to the requirements. The SDT concluded the risk posed to BES reliability by a compromised, misused, degraded, or unavailable PACS warrants the inclusion of PACS as an applicable Cyber Asset category for supply chain risk management controls.

Further, the inclusion of PACS:

1. addresses the Commission's remaining concern stated in FERC Order No. 850 P 6. that, "…the exclusion of these components may leave a gap in the supply chain risk management Reliability Standards.",
2. addresses the expectations of FERC Order No. 850 P 24. "…to direct that NERC evaluate the cybersecurity supply chain risks presented by PACS and PCAs in the study of cybersecurity supply chain risks directed by the NERC BOT in its resolutions of August 10, 2017.", and
3. directly aligns with NERC's recommendation to include PACS as documented in NERC's final report on "*Cyber Security Supply Chain Risks"*[2].

In further support of the SDT's decision to include PACS, as cited on page 4 of NERC's final report on "*Cyber Security Supply Chain Risks*", "The NERC CIP Reliability Standards provide a risk-based, defense-in-depth approach to securing the BES against cyber and physical security threats." While this statement appears in the context of EACMS, it acknowledges physical security threats equally; therefore, the concept is transferable and applicable to PACS, which serve as an integral component to a strategy involving layers of detective and preventive security controls. PACS are intended to manage physical access to BES Cyber Systems in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES and are implemented with that specific intention to protect the BES Cyber System.

Additionally, NERC states on page 15 of their final report on "*Cyber Security Supply Chain Risks"* that, "In addition, a threat actor must be physically present at the facility in order to exploit the vulnerability created by a compromised PACS system. A threat actor may also need to bypass several physical access or monitoring controls that have not been compromised in order to gain access." While a cyber-compromised PACSs may not in and of itself represent an immediate 15-minute adverse impact to the reliability of the BES, it could demonstrate a threat Actor's intention to gain fully unauthorized electronic access. With electronic access to the PACS an initial deliberate action to facilitate reconnaissance and intentional harm to the BES Cyber Systems.

Furthermore, there is precedent set in CIP-006-6 Requirement R1 Part 1.5 that speaks to a recognized importance of PACS, its functions, and the timeliness of information provided by these systems by requiring issuance of an alarm or alert in response to detected unauthorized access through a physical access point into a PSP to incident response personnel within 15 minutes of detection. This strict timeline suggests imminent threat that compromised physical security poses to the associated BES Cyber System and the reliable operation of the BES Facilities it serves.

The SDT agrees that NERC correctly refers to various Reliability Standards that mitigate certain security risks relating to PACS; however, the SDT asserts that these existing requirements do not address risk associated to the supply chain and therefore do not sufficiently mitigate that risk.

An additional aspect of the NERC Supply Chain Report the SDT considered was around the risk associated with the different aspects of both EACMS and PACS. While both types of systems, under the current definitions, have various

---

[2] NERC, "Cyber Security Supply Chain Risks, Staff Report and Recommended Actions", May 17, 2019. https://www.nerc.com/pa/comp/SupplyChainRiskMitigationProgramDL/NERC%20Supply%20Chain%20Final%20Report%20(20190517).pdf

functional activities they perform, the NERC Supply Chain Report pointed to the increased risk of the control function. The SDT considered limiting the scope of the requirements to only control functions, however chose to stay with the currently approved definitions of both EACMS and PACS. The SDT concluded staying with approved definitions would introduce less confusion. Additionally an attempt to change the EACMS and PACS definitions was outside the 2019-03 SAR.

Rational for Requirement 1 and Requirement 2

Requirement R1 Part 1.1 addresses the directive in Order No. 829 (P.56) and Order 850 (P.5) for identification and documentation of cyber security risks in the planning and development processes related to the procurement of medium and high impact BES Cyber Systems, and their associated EACMS and PACS. The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

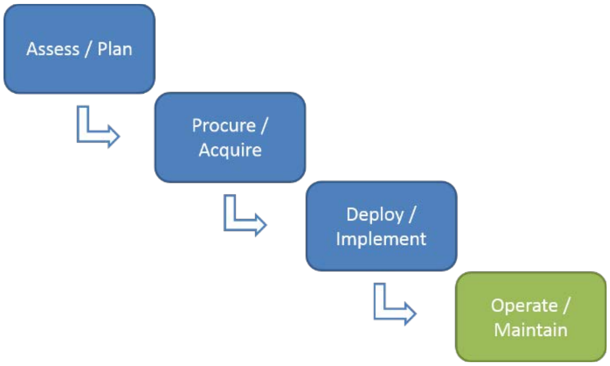
The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The use of remote access in Part 1.2.6 includes vendor-initiated authenticated remote connections and system to system remote connections for EACMS and PACS; and vendor-initiated IRA and system to system access to BCS and PCAs.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-2 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R3

General Considerations for Requirement R3

The requirement addresses Order No. 829 directives for entities periodically to reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

Technical Rational for Reliability Standard CIP-013-1

This section contains a “cut and paste” of the Technical Rationale components of the former Guidelines and Technical Basis (GTB) as-is of from CIP-013-1 standard to preserve any historical references. Similarly, former GTB content providing compliance guidance can be found in a separate Implementation Guidance document for this standard.

Rationale

Requirement R1:

The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;

(2) Vendor remote access;

(3) Information system planning; and

(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

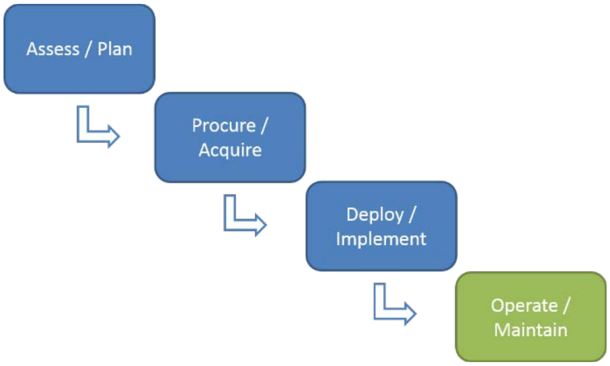
Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires

entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.
The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



Requirement R2:

The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2016-02 Modifications to CIP Standards

Formal Comment Period Open through March 22, 2021
Ballot Pools Forming through February 19, 2021

Now Available

A 60-day formal comment period for the **CIP Virtualization suite of standards (outlined below)** is open through **8 p.m. Eastern, Monday, March 22, 2021**.

- CIP-002-7 – Cyber Security - BES Cyber System Categorization
- CIP-003-9 – Cyber Security - Security Management Controls
- CIP-004-7 – Cyber Security - Personnel & Training
- CIP-005-8 – Cyber Security - BES Cyber System Logical Isolation
- CIP-006-7 – Cyber Security - Physical Security of BES Cyber Systems
- CIP-007-7 – Cyber Security - Systems Security Management
- CIP-008-7 – Cyber Security - Incident Reporting and Response Planning
- CIP-009-7 – Cyber Security - Recovery Plans for BES Cyber Systems
- CIP-010-5 – Cyber Security - Configuration Change Management and Vulnerability Assessments
- CIP-011-3 – Cyber Security - Information Protection
- CIP-013-3 – Cyber Security - Supply Chain Risk Management

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. Contact Wendy Muller regarding issues using the SBS**.** An unofficial Word version of the comment form is posted on the project page**.**

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Friday, February 19, 2021.** Registered Ballot Body members can join the ballot pools here. Note that there is a separate ballot and non-binding poll for each of the standards, so it is necessary to join each ballot pool in order to submit votes on all of the standards and their associated Violation Risk Factors and Violation Severity Levels.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **March 12-22, 2021**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2016-02 Modifications to CIP Standards Observer List” in the Description Box. For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at (404) 446-2589.

There were 91 sets of responses, including comments from approximately 210 different people from approximately 133 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. The SDT added, revised, and retired several defined terms to incorporate virtualization and future technologies within the CIP Standards. Do you agree with the proposed changes to the NERC Glossary terms? If not, please provide the basis for your disagreement and an alternate proposal.

2. CIP-005 Requirement R1 part 1.1 was revised to permit only needed and controlled communications to and from applicable systems either individually or as a group and logically isolate all other communications. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

3. The SDT modified CIP-005 Requirement R1 Part R1.2 to establish logical isolation requirements for Management Systems, Management Interfaces, and associated SCI. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

4. The SDT modified CIP-005 Requirement R1 Part1.3 to protect the confidentiality and integrity of data traversing communication links that span multiple Physical Security Perimeters. Does the proposed requirement fulfill the directive from FERC Order 791, paragraph 150? Please provide the basis for your response.

5. The SDT modified CIP-005 Requirement R2 to ensure remote access management requirements align with the new and revised virtualization terms. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

6. The SDT revised CIP-007 Requirement R1 Part 1.1 to shift the security objective from logical network accessible ports to services. The proposed revisions require Responsible Entities to enable only network accessible services that have been determined to be needed by the Responsible Entity. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

7. CIP-010 Requirement R1 currently requires Responsible Entities to develop a baseline configuration, authorize changes to the baseline, and document the changes. The SDT proposes to revise Requirement R1 to remove the reference to baseline configurations. The proposed revisions require the authorization of changes to Operating System(s), firmware, commercially available open-source software, custom software, logical network accessible ports, security patches applied, and SCI configurations. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

8. The SDT modified CIP-010 Requirement R3 Part 3.3 to ensure that vulnerability assessments are performed prior to logically connecting Cyber Assets, VCA, and SCI. The revised requirement allows the use of remediation VLANs to perform active vulnerability assessments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

9. CIP-002-5.1a includes exemption 4.2.3.2, which exempted Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. In the development of conforming changes, the SDT determined that the exemption should be split into two distinct exemptions to adequately cover all cyber systems associated with conforming changes. The SDT

established those conforming changes in proposed Exemptions 4.2.3.2 & 4.2.3.3. Do the changes clearly identify the exempted cyber systems? If not, please provide the basis for your disagreement and an alternate proposal.

10. BCS and SCI are mutually exclusive by definition, however SCI poses a significant reliability risk to the Bulk Electric System. The SDT considered the risks associated with SCI and revised CIP-002 Requirement R1 to include the identification of SCI in Parts 1.3, 1.4, and 1.5. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

11. In the current enforceable standards, there are no requirements that can be used to tie a non-identification of EACMS, PACS, and PCAs to a single requirement. The SDT revised CIP-002 to include the identification of SCI associated with EACMS, PACS, and PCAs to help address this issue within the virtualization scope of the current SAR. The proposed requirement could reduce possible non-compliance to a single issue if a Responsible Entity fails to properly identify SCI associated with EACMS, PACS, or PCAs. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

12. The SDT modified CIP-002 Attachment 1, Criterion 2.1 to align with a previously approved Request for Interpretation (RFI) regarding “shared BES Cyber Systems.” The SDT modified the criterion to reference each discrete shared BCS. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

13. The SDT made conforming changes to CIP-003 and CIP-004. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

14. The SDT modified the Applicable Systems column in CIP-006 to include SCI hosting PACs associated with Medium Impact BCS with ERC or IRA. The SDT made the proposed revisions to clarify the scope of requirements that apply when an entity implements serial IRA. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

15. The SDT made conforming changes to CIP-008 and CIP-009. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

16. The SDT modified CIP-011 Requirement R2 part 2.1, which will allow cryptographic erasure in scenarios where BCSI can’t be mapped to particular disks in virtualized storage. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

17. The SDT performed a review of the CIP Standards and determined that CIP Exceptional Circumstances could be applied to the following additional requirements: CIP-004-7 Requirement R2 Part 2.2, CIP-004-7 Requirement R3 Part 3.5, CIP-006-7 Requirement R1 Part 1.8, CIP-006-7 Requirement R1 Part 1.9, CIP-006-7 Requirement R2, CIP-010-5 Requirement Part 1.2, and CIP-010-5 Requirement R1 Part 1.3. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

18. Implementation Plan: The SDT proposes an Implementation Plan that makes the revised CIP Standards and definitions effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority’s order. However, the implementation plan allows a Responsible Entity to elect to comply with the Revised CIP Standards and Definitions following their approval by the applicable governmental authority, but prior to the Effective Date. Do you agree with this proposal? If you think an alternate effective date is needed, please provide a detailed explanation of actions and time needed.

19. Please provide any additional comments for the SDT to consider, if desired.

1. The SDT added, revised, and retired several defined terms to incorporate virtualization and future technologies within the CIP Standards. Do you agree with the proposed changes to the NERC Glossary terms? If not, please provide the basis for your disagreement and an alternate proposal.

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy

Answer	No
Document Name	

Comment

Duke Energy does not generally agree with the proposed modifications. The definitions as currently drafted introduce a complex and difficult matrix of possible “device” identifications that are theoretically mutually exclusive (Cyber Asset, Virtual Cyber Asset, Shared Cyber Infrastructure, Management Modules) and that must then be assigned one or many “roles” (BCA, EACMS, etc.). It may be more straightforward to update the Cyber Asset definition to accommodate multiple technologies including physical or virtual components that comprise the a device (such as hardware, software, and data). The VCA definiation may not be needed if this concept is added to the definition of Cyber Asset. This would avoid introducing another device ‘type’ that is not currently included in applicability statements.

We have concerns that the definition of Management Module may apply to substation devices that have no relationship to virtualiztion. Is the intent to confine use of this term to SCI only? This question may highlight a concern with the approach of defining terms that can only be understood when read in context of the applicability statements.

The proposed definition of Self-Contained Application includes terms such as “isolated” that could be interpreted by regional entities to mean that they would not be allowed network connectivity. Most containers inherently need a network address to perform their purpose. We suggest revising the definition to something like “Packaged software, consisting of binaries that cannot be modified, containing application software, operating system, and all relevant dependencies designed to execute independent of any other software or containers residing on the same infrastructure. SCA may exist on Cyber Assets, VCA, or SCI.”

Duke recommends the SDT add a definition of ‘Logical Isolation’, as that term is central to multiple requirements.

TVA has concerns with the Share Cyber Infrastructure (SCI) definition: As currently drafted, this term is too vague and could be misinterpreted to extend scope inappropriately.

SRP would like clarification on the mixed use of CIP and non CIP assets. What components within virtualization becomes an EACMS? Requirements R1 Parts 1.1, 1.2, and 1.3 are a big step from referencing an Electronic Access Point (EAP).

Comments: The MRO NSRF believes the existing standard requirements could be revised more efficiently to meet the SAR requirements, ensure the virtualization security objectives are met, reduce the impact to entities' programs, and provide greater clarity to auditors. We recommend reviewing our comments in reply to Question 19 first. This provides an overview basis for our comments in general.

A. SCI - Virtual environments could reside within specified physical security zones thus eliminating the need for a Shared Cyber Infrastructure (SCI) definition. For example, a BCA and PCA supported by the same hardware (server farm, storage system, management system) could be classified as a BCA (high watermarked). Using this logic also eliminates the need to retire the Electronic Security Perimeter (ESP) definition and results in less impact to entities.

B. Logical Isolation - is problematic in that it is undefined. The existing term 'routable protocol' becomes obsolete when 'logical isolation' is used as or in place of an ESP – i.e., to establish an electronic security zone. Logical isolation can expand compliance scope by bringing in non-routable serial connections.

C. VCA - Given no existing specific requirements for a VCA, the SDT could consider modifying the definition of Cyber Asset to include the entire hardware platform hosting the virtual machines. This allows entities to identify and address the appropriate CIP security risks for virtual machines. This also eliminates the need for the term VCA throughout the standards and other definitions, and in entity compliance documentation and processes.

D. Categorization - If an SCI, Management System or Management Module, such as hypervisor host and vCenter, can create, modify, delete or turn off a BCA, it should be identified and categorized in its entirety as a BCA, because it would have an adverse impact on the Bulk Electric System within 15 minutes. Entities whom choose to put many systems in one hardware platform may consider the risks associated with combined systems.

E. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off an EACMS or PACS, it should be identified as EACMS or PACS since it can remove or change the electronic/physical access control functions. This is implied but not clearly stated in the current definition. For clarity, we suggest addressing this gap by modifying the existing definitions of EACMS and PACS.

F. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off a BCA and EACMS, it should be identified as a BCA for the highest-level protection or identified with dual classifications to meet the requirements of both a BCA and EACMS.

Additional Comment: The definition of 'Self-Contained Applications' is problematic in that the current phrase "packaged to execute in an isolated environment" could scope OS installed and managed applications that use a form of virtual isolated containers such as Java Runtime Environment (JRE) that commonly runs an isolated JVM (java virtual machine) that allows local Java code to be compiled into Java Bytecode.

Recommendation: Self-Contained Applications are immutable software binaries containing operating system dependencies and application software packaged to execute in an isolated environment and **are managed via Management Systems**.

G. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off an EACMS and PACS, the multiple classifications should apply. It should be identified as both an EACMS and PACS and meet requirements of both. The ability for dual classification already exists in the current version. For example, when an EACMS device is located inside an ESP, this device would be also a PCA and should meet the requirements of both EACMS and PCA.

H. Categorization - Where a storage array (raid) is using data and/or information to operate CIP Cyber Assets (rather than solely for backup), the storage array should be identified as a component of the CIP Cyber Asset and meet the same classification as the CIP Cyber Asset. This is a logical conclusion given a CIP Cyber Assets is inoperable without the storage array information and/or data. For mixed trust environments, the high-water marking rule should apply. To keep the storage raid hosting non-CIP data out of CIP scope, non-CIP storage media should be isolated or separated.

RECOMMENDATIONS - Modifications to Existing Definitions (Cyber Asset (CA), EACMS and PACS):

We recommend modifying the definitions of Cyber Asset, EACMS and PACS to eliminate the definitions of SCI, Management System and Management Modules and recommend:

- **Cyber Asset (CA):** Programmable electronic devices, including the hardware, software, and data in those devices. This includes platforms operating virtual machines, which are logical instances of an operating system or firmware hosted on a physical platform.
- **EACMS:** Cyber Assets that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems. This includes Intermediate Systems and the Cyber Assets that can create, modify, delete or turn off the above Cyber Assets.
- **PACS:** Cyber Assets that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers. This includes the Cyber Assets that can create, modify, delete or turn off the above Cyber Assets.

SDT INTENT - Clarity is needed regarding the modifications to definitions of ERC, IRA, IS, PCA, and the retirement of ESP and EAP.

A. If the SDT intended to include non-ESP ERC, modifications to existing ERC definition should include ESP and non-ESP ERC to make it compatible with the existing requirements.

B. If the SDT intended to include non-routable IRA access, a minor modification to the existing IRA can achieve the goal. Actually the current IRA definition has already covered the serially connected devices outside of ESP resulting from (1) the current IRA definition only states the user-initiated access using a routable protocol and doesn't say all communication sessions need to be routable all the way until the end device, and (2) it doesn't say the Cyber Asset that is accessible by a remote client has to be within an ESP. For instance, when a device serially connected to a terminal server and it can be accessible by a remote client, it meets current IRA definition, but current CIP-005-5 R2 doesn't address IRA definition since it only apply to BCS with ERC and missed the serial connected devices.

However, the current CIP-004 R5.1 has implied an IRA definition (for terminations) applies to non-routable EACMS and PACS, where CIP-004 R5.1 requires entities to revoke IRA access to high and medium impact BCS w/ERC and associated EACMS and PACS, it implies EACMS or PACS may have IRA access even though they may not within an ESP- meaning not routable – but you have to revoke the IRA access to them. We suggest changes to IRA to make it clear that the initial access using routable protocol is one of the IRA qualifiers, where the rest of the remote access session can be non-routable.

C. Given the proposed modifications to EACMS listed in this document, the current IS definition could remain unchanged.

D. Definition of ESP and EAP should not be retired since they are still an effective approach for the network perimeter level security controls for physical and virtual machines. Logical isolation is not a defined term is very subjective. If the SDT intended to allow Cyber Asset level security controls, such as using local policies based firewalls, it should be an alternative measure rather than eliminating ESP and EAP approach.

E. If the SDT intended to include non-ESP PCAs, our proposed modifications to PCA can meet SDT's goal.

RECOMMENDATIONS - Modifications to ERC, IRA, and PCA:

- **ERC:** The ability to access a BCS from a Cyber Asset that is outside of the Electronic Security Perimeter in which the BCS resides via a bi-directional routable protocol connection, or the ability to access a BCS that is not within any ESPs from a Cyber Asset through an EACMS controlling communications to and from the BCS via a bi-directional routable protocol connection.
- **IRA:** User-initiated interactive access by a person employing a remote access client or other remote access technology. Remote access originates from a Cyber Asset, using a routable protocol, that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications.
- **PCA**: One or more Cyber Assets (1) that are connected to a BCS using a routable within an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP; or (2) that are connected to a BCS using a routable protocol where an ESP model is not used and doesn't pass through any EACMS controlling communications to and from the BES Cyber System. The impact rating of Protected Cyber Assets is equal to the BCS it is connected to; (3) that share CPU or memory with a BCA, EACMS or PACS. The impact rating of Protected Cyber Assets is equal to the above highest rated Cyber Asset that shares CPU or memory with the Protected Cyber Assets.

Additional Comment: The proposed definition for IRA does not account for serial connections that have the only user connection point within a PSP and cannot be moved outside of the PSP.

Recommendation: IRA: If the proposed definition for IRA in Question 1 section B of the modifications to definitions of ERC and IRA is not accepted, then there should be an exception included for communications that can only originate within a PSP.

Todd Bennett - Associated Electric Cooperative, Inc. - 3, Group Name AECI

Answer	No
Document Name	

Comment

The proposed definitions are used to significantly expand the number of “Applicable Systems” within the CIP Standards. This leads to a complex applicability section within already complex subject matter. Some of the proposed definitions are mutually exclusive, while multiple proposed terms can apply to a device’s role within the standards. The proposed definitions shift from concepts that are understood by subject matter experts and compliance staff alike, to definitions that are not clear to subject matter experts. The SDT has proposed the retirement of well-known terms such as EAPs and ESPs and added definitions with terminology that includes immutable software binaries, logical instance, and logical isolation. The proposed definitions do not provide industry with a clear understanding of cyber asset applicability. Additionally, the SDT should consider defining logical isolation due to its pervasive use throughout the proposed definitions.

Comments: WAPA believes the existing standard requirements could be revised more efficiently to meet the SAR requirements, ensure the virtualization security objectives are met, reduce the impact to entities’ programs, and provide greater clarity to auditors. We recommend reviewing our comments in reply to Question 19 first. This provides an overview basis for our comments in general.

1. SCI - Virtual environments could reside within specified physical security zones thus eliminating the need for a Shared Cyber Infrastructure (SCI) definition. For example, a BCA and PCA supported by the same hardware (server farm, storage system, management system) could be classified as a BCA (high watermarked). Using this logic also eliminates the need to retire the Electronic Security Perimeter (ESP) definition and results in less impact to entities.

2. Logical Isolation - is problematic in that it is undefined. The existing term ‘routable protocol’ becomes obsolete when ‘logical isolation’ is used as or in place of an ESP – i.e., to establish an electronic security zone. Logical isolation can expand compliance scope by bringing in non-routable serial connections.

3. The definition of ‘Self-Contained Applications’ is problematic in that the current phrase “packaged to execute in an isolated environment” could scope OS installed and managed applications that use a form of virtual isolated containers such as Java Runtime Environment (JRE) that commonly runs an isolated JVM (java virtual machine) that allows local Java code to be compiled into Java Bytecode.

Self-Contained Apps Recommendation: Self-Contained Applications are immutable software binaries containing operating system dependencies and application software packaged to execute in an isolated environment and **are managed via Management Systems**.

VCA - Given no existing specific requirements for a VCA, the SDT could consider modifying the definition of Cyber Asset to include the entire hardware platform hosting the virtual machines. This allows entities to identify and address the appropriate CIP security risks for virtual machines. This also eliminates the need for the term VCA throughout the standards and other definitions, and in entity compliance documentation and processes.

1. Categorization - If an SCI, Management System or Management Module, such as hypervisor host and vCenter, can create, modify, delete or turn off a BCA, it should be identified and categorized in its entirety as a BCA, because it would have an adverse impact on the Bulk Electric System within 15 minutes. Entities whom choose to put many systems in one hardware platform may consider the risks associated with combined systems.

2. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off an EACMS or PACS, it should be identified as EACMS or PACS since it can remove or change the electronic/physical access control functions. This is implied but not clearly stated in the current definition. For clarity, we suggest addressing this gap by modifying the existing definitions of EACMS and PACS.

3. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off a BCA and EACMS, it should be identified as a BCA for the highest-level protection or identified with dual classifications to meet the requirements of both a BCA and EACMS.

4. Categorization - If an SCI, Management System or Management Module can create, modify, delete or turn off an EACMS and PACS, the multiple classifications should apply. It should be identified as both an EACMS and PACS and meet requirements of both. The ability for dual classification already exists in the current version. For example, when an EACMS device is located inside an ESP, this device would be also a PCA and should meet the requirements of both EACMS and PCA.

5. Categorization - Where a storage array (raid) is using data and/or information to operate CIP Cyber Assets (rather than solely for backup), the storage array should be identified as a component of the CIP Cyber Asset and meet the same classification as the CIP Cyber Asset. This is a logical conclusion given a CIP Cyber Assets is inoperable without the storage array information and/or data. For mixed trust environments, the high-water marking rule should apply. To keep the storage raid hosting non-CIP data out of CIP scope, non-CIP storage media should be isolated or separated.

RECOMMENDATIONS - Modifications to Existing Definitions (Cyber Asset (CA), EACMS and PACS):

We recommend modifying the definitions of Cyber Asset, EACMS and PACS to eliminate the definitions of SCI, Management System and Management Modules and recommend:

-
    - **Cyber Asset (CA):** Programmable electronic devices, including the hardware, software, and data in those devices. This includes platforms operating virtual machines, which are logical instances of an operating system or firmware hosted on a physical platform.
    - **EACMS:** Cyber Assets that perform electronic access control or electronic access monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems. This includes Intermediate Systems and the Cyber Assets that can create, modify, delete or turn off the above Cyber Assets.
    - **PACS:** Cyber Assets that control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers. This includes the Cyber Assets that can create, modify, delete or turn off the above Cyber Assets.

SDT INTENT - Clarity is needed regarding the modifications to definitions of ERC, IRA, IS, PCA, and the retirement of ESP and EAP.

-
    i. If the SDT intended to include non-ESP ERC, modifications to existing ERC definition should include ESP and non-ESP ERC to make it compatible with the existing requirements.

    ii. If the SDT intended to include non-routable IRA access, a minor modification to the existing IRA can achieve the goal. Actually the current IRA definition has already covered the serially connected devices outside of ESP resulting from (1) the current IRA definition only states the user-initiated access using a routable protocol and doesn't say all communication sessions need to be routable all the way until the end device, and (2) it doesn't say the Cyber Asset that is accessible by a remote client has to be within an ESP. For instance, when a device serially connected to a terminal server and it can be accessible by a remote client, it meets current IRA definition, but current CIP-005-5 R2 doesn't address IRA definition since it only apply to BCS with ERC and missed the serial connected devices.

However, the current CIP-004 R5.1 has implied an IRA definition (for terminations) applies to non-routable EACMS and PACS, where CIP-004 R5.1 requires entities to revoke IRA access to high and medium impact BCS w/ERC and associated EACMS and PACS, it implies EACMS or PACS may have IRA access even though they may not within an ESP- meaning not routable – but you have to revoke the IRA access to them. We suggest changes to IRA to make it clear that the initial access using routable protocol is one of the IRA qualifiers, where the rest of the remote access session can be non-routable.

iii. Given the proposed modifications to EACMS listed in this document, the current IS definition could remain unchanged.

iv. Definition of ESP and EAP should not be retired since they are still an effective approach for the network perimeter level security controls for physical and virtual machines. Logical isolation is not a defined term is very subjective. If the SDT intended to allow Cyber Asset level security controls, such as using local policies based firewalls, it should be an alternative measure rather than eliminating ESP and EAP approach.

v. If the SDT intended to include non-ESP PCAs, our proposed modifications to PCA can meet SDT's goal.

RECOMMENDATIONS - Modifications to ERC, IRA, and PCA:

- **ERC:** The ability to access a BCS from a Cyber Asset that is outside of the Electronic Security Perimeter in which the BCS resides via a bi-directional routable protocol connection, or the ability to access a BCS that is not within any ESPs from a Cyber Asset through an EACMS controlling communications to and from the BCS via a bi-directional routable protocol connection.
- **IRA:** User-initiated interactive access by a person employing a remote access client or other remote access technology. Remote access originates from a Cyber Asset, using a routable protocol, that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications.
- **PCA**: One or more Cyber Assets (1) that are connected to a BCS using a routable within an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP; or (2) that are connected to a BCS using a routable protocol where an ESP model is not used and doesn't pass through any EACMS controlling communications to and from the BES Cyber System. The impact rating of Protected Cyber Assets is equal to the BCS it is connected to; (3) that share CPU or memory with a BCA, EACMS or PACS. The impact rating of Protected Cyber Assets is equal to the above highest rated Cyber Asset that shares CPU or memory with the Protected Cyber Assets.

Comment	

Some of the proposed changes are unclear and require clarification to correctly scope requirements. Examples include:

1. ERC – With the new definition the term “external” becomes vague. Since there would be no ESP the entity would have to define “external” to what.

2. IRA - Explanation would be needed to clearly define what a “remote access client” is in a virtual environment.

These are a few of the concerns with the proposed changes which could create a hole in applicability scoping.

Also, the retirement of well-established terms (EAP and ESP) will make entities have to make changes to their CIP program regardless if an entity moves into virtualization or not. Recommend that ESP and EAP definitions be left in the glossary of terms.

Response

Richard Jackson - U.S. Bureau of Reclamation - 1

Answer	No
Document Name	

Comment

Reclamation recommends the following changes:

- Management Interface should be from within a BES level protected physical location and maintain NERC CIP electronic cyber security controls.
- Include Management Modules within the SCIdefinition..
- Include Management Interface and Modules in BCS definition.

Reclamation also identifies that Self-contained Application is essentially bundled software and may not need to be defined as a new definition within the NERC Glossary of Terms.

EAP and ESP should not be retired terms because they are still acceptable methods for isolating BCS from other assets and will continue to be widely used by entities that do not convert to virtualization or phase it in over time.

John Galloway - John Galloway On Behalf of: Michael Puscas, ISO New England, Inc., 2; - John Galloway

Answer	No
Document Name	

Comment

ISO-NE disagrees with the proposed draft definitions. The draft definitions are complex and ambiguous, which could lead to misinterpretations, improper technical implementations and increased risk of non-compliance with the NERC CIP Standards.

ISO-NE believes that the draft definitions introduce a complex and difficult matrix of possible device identifications that are theoretically mutually exclusive (Cyber Asset, Virtual Cyber Asset, Shared Cyber Infrastructure (SCI), Management Modules) and that must then be assigned one or many ‘roles’ (BCA, EACMS, etc.).

ISO-NE recommends that the Standard Drafting Team (SDT) create definitions that are mutually exclusive, do not embed dependencies and references to other definitions for scope, and assign only one role or categorization to a cyber system. It may be more straightforward to update the Cyber Asset definition to accommodate multiple technologies including physical or virtual components that comprise a device (such as hardware, software, and data).

Additionally, ISO-NE disagrees with the retirement of the Electronic Security Perimeters (ESP) and Electronic Access Points (EAP) defined terms. These defined terms are well understood and implemented throughout the industry with known costs and audit expectations. Retiring the ESP and EAP defined terms will require local definition of logical isolation with unknown impacts to programs as well as audit expectations. Maintaining the definitions does not prevent adoption of technology and practice that can enhance security of critical infrastructure. The SDT has publicly commented that the proposed logical isolation requirements allow for backwards compatibility and that an Entity may continue to implement ESPs and EAPs as a form of logical isolation. Therefore, these terms should not be retired and should remain active in the Glossary of Terms Used in NERC Reliability Standards.

The SCI definition seems to address specific scenarios involving storage and/or host virtualization infrastructure, but may be interpreted more broadly to include sets of systems supporting configuration management and monitoring/remediation support systems that may not have been intended for inclusion, e.g. Ansible Tower, Tripwire, and Tenable Security Center. The SDT should consider greater specification of the characteristics of “Management Systems used to initialize, deploy, or configure the Shared Cyber Infrastructure.”

The proposed Self-Contained Application (SCA) definition includes terms such as “isolated,” which could be interpreted by Regional Entities to mean that SCAs would not be allowed network connectivity. Most containers inherently need a network address to perform their purpose.

In addition, the use of “immutable” may be problematic. The definition of Self-Contained Applications containing the term “immutable” does not apply to Containers. A running container can be configured to be ‘mutable’ during the runtime. This may negate containers from the definition. ISO-NE recommends revising the definition to the following suggested language:

“Packaged software, consisting of binaries that cannot be modified, containing application software, operating system, and all relevant dependencies designed to execute independent of any other software or containers residing on the same infrastructure. Self-Contained Applications may exist on Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructures.”

Comment

We have numerous reasons for voting NO. Several other Entitys' comments show some of our concerns.

After a couple years of Industry and Drafting team laborous discussions and outreach, NERC recent decided to withdrawn CIP-002-6 for FERC's approval and comments. This is a clear sign a Master Plan needs to be created instead of the current numerous different CIP Projects being run with different drafting teams. Too many old and out dated tasks and orders. Soon, and to confuse things more, there will be four CIP drafting teams all changing CIP standards, in most cases the same ones with all different implementation plans. Very confusing, expensive, and administratively budensome for registered entities.

We suggest NERC work with Industry, DOE, and FERC to decide which way to procede with all CIP Standards (develop a Master Plan). Instead of having numerous drafting teams, such as this ones, working on old outdated assignments that will be changed or withrawn in the near future. It seems we are spinning our wheels and getting bogged down in paperwork and cost with no measurable/tangible reliability benefits being realized.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment

Southern Company supports most but not all of the proposed additions, revisions, and retirements of terms. Southern respectfully would like to make the following suggestions for SDT consideration:

1. **Electronic Security Perimeter (ESP)** – Southern requests that the definition of ESP not be retired because the transition (or no transition at all) to virtualization and/or virtualized networks will take considerable amounts of time and effort, and ESPs are still a viable form of logical isolation that can help entities and auditors if it remains active as a defined term. Southern also suggests either referring to ESP’s within a new proposed definition of Logical Isolation, or adding it to the Measures as an example compliance method.

2. **Electronic Access Point (EAP)** – Southern requests that the definition of EAP not be retired because the transition (or no transition at all) to virtualization and/or virtualized networks will take considerable amounts of time and effort, and EAPs are still a viable form of logical isolation that can help entities and auditors if it remains active as a defined term. Southern also suggests either referring to EAP's within a new proposed definition of Logical Isolation, or adding it to the Measures as an example compliance method.

a. Now, taking a step back, Southern request the SDT to also consider:

i. What if the SDT were to retire just the EAP term and then redefine ESP (keep the term) so that it can incorporate a FW on a network edge or a full ZTA "dynamic, encrypted, authenticated, and authorized session" between two objects defined in an access policy without regard to network locations? In other words, static or dynamic "perimeters". Keep the term, just define it at a more objective level than "logical border around a network" and in terms of protecting access to and from a group of applicable assets.

3. **Electronic Access Control and Monitoring System** – Southern requests that the SDT consider that the proposed modifications to the EACMS definition appears to exclude electronic access monitoring by an EACMS of the BES Cyber Systems themselves, but rather that only electronic access monitoring of the logical isolation of those systems is required.

a. *Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring of* ***the logical isolation of BES Cyber Systems.*** *This includes Intermediate Systems.*

b. Consider this as an alternative to the EACMS definition: *Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform (1) electronic access control (including Intermediate Systems) or (2) electronic access monitoring of high and medium impact BES Cyber Systems and their associated* ***logical isolation configuration(s)****.*

4. **Logical Isolation** (Undefined Term) – Southern supports the SDT's move toward the use of the term "logical isolation", however, due to its expansive use within CIP definitions and enforceable Reliability Standards, a common understanding and definition of this term is needed to support entity compliance. Southern provides the below suggested language for consideration in this newly defined term:

a. **Logical Isolation:** the implementation of tools, devices, systems, or rules to restrict access and communications to that which is deemed necessary, and deny all other access or communications by default. Examples of Logical Isolation include the implementation of ESPs, EAPs, Zero Trust architectures, affinity rules, etc.

NOTE: *Cyber Security Incident; Electronic Access Control or Monitoring Systems (EACMS); Interactive Remote Access (IRA); Protected Cyber Asset (PCA); Removeable Media; Reportable Cyber Security Incident; Transient Cyber Asset (TCA) are all definitions that require a common understanding of "logical isolation" for it to be correctly implemented.*

5. **Cyber Security Incident** – Southern respectfully requests the SDT consider the following edits to the proposed changes to the CSI definition:

a. A malicious act or suspicious event that:

• For a high or medium impact BES Cyber System, compromises or attempts to compromise (1) a BCS, (2) a Cyber Asset, VCA, or SCI performing logical isolation of a BCS (e.g., EACMS, SCI), or (3) a Physical Security Perimeter; or

• Disrupts or attempts to disrupt the operation of a BES Cyber System

6. **Cyber System** (Undefined Term) – Modifications have been made under the exemptions section in CIP-002-7 which move from a Cyber Asset focus to a "cyber system" focus without a corresponding definition of what that term encompasses. With the difficulty of understanding the scope of this undefined term in virtualized environments, Southern recommends developing a definition for "cyber system", such as:

a. **Cyber System:** one or more Cyber Assets, VCAs, or SCI used to perform or achieve a cyber-based objective by a Responsible Entity or other party.

b. Additionally, Southern requests the SDT to consider that Part 4.2.3.3. should be a sub-set of Part 4.2.3.2. rather than a stand alone item.

7. **Self-Contained Application** - Southern does not support the proposed definition for Self-Contained Application as it is highly technical and ambiguous in nature. Southern requests that the SDT consider the NIST defined term for “Container” below, which we believe is a clearer and more understandable definition for what Self-Contained Application is trying to achieve.

A method for packaging and securely running an application within an application virtualization environment. Also known as an application container or a server application container.

Alternatively, consider having no definition for Self-Contained Application and allow CIP-010 R1 to track changes to “application container repositories.” Include in the TR or IG, entities should treat “containers/repositories” like applications and not like Cyber Assets or Virtual Cyber Assets.

8. **Shared Cyber Infrastructure** – Southern does not support the current definition of Shared Cyber Infrastructure for the following reasons:

a. The SCI definition refers to Management Systems used to initialize, deploy, ***OR*** configure, but the definition of Management Systems states that in order to be a Management System it must initialize, deploy ***AND*** configure. The two definitions appear to conflict with each other, and Southern requests that both terms use the ***AND*** conjunction.

b. **Below is a proposed revision:**

i. One or more programmable electronic devices (excluding Management Modules) and their software that share CPU, memory, or storage resources with one or more BES Cyber Systems or their associated EACMS, PACS, or PCA; this includes Management Systems used to initialize, deploy, **and** configure the Shared Cyber Infrastructure.

c. Given the complexity of trying to mix requirements that apply equally to physical Cyber Assets and Cyber Assets hosted on SCI, Southern also requests the SDT consider the possibility of splitting definitions and applicable requirements out further to avoid confusion and still provide forward-looking, objective-based requirements for each scenario. For example – the “V” prefix used below could be a qualifying indicator of “virtual” BCS, EACMS, or PACS.

i. Shared BCS Infrastructure (SBI): For H/M impact V-BCS and associated PCA.

ii. Shared Cyber System Infrastructure (SCI): For V-EACMS, or V-PACS associated with H/M BCS or SBI.

During the Feb. 23, 2021 webinar, the SDT pointed out the scope of changes is limited by the SAR (V5 TAG, Order 822). When asked during the webinar, they referenced looking to the Applicable Systems where they tried to keep the proposed changes only to address those items in scope. This can be seen in numerous requirements where Management Modules only "of SCI" have been added when logically the definitions could also apply to Management Modules of any applicable stand-alone system. The SDT explained the definitions are not intended to reach outside of virtualization by bringing in patching or other configuration management systems. This is supported by the rationale presented with the proposed definitions for Management Modules and Management Systems. The proposed definitions for these glossary terms do not align with that limitation.

The Management Modules definition as written clearly includes physical Cyber Assets with out-of-band management ports, which does not align with the SDT intent discussed above.

The Management Systems definition as written would include a Cyber Asset that maintains the integrity of another Cyber Asset, through control of the processes for configuring those assets, which would expand the scope of the definition beyond virtualization.

These inconsistencies between the definitions and intended scope will inevitably cause confusion for industry and auditors. Although the expanded scope of these terms is in the best interest of Cyber Security, the definitions should be revised to match the rationale and only target the intended virtualization scope. The definitions can always be expanded in future Standards Authorization Requests when the scope of change also allows for the SDT to include the applicable stand-alone systems.

Recommendations:

Revise the definitions of Management Modules and Management Systems to limit the scope for purposes of virtualization. Suggested revisions are below.

Management Module - An autonomous subsystem of a [**delete: Cyber Asset or**] Shared Cyber Infrastructure that provides management and monitoring capabilities independently of the host system's CPU, firmware, and operating system.

Management Systems - Any combination of Cyber Assets or Virtual Cyber Assets that establish and maintain the integrity of [**delete: Cyber Assets or]** Virtual Cyber Assets, through control of the processes for initializing, deploying and configuring those assets and systems; excluding Management Modules.

Revise the definition of Shared Cyber Infrastructure to be consistent with the definition of Management Systems. Suggested revision below.

Shared Cyber Infrastructure (SCI) - One or more programmable electronic devices (excluding Management Modules) and their software that share their CPU, memory, or storage resources with one or more BES Cyber Systems or their associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets; including Management Systems used to initialize, deploy, **[delete: or**] and configure the Shared Cyber Infrastructure.

We propose to keep the **EAP** and **ESP** as NERC Glossary terms; this will avoid future auditor interpretation issues, allow consistent application of the concepts across industry and preserve backwards compatibility.

We propose the SDT creates a glossary term for “logical isolation” to assist entities and auditors in establishing the scope of this concept as it applies to the CIP Standards.

Response

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name CHPD

Answer	No
Document Name	

Comment

CHPD has a concern with the change to the definition of EACMS. The new definition reads, “Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring **of the logical isolation of BES Cyber Systems.** This includes Intermediate Systems.” Previously, the definition stated, “… monitoring **of the Electronic Security Perimeter or BES Cyber Systems**”. The new language excludes devices that perform access control and monitoring of BES Cyber Systems. This will exclude things like AD Controllers, logging servers, etc.

Another concern is the definition of Protected Cyber Asset. CHPD had hoped that the new standards would allow more use of virtualization by clarifying the requirements and making it easier to virtualize a BES Cyber System. Instead, with the phrase “Share CPU or memory with a BES Cyber System; excluding Shared Cyber Infrastructure” in the definition of Protected Cyber Asset it becomes too onerous to even consider virtualizing a BES Cyber System, as simply locating it on the same hardware as a non-BES Cyber System forces all the other VMs to become PCAs. Virtualization of a BES Cyber System was never impossible under the old standards, it was simply the guidance that all VMs would become PCAs that made it untenable, especially for smaller entities who do not have enough BES Cyber Systems to justify separate hardware just for them. It also does not consider network architectures that would mitigate vulnerabilities, such as isolating the virtual cluster from the internet or even the corporate network. The CPU/memory isolation language used in this definition and in other requirements make this draft untenable. Please see question 19 for more on this.

The term “asset” in the definition of IRA is not a defined term and needs to be made clearer. Either “the asset described in CIP-002 Attachment 1” or PSP could be alternatives.

One last concern is the way that scoping has been removed from the definitions. While CHPD could support the removal of scoping from the requirements, it has left the requirement language cumbersome and confusing. Scoping should be kept out of the requirement language and should be limited to the Applicable Systems language, or if that is impossible, left in the definition. For details on this, see comments on CIP-005 R1.2 in question 3.

Adrian Andreoiu - BC Hydro and Power Authority - 1

Answer	No
Document Name	

Comment

BC Hydro SME team appreciates the opportunity to review the proposed changes and offers specific comments on the following new terms or modified definitions:

- IRA (Interactive Remote Access): The new definition of IRA no longer limits the applicability to routable protocols only. This may result in some additional communication types to be included in scope like serial over dial-up and potentially could have significant scope impact on BC Hydro's NERC CIP compliance program e.g., this removal of routable only restriction specifically affects Medium Impact BES Cyber BCS with Interactive Remote Access (IRA) and their associated PCA (CIP-005-8 R2.1) and a large number of Medium Impact BES Cyber BCS without External Routable Connectivity assets will come in scope due to this change and expansion in scope to meet the requirement of utilizing an Intermediate System as per the new definition of IRA.

Secondly, we seek clarity on the terms used in the definition of IRA e.g., what is the difference between outside of the asset containing the system being accessed (what is defined as the 'asset') vs. outside of the logical isolation. A typical example is an asset that could be a transmission station or a specific line. If a digital protection relay associated with line has a logical isolation perimeter, would there be concerns with communications from within the station but outside that perimeter, or only with communications from outside of the station completely, as stated in the IRA definition with the specific use of the 'OR' condition.

BC Hydro recommends that the definition of the IRA continues to include the use of the terms related to routing, and suggests that IRA be defined as follows:

"User-initiated access by a person employing a remote access client from outside of the asset containing the system being accessed or outside of the logical isolation of the system being accessed, or other remote access technology using a routable protocol."

SCA (Self-Contained Application): We request additional clarification and/or examples on SCA, e.g. examples of immutable software in NERC CIP environment.

Response

Nicolas Turcotte - Hydro-Qu?bec TransEnergie - 1

Answer	No
Document Name	

Comment

We support the NPCC TFIST and RSC comments and submit the following additional comments:

Request clarification of Logical Isolation definition. Is the intended definition “The logical border surrounding a VCA associated to a BES Cyber Systems which is connected using a routable protocol”?

Request the review of the EACMS definition or define logical isolation, because the current definition is suggesting that only EACMS are to be used for logical isolation which is not the current case. For example, the usage of an Active Directory could be associated to a BES Cyber System only and not to a logical isolation. Suggest reinstating the “OR”, of the logical isolation Electronic Security Perimeter(s) of BES Cyber Systems or BES Cyber Systems.

Request the review of the Shared Cyber Infrastructure (SCI), the definition seems to define two types of objects; the first object being the server that is sharing the CPU, memory, or storage and the second oject is the console (management system) which is used to initialize, deploy, or configure the Shared Cyber Infrastructure. So in the VMWARE world, the ESX is SCI and the VCenter is a SCI.

Colleen Peterson - Basin Electric Power Cooperative - 1,3,5,6

Answer	No
Document Name	

Comment

Basin Electric's concern is that it appears that none of this is applicable to the cloud throughout this project 2016-02 and none of it identifies it as such. This hinders NERC's ability to move forward in the area of cloud based applications. Again - this applies across the board to all questions.

Are they going to keep the concept of EAC and EAMs? Basin would be in support of this depending on how they define and write up EAC and EACMS.

Storage array issue - since storage array wasn't directly impacting assets, this would massively impact Basin Electric - goes against how we have been defining that. PACS on to the storage array - which by these new definitions, the implication would be that we would need separate storage array for assets that are in scope. Inherent separations are there such as encryption, so this would cause quite a bit of additional work here. NERC needs to clearly identify what is contained here.

Section D - logical isolation is not a defined term. We would like to see an actual definition for "logical isolation"

IRA recommendation - would rope in all desktops by definition to Cyber Assets but not BES Cyber Assets. Clarify between BES Cyber Asset - BROS reliability impacts - 15 minute impact; Cyber Asset is all encompassing, programmable electronic devices that include hardware, software.

Response

Eli Rivera - CenterPoint Energy Houston Electric, LLC - NA - Not Applicable - Texas RE

Answer	No
Document Name	

Comment

CenterPoint Energy Houston Electric, LLC (CEHE) suggests that the phrase, “or other remote access technology” does not need to be removed from the Interactive Remote Access definition. The proposed definition for Interactive Remote Access (IRA) seems to dictate a remote access client must be used. Otherwise, entities not using a remote access client would not consider their remote connections to be IRA.

The proposed definition for Intermediate Systems is overly broad and could potentially label other EACMS (such as Cyber Assets controlling two-factor authentication or domain controllers) as Intermediate Systems as these systems aid in restricting IRA. Furthermore, Intermediate Systems do not by themselves restrict IRA. For instance, access control for a Microsoft Windows server acting as a jump host (Intermediate System) is performed by a domain controller.

External Routable Connectivity (ERC) as previously defined using the Electronic Security Perimeter (ESP) implied a degree of separation between a system with ERC and the external world, even though it doesn’t use physical or geographical terms. The new definition removes the words “that is outside of its associated ESP” since ESP is no longer defined. This makes the definition confusing and could possibly be misinterpreted. For example, in a segmented network, each BCS could have ERC to its neighbor in the same rack if traffic is traversing a firewall or router with ACLs defined.

ERC was meant to define access from outside the asset facility, not from the same rack. It is not clear this new definition means what is intended.

CEHE suggests retaining a sense of separation by saying ERC originates from: a) a Cyber Asset not identified in CIP-002; b) an identified Cyber Asset located at another asset; or c) an identified Cyber Asset that is logically separated behind a different EACMS. These criteria may not be airtight, but begin to address this issue, where a BCS could have ERC to its physical neighbor but not to a Control Center that controls it.

Southern Indiana Gas & Electric Company d/b/a CenterPoint Energy Indiana South (SIGE) suggests that the phrase, “or other remote access technology” does not need to be removed from the Interactive Remote Access definition. The proposed definition for Interactive Remote Access (IRA) seems to dictate a remote access client must be used. Otherwise, entities not using a remote access client would not consider their remote connections to be IRA.

The proposed definition for Intermediate Systems is overly broad and could potentially label other EACMS (such as Cyber Assets controlling two-factor authentication or domain controllers) as Intermediate Systems as these systems aid in restricting IRA. Furthermore, Intermediate Systems do not by themselves restrict IRA. For instance, access control for a Microsoft Windows server acting as a jump host (Intermediate System) is performed by a domain controller.

External Routable Connectivity (ERC) as previously defined using the Electronic Security Perimeter (ESP) implied a degree of separation between a system with ERC and the external world, even though it doesn’t use physical or geographical terms. The new definition removes the words “that is outside of its associated ESP” since ESP is no longer defined. This makes the definition confusing and could possibly be misinterpreted. For example, in a segmented network, each BCS could have ERC to its neighbor in the same rack if traffic is traversing a firewall or router with ACLs defined.

ERC was meant to define access from outside the asset facility, not from the same rack. It is not clear this new definition means what is intended.

SIGE suggests retaining a sense of separation by saying ERC originates from: a) a Cyber Asset not identified in CIP-002; b) an identified Cyber Asset located at another asset; or c) an identified Cyber Asset that is logically separated behind a different EACMS. These criteria may not be airtight, but begin to address this issue, where a BCS could have ERC to its physical neighbor but not to a Control Center that controls it.

IRA—The changes to Interactive remote Access (IRA) could use some additional changes. The phrase “outside of the asset containing the system being accessed” seems like it could be removed. Many entities use logical isolation to control access to groups of assets (whether virtual or physical) within the current ESP definition. There shouldn’t be a requirement to control access from each device but simply a requirement to show that there are controls in place to prevent access. This can be done by showing logical or physical isolation, which would include an asset or group of assets. The remaining phrase “from outside of the logical isolation of the system being accessed” appears sufficient to meet this intent.

PCA —The changes to the Protected Cyber Asset (PCA) definition has a phrase that states “that are being actively remediated prior to indroduction to the production environment.” This seems to indicate a compliance activity or compliance requirement and not a compliance definition. It is not clear from this phrase what is being actively remediated. The rationale indicates that it is while the VCA is being prepped from deployment, but there still appears to be a lack of clarity with mixing definitions and activities and this could use some clean up. Additionally, in the previous defintions, PCA was defined as something that was routably connected to a BCS. This newly proposed definition moves to a concept of logically isolated. It is unclear at this time what is expected to logically isolated a devices from a BCS when the devices is serially connected to the BCS. Therefore, it makes it makes it unclear if a device qualifies as a PCA when it is serially connected to a BCS with this proposed definition.

AZPS agrees with the comments provided by EEI on the proposed additions, revisions, and retirements of terms. A further clarification to the following definitions would be appreciated:

1. Logical Isolation (Undefined Term) – AZPS recommends “logical isolation” be defined. A clear understanding of this term is necessary given that new and revised CIP definitions rely on this term. Additionally, a definition is needed to support compliance.

2. Cyber System (Undefined Term) - AZPS recommends developing a definition for “cyber system”. The exemptions contained within CIP-002-7 have moved from a Cyber Asset focus to one that focuses on the undefined term “cyber system”. The development of a definition for cyber system is needed to provide a common understanding for compliance.

3. Cyber Security Incident; Electronic Access Control or Monitoring Systems (EACMS); Interactive Remote Access (IRA); Protected Cyber Asset (PCA); Removeable Media; Reportable Cyber Security Incident; Transient Cyber Asset (TCA) – AZPS generally supports the revisions of these terms, however, the definitions for these terms rest on a common understanding of “logical isolation”. Logical isolation should be defined prior to implementing these changes.

Response

JT Kuehne - AEP - 6

Answer	No
Document Name	

Comment

AEP agrees with many of the proposed additions, revisions, and retirements of terms. While we support modifications to the CIP Reliability Standards and associated definitions that more clearly accommodate virtualization, it is imperative that legacy solutions remain in the standards for those entities who intend to continue to use those solutions.

AEP generally supports EEI’s suggestions and further suggests that acceptable methods of Logical Isolation including ESP, Zero Trust, etc. should be included in the definition of Logical Isolation and not include these acceptable methods within Measures. These suggestions are listed below.

Electronic Security Perimeter (ESP) – AEP does not support the retirement of this term because some companies may not have immediate plans or ability to move to virtualized networks. While we support changes made to CIP-005, the retirement of the term ESP without some reference to this term within the definition of logical isolation or within the measures within CIP-005 could create confusion. To resolve this concern, AEP requests the term ESP to be referenced within the definition of logical isolation.

Electronic Access Point (EAP) – AEP does not support the retirement of this term because many companies may not have immediate plans or ability to move to virtualized networks. AEP requests similar accommodations as suggested above within our comments regarding ESPs.

Logical Isolation (Undefined Term) – AEP supports the move toward the use of the concept of “logical isolation,” however, due to its expansive use within the Reliability Standards, a definition of this term is needed. In developing a definition, AEP requests that the definition for logical isolation include ESP as an acceptable method of Logical Isolation within a defined term. NOTE: *Cyber Security Incident; Electronic Access Control or Monitoring*

Systems (EACMS); Interactive Remote Access (IRA); Protected Cyber Asset (PCA); Removable Media; Reportable Cyber Security Incident; Transient Cyber Asset (TCA) are all definitions that require a common understanding of "logical isolation" to be fully understood.

Cyber System (Undefined Term) - AEP recommends developing a definition for "cyber system" as a defined term. The Exemptions section contained within all of the proposed CIP Reliability Standards have moved from a Cyber Asset focus to one that focuses on the undefined term "cyber system". The development of a definition for cyber system is needed to provide a common understanding for compliance.

Self-Contained Application - AEP does not support the proposed new definition for Self-Contained Application and questions the need for this term. AEP recommends commonly used and understood IT terms be used. In place of the proposed term, AEP suggests the IT term "Container", which is commonly understood and appears to have the same definition as proposed for "Self-Contained Application".

Shared Cyber Infrastructure (SCI) – AEP does not support the currently proposed definition for Shared Cyber Infrastructure for the following reasons:

- The proposed definition refers to Management Systems used to initialize, deploy, **OR** configure but the definition of Management Systems states that to be a Management System it must initialize, deploy, **AND** configure. These two definitions presently conflict with each other. Before the proposed definition of SCI can be accepted, the identified conflict between this term and its companion term (Management Systems) needs to be harmonized.
- Currently, the scope of SCI is unclear. An explanation of the limiting factors for the scope of SCI regarding their software should be provided, e.g., would the firmware of a server blade be included within the scope of SCI?
- AEP also suggests that the proposed definition would be more easily understood if more language and terms were drawn from current NERC CIP acronyms rather than using their long form names.
- The term SCI may not be clear or fully understood by all entities and we suggest adding examples within the Technical Rationale.

Interactive Remote Access (IRA): While AEP understands the need to streamline the definition of IRA, additional clarification is needed to better describe IRA in the context of virtualization, particularly regarding serial links.

Management Systems: This definition appears to align with the definition of a hypervisor, however, it also includes some language that tries to straddle between both virtualized and non-virtualized environment. This ambiguity may create confusion, and AEP recommends the definition be clarified. It may also be helpful to include some examples of Management Systems within the Technical Rationale.

External Routable Connectivity (ERC): AEP recommends adding "or SCI" at the end of the proposed modification once the definition of SCI is clarified. Current draft reads, "The ability to access a BES Cyber System or Shared Cyber Infrastructure from a Cyber Asset or Virtual Cyber Asset through an Electronic Access Control or Monitoring System controlling communications to and from the BES Cyber System that is outside of its associated Electronic Security Perimeter via a bi-directional routable protocol connection."

Comment

AEPCO is signing on to ACES comments, see below:

ACES feels it's time to address Intermediate Systems (IS) as applicable systems without lumping it in with EACMS. This will allow for more granular controls for IS without having to change other standards and requirements.

On the NERC/SDT webinar, the term "Self-Contained Application" wasn't covered thoroughly. The term is only used in CIP-010, and the definition seems to allude to a software appliance/package such as a virtual firewall, router, etc. Further, if software is running in a truly isolated environment the only security risk would be a physical attack. ACES does not see the need for this Term.

External Routable Connectivity's definition does not read well. Having Cyber Asset or Virtual Cyber Asset in the definition limits scope to those asset classes. The "from" is irrelevant and should be not be limited to any type of device. The definition is founded in communication, not Cyber Assets. Proposed language: The ability to communicate, via a bi-directional routable protocol connection, with a BES Cyber System or Shared Cyber Infrastructure from outside of the BES Cyber System's or Shared Cyber Infrastructure's logical isolation.

Comment

Proposed definitions such as Management Module, Management Systems, Self-Contained Applications, Revised IRA definitions are vague or confusing. Definitions should not rely on rationale documents as a supplement; rather, they should be clear in a standalone format within NERC Glossary of Terms. There appears to be some overlap between the definition of SCI and Management Systems. As the new proposed definitions are used to determine applicability, their clarity is extremely important. We recommend further clarifications be made to these new definitions. As the new/revised definitions are the basis for all the revisions, Hydro One is not able to support the proposed revisions to CIP Standards at this time.

Response

David Jendras - Ameren - Ameren Services - 3

Answer	No
Document Name	

Comment

Ameren generally agrees with EEI's comments with some added suggestions. We suggest that logical isolation should be fully defined, and also suggest using the term "logical border" instead of logical isolation. We suggest that assets should be required to have one logical border. In regards to the term Cyber System, Ameren suggests the definition Collection of Cyber Capable Devices. We ask that the SDT not be too prescriptive in their definition, and suggest using the NERC Glossary of terms definition.

We differ with EEI's suggestion for Self-Contained Application because if there's new technology that isn't a container, it could be classified as SCA. Regarding Shared Cyber Infrastructure, Ameren suggests including examples of systems, and we ask that the scope be more defined. Regarding Interactive Remote Access, Ameren believes that the definition provided doesn't make much sense, as current remote workspaces would be considered remote access.

Comment

Definition changes are not clear and will cause confusion as well as differing interpratations.

Concerns with the definition changes creating a gap in applicable system scope. Proposed defintions appear to create multiple identifiers (SCI, EACMS, Intermediate System, PCA) to the same device.

We suggest keeping the ESP and EAP definitions in the active portion of the glossary.

Does new ERC definition introduce a new Requirement?

Other areas of concern include

- What is the definition of a “remote access client?” 2)
- Need clarification on “outside the asset”.
- Need clarification on the relationship of physical isolation to logical isolation
- Need clarification in regards to Intermediate Systems. The proposed definitions can be interpreted to include firewalls as Intermediate System.
- Need clarification on Management Module and Management Systems
- Need clarification of SCI’s definition. The proposed definition of SCI could include network devices. SCI interpretations say that network services are not SCI.
- Need clarification on Storage. Appears that Storage is a Cyber Asset but not part of a Virtual Cyber Asset. This appears inconsistent.
- Need clarification on Virtual Cyber Asset as a Protected Cyber Asset

Comment

Texas RE appreciates the Standard Drafting Team's (SDT's) efforts to establish a framework to specifically address the implementation of virtualized CIP architectures within CIP environments. Nevertheless, Texas RE does not agree that wholesale changes are need to the CIP standards to address virtualization. Instead, Texas RE suggests the SDT consider creating virtualization specific terminology that is applicable to the current overarching CIP framework. Texas RE believes this is best accomplished by (1) amending current CIP definitions to specifically address virtualization concepts; and (2) creating virtualization specific definitions where appropriate. Consistent with this overarching view, Texas RE has the following comments on the proposed definitions:

Electronic Access Control or Monitoring Systems (EACMS)

Texas RE seeks clarification on why the SDT proposed to remove the phrase "or BES Cyber Systems" found in the current approved EACMS definition. Removing this language could inadvertently remove Cyber Assets such as log collectors, SIEMS, and active directories from being identified as EACMS because they do not "*perform electronic access control or electronic access monitoring of the logical isolation of BES Cyber Systems*." Texas RE instead suggests retaining the concept that EACMS include Cyber Assets that perform electronic access monitoring of either logical isolation or BES Cyber Systems to include these devices.

Additionally, Texas RE strongly recommends the proposed EACMS definition retain the five EACMS functions – (1) authentication; (2) monitoring and logging; (3) access control; (4) Interactive Remote Access; and (5) alerting – documented in CIP-002-5.1a, recognized by the SDT in the CIP-008-6 project, and documented by FERC addressing enhanced reporting for EACMS performing those five functions. This inclusion will reduce ambiguity by clarifying the functional attributes associated with EACMS.

BES Cyber System Information (BCSI)

The words "ESP names" was removed with no replacement. Texas RE recommends adding the words "Logical Isolation names" to ensure clarity.

Electronic Access Point (EAP)

Texas RE does not agree this term should be retired. Please see the comments regarding CIP-005 in response to the SDT’s Question No. 2.

External Routable Connectivity (ERC)

The current language states “…through an Electronic Access Control or Monitoring System controlling communications...”. If in the scenario, routable protocol is being used but not through an EACMS, then by definition there would be no ERC. Texas RE recommends revising the language to “*The ability to access a BES Cyber System or Shared Cyber Infrastructure from a Cyber Asset, Virtual Cyber Asset, or Shared Cyber Infrastructure that is outside its associated logical isolation via a bi-directional routable protocol connection*.”

Electronic Security Perimeter (ESP)

Texas RE does not agree this term should be retired. Please see the comments regarding CIP-005 in response to SDT Question No. 2. Texas RE recommends defining “logical isolation” for clarity. The undefined term “routable protocol” should be defined to address layer 3 traffic. In part 1.5 further confusion is added by using an uppercase “Internet Protocol (IP)”, which is also not defined. In Texas RE’s experience, these undefined terms have caused interpretation issues in the past. Texas RE therefore recommends limited use of undefined terms in the proposed Standard Requirement revisions.

Interactive Remote Access (IRA)

Removing the words “or other remote access technology”, causes a risk that if a remote access client is not used then it is out of scope for IRA. To address this and ensure a comprehensive IRA definition, Texas RE recommends the proposed IRA definition be revised to read: “User-initiated access by a person employing remote access technology outside of the asset containing the system being accessed or outside of the logical isolation of the system being accessed.”

Intermediate Systems

Texas RE recommends the proposed Intermediate Systems definition be adjusted slightly to address the possibility that there could be one or more EACMS used to restrict IRA by adding “(s”) to the EACMS definition. The revised language would read: “*Electronic Access Control or Monitoring System(s) that is used to restrict Interactive Remote Access*.”

Cyber Asset

Texas RE recommends the definition of Cyber Asset be renamed to “Hardware Cyber Asset” to make the distinction with Virtual Cyber Asset.

BES Cyber Asset (BCA)

Consistent with Texas RE’s suggested revisions to the “Cyber Asset” definition to better clarify the distinction between physical and virtual Cyber Assets, Texas RE further recommends that the SDT revise the BCA definition to “A Hardware Cyber Asset or Virtual Machine that” in order to clarify that BCAs include both physical and virtual Cyber Assets.

Virtual Cyber Asset (VCA)

Texas RE recommends aligning the VCA definition set forth in NIST's Computer Security Resource Center glossary as proposed below. The SDT could accomplish this by either addressing the concepts below in the VCA definition itself or creating new definitions.

New term: Virtual Machine.

Definition: A simulated environment created by Virtualization.

New term: Hypervisor.

Definition: The Virtualization component that manages the guest OSs on a Virtualized Host and controls the flow of instructions between the guest OSs and the physical hardware.

New term: Virtualized Host.

Definition: The Hardware Cyber Asset on which the virtualization software such as the Hypervisor is installed. Usually, the Virtualized Host will contain a special hardware platform that assists virtualization - specifically Instruction Set and Memory virtualization. Virtualized Hosts inherit the impact rating and categorization of all hosted Virtual Machines. This phrase would be used instead of Shared Cyber Infrastructure (SCI).

New term: Virtualization.

Definition: The simulation of the software and/or hardware upon which other software runs.

New term: Container

Definition: A method for packaging and securely running an application within an application virtualization environment. Also known as an application container or a server application container.

Shared Cyber Infrastructure (SCI)

Texas RE believes that the proposed definition for "Shared Cyber Infrastructure" is too broad in scope. Texas RE reads the current language to include devices normally considered part of the Cyber Asset definition.

Many computer systems are, by design, discrete programmable electronic devices joined together to serve a collective function. This is accomplished by sharing one or more of their CPU, memory, or storage resources with each other. For example, a video card is a programmable electronic device. It shares its CPU and resources with the Cyber Asset it is installed on. As such, it would appear to meet this definition of SCI. Along similar lines, because a data storage virtualization technology (RAID) controllers share their storage resources with the Cyber Assets in which they are installed, such storage technology controllers would also appear to meet this definition. Finally, a computer's motherboard is a programmable electronic device. Its primary function is to facilitate the sharing of CPU, memory, and storage resources between the various discrete devices that have been connected to it. Texas RE respectfully requests the SDT consider these examples in developing an appropriate SCI definition.

Management Modules

Texas RE recommends defining the phrase “autonomous subsystem” as the definition of Management Modules may pull into scope certain devices, depending on how “autonomous subsystem” is defined. For example, some data storage virtualization technology (RAID) controllers provide management and monitoring capability independent of the host system’s CPU, firmware, or operating system. As such, these data storage virtualization technology controllers would appear to meet the definition of Management Module.

The definition of Shared Cyber Infrastructure is open to multiple interpretations as written. The confusion is compounded by the exclusion of Shared Cyber Asset from the definition of Cyber Asset (Cyber Asset itself a problematic definition at times). The intent of the SDT is unclear preventing recommending an alternative proposal.

The definition of Intermediate System is excessively hazy and could be interpreted to mean an authentication system or a Jump host. The intent of the SDT is unclear preventing recommending an alternative proposal.

NERC, including the SDT, needs to be prepared and ensure that adequate CMEP SDT developed guidance is in place to broadly communicate the intent, implementation guidance, and interpretation of the new definitions on passage and prior to NERC Membership and our vendors beginning work to bring systems into compliance. In general terms, WVPA would have preferred that the SDT adopted the terms and directly adapted the definitions used by NIST in their documentation, such as NIST SP 800-125.

Comment

Concerns on the definitions may result in a no vote in standards that use those definitions.

Cyber Asset: The current term is “Assets”. The proposed term is “Asset”. The language in the definition is still plural. Solution to make it singular.

Electronic Access Control or Monitoring Systems (EACMS): SDT members have said that VLANS are not allowed because network equipment is not considered SCI since “network services” are not included in what the SCI is sharing. If this is the case, it is difficult to understand why SCI is included in the proposed definition of EACMS.

Need clarification: Is the logical isolation of a Cyber Asset(ie. Windows based firewall) that is part of a system (BCS, Intermediate Systems...) the same as logical isolation of the system? It seems that the Windows based firewall that may be implemented on a Intermediate System or BES Cyber Asset could be considered an EACMS. If this is true then all communication to that Cyber Asset would be ERC.

Electronic Access Point: In order to maintain backward compatibility, this term should not be retired. It has been mentioned that retired terms would be retained in the “Retired Terms” section of the NERC Glossary and therefore not need to be defined by each entity that wishes to use these terms in their compliance documents. It is our view that retired terms and their definitions are no longer recognized by NERC and therefore would have to be redefined by each entity.

Electronic Security Perimeter: This term, or something that captures a boundry between what is protected and what is not protected need to be retained in order to make the “External” in ERC have meaning.

In order to maintain backward compatibility, this term should not be retired In order to maintain backward compatibility, this term should not be retired. It has been mentioned that retired terms would be retained in the “Retired Terms” section of the NERC Glossary and therefore not need to be defined by each entity that wishes to use these terms in their compliance documents. It is our view that retired terms and their definitions are no longer recognized by NERC and therefore would have to be redefined by each entity.

External Routable Connectivity (ERC): The ERC definition used “Electronic Access Control or Monitoring System controlling communications to and from the BES Cyber System”. The Intermediate System definition uses “An Electronic Access Control or Monitoring System that is used to restrict Interactive Remote Access.” It is unclear what the difference is between “controlling” and “restricting”. Solution consistency in language regarding the concept(s).

The proposed definition would make any controlled communication ERC even if that communication is within what would have been the ESP. For examples, an ESP with an internal VLAN would now have ERC for communication between VLANS, communication through a Windows based firewall on a BCA or Intermediate System would be ERC.

Interactive Remote Access (IRA): Does "asset" mean the CIP-002 R1 assets?

Because the network equipment is not clearly excluded from being SCI based on the SCI definition, VLANs could be allowed as logical isolation. Defense in Depth strategies would also create logic isolation within a BCS. Both of these situations could cause IRA to be used for communication performed inside the what was an ESP.

Request clarification on the difference or relationship between physical and logical isolation. The definitions and standards only list logical isolation.

Intermediate Systems: A firewall would implicitly or explicitly restrict Interactive Remote Access that was attempted through it. Therefore, a firewall would be an Intermediate System. This is not consistent with how the term is used in the CIP standards and the security controls that the Intermediate System is intended to provide. Did you intend this definition to be this broad? Example: A router could be Intermediate System based upon the language. Please clarify the intent of this definition.

The term was changed from “System” to “Systems” but the language is still singular.

Management Interface: A Protection System Relay control panel or on/off button may meet this definition. Define monitor. Is a local display, monitoring? Does monitoring require alarms? What do you mean by a physical interface? Why define a term that is only used once in CIP-005-8 R1.2? Suggest that definitions only used in a single requirement should not be defined in the NERC glossary. This would be consistent with the removal of the LERC and LEAP terms.

Is monitoring, as it is used here, consistent with the use in PRC-005?

Management Module: Based on discussions with SDT members, the definition of this term may be based on how it is used in the standards. We believe that all definitions should be clearly written and understood, independent of their use in the standard.

Is it correct that the panel on a Protection System Relay is not a MM because it is not independent of the host systems….?

Does Wake on LAN meet this definition?

Is the Management Module part of the Cyber Asset or is it a separate Cyber Asset? It seems that an autonomous subsystem could be identified as a Cyber Asset.

Please provide some examples of these devices.

Management Systems: Is the use of integrity consistent with its use in CIP-010-5 R1.4? What is the "those assets and systems" referencing at the end? Should it be “Cyber Assets and BCS? Solution “systems” should be removed and “assets” replaced with Cyber Assets and Virtual Cyber Assets.

The Technical Rational restricts this definition to virtual environments but the definition does not include this restriction. It seems that tools such as Ghost, used to image systems, might meet this definition.

Removable Media: What does it mean to be "directly connected .. to .. a network". If thumb drive is connected to a USB port of a PCA but that drive is not shared as a network device, was it connect to the network? What is the difference between "a network not logically isolated from…" and a PCA? Was it the intent of the SDT to remove directly connecting to a PCA?

If I had two BCS each on its own VLAN that all PCA's would be isolated from the other "logical network (VLAN)" and not be Removeable Media if plugged into PCA.

Suggest formatting the proposed Removeable Media definition in the same way that the TCA definition is formatted.

Self-Contained Application: This is only used in CIP-010 R1.1.1 and R1.1.2 for change authorization. Suggest that definitions only used in a single requirement should not be defined in the NERC glossary. This would be consistent with the removal of the LERC and LEAP terms.

Shared Cyber Infrastructure (SCI): In discussions with SDT members, it was stated that VLANs are not allowed because the proposed SCI definition does not include the sharing of “network services”. Some network devices would meet the proposed definition of SCI. The fact that other aspects of these network devices are not listed in the definition does not exclude them from meeting the definition. The proposed definition of SCI must be modified to clearly remove network devices if this is the intent of the SDT.

Transient Cyber Asset (TCA): Not logically isolated would include devices that are physically isolated. Solution clarify the difference between physical and logical isolation.

Need a better understanding of how a VM that spawns for a short period of time is treated. Is the VM image (or whatever it is called) the VCA and not the image or images that are spawned.

The following terms are used but not defined by the SDT.

Logical Isolation: Would like this term defined to include the relationship with physical isolation.

Kimberly Van Brimer - Southwest Power Pool, Inc. (RTO) - 2 - MRO,WECC

Answer	No
Document Name	

Comment

Southwest Power Pool (SPP) offers the following comments and questions for the SDT consideration of Question 1:

Cyber Asset Definition - The definition of a Cyber Asset is confusing with the exclusion of SCI.

EAP Definition – Consideration that if there is a retirement of EAP, and if we keep with backwards compatibility while using an ESP, we will still need the EAP definition.

ERC Definition - The definition of ERC is confusing because of the introduction of logical isolation. What happens to the IAL network?

IRA Definition - Based on the new definition of IRA, every time you connect to a CIP asset in the same logical isolation area, you are doing ERC. This is not the case in the current version of the standard, and adds a level of confusion.

During the Feb. 23, 2021 webinar, the SDT pointed out the scope of changes is limited by the SAR (V5 TAG, Order 822). When asked during the webinar, they referenced looking to the Applicable Systems where they tried to keep the proposed changes only to address those items in scope. This can be seen in numerous requirements where Management Modules only “of SCI” have been added when logically the definitions could also apply to Management Modules of any applicable stand-alone system. The SDT explained the definitions are not intended to reach outside of virtualization by bringing in patching or other configuration management systems. This is supported by the rationale presented with the proposed definitions for Management Modules and Management Systems. The proposed definitions for these glossary terms do not align with that limitation.

The Management Modules definition as written clearly includes physical Cyber Assets with out-of-band management ports, which does not align with the SDT intent discussed above.

The Management Systems definition as written would include a Cyber Asset that maintains the integrity of another Cyber Asset through control of the processes for configuring those assets, which would expand the scope of the definition beyond virtualization.

These inconsistencies between the definitions and intended scope will inevitably cause confusion for industry and auditors. Although the expanded scope of these terms is in the best interest of Cyber Security, the definitions should be revised to match the rationale and only target the intended virtualization scope. The definitions can always be expanded in future Standards Authorization Requests when the scope of change also allows for the SDT to include the applicable stand-alone systems.

Recommendations:

Revise the definitions of Management Modules and Management Systems to limit the scope for purposes of virtualization. Suggested revisions are below.

Management Module - An autonomous subsystem of a [delete: Cyber Asset or] Shared Cyber Infrastructure that provides management and monitoring capabilities independently of the host system's CPU, firmware, and operating system.

Management Systems - Any combination of Cyber Assets or Virtual Cyber Assets that establish and maintain the integrity of [delete: Cyber Assets or] Virtual Cyber Assets, through control of the processes for initializing, deploying and configuring those assets and systems; excluding Management Modules.

Revise the definition of Shared Cyber Infrastructure to be consistent with the definition of Management Systems. Suggested revision below.

Shared Cyber Infrastructure (SCI) - One or more programmable electronic devices (excluding Management Modules) and their software that share their CPU, memory, or storage resources with one or more BES Cyber Systems or their associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets; including Management Systems used to initialize, deploy, [delete: or] and configure the Shared Cyber Infrastructure.

We propose to keep the **EAP** and **ESP** as NERC Glossary terms; this will avoid future auditor interpretation issues, allow consistent application of the concepts across industry and preserves backward compatibility.

We propose the SDT creates a glossary term for “logical isolation” to assist entities and auditors in establishing the scope of this concept as it applies to the CIP Standards.

Concerns with definitions could result in NO votes.

Concerns with the definition changes creating a gap in the applicable system scope. The current definitions define scope boundaries (such as ESP, ERC, EAP, IRA) with established demarcations. It is also unclear if multiple identifiers (SCI, EACMS, Intermediate System, PCA) are applied to the same device, causing overlapping scoping requirements (it is unclear of interactions or precedence). The modification or retirement within the proposed definitions causes confusion on the interpretation and application of current and future CIP program-related decisions to remain in compliance.

Request keeping the ESP and EAP definitions in the active portion of the glossary. Having a section for retired terms will not help with compliance. We prefer a clear delineation.

Does the new ERC definition introduce a new Requirement?

ERC comments; 1) request clarification on “external” to what? 2) request clarifications on how VLANs work with ERC 3) request clarification on where the PCAs are 4) Request clarification on physical security, like air gapping, and 5) request that any definition be consistent wherever it is used instead of needing to review the intersection of each definition with each Requirement’s Applicability.

IRA comments; 1) where is the definition of a “remote access client?” 2) request clarification on “outside the asset” – is that referring to CIP-002 R1? 3) request clarification on the relationship of physical isolation to logical isolation.

Request clarification on Intermediate Systems. The proposed definitions can be interpreted to include firewalls as Intermediate System. This would remove the Intermediate Systems requirement as required now and impose additional controls on firewalls that are unnecessary.

Request clarification on Management Module and Management Systems – should the entity internally define “management and monitoring capabilities?” SCI definition use AND while the Management Systems definition uses OR. Request consistency.

Was PCA intentionally removed from the definition of Removable Media?

Request clarification of SCI’s definition. The proposed definition of SCI could include network devices. SCI interpretations say that network services are not SCI.

Request clarification on Storage. Appears that Storage is a Cyber Asset but not part of a Virtual Cyber Asset. This appears inconsistent.

Request clarification on Virtual Cyber Asset as a Protected Cyber Asset.

Request clarification of Logical Isolation definition, is the expected definition be “The logical border surrounding a VCA associated to a BES Cyber Systems which is connected using a routable protocol.

Request the review of the EACMS definition or define logical isolation, because the current definition is suggesting that only EACMS are to be used for logical isolation which no the current case. For example, the usage of an Active Directory could be associated with a BES Cyber System only and not perform logical isolation. Suggest reinstating the “OR”, of the logical isolation Electronic Security Perimeter(s) of BES Cyber Systems or BES Cyber Systems.

Request the review of the Shared Cyber Infrastructure (SCI), the definition seems to define two types of objects; the first object being the server that is sharing is CPU, memory, or storage and the second object is the console (management system) which is used to initialize, deploy, or configure the Shared Cyber Infrastructure. So, in the VMWARE world, the ESX is SCI and the VCenter is an SCI.

Comment

EEI agrees with many of the proposed additions, revisions, and retirements of terms. While we support modifications to the CIP Reliability Standards and associated definitions that more clearly accommodate virtualization, it is imperative that legacy solutions remain in the standards for those entities who intend to continue to use those solutions. It is from this perspective that EEI offers the following suggestions for consideration.

Electronic Security Perimeter (ESP) – EEI does not support the retirement of this term because some companies may not have immediate plans or ability to move to virtualized networks. While we support changes made to CIP-005, the retirement of the term ESP without some reference to this term within the definition of logical isolation or within the measures within CIP-005 could create confusion. To resolve this concern, EEI recommends the term ESP either be referenced within the definition of logical isolation or a reference to ESPs be included within CIP-005 within Measures.

Electronic Access Point (EAP) – EEI does not support the retirement of this term because many companies may not have immediate plans or ability to move to virtualized networks. EEI recommends similar accommodations as suggested above within our comments regarding ESPs.

Logical Isolation (Undefined Term) – EEI supports the move toward the use of the concept of "logical isolation," however, due to its expansive use within the proposed Reliability Standards a definition of this term is needed. In developing a definition, EEI requests that the definition or measures for logical isolation include ESP as an acceptable method of Logical Isolation. E.g., include in the measures that acceptable methods of Logical Isolation include ESP, Zero Trust, etc. NOTE: *Cyber Security Incident; Electronic Access Control or Monitoring Systems (EACMS); Interactive Remote Access (IRA); Protected Cyber Asset (PCA); Removeable Media; Reportable Cyber Security Incident; Transient Cyber Asset (TCA) are all definitions that require a common understanding of "logical isolation" to be fully understood.*

Cyber System (Undefined Term) - EEI recommends developing a definition for "cyber system". The "Exemptions" section contained within all of the proposed CIP Reliability Standards have moved from a Cyber Asset focus to one that focuses on the undefined term "cyber system". The development of a definition for cyber system is needed to provide a common understanding for compliance. (Questions about the difficulty of defining in virtualized environment.)

Self-Contained Application - EEI does not support the proposed new definition for Self-Contained Application and questions the need for this term. EEI recommends commonly used and understood IT terms be used. In place of the proposed term, EEI suggests the IT term "Container", which is commonly understood and appears to have the same definition as proposed for "Self-Contained Application". NIST defines Container as the following:

A method for packaging and securely running an application within an application virtualization environment. Also known as an application container or a server application container.

Shared Cyber Infrastructure – EEI does not support the currently proposed definition for Shared Cyber Infrastructure for the following reasons:

a. The proposed definition refers to Management Systems used to initialize, deploy, **OR** configure but the definition of Management Systems states that, to be a Management System, it must initialize, deploy, AND configure. These two definitions presently conflict with each other. Before the proposed definition of SCI can be accepted, the identified conflict between this term and its companion term (Management Systems) needs to be harmonized.

b. Currently the scope of SCI is unclear. An explanation of the limiting factors for the scope of SCI regarding their software should be provided. e.g., would the firmware of a server blade be included within the scope of SCI?

c. {C}We also suggest that the proposed definition would be more easily understood if language and terms were drawn from current NERC CIP acronyms rather than using their long form names.

d. {C}The term may not be clear or fully understood by all entities and we suggest adding examples within the Technical Rationale.

Interactive Remote Access: While EEI understands the need to streamline the definition of IRA, additional clarification is needed to better describe IRA in the context of virtualization, particularly regarding serial links. While some clarity has been provided within the Technical Rationale regarding serial to IP converter, it is silent on serial links that are used exclusively for polling purposes and have no interactive capability beyond providing requested data.

Management Systems: This definition appears to align with the definition of a hypervisor; however, it also includes some language that tries to straddle between both virtualized and non-virtualized environment. This ambiguity may create confusion, and EEI recommends the definition be clarified. It may also be helpful to include some examples of Management Systems within the Technical Rationale.

We have a concern about the definition of SCI. In two places we say "one or more". The problem is what if both statements are answered with one and no more than one. It isn't clear when we say "One programmable electronic device (excluding Management Modules) and its software that share its CPU, memory, or storage resources with one BES Cyber Systems or their associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets;" What happens when the device itself is a BCS? Is it sharing resources with itself and thus SCI and thus any physical stand alone box is SCI? Consider clarifying that the share is with something besides itself.

The Management Systems definition as written would include a Cyber Asset that maintains the integrity of another Cyber Asset, through control of the processes for configuring those assets, which would expand the scope of the definition beyond virtualization. Please see suggestions from Darnez Gresham, Berkshire Hathaway Energy - MidAmerican Energy Co., 3/19/2021.

Intermediate System: N&ST suggests, “An Electronic Access Control or Monitoring System that is used to restrict Interactive Remote Access to only authorized users. The Intermediate System must be located outside the BCS’s logical isolation.”

ERC: N&ST suggests, “The ability to access a BES Cyber System or Shared Cyber Infrastructure from a Cyber Asset or Virtual Cyber Asset that is outside of its associated logical isolation via a bi-directional routable protocol connection.”

Rationale: Clearer and more consistent with the revised definition of IRA.

Management Systems: N&ST suggests, “Any combination of Cyber Assets or Virtual Cyber Assets that establish and maintain the integrity of Cyber Assets or Virtual Cyber Assets, through control of one or more of the processes for initializing, deploying and configuring those assets and systems; excluding Management Modules.”

Rationale: N&ST believes that specifying a system must be capable of managing all three of “initializing, deploying and configuring” in order to qualify as a “Management System” will set the stage for endless arguments about whether a given system does or doesn’t fit the definition. N&ST agrees with the SDT’s opinion that devices used to initialize, deploy, or configure EACMS performing logical isolation should be subject to CIP-005 R1 Part 1.2. However, the proposed definition creates a potential loophole which, we believe, should be eliminated.

Shared Cyber Infrastructure (SCI): N&ST believes the inclusionary language at the end of the proposed definition (“...including Management Systems used to initialize, deploy, or configure the Shared Cyber Infrastructure.”) makes the definition confusing and possibly recursive (a Management System used to configure SCI is SCI?). We recommend removing “Management Systems” from the proposed definition. If the SDT believes Management Systems used to configure SCI should be subject to the same set of requirements as SCI, the SDT should consider adding them to the appropriate “Applicability” lists in each Standard.

Cyber Asset should not exclude Shared Cyber Infrastructure. It is just another type of Cyber Asset. Shared Cyber Infrastructure is really a Cyber Asset with a specific purpose.

Cyber Security Incident is written to introduce significant scope creep.

Interactive Remote Access should be reviewed to determine if the language, “User-initiated access by a person employing a remote access client” is still appropriate. There are many implementations that would meet the intent of Interactive Remote Access but may not use a traditional remote access client. If “remote access client” is still necessary, more definition should be provided for the wording.

Intermediate System should retain the wording of access control to restrict Interactive Remote Access to only authorized users. The revision could be unintentionally seen as restricting access from all users. There is no provision in the definition to allow access to anyone.

Virtual Cyber Asset should be clarified to note whether they are required to be on-premises or cloud. If it intended to allow for cloud, it would be beneficial to state that clearly. As written, it could be interpreted that a virtual appliances would be out of scope.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee 2016-02 Virtualization

Answer	No
Document Name	

Comment

Conceptually, the ISO/RTO Council (IRC) Standards Review Committee (SRC) [1] supports the SDT and its efforts to expeditiously modify the CIP standards to accommodate the use of Virtualization and to more readily be able to adopt other future technological innovations. We believe this will pave the way for increased flexibility, upgradeability and security. In support of the SDT’s efforts, the SRC offers the following comments to assist the SDT in moving forward with this very important initiative.

Recommendation: To ensure entities can continue all or a portion of their existing programs without having to implement virtualization or undertake significant administrative changes, the SRC recommends the terms, Electronic Security Perimeter (ESP) and Electronic Access Point (EAP), be retained as an option for the following reasons:

1) **Ease of backward compatibility**. The concepts of ESP and EAP are well understood and consistently implemented by entities with well-known costs, documentation and audit requirements. Retention of the ESP and EAP concepts will provide a clear path for entities who choose to maintain status quo to remain compliant.

Regardless of whether the terms ESP and EAP are kept, auditors will want/need to know where the logical isolation zone begins and ends.

2) **Continued clarity**. Replacing ESP and EAP with an undefined term, “logical isolation,” will require individual entities to define “logical isolation” with unknown impacts to their existing program and audit requirements. While the IRC SRC sees a benefit to having a more open and flexible definition from the standpoint of being able to more readily adopt new technology and practices that can enhance the security of critical infrastructure, the related cost and compliance risk associated with this change may have the adverse effect of increasing resistance to change in order to avoid audit risk.

The IRC SRC sees a path forward whereby the SDT can introduce the use of the term “logical isolation” in concert with retaining the prior concepts of ESP and EAP by either:

A) Defining the term “logical isolation” to include the terms ESP and EAP as acceptable means of meeting this definition or

B) Reinstating prior language references to ESP and EAP in each applicable requirement and definition in the **Glossary of Terms Used in NERC Reliability Standards** that has been modified to introduce “logical isolation” and offer the prior language as an alternative acceptable means of continuing to comply with the requirement and meet the definition, respectively.

- **Cyber Security Incident** – as noted above, SRC recommends the definition be revised to accommodate prior ESP concepts.
- **External Routable Connectivity (ERC)** – as noted above, SRC recommends the definition be revised to accommodate prior ESP concepts.
- **Interactive Remote Access (IRA)** – as noted above, SRC recommends the definition be revised to accommodate prior ESP concepts.

Clarify the **Management Interface**, **Management Module** and **Management Systems** definitions as they are overly vague.

- **Management Interface** – SRC proposes the SDT narrow this definition to include only those interfaces that can be used to configure Cyber Assets.
- **Management Module** – Describe the type of devices in this category; e.g. out-of-band management devices, I/O devices, etc
- **Management Systems** – per the **Definitions and Exemptions Technical Rationale**, this term is intended to address “the unique risk for virtual environments presented by the management ‘consoles’ for such environments.” It then goes on to say the “intent is to define that capability and then include this within the definition of SCI.”

Recommendation: Clarify where management console servers fall; i.e. under Management Module or Management Systems? Note: the Management Systems definition explicitly excludes Management Modules.

- **Physical Access Control Systems (PACS)** – SRC is concerned that the defintion for PACS could be interpreted to mean that SCI could be solely responsponsible for controlling, alerting or logging access to a Physical Security Perimeter (PSP), even though the word “or” is used to denote that: “Cyber Assets, Virtual Cyber Assets, ***or*** Shared Cyber Infrastructure that control, alert, or log access to the Physical Security Perimeter(s)…”

Recommendation: SRC recommends the following change to the definition to clarify intent:

Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that ***collectively*** *control, alert, or log access to the Physical Security Perimeter(s), exclusive of locally mounted hardware or devices at the Physical Security Perimeter such as motion sensors, electronic lock control mechanisms, and badge readers.”*

- **Reportable Cyber Security Incident** - the “Currently Approved Definition” provided in the CIP Definitions document for Project 2016-02 does *not* match the current definition in the **Glossary of Terms Used in NERC Reliability Standards**; i.e. “*A Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity."*

Recommendation: Clarify why it is necessary to change the definition for **Reportable Cyber Security Incident** if the underlying definition for **Cyber Security Incident** is modified. If it is unnecessary, leave the existing definition for **Reportable Cyber Security Incident** as is.

- **Self-Contained Application** – the SRC requests the SDT clarify the nature of “immutable software binaries.” During which stage of the software lifecycle is the software binary expected to be immutable?
- **Shared Cyber Infrastructure** - the definition seems to address specific scenarios involving storage and/or host virtualization infrastructure; however, may be interpreted more broadly to include sets of systems supporting configuration management and monitoring/ remediation support systems. It is not clear whether it was the SDT’s intent to include the latter systems.

Recommendation: Clarify the characteristics of “Management Systems used to initialize, deploy, or configure the Shared Cyber Infrastructure.” Would configuration management systems; e.g. Ansible Tower, Tenable Security Center or Tripwire Enterprise Console be considered Management Systems?

[1] For purposes of these comments, the IRC SRC includes the following entities: CAISO, ERCOT, IESO, ISO-NE, MISO, NYISO, PJM and SPP (with the exception of our response to question 5).

Capital Power appreciates the opportunity to participate in stakeholder consultation on this project. While Capital Power supports modifications to CIP Reliability Standards and associated definitions that more clearly accommodate virtualization, it is imperative that legacy solutions remain in the standards for those entities who intend to continue to use those solutions.

Shared Cyber Infrastructure (SCI) – Capital Power does not support the currently proposed definition for Shared Cyber Infrastructure for the following reasons:

- The proposed SCI definition refers to Management Systems used to initialize, deploy, **OR** configure but the definition of Management Systems states that to be a Management System it must initialize, deploy, **AND** configure. These two definitions presently conflict with each other. Before the proposed definition of SCI can be accepted, the identified conflict between this term and its companion term (Management Systems) needs to be harmonized.
- Currently, the scope of SCI is unclear. An explanation of the limiting factors for the scope of SCI regarding their software should be provided, e.g., would the firmware of a server blade be included within the scope of SCI?
- The term SCI may not be clear or fully understood by all entities and we suggest adding examples within the Technical Rationale.

Virtual Cyber Asset (VCA) – Capital Power agrees with other stakeholder comments encouraging the integration of the concept of a VCA into a revised definition for Cyber Assets. As there are no additional or specific requirements for a VCA, the integration of this concept into the Cyber Asset definition removes unnecessary complexity.

- Proposed modification to **Cyber Asset (CA):** Programmable electronic devices, including the hardware, software, and data in those devices. This includes platforms operating virtual machines, which are logical instances of an operating system or firmware hosted on a physical platform.

Interactive Remote Access (IRA): The new definition of IRA no longer limits the applicability to routable protocols only. This may result in some additional communication types to be included in scope like serial over dial-up and potentially could have significant scope impact on entities compliance programs. Capital Power recommends that the SDT provide guidance regarding if this was the intent or if the use of the terminology ‘user-initiated’ was intended to point towards routable protocols.

Standards are becoming much more difficult to navigate with this terminology, inclusions and exclusions. The prescriptive nature tends to leave certain high risk Cyber Assets out of scope (vulnerability scanners and Tripwire for example). We do agree that management systems were excluded and that they are high risk, so we support their inclusion.

SMUD was already protecting our SCI without all of this prescriptive language and we do not agree with the 20% of the entities that were polled and said that the standards were holding them back. If this is the direction that the standards are going, we should consider adopting and already developed standard such as PCI rather than reinventing the wheel.

Comment	

GSOC provides the following comments regarding the added, revised, and retired defined terms:

1. The definition of BCSI has been revised to include SCI, but not Management Modules or Management Interfaces. It would seem that, at a minimum, information about Management Modules could provide critical information about associated SCI and BCS. GSOC suggests that Management Module should be included in the definition of BCSI. If not, can the SDT provide its explanation for not including Management Module in the definition of BCSI?

2. Relative to Cyber Security Incident and Reportable Cyber Security Incident, both are revised to add the Shared Cyber Infrastructure (SCI), which excludes Management Modules and Management Interfaces, but not Management Systems. Would the attempt to compromise or compromise of an active Management Module in an attempt to access or disrupt the functions of SCI or BCS not merit reporting? This seems like a potential gap where these could be used to compromise related SCI or other cyber assets. GSOC suggests that Management Module should be included. If not, can the SDT provide their explanation or justification?

3. Electronic Access Control or Monitoring Systems should be revised to Electronic Access Control or Monitoring System to comport with its use in its singular form in other defined terms.

4. GSOC provides the following comments on the proposed revision of Interactive Remote Access:

a. The revision of Interactive Remote Access removes the ability to utilize technology other than remote access clients, which seems to militate against the level of flexibility available to facilitate the use of new and advanced technology.

b. The revision of IRA seems to obfuscate whether an “asset” is physical or logical in nature and whether being inside of a trusted network would be considered IRA. Clarification of the SDT’s intent relative to the revision is recommended.

5. The added terms regarding management module, management system, and management interface require some additional clarification to ensure that the distinctions between the new terms are clear and unambiguous. GSOC provides comment relative to the following:

a. Burying management systems in the definition of SCI may create confusion where it is intended to be or should be clearly correlated to other defined terms and requirements. It is recommended that – where such terms are utilized – they should be directly correlated to reduce the potential for confusion.

b. Suggest the following revision to the term “Management Interface” - A physical or logical interface of a Cyber Asset or Shared Cyber Infrastructure with the capability to manage and monitor the hosted Cyber Assets and the Shared Cyber Infrastructure.

c. Suggest the following revision to the term “Management Module” - An autonomous subsystem of a Cyber Asset or Shared Cyber Infrastructure that provides management and monitoring capabilities of the function and health of the hardware underlying the Cyber Asset or Shared Cyber Infrastructure. This is independent of the host system's CPU, firmware, and operating system and any management or monitoring thereof.

d. Suggest the following revision to the term “Management Systems” - Any combination of Cyber Assets or Virtual Cyber Assets that control the processes for initializing, deploying and configuring those assets and systems; excluding Management Modules.

e. Why do Management Modules not require PSP protection?

6. Is the exclusion noted in the definition of a Protected Cyber Asset necessary given that the initial criteria seems to require logical connection and, therefore, would already exclude assets that are not logically connected? Perhaps reformatting of the exclusions would increase clarity. 7. The definition of Self-Contained Application is not easily comprehended or relatable by non-technical personnel. As the reliability standards are intended for use by personnel across the utility industry, including compliance, legal, and other non-technical personnel, revision is recommended to make this defined term more universally understood.

2. CIP-005 Requirement R1 part 1.1 was revised to permit only needed and controlled communications to and from applicable systems either individually or as a group and logically isolate all other communications. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Conceptually, the SRC agrees with what the SDT is proposing; however, we don’t think the language is clear enough to implement in practice. Controlled communications are undefined and could require significant effort by entities to interpret and define what is intended and essential to meeting this requirement. What happens if access is over-provisioned because an entity anticipates services are needed and then aren’t used? Due to the vagueness of the language, it seems like this could happen quite readily.

Recommendation: Clarify the definition so there is a level of consistency across the ERO.

In addition, wording such as “e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE)” is difficult to understand.

Recommendation: Replace this language with something in layman’s terms; e.g. “communications for substation automation systems.”

Historically CIP-005 has related to the protection of the BCS. This should be the focus going forward. The applicable systems needs to be clarified that it only applies to PACS and EACMS that share infrastructure with something inside the ESP.

This draft requires PACS and EACMS on SCI to have logical protections, but not for all PACS and EACMS. This allows for human error when applying the standards as people will have to remember which rules apply to which since the rules were not applied in a uniform fashion. Additionally, the elimination of ESP will require extensive modifications to procedure, evidence, RSAWs, etc. Without ESP, how is the logical electronic security perimeter expressed?

Comment

Conceptually, the proposed change to only permit needed and controlled communications to and from applicable systems either individually or as a group is clear, however, it is unclear what it means to logically isolate all other communications. A clear understanding of the term logical isolation is needed to address this concern.

Additionally, EEI asks for clarification for the following:

- EEI asks for clarifications of the term “group” as used in Requirement R1, part 1.1. Currently, the Requirements of CIP-005-6 allow multiple BES Cyber Systems to exist within the same Electronic Security Perimeter. However, our understanding of proposed CIP-005-8 is that, when two or more BES Cyber Systems are 1) located within a Control Center; 2) utilizing a shared ESP; and 3) compliant under the current version of CIP-005, they may not be compliant under the proposed Requirements of CIP-005-8. This understanding is based on the potential inability to demonstrate control of communication between the two BES Cyber Systems. While we recognize that the intent may have been for those systems to be considered as part of a group, this is not clearly defined or explained. Without such clarification, entities may find it difficult to continue to use legacy systems under the proposed new Requirements.

- Applicability: PACS and EACMS are included when “hosted on SCI”. It is unclear whether PACS or EACMS hosted on standalone hardware would also meet this requirement. We recommend the language be clarified in proposed CIP-005 Requirement R1 part 1.1. (EEI also recommends evaluation of this issue with respect to R1.3, R1.4 and R1.5)
- Measures: EEI understands that if a VLAN is an acceptable logical isolation technique, then the device enforcing the VLAN would also need to be addressed. EEI requests clarification where these devices are within the proposed standard. (E.g., a switch with a VLAN that has a BCS connected to it. Would that switch be a high impact BCS? Or possibly SCI?) Please clarify how this concern has been addressed within the propose language of R1.1.

Comment

Permitting only “needed and controlled communications” is confusing. Controlled communications could be needed and needed communications should be controlled. We suggest the requirement be changed such that the entity first identifies needed communications, thenapplies control of the permitted communications.

Suggested language for R1.1 -

Identify needed communications and control permitted communications to and from applicable systems either individually or as a group and logically isolate all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).

SPP offers the following comments and questions for the SDT consideration for Question 2:

How would an entity logically isolate from its systems if the term ESP is removed? Recommend SDT consideration that there is no difference, but would require additional documentation and explanation on how network isolation is done, unless we define the two IP addresses as the isolation.

Recommend the SDT consider a definition of what Logical Isolation is, or offer clearly communicated examples.

Response

Brian Evans-Mongeon - Utility Services, Inc. - 4

Answer	No
Document Name	

Comment

Concerns on the definitions caused this no vote for this standard.

Would like clarification on if physical isolation is considered a type of logical isolation and if not, if it should be added as an applicable security control.

Would like clarification why the SDT choose to use “needed”, instead of “necessary” as used in CIP-003 R2 Attachment 1,Section 3.

There has been considerable push by some regions to have phone systems identified as BES Cyber Sytems. In their push, they want the possible threat of someone using calling in and pretending to have the authority to issues operational directives, to be considered in the BCS determination process. While we do not agree with this position, boic communication would be applicable for the R1.1 controls. Suggest including language that clearly exempts voice communication.

There is a lack of clarity around the expectation related to use of the term needed. If the intent of the SDT is to continue requiring documentation of “needed” communications, this should be converted to an explicit requirement stating the expected documentation rather than an implied requirement. If the intent is to continue the V5 expectations, document the communications services that are permitted (e.g. TCP ports, UDP ports, IP proctocols) with reason access is needed. If the intent is broader to address items such as services in a hypervisor, VLANs, VXLANs, it is not clear what is expected and appropriate language should be developed by the SDT. Further, when considering logically isolated networks that span multiple PSPs connected via a telecommuncations company, configuration is often not in the control of the entity.

There is no need to change a pre-established definition such as ESP. New application creates extreme confusion for application of security for cyber assets. Compartmentalization should be based on security enclaving but high watermarking. A VLAN should be highwater marked to Cyber Asset level as BES function will be impacted if it is compromised. **It seems SDT has compartmentalized assets in order to limit compliance application. Selective application of controls will result in significant security risks.**

The Applicability in CIP-005 R1 Part 1.1 may contain a hall of mirrors for EACMS requiring an EACMS with the inclusion of “3. EACMS hosted on SCI” under the High and Medium Applicable Systems entries. One possible solution is to modify the inclusion to be something like:

“3. EACMS, not performing logical isolation, hosted on SCI.”

This would then become the corollary to the R1 Part 1.2 “EACMS performing logical isolation” inclusion. This change could solve the hall of mirrors and serve the security objective of requiring logical isolation of EACMS like Active Directory, where you can without requiring an EACMS for an EACMS that provides logical isolation.

The wording of the requirement is not clear. It states that entities are to permit only the needed and controlled communications but then goes on to state “logically isolate all other communications”. If only the needed communicates are allowed, what communications are being isolated? Other communications to non-CIP devices or systems? And why would this statement be needed? This would still be captured within the phrase of permit only the needed and controlled communications. Is the intent to prevent all other communications other than what is needed or to create a VPN or to encrypt the communication path? Additionally, the applicable systems column is not clear. Does the addition of routable protocols to the High Impact systems mean that if a High Impact system only has serial protocols (while unlikely) this requirement would not apply? This also creates another tier of systems: High with routable, High without routable, Medium with routable, Medium without routable, low, etc. Continuing to create tiers within the requirements complicates the requirements from an administrative standpoint without major security gains. Also, does the phrasing “hosted on SCI” for both PACS and EACMS mean that if a PACS or EACMS is not hosted on SCI that this requirement does not apply? Is this requirement only intended to apply to

virtualized environments? The technical rational speaks heavily to logical isolation, but the requirement language and the language used in the applicable system column don’t seem to completely line up.

SIGE does not agree with the proposed changes of adding virtual PACS and EACMS to the applicable systems since it expands the scope of the requirement. There is no documented reason for the scope increase. SIGE assumes that this change may be due to the possibility that BCS, PACS, and EACMS may use the same SCI. If that is correct, then SIGE proposes more specific language such as “PACS hosted on SCI that also hosts BCS; and EACMS hosted on SCI that also hosts BCS”.

Proposed changes to R1 Part 1.1 are not required because the ESP concept can still be used with virtualization as one of the options.

Does a zero trust model make it difficult to do virtualization in other ways?

Would segmentation technology count as the control or as the firewall?

An ESP for each microsegmentation would be daunting to any entity.

Logical isolation is not a defined term. We would like to see an actual definition for "logical isolation"

The prior definition defined traffic as ERC, then had a requirement to pass that through an EACMS. The new definition adds ‘through an EACMS’ as a qualifier of the traffic, but falls short of requiring the traffic to pass through an EACMS. (Traffic not going through an EACMS would then not meet the definition of ERC, so the applicable requirements would then not apply.) Consider replacing ‘through an EACMS’ with ‘across logical network isolation’.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name CHPD

Answer	No
Document Name	

Comment

CHPD approves of the direction of performing logical isolation at either the individual or group level instead of requiring an ESP.

However, including PACS and EACMS hosted on SCI in the Applicable Systems creates differing requirements for virtualized PACS and EACMS and physical devices. It is also not backwards compatible with entities who have already virtualized PACS or EACMS and are compliant today but would not be under the draft requirements. Given that the SDT acknowledged during its recent webinar that the only reason it has not extended this requirement to all EACMS and PACS is that it would be outside the SAR, it is clear that this is not a virtualization-based change and is outside the SAR. Additionally, it creates an issue where the device performing the logical isolation of the EACMS or PACS is not a CIP device, and is not required to comply with the CIP standards, creating a hall of mirrors situation, such as a virtual firewall providing logical isolation for a domain controller (but not for any BCS).

Anthony Jablonski - ReliabilityFirst - 10

Answer	No
Document Name	

Comment

RF does not agree with the proposed changes for the following reasons:

a. With each system becoming its own ESP (zero trust) – mixing of CIP and non-CIP network traffic on local network segments is permitted.

b. Logical isolation is not defined, leading to diverse definitions between entities and regions, therefore, a definition of logical isolation is required. In addition, a significant concern is that an entity could implement logical isolation using only a host-based firewall and essential systems could be directly connected to the internet – a side effect breaking the definition of External Routable Connectivity and enabling entities to bypass many now-required protections.

c. The use and definition of “controlled communications” within P1.1 is not defined. The SDT inferred access control, however, this should be explicitly stated in the Requirement.

d. Remediation VLANs are not defined and may introduce situations where an entity could inadvertently place production Cyber Assets in this VLAN.

e. Dormant VMs that could be either explicitly or inadvertently activated could lead to noncompliance if they are not properly identified.

f. Parent Images and Parent/Child Images are not defined terms and could lead to compliance issues regarding network access and/or identification of Cyber Systems.

Response

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment

Southern agrees with the concept of only permitting, either individually or as a group, needed and controlled communications to and from Applicable Systems. However, the full intent and scope of “logically isolate all other communications” is unclear absent a defined term for “Logical Isolation”. This issue may be resolved by defining Logical Isolation and providing a clearer understanding of what is required here.

Additionally, Southern requests clarification for the following:

1. Applicability: PACS and EACMS are included when “hosted on SCI”. However, those devices are also included in the definition of SCI; thefore, the requirement language equates to the following applicability:

a. This requirement applies to PACS and EACMS hosted on programmable electronic devices that share their software, CPU, storage, or memory resources between those hosted PACS or EACMS *AND* one or more (1) H/M BCS ***OR*** their associated (2) EACMS, (3) PACS, or (4) PCA.

b. Southern requests the SDT consider the concepts outlined in the following clarifying changes to the Applicable Systems column, which helps clarify the vastly broadening scope of these requirements to EACMS and PACS assets not previously required. This is potentially a major change, but is supported by our other comments in this posting addressing the lower risk profile posed by PACS assets and EACMS assets that only perform a monitoring function. The intent here is to more properly scope risk where stand-alone virtual PACS and EACMS on SCI are of a significantly lower risk than SCI hosting BCS (and virtual PACS on the same SCI). From a risk-based perspective, please consider these associations for Applicable Systems:

i. High and medium impact BCS connected to a network via a routable protocol and their associated:

1. PCA;

2. PACS hosted on the same SCI as the BCS; and

3. EACMS hosted on the same SCI as the BCS.

c. Southern requests the SDT consider the potential “Hall of Mirrors” that is achieved when the object of the requirement (an EACMS) that is used to “permit” and “logically isolate” communications is also subject to having the requirement enforced on itself as an Applicable System. For example – with an EACMS being the object of the requirement, how then does an entity also concurrently use a Cyber Asset(s) (i.e., a 2nd EACMS) to “permit” and “logically isolate” communications to the 1st EACMS?

i. This is exponentially more complicated in a virtualized environment and could force entities, who would not be able to achieve the requirement, to forgo the benefits of virtualization as this would result in endless amounts of dedicated virtual clusters on dedicated hardware for each Applicable System type.

ISO-NE generally agrees with the proposed changes. The logical isolation requirements provide flexibility and a pathway to adopt technology and practices that can enhance security of critical infrastructure. However, ISO-NE recommends several changes to improve comprehension, readability, and compliance with the requirements.

The SDT should define the term “controlled communications” for a consistent interpretation across the industry and Electric Reliability Organization (ERO). Undefined terms create varying definitions and interpretations that can lead to disputes and disagreements between a Registered Entity and the Regional Entities that represent the ERO.

ISO-NE also recommends removal or replacement of the word “ensure” as this language and expectation is inconsistent with all other requirements.

Comments: The proposed changes to R1 part 1.1 are not required because the existing ESP language and concepts can still be used with virtualization.

1. The language "Permit only needed and controlled communications to and from applicable systems" is problematic because it exceeds what the SAR requires. This language is more based in security defense in depth (multi-layered security controls) but for CIP, routable protocol traffic control between CIP Cyber Assets within the ESP is not required.
2. If the SDT intended to allow a non-ESP model (e.g., zero trust model) for controlling routable protocol electronic communications ingress or egress a BCS, adding EACMS as an alternative option for CIP-005-6 R1.1 could resolve this issue. For instance, in the VMware zero trust model, VMware NSX using a transparent in-kernel stateful firewall to block traffic between VMs, the NSX platform could be identified as an EACMS resulting from our proposed EACMS revisions.

The rationale for discussing logical isolation is as follows:

- The logical isolation is not a defined term and very subjective and can be interpreted differently;
- For routable connectivity, ESP and EAP as one of the options still would apply to a VCA and can be used seamlessly based on existing language and concepts. The term logical isolation is not needed
- For the non-routable connectivity, the objective of the SAR was to address IRA related serial connection issues, which can be resolved by our proposed IRA revision (See our comment for QUESTION 1). Except for IRA related non-routable connectivity, the logical isolation between CIP Cyber Assets using layer 1 and layer 2 connectivity is not required by the SAR.

RECOMMENDATION: We suggest keeping the applicable systems and making the following change to the CIP-005-6 R1 part 1.1

- All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP, or
- All applicable Cyber Assets connected to a network via a routable protocol shall through an EACMS that denies all communications to and from other Cyber Assets by default if ESP model is not used.

The proposed revision to CIP-005 R1.1 is clear with the exception of "controlled communications." If an entity permits needed communications via an ACL, does that mean it is controlled? The requirement text starts with "Permit only needed…" which appears to make "controlled" unnecessary. Additionally, logical isolation is not defined and is subject to interpretation.

Consider alternative wording to clarify the treatment of time-sensitive protections and control functions: *Permit communications that are needed to and from applicable systems either individually or as a group and isolate them from other communication channels. Exclude devices that communicate using control functions (power system automation) or time-sensitive network (TSN) protections (e.g, IEC 61850, GOOSE, SV, PTP)*

Response

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy

Answer	No
Document Name	

Comment

Duke Energy does not generally agree with the proposed modifications. The verbiage within this requirement appears to be too vague for consistent implementation. The Requirements must be made clear that current ESP models are compliant. Duke Energy suggests including examples in the Measures column that are consistent with current ESP definitions to reinforce that current approaches remain valid.

The proposed language leaves possibility for auditors to disagree with entity application of controls and enforce controlled communications within existing "groups" defined by current ESP boundaries. Duke Energy suggests clarifying as follows "Identify and document logical isolation for applicable systems individually or in groups, and only permit needed and controlled communications across the identified isolation, excluding time-sensitive protection or control functions between intelligent electronic devices (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE)."

Comment

What are intelligent electronic devices? Please use define terms.

The requirement doesn't clearly state the creation (establish) of the logical isolation. The requirement should establish logical isolation. In this context, logical isolation is not defined nor specified.

Suggest removing any reference to "communications using protocol IEC TR-61850-90-5 R-GOOSE" and simply stay to excluding time-sensitive protection or control functions.

GSOC provides the following comments regarding CIP-005, requirement R1: 1. In the proposed revisions for CIP-005, for applicable systems, it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., “…hosting [] impact BCS and the BCS’s associated …..” or “….hosting [] impact BCS and the SCI’s associated…..” 2. Revise requirement R1.1. for clarity as follows: Permit only controlled communications that are [necessary/needed] to and from applicable systems either individually or as a group and logically isolate all other communications, excluding time sensitive protection or control functions between intelligent electronic devices (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).

Texas RE is concerned with removing the terms Electronic Access Point (EAP) and Electronic Security Perimeter (ESP) from the NERC Glossary of Terms without adequately addressing those concepts in the proposed “logical isolation” definition. The EAP and ESP concepts are known throughout industry and have been further clarified through repeated compliance engagements. As noted in its response to SDT Question No. 1 above, Texas RE believes that registered entities can implement virtualized environments within the existing EAP and EACMS framework today. The SDT is proposing to remove these terms and replace it with the term “logical isolation,” which does not have a proposed definition. Texas RE recommends the SDT define the term “logical isolation.” In doing so, Texas RE further suggests the SDT clarify that the EAP and ESP concepts apply as part of the overarching “logical isolation” concept. Finally, Texas RE recommends retaining the measure language, which states: “*a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP*.”

Response

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

The inclusion of virtualization concepts with newly defined Applicable Systems makes the requirements harder to understand and identify what is truly applicable. SRP doesn’t like how all the standards increased in size due to these additions. SRP prefers to implement a way to account for virtualization without sweeping changes – similar to Low Impact. The attention given to virtualization feels over weighted compared to non-virtualized systems. This increases the burden on entities without virtualization to comb through the standards to find what is applicable.

The requirement is written for Vitural environment, and SRP doesn’t see in the requirement where it written for the backward compatibility and no reference to the current standard.

SRP would like clarification on how the applicable systems, in particular EACMS, are expanded because of the SCI term.

Comments: We believe there are more efficient methods to meet the SAR. Refer to the comments in QUESTION 1 regarding existing definitions.

The term “Management Interface” already exists in the inherent properties of a Cyber Asset in the manner in which a Cyber Asset connects to the network – i.e., copper, fiber, wireless, etc.… If the intent was to address access to a Cyber Asset, the existing language covers these controls in electronic access – ports and services and authentication (EACMS).

The management system could fall within one of the existing CIP cyber asset classifications. Based on our proposed language to the R1 part 1.1, the SDT only needs to add EACMS to R1 part 1.2 to resolve the zero trust model scenario.

Recommendation:

- Restore current CIP-005-6 R1.2 Requirements language and add “or EACMS”. The Requirements language could be such as:

“All External Routable Connectivity must be through an identified Electronic Access Point (EAP) or EACMS controlling communications to and from the BES Cyber System.”

Comment: If SCI is hosting a similar trust BCS then the SCI would be high watermarked to that trust level and should be exempt from R1.2. If the concern is transient execution then it would not make sense that the VCA within the BCS would be sharing the same resources as well.

Recommendation: If this is not a security concern, then in a similar trust environment, Management Systems should be excluded from R1.2

Richard Jackson - U.S. Bureau of Reclamation - 1

Answer No

Document Name

Comment

Reclamation recommends the virtualization requirements contain direct and detailed references to associated physical security requirements that protect and manage the equipment containing the virtual systems. Without this information, field employees could erroneously focus only on the logical protections.

Reclamation also recommends physical security requirements be connected to their associated virtualization requirements with direct and detailed references to clarify what is being protected.

Technical Guidance talks about the new term Management Interface being protected as described in CIP-005 R1 P1.2, but the redline for CIP-005 R1 P1.2 has no mention of the term Management Interface (only refers to Management Module). The Technical Guidance describes that Management Module will be addressed in CIP-005 R1.5, but there is not mention of Management Module in this Requirement.

ISO-NE generally agrees with the proposed changes. However, the requirement for anti-affinity rules for Management Systems appear to be overly burdensome and may outweigh any security benefit. We recommend allowing Management Systems to share memory and CPU with high-watermarked BES Cyber Systems as it still provides adequate security and eliminates the need for a physical host that would serve a single VM in many cases.

Additionally, as with the other proposed modifications, the “Applicable Systems” column should be reviewed for clarity, consistency and readability.

Best practices for vSphere suggest virtualizing vCenter (a Management System). However, for smaller entities who may only have a handful of Management Systems, requiring these systems to not share CPU and memory with other systems eliminates many of the benefits of virtualization and increases the complexity for no real tangible gain. This is compounded if the entity wants to implement best practices and have redundant Management Systems. Additionally, there are additional protections that are not accounted for by the proposed requirement, such as isolating the SCI from the internet or other controls that would mitigate such issues. See comments for question 19.

The language here creates a confusing scoping issue. The entity must look to three places to determine if a device must comply with the requirement, first the Applicable Systems column to find the "applicable system" (despite the fact the applicable system itself is not the device that needs to comply), the text of the requirement then to find which device actually needs to comply, and finally the definition Management System/Interface to see which devices meet that definition. Instead, the SDT should scope the Management System/Interfaces in the Applicable System column. That would allow the SDT to include logical isolation of Management Systems/Interfaces in CIP-005 R1.1 and isolation of BCS from Management System/Interfaces could be its own requirement part. For example, the Applicable Systems text could read, "Management Systems of SCI (and associated Management Modules) hosting High or Medium BCS or their associated: PCA; PACS; or EACMS".

We support the NPCC TFIST and RSC comments and submit the following additional comments:

Applicable system mentions "management modules of SCI". Requirements mention "Management system", "Management Interface". Those management reference three different definitions. Request clarification on the requirements (1.2.1,1.2.2,1.2.3) on management modules of SCI

With the new definition of EACMS (Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring of the logical isolation of BES Cyber Systems), why specify "EACMS that perform logical isolation for a High Impact BCS", its clear that and EACMS is a logical isolation.

AZPS generally agrees with the proposed change to establish logical isolation requirements for Management Systems, Management Interfaces and associated SCI. We would like a clearer definition and understanding of what the term “logical isolation” means. Are the examples provided in the parenthesis, valid examples of logical isolation, ACL/VLAN/VXLAN/MPLS/VRF/multi-context, or multi-tenant environment.

Response

JT Kuehne - AEP - 6

Answer	No
Document Name	

Comment

AEP is concerned that the requirements containing the term logical isolation present a potential ambiguity for determining compliance. Logical isolation should be defined to ensure entities can achieve the performance-based requirement. AEP fully supports EEI’s suggestions, copied below for reference.

Specific Comments:

Requirement R1, Part R1.2

Please clarify how Requirement R1, Part R1.2 might apply to substation environments where no SCI exists.

1.2.1: The proposed definition of "Management System" lacks sufficient clarity (see our response to Question 1). We understand Management System to mean hypervisor. If this understanding is correct, the management system is what defines CPU/memory usage for its child VCAs. From this perspective, we request clarification on how management systems would restrict CPU/memory usage of other management systems and whether this is intended to be used for cloud-type services. To resolve this issue, the current language for this requirement should be clarified with additional explanation provided in the Technical Rationale.

1.2.2: AEP asks for clarification on why Management Modules have not been included in the language for this requirement, along with Management Interfaces and Management Systems. We note that Management Modules are included in the Applicability and Measures section but not in the Requirements. Please clarify whether this was intended and why or whether this was an oversight.

1.2.3: It appears that Part R1.2.2 already requires limiting the communication to Management Interfaces and Management Systems. Should this requirement be understood to mean that all communications to these Management Interfaces and Management Systems from BCS and their associated PCAs is to be denied? AEP requests clarification for this requirement.

Response

Mike Magruder - Avista - Avista Corporation - 1

Answer	No
Document Name	

Comment

As written, this standard appears to require that Management Interfaces be configured with logical isolation from the BCSs. It is unclear what security benefit this achieves. Management Interfaces in the same VLAN as BCSs would be as secure as the BCSs, therefore access to the Management Interface would be restricted even in that configuration. We would prefer to have the option of configuring Management Interfaces in the same VLAN as BCSs.

Requirement R1.2 applies to EACMS that perform logical isolation for a High or Medium Impact BCS. EACMS could be a traditional firewall or a virtual firewall. R1.2.3 may cause confusion and prevent entities from communicating their EACMS (traditional firewall in this case) from within an ESP, such as BGP. Suggest clarifying that R1.2 is only applicable to virtual constructs, or R1.2.3 is only applicable to management access only.

System should continue to follow security model of complete distrust. Only communication that is required must be allowed. This can only be established if rules are explicit including, Source, destination, Ports and Protocol. New application is very subjective and confusing. Industry is currently using Goose and still compliant, why change configuration and standards must be technology neutral.

Permitting only “needed and controlled communications” is confusing. Controlled communications could be needed and needed communications should be controlled. We suggest the requirement be changed suchthat the entity first identifies needed communications, then applies control of the permitted communications. Suggested language for R1.2.2 - 1.2.2. Identify needed communications and control permitted communications to and from Management Interfaces and Management Systems, logically isolating all other communications.

Request a better separation for Requirements between SCI and locally managed for non-SCI. By including EACMS there will be additional work required to segment the networks between the IRA and management networks and would bring into scope more of the IT network. Additionally, we propose this as a different definition for IRA: Authenticated access (a person/human) to the BCS from a VCA outside the logical isolation zone containing the BCS.

Conceptually, the SRC agrees with what the SDT is proposing; however, CIP-005, R1, Part 1.2 envisions the segmentation of the management plane. What if the management plane cannot be separated? There should be allowance for this possibility. **Recommendation:** Modify Part 1.2 as follows: **1.2.1** “Restrict Management Systems to only share CPU and memory with its associated SCI and other Management Systems, per ***Cyber Asset*** capability.” **1.2.3** “Deny communications from BCS and their associated PCAs to the Management Interfaces and Management Systems, per ***Cyber Asset*** capability.”

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy	
Answer	Yes
Document Name	
Comment	

Duke Energy generally agrees with the proposed modifications. However, the proposed applicability may be confusing. Is SCI hosting only EACMS subject to requirements beyond that which presently applies to physical EACMS?

Duke Energy in concerned that the inclusion of physical EACMS in the applicability of this requirement represents a significant expansion of scope. It appears that management interfaces of substation firewalls would go from having no specific network-based CIP requirements to being relevant for additional restrictions that would present a high management burden. It is unclear whether local ACLs on those management interfaces would be sufficient to meet the new requirement.

Additionally, the requirement for anti-affinity rules for Management Systems appear to be overly burdensome in relation to the purported security benefit – allowing them to share memory and CPU with high-watermarked BCS provides adequate security and eliminates the need for a physical host that would serve a single VM in many cases. System capability is inadequately defined in this context (for example, is a two-host cluster with one host in maintenance mode given a “capability” waiver for allowing a resident virtual management system to share the remaining active physical host with virtual BES Cyber Assets?).

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	Yes
Document Name	
Comment	

Southern supports the SDT’s proposed direction in R1.2, and requests the SDT to consider the following with regard to the use of these two statements used throughout CIP-005:

1. “Permit only needed and controlled communications to and from…”

2. “Logically isolate all other communications…”

Here, the act of “permitting only needed and controlled communications” is also a form of “logical isolation.” We suggest the SDT consider the below proposed modifications for multiple requirements that carry this former language:

1. “Implement Logical Isolation to permit only needed and controlled communications to and from XYZ … and deny all other communications.”

Southern also reiterates that the requirements for logical isolation represent a potential compliance risk for applicable entities because the term is undefined, making the reliability objective unclear for the industry to ensure their processes will pass regulatory inspection. We encourage the SDT to define Logical Isolation to ensure entities can achieve the performance-based requirement.

Andrea Barclay - Georgia System Operations Corporation - 4

Answer	Yes
Document Name	

Comment

GSOC provides the following comments regarding CIP-005, requirement R1.2:

1. In the proposed revisions for CIP-005, for applicable systems, it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., “…hosting [] impact BCS and the BCS’s associated …..” or “….hosting [] impact BCS and the SCI’s associated…..”

2. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

3. In the defined terms, Management Modules are specifically excluded from SCI; however, the applicable systems column references Management Modules of SCI. This verbiage creates the potential for confusion and ambiguity relative to Management Modules. The following clarification is suggest to reduce the potential for ambiguity:

Management Modules supporting [or associated with] SCI hosting High or Medium Impact BCS or their associated: • PCA; • PACS; or • EACMS

4. It is unclear why Management Modules are included in the applicable systems column of Requirement R1.2 when they are not specifically addressed in the requirements in the next column whereas other applicable systems are. Revision may be necessary to ensure clarity and consistent application and understanding.

5. Revise requirement 1.2.2. For clarity as follows:

Permit only controlled communications that are [necessary/needed] to and from Management Interfaces and Management Systems, logically isolating all other communications.

4. The SDT modified CIP-005 Requirement R1 Part1.3 to protect the confidentiality and integrity of data traversing communication links that span multiple Physical Security Perimeters. Does the proposed requirement fulfill the directive from FERC Order 791, paragraph 150? Please provide the basis for your response.

The applicable system mentions “management modules of SCI”. Requirements mention “Management system”, “management Interface”. That management references three different definitions. Request clarification on the requirement (1.2.1, 1.2.2, and 1.2.3) on a management module of SCI. With the new definition of EACMS (Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring of logical isolation of BES Cyber Systems), why to specify “EACMS that perform logical isolation for a High Impact BCS”, it’s clear that and EACMS is logical isolation.

While it might fulfill the directive from FERC, it is unclear what technology would be used to accomplish this. Would we need to create IPSEC tunnels between switches on the same network but in different PSPs and have cabling traversing those PSPs? Or does the SDT believe something like IPv6 to be a valid way of complying with this requirements?

Comment	
EEI is concerned that the change that moved CIP-006 R1.10 to CIP-005 R1.3 has created some unintended reliability gaps that appear to exceed the scope of the Project 2016-02 SAR. In CIP-006-6, Requirement R1, Part 1.10 specific changes were made to satisfy FERC Order 791, paragraph 150 regarding access physical restrictions to cabling and other nonprogrammable communications components used for connection between appliable Cyber Assets within the same ESP. Among the applicable systems identified to satisfy this Commission-mandated change included “Medium Impact BES Cyber Systems at Control Centers and their associated PCA”. However, the new requirement in CIP-005 R1.3 does not duplicate this requirement and fails to specifically include language identifying Medium Impact BES Cyber Systems at Control Centers. EEI recommends the restoration of the CIP-006 Requirement R1, Part 1.10 in its entirety or modify CIP-005 to fully address the identified reliability gap.

Exclusions have an undefined term. Proposed Requirements address some of the protections of a communication network without defining it.

Request removing specific technologies like encryption.

Request new wording on the exclusion of CIP-012 and time-sensitive protocols since Real-time Assessment and Real-time Monitoring are not clearly defined.

The proposed change isn’t in relation to the SAR. The requirement should have stayed in CIP-006, furthermore, the new requirement isn’t in tune with the old requirement.

Suggest removing any reference to “communications using protocol IEC TR-61850-90-5 R-GOOSE”, what about other similar protocols.

Suggest removing any reference to “CIP-012”.

Suggests stating the exclusion to *time-sensitive protection or control functions*, which is the common language.

Suggest removing any reference to “physical controls” as the concept of implementing confidentiality and integrity controls can include physical controls.

Comment

Concerns on the definitions caused this no vote for this standard.

The “Physical controls that restrict access to the cabling and other nonprogrammable communication components,” should be moved to CIP-006 with all other physical security controls.

Request new wording on the exclusion of CIP-012 and time-sensitive protocols since Real-time Assessment and Real-time Monitoring are not clearly defined.

The exclusion for CIP-012 should be expanded to also exclude communication to a Control Center owned by others. The current language seems to require a GO with only a control room, to encrypt their communication to an LCC or ISO.

Suggest excluding voice communications as is done in CIP-012

The modified requirement covers all medium and high impact BES Cyber Systems. The former requirement's scope was limited to high BCS and medium impact BCS at Control Centers. This would require significant changes to BES facilities with medium impact BCS which are not Control Centers, such as large generation facilities which have disperse PSPs. This change is not in the scope of the SAR and should be updated such that the scope is limited to the prior version.

Applicability section is confusing. Too much compartmentalization of devices and non-industry standard definition are not needed. BCS definitions should be updated to address logical assets and apply high watermarking.

Current approach limits security with assumption that associated devices can be compromised externally, but BES impact must be considered if Cyber system is compromised and made unavailable.

AEP fully supports EEI's comment with the concern that the change of moving CIP-006 R1.10 to CIP-005 R1.3 has created some unintended reliability gaps that appear to exceed the scope of the Project 2016-02 SAR. As noted in EEI's comments, specific changes were made in CIP-006-6, Requirement R1, Part 1.10 to satisfy FERC Order 791, paragraph 150 regarding access physical restrictions to cabling and other nonprogrammable communications components used for connection between applicable Cyber Assets within the same ESP. Among the applicable systems identified to satisfy this, Commission mandated change included "Medium Impact BES Cyber Systems at Control Centers and their associated PCA". However, the new requirement in CIP-005 R1.3 does not duplicate this requirement and fails to specifically include language identifying Medium Impact BES Cyber Systems at Control Centers.

MPC supports comments submitted by Duke Energy and submits the following comment for consideration:	

MPC requests a clarification on the intent of the changes to CIP-005 R1.3. The proposed language would require physical protections for data traversing communication links between two adjacent PSPs within a substation control yard with no virtualization present. This effectively extends CIP-006-6 R1, part 1.10 to medium impact BES Cyber Systems. Is this the intent of the drafting team? The SAR does not contain any language that would support this change when virtualization is not present.

The proposed Requirement, R1 Part 1.3, states that the use of encryption or physical controls are acceptable; however, the Measures do not state that evidence may include proof of physical controls. The SDT needs to include evidence of physical controls in the Measures section, such as,

“Evidence may include, but is not limited to:

• architecture documents detailing the methods used to protect the confidentiality and integrity of the data (e.g., encryption), or

• documents detailing the physical control methods used to restrict access to the cabling and other nonprogrammable communication components.”

We support the NPCC TFIST and RSC comments and submit the following additional comments:

The proposed change isn’t in relation to the SAR. The requirement should have stayed in CIP-006, furthermore, the new requirement isn’t in tune with the old requirement.

Suggest removing any reference to “communications using protocol IEC TR-61850-90-5 R-GOOSE”, in order to take into consideration other similar protocols?

Suggest removing any reference to “CIP-012”

Suggest stating the exclusion to *time-sensitive protection or control functions*, which is common language.

Suggest removing any reference to “physical controls” as the concept of implementing confidentiality and integrity controls can include physical controls.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name CHPD

Answer	No
Document Name	

Comment

CHPD supports the move of CIP-006 R1.10 to CIP-005, as it was not really a physical security requirement. The language still fulfills the directive of Order 791.

However, as with CIP-005 R1.1, the inclusion of PACS and EACMS hosted on SCI is not consistent with the SAR and should be removed. Additionally, the scope has been expanded to beyond Control Centers, which should be removed.

Having added “where logical isolation spans multiple physical security perimters” excludes a lot of traffic. Not sure why this is limited to traffic that is logically isolated vs all traffic which appears to be the intent of the ferc order. It would be good to narrow the traffic down to traffic that is crossing network equipment managed by a third party, a carrier, or communication links shared with other entities.

We do not feel that the standard addresses the protection of the non programmable aspect of communication networks as currently written because of the wording “where logically spans…”

Comment

Southern supports the modifications to CIP-006-6 R1.10 and moving it to CIP-005-8 R1.3 to continue to satisfy the Commission's directive in FERC Order 791 (paragraph 150.). Specifically, the deletion of CIP-006, Requirement R1, Subpart 1.10 and the development of a new requirement within CIP-005-8 (i.e., Requirement 1, Subpart 1.3) to protect "nonprogrammable" communication devices within networks that span multiple PSPs, per FERC Order 791, paragraph 150, *is achievable if simply relocating a requirement*. However, Southern questions the SDTs intent in removing medium impact BCS at Control Centers as an Applicable System, and replacing it with medium impact BCS connected to a network via a routable protocol. This alone has the potential to greatly increase the scope of the former CIP-006-6 R1.10 requirement, and the risk reduction or BES reliability benefit is not fully understood.

Additionally, Southern fails to see the need to add PACS and EACMS hosted on SCI, and the SCI hosting those PACS and EACMS, to the Applicable Systems column. Southern requests the SDT provide additional context into these additions from the former CIP-006-6 R1.10 requirement; specifically, is there commensurate increase in risk and probability for EACMS and PACS warranting this scope expansion? Is there a reliability benefit to "protect the data" traversing communication links between two or more PACS or EACMS assets residing on the same SCI if that SCI physically spans more than one PSP, but that does not apply when these are physical stand-alone assets? To now add EACMS and PACS data protections is an unexpected scope expansion, and the risk reduction or BES reliability benefit is not clearly understood. Under R1.3, the SDT appends the phrase "connected to a network via a routable protocol" for medium impact BCS, but does not also use this phrase for the high impact BCS, which it did use under R1.1. Is there a specific purpose for this omission here in R1.3? Additionally, the SDT appears to be inconsistently using the conjunctions "and" and "or" within the Applicable Systems column. For example – R1.1 uses "**AND** their associated:", but R1.2 uses "**OR** their associated:" and R1.3 uses both "and" and "or" when describing associated Cyber Assets as Applicable Systems. Is this inconsistency intentional?

Richard Jackson - U.S. Bureau of Reclamation - 1

Answer	No
Document Name	

Comment

Reclamation recommends that Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and other BES Cyber Systems could be housed within virtual machines providing the same functionality residing locally on entity-owned computer hardware. Demarcation points of physically separated hardware and communication pathways between virtualized environments must be robust, redundant, and physically separated. Reclamation recommends virtual firewall appliances be used to segregate High/Medium/Low Impact systems in virtual environments. If virtual firewalls are used, mixed trust environments may not be an issue but hardware and supporting systems will need to be protected physically and electronically at the highest system impact level residing on the physical hardware.

Reclamation also recommends that with Standards working on a zero-trust model there needs to be a documented approval process above technical support staff to make changes and approve any trust relationships.

Comments: The proposed language to addresses CIP-006-6 R1.10, exceeds the SAR. There is a current exclusion for communications equipment and links between ESPs – which implies multiple physical locations. If the SDT intended to address the exclusions of discrete communications links between ESPs, then we suggest a revision to CIP-006-6 R1.10. If NERC is interested in addressing confidentiality and integrity between multiple ESPs (i.e., a super ESP), then we suggest a new SAR to add additional requirements.

Recommendation:

- Restore current CIP-005-6 R1.3 language to retain the EAP and revise to include EACMS. Requirement language could be “Utilize an EAP or EACMS, to require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.”

Suggest changing the Applicable Systems for CIP-005-6 R1.3 to:

“High Impact BES Cyber Systems and their associated:

- PCA

Medium Impact BES Cyber Systems with External Routable Connectivity and their associated:

• PCA”

1. SRP in general, the inclusion of virtualization concepts with newly defined Applicable Systems makes the requirements harder to understand and identify what is truly applicable. SRP doesn’t like how all standards increased in size due to these additions. SRP would prefer to implement a way to account for virtualization without sweeping changes – similar to Low Impact. The attention given to virtualization feels over weighted compared to non-virtualized systems. This increases the burden on entities without virtualization to comb through the standards to find what is applicable.

2. SRP reads the rational to imply that the communications need to be encrypted if the communications link is provided by a 3rd party, however the verbiage of the standard excludes that detail. Is encryption required if the communications infrastructure is soley under the control of SRP?

3. Does SRP need to encrypt the communications to the multiple PSPs, or can we protect the links with a harden conduit between both PSPs – more of an explanation is needed. It mentions protect the data traversing communication links, where the logical isolation spans multiple PSPs.

4. SRP request the clarification on third party communications, and devices not within the PSP. Standard does not specifically call out third party communications. Standard is not specific in listing what equipment or types of equipment and what communication links are included.

5. SRP considers this requirement to be written for both Physical and Virtual environemnts.

Duke Energy does not generally agree with the proposed modifications. It is not clear how this impacts existing compliance postures for CIP-006 R1 for ESPs that span multiple PSPs. It appears there may be a significant scope expansion based on the new applicability as written to Medium BCS at Generation facilities, with limited reduction of risk. Duke Energy believes the proposed language to address CIP-006 R1.10 potentially exceeds the scope of this SAR.

Issue 1:

The intent of removing CIP-006 R1 Part 1.10 in favor of a single requirement to address this security objective of ensuring the confidentiality and integrity of data when moving across unprotected physical space is positive, however the Applicability of the Requirement parts differs. CIP-006 R1 Part 1.10 applies to Control Centers only, and this change will force additional locations to be secured that are not currently required.

Issue 2:

Tacoma Power requests the SDT provide clarification on their intent for using the language “confidentiality and integrity controls (such as encryption)” rather than the general language of “encryption”. It would be helpful if the SDT would provide guidance on what type of evidence can be used to meet the confidentiality and the integrity in the Measures column for this Requirement. For example, an entity may choose to use an IPSEC Site-to-Site VPN to secure communications. The IPSEC VPNs are configured to use IKE v2 with AES256 encryption to provide confidentiality and certificates for authentication to provide integrity for the link. Is this the type of evidence the SDT is looking for to meet the requirement, or is simply providing evidence the link is encrypted sufficient to meet the SDT’s intent for using the confidentiality and integrity controls language? Suggest including specific technology examples within the Implementation Guidance, much like was presented at the March 3, 2021 Webinar.

Response

Andrea Barclay - Georgia System Operations Corporation - 4

Answer	Yes
Document Name	

Comment

GSOC agrees that the requirement fulfills the directive and respectfully suggests the following clarifications:

1. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

2. Clarification of the included exclusions is recommended as follows:

…excluding data being transmitted between Control Centers that is subject to CIP-012 and time-sensitive protection or control functions between intelligent electronic devices (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).

1. As SRP reads, R2.1: “Ensure…” should be replaced with strong verbiage. R2.2: “Protect the confidentiality and integrity…” appears to provide flexibility, it will likely result in entities seeking and following the opinion of auditors on what is sufficient. SRP would prefer 2.2 be the first requirement in the R2 section, then 2.1 and 2.3.

Comments: In order to accommodate the SDT language for these requirements, the definition of IRA could be revised per our recommendations in Question 1 to include routable connectivity for the initiation of Interactive Remote Access.

Recommendations:

- Retain the current CIP-005-6 R2 language and revise the Applicable Systems to change from Medium Impact with ERC to Medium Impact with IRA.
- Retain the current CIP-005-6 R3 language for Applicable Systems.

Comment

The proposed definition and requirements decouple ERC as a qualifier for IRA and imposes additional requirements on systems that were previously out of scope. This prevents backwards compatibility for entities with serial connections to medium impact BCS at substations and generation facilities. The requirement was modified to address conversion from IP to serial protocol conversion at a substation or generating facility due to the perceived risk of the routable communications. However, the changes adversely impact entities that use the “500 mile serial cable” for communications. How does an entity protect confidentiality and integrity of communications on a serial link that transverses through an asset boundary? The proposed revisions ultimately require the conversion of substations/facilities with serial connections to BCS with ERC in order to meet IRA requirements in CIP-005 R2.

Comment	
For CIP-005 Requirement R2.1, ISO-NE recommends the replacement of the word “ensure” as this represents internal control language and is inconsistent with all other requirements. ISO-NE suggests the following replacement language: “For all IRA, utilize an Intermediate System (IS).”	

For CIP-005 Requirement R2.2, ISO-NE recommends removal of the cross-reference to another Part of the same requirement in the Applicable Systems, “Intermediate Systems used to access applicable systems of Part 2.1.” This approach deviates from other CIP “Applicable Systems” columns and requires a reader to refer to other requirements for scope. ISO-NE suggests either including the CIP-005 Part 2.2 requirements in the CIP-005 Part 2.1 requirements, or adjusting CIP-005 Part 2.2 to state “Intermediate Systems used for IRA.”

For CIP-005 Requirement R2.3, ISO-NE recommends removal of the cross-reference to another Part of the same requirement in the applicable systems, “Intermediate Systems used to access applicable systems of Part 2.1.” This approach deviates from other CIP “Applicable Systems” columns and requires a reader to refer to other requirements for scope. ISO-NE recommends adjusting CIP-005 Part 2.3 to state “Intermediate Systems used for IRA.”

Comment

Southern does not support the proposed changes to R2 and requests that the SDT consider the following comments:

• Southern requests that the SDT consider that the R2.1 requirement, as currently proposed, (1) adds further scope expansion from previous versions, and (2) reintroduces again the concept of the “Hall of Mirrors” where the object of the requirement (an EACMS-Intermediate System) is also an Applicable System (EACMS) where the object must apply the requirement to itself.

o In the first case, PACS assets have historically not been required to have an EACMS-Intermediate System regulate remote access to them; here PACS hosted on SCI have been added as an Applicable System, which now would require an entity implement an EACMS-IS for remote access to PACS assets hosted on SCI, and the IRA definition has been expanded to now make IRA applicable to PACS assets hosted on SCI because IRA is no longer tied to the outer boundary of an “ESP”.

o In the second case, the Applicable Systems column includes EACMS hosted on SCI, which now requires that IRA to an EACMS go through an Intermediate System; however, the Intermediate System is also an EACMS and IRA to it would therefore require another Intermediate System in front of it, and so on and so forth.

o However, a review of the revised definition of EACMS states:

 Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure that perform electronic access control or electronic access monitoring of **the logical isolation of BES Cyber Systems.** This includes Intermediate Systems.

 This definition of an EACMS explicity excludes itself from performing electronic access controls (IRA) or electronic access monitoring for PACS assets or other EACMS assets, whether hosted on SCI or not, and rather only includes that performance for the “***logical isolation*** of BES Cyber Systems”, and not PACS, other EACMS, or the BES Cyber Systems themselves.

• It is also not explicitly clear what is meant by the term “from outside of the asset containing the system being accessed” from the IRA definition. Southern recommends the SDT provides clarification on this specificity in defining IRA that appears to make any communication from outside of the “asset” (little “a”, Facility) where the system being accessed “resides” as now being IRA. This seems ot be a result of the concepts of losing the outer boundary of an ESP such that the definition of “remote” becomes very broad. As a result, for those entities that do retain ESPs as a form of Logical Isolation, this significantly complicates inter-ESP communication that spans multiple “assets” or Facilities.

• Under Requirement R2.6.1, the requirement is written in a way that could be interpreted to mean that all Intermediate Systems must be virtualized and therefore must, in every case, only “share CPU and memory with other Intermediate Systems and their associated SCI.” Southern requests the SDT consider the addition of the following phrase to the requirement as follows: “Restrict Intermediate Systems ***hosted on SCI*** to only share CPU and memory with other Intermediate Systems and their associated SCI.”

o Additionally, the R2.6.1 language confirms the interpretation that Intermediate Systems hosted on SCI and associated with any of the Applicable Systems from Part 2.1 cannot share virtual space or Management Systems with BES Cyber Systems or non-CIP assets, and therefore must be stand-alone systems. A utility is then required to have at least three separate sets of hardware/management systems: one for medium and high BCS, one for IS, and one for associated PACS and EACMS hosted on SCI (and more if using virtualization for non-CIP/exempt cyber assets and/or separating medium impact and high impact assets from a risk-based perspective). This seems to disincentivize the use of, and achievement of better security offered by, virtualized systems and architectures.

• The Technical Rationale for CIP-005-8 mentions that this is now an objective-based requirement, but that outdated encryption methods or protocols would not meet the objective. Who decides what encryption methods or protocols are “outdated” and thus would be non-compliant? Can a list of these be provided by NERC and the Regions? Can the SDT remove this from the TR and potentially allow common sense to apply to appropriate security and encryption protocols between entities and auditors?

Response

Anthony Jablonski - ReliabilityFirst - 10

Answer	No
Document Name	

Comment

RF does not agree with the proposed changes for the following reasons:

A significant concern is that an entity could implement logical isolation using only a host-based firewall and essential systems could be directly connected to the internet – a side effect breaking the definition of External Routable Connectivity and enabling entities to bypass many now-required protections.

With each system becoming its own ESP (zero trust) – mixing of CIP and non-CIP network traffic is permitted and could lead to issues regarding secure communications if implemented policies are not closely scrutinized and exceptional care taken to maintain and control policies on each individual Cyber Asset.

As written and presented, there is a gap between what is system-to-system and what is Interactive Remote Access (IRA) with the new IRA definition. Entities often rely on IRA ports for system-to-system communication, but have not adequately enforced protections to ensure that the ports are not used by malicious actors – regardless of whether a remote access client is available or used. Additional technical measures or controls should be added to ensure validity of communications to Applicable Systems.

Logical Isolation is not defined, leading to diverse definitions between the entities and regions.

Comment

R2.1: The Intermediate System is an EACMS. Adding associated EACMS to the Applicable Systems creates an EACMS for an EACMS situation. There is no need for this requirement to be applicable to associated PACS or EACMS. The Intermediate System is designed to protect IRA sessions to logically isolated systems. If any PACS or EACMS are inside the logical isolations, then those PACS or EACMS are PCAs. We recommend removing “PACS or EACMS” from the Applicable Systems for both SCI and Management Modules.

R2.2: We understand the concept of the requirement as currently written, “ For all IRA sessions, utilize encryption that terminates at the Intermediate System.” The revised language “between the client and the Intermediate System” is not clear. Either clarify or define “the client” in the requirement or revert back to the current language.

R2.6: Is the intent to require any virtualized Intermediate System(s) to be hosted on SCI that does not contain virtual BCS, EACMS, PACS or PCAs? Please clarify the intent.

R2.6.2 seems duplicative of R1.1. R2 requires Intermediate Systems to be used to access logically isolated applicable systems. R1.1 requires that we identify needed communications. If the communications between the Intermediate Systems is needed and controlled into the logically isolated systems, then R2.6.2 is redundant and covered by R1.1. Please clarify the SDT intent for R2.6.

Could you please specify the kind of access you are referring to for IRA? For example, we have operators that will issue commands to close or open a breaker, start or shutdown a Turbine generating unit. But they don't have access to configure or change the configuration of the asset. In that case is that consider IRA ?

Our understanding is that the "User-initiated access by a person employing a remote access client" you are referring to, is basically **for configuration changes** from outside of the asset containing the system being accessed or outside of the logical isolation of the system being accessed.

Proposed definition:

User-initiated access by a person employing a remote access client from outside of the asset containing the system being accessed or outside of the logical isolation of the system being accessed; **excluding control functions** (e.g. access for issuing commands)

Comment

the standard requires that an entity must use an IS to access and EACMS but and IS is an EACMS so do you need and IS to access and IS? This comment is based on the interpretation by some SMEs that CIP-005 R2.1 includes with IRA including the VCA hosted by them (discussed below).

In requirement 2.1 for:

SCI with IRA hosting High or Medium Impact BCS or their associated:

PCA

PACS; or

EACMS

For R2.1 It is not clear if EACMS and PACS on SCI is applicable if there is no High or Medium Impact BCS on the same SCI. Some SMEs read that EACMS and PACS are only applicable if High or Medium Impact BCS are on the same SCI; other SMEs read the applicability to be associated EACMS and PACS on SCI, regardless of whether the High or Medium Impact BCS are virtual. A third way to interpret the applicability is that SCI with IRA hosting high or medium impact BCS or associated PCA, PACS or EACMS must have an intermediates system just to access the manament system. It’s unclear what the applicable systems are.

For CIP-005 R2 and others, where the intent may be to protect the SCI or have the SCI be the applicable system, it might be better to write like this:

SCI with IRA hosting:

High or Medium Impact BCS or their associated;

PCA;

PACS; or

EACMS

The above would make it clear that the applicable system is the SCI.

JT Kuehne - AEP - 6	
Answer	No
Document Name	
Comment	

AEP is concerned that proposed changes to CIP-005 Requirement R2 may have created some unintended gaps in how the requirements may be audited and seeks additional clarification. AEP fully supports EEI's suggestions, copied below for reference.

Part 2.1: Requirements do not specify that the Intermediate Systems (IS) must be logically separated from the system being accessed. The current IS definition states that it must be located outside the ESP. The Technical Rationale for the IS definition states that placement of IS has been moved to R2. AEP seeks clarification on how this is addressed within Requirement R2.

Part 2.2: The proposed IRA definition states that IRA shall be from outside the logical isolation of the system being accessed. R2, Part 2.2 requires that IRA between client and IS must be protected. Assuming the client is the initiating device, there must be logical separation between client and IS. Considering this and what was previously required, separation was required between IS and BCA (i.e., "IS must be outside ESP"). AEP's concern with R2, Part 2.2 is that it is no longer clear if that level of isolation is still required. The existing requirement should be clarified to address what is required.

- Clarification is needed on the change from "encryption that terminates at an intermediate system" to "between client and the IS". It is not clear where encryption is required. Diagrams in the Technical Rationale would be useful to ensure that entities understand what is expected.
- We also note that the Technical Rationale states that R2, Part 2.2 is now objective-based and the requirement now "prevents outdated encryption methods from being used that no longer meet the objective." (CIP-005-8 Technical Rationale, R2, Part 2.2, page 10). Clarification is needed on who makes this determination and how this would be determined.

Part 2.6: AEP also suggests to add Applicable Systems from Part 2.1 to Part 2.6 instead of just referencing it.

- Part 2.6.1: Is this intended to separate IS from exempt cyber assets, meaning IS cannot be hosted by Management Systems shared with non-CIP systems? This also prevents IS from being hosted by Management Systems containing BCS. The result is that, in a virtualized environment, a utility requires three separate sets of hardware/management systems: one for medium and high BCS, one for IS, and one for non-CIP/exempt cyber assets. Can IS be hosted on SCI with non-CIP systems? Again, the "IS" definition in the glossary indicates IS placement is handled in CIP-005 R2 but that detail is not included here.

- Part 2.6.2: AEP is concerned that this requirement may be duplicative of Requirement R1, Part 1.1. In Part 1.1, it already requires that EACMS "Permit only needed and controlled communications to and from applicable systems" and the IS definition indicates it is a "type of EACMS". For these reasons, Clarification is needed on why R2, Part 2.6.2 is not duplicative to R1, Part 1.1.

AEPCO is signing on to ACES comments, please see below:

ACES does not agree with the language used in requirement R2.2. "Client" is a vague and an undefined term. We suggest:

Protect the confidentiality and integrity (e.g., encryption) of IRA between the remote host and the Intermediate System.

ACES does not agree with the language used in R2.6.2 as it is redundant to R1.1 and not necessary. If implemented, any communications with Applicable Systems in part 1.1 would already be permitted, controlled, and documented, which would include IRA, and make R2.6.2 unnecessary. If the scope of R1.1 does not include all of R2.1, updating the scope of R1.1 would suffice.

R2.2 and 2.3: With the revised definition, it is unclear if Intermediate System, defined as “An Electronic Access Control or Monitoring System that is used to restrict Interactive Remote Access”, is referring to a jump host or an authentication system. Based on the language used, encryption is only required during the authentication phase.

R2.4: The language states that a method for determining active vendor remote sessions is required. However, the measures appear to be primarily focusing on logging of access while ignoring real time access. Is the intent to log, or is the intent to be able to identify active sessions. Intent and language in the requirement is unclear.

R2.1: The Intermediate System is an EACMS. Adding associated EACMS to the Applicable Systems creates an EACMS for an EACMS situation. There is no need for this requirement to be applicable to associated PACS or EACMS. The Intermediate System is designed to protect IRA sessions to logically isolated systems. If any PACS or EACMS are inside the logical isolations, then those PACS or EACMS are PCAs. We recommend removing “PACSor EACMS” from the Applicable Systems for both SCI and Management Modules.

R2.2: We understand the concept of the requirement as currently written, “For all IRA sessions, utilize encryption that terminates at the Intermediate System”. The revised language “between the client and the Intermediate System” is not clear. Either clarify or define “the client” in the requirement or revert back to the current language.

R2.6: Is the intent to require any virtualized Intermediate System(s) to be hosted on SCI that does not contain virtual BCS, EACMS, PACS or PCAs? Please clarify the intent.

R2.6.2 seems duplicative of R1.1. R2 requires Intermediate Systems to be used to access logically isolated applicable systems. R1.1 requires that we identify needed communications. If the communications between the IS is needed and controlled into the logically isolated systems, then R2.6.2 is redundant and covered by R1.1. Please clarify SDT intent for R2.6

Request clarification on R2.1 “ensure.” The requirement says “Ensure that IRA is through an Intermediate System.”

Request clarification on R2.1 “ensure.” The requirement says “Ensure that IRA is through an Intermediate System.”

Request clarification on the definition of SCI (including Management Systems) and the column applicable systems, in requirement 2.1 Management Modules.

Suggest not to include PACS and EACMS into the scope in the context of SCI as this requirement doesn’t exist for a PACS and EACMS not on an SCI.

Requirement R2

2.1: Requirements do not specify that the Intermediate Systems (IS) must be logically separated from the system being accessed. The current IS definition states that it must be located outside the ESP. The Technical Rationale for the IS definition states that placement of IS has been moved to R2. EEI seeks clarification on how this is addressed within Requirement R2.

2.2: The proposed IRA definition states that IRA shall be from outside the logical isolation of the system being accessed. R2, Part 2.2 requires that IRA between client and IS must be protected. Assuming the client is the initiating device, there must be logical separation between client and IS. Considering this and what was previously required, separation was required between IS and BCA (i.e., “IS must be outside ESP”). EEI’s concern with R2, Part 2.2 is that it is no longer clear if that level of isolation is still required. The existing requirement should be clarified to address what is required.

EEI also seek clarification on the change from “encryption that terminates at an intermediate system” to “between client and the IS”. It is not clear where encryption is required. Diagrams in the Technical Rationale would be useful to ensure that entities understand what is expected.

We also note that the Technical Rationale states that R2, Part 2.2 is now objective-based and the requirement “prevents outdated encryption methods from being used that no longer meet the objective.” (CIP-005-8 Technical Rational, R2, Part 2.2, page 10). EEI requests clarification on who makes this determination and how this would be determined.

2.6.1: Is this intended to separate IS from exempt cyber assets, meaning IS cannot be hosted by management systems shared with non-CIP systems? This also prevents IS from being hosted by management systems containing BCS. The result is that, in a virtualized environment, a utility requires three separate sets of hardware/management systems: one for medium and high BCS, one for IS, and one for non-CIP/exempt cyber assets. Can IS be hosted on SCI with non-CIP systems? Again, the “IS” definition in the glossary indicates IS placement is handled in CIP-005 R2 but that detail is not included here.

2.6.2: EEI is concerned that this requirement may be duplicative of Requirement R1, Part 1.1. In R1, Part 1.1 it already requires that EACMS “Permit only needed and controlled communications to and from applicable systems” and the IS definition indicates it is a “type of EACMS”. For these reasons, EEI requests clarification why R2, Part 2.6.2 is not duplicative to R1, Part 1.1.

In R2 there is a Hall of Mirrors effect. In R2.1 it appears the EACMS on SCI needs to have IRA through an Intermediate System, but an Intermediate System itself is by definition an EACMS. So if I have my Intermediate System on SCI then does that Intermediate System which is a EACMS on SCI also need another Intermediate System to perform IRA?

We have a concern about R2.6. Many multifactor authentication systems reside on the domain controller. The Multifactor authentication is part of the Intermediate System. The concern is restricting the sharing of CPU and memory. These domain controllers may also be EACMS for other devices. Can we restrict the sharing of CPU and memory to other in scope CIP devices to allow more flexibility in architecture?

We don't agree with replacing ERC with IRA, as it will bring into compliance more devices that were previously excluded. Additionally, we recommend that R2.4 – 2.5 are updated with the same exclusion as R1.3 for Real-time Assessment and real-time monitoring data. We do not believe ICCP protocol should be considered vendor system-to-system remote access. Our EMS system does not allow modifications through the ICCP protocol, thus there is no "access".

GSOC provides the following comments regarding the proposed revisions to CIP-005, requirement R2:

3. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

4. In the applicable systems column, ERC has been struck with respect to Medium Impact BCS and IRA or vendor remote access has been added. This is different from other areas where IRA has been added to a similar requirement and ERC has been retained and vice versa. While it is understood that such scoping can better tailor the requirements, inconsistent application and use of scoping verbiage can lead to ambiguity and confusion. For this reason, review and use of consistent scoping verbiage is recommended.

5. In the defined terms, Management Modules are specifically excluded from SCI; however, the applicable systems column in R2 and R3 references Management Modules of SCI. This verbiage creates the potential for confusion and ambiguity relative to Management Modules. The following clarification is suggest to reduce the potential for ambiguity:

Management Modules supporting [or associated with] SCI hosting High or Medium Impact BCS or their associated: • PCA; • PACS; or • EACMS

6. The intent and expectations of requirement R2.1 is unclear. As revised, the new requirement could be construed as allowing the Intermediate System to acts as a pass-through or flow-through device that is not contributing to the security controls applied to IRA. Suggest clarification through the proposed revisions below:

Ensure that IRA is [implemented/controlled] through an Intermediate System.

7. CIP-004 does not address the authorization of electronic access to Management Modules; however, requirements in Requirement R2.1 hint that there are expectations and obligations associated with access to these assets. This should be clarified.

8. In requirement R2.6, the following revision is recommended for clarity:

2.6.2. Permit only controlled communications that are [needed/necessary] between Intermediate Systems and applicable systems of Part 2.1.

As written, CIP-007, R1, Part 1.1 continues to reference both ports and services:

- Requirement: “Enable only network accessible services that have been determined to be needed…, or the logical network accessible *ports* if unable to determine service, including *port* ranges where needed to handle dynamic *ports*) per system capability”
- Measure: “Documentation of the need for all enabled *ports*.”

Recommendation: If the intent is to focus on services only, the SDT should clarify this in non-ambigous terms; i.e. indicate entities will be audited on “**services only**” (as opposed to “*ports and* services”).

N&ST believes proposed changes beyond those needed for conformance:

Have little or nothing to do with virtualization,

Are unlikely to improve anyone’s cyber security posture,

Are outside the scope of the original 2016 SAR,

Are not addressed in any relevant FERC Order, and

Would be an unnecessary and unwelcome distraction for entities trying to adjust their CIP programs and documentation to accommodate new virtualization-related requirements.

General comment on CIP-007. Request consistent use of “system hardening.” We concerned that the label “system hardening” is used differently in the R3.1 Measures and with Transient Cyber Assets.

Request clarification of “services” – entity may need to map their BES Cyber Assets to Applicable Systems.

Suggest reviewing the Requirements column for requirements 1.1 and 1.3, the objective is the same, yet the text isn’t. It should have the same level of detail.

Suggest reviewing the Applicable Systems of CIP-007 should include Management Systems.

Suggest not to include PACS and EACMS into the scope in the context of SCI as this requirement doesn’t exist for a PACS and EACMS, not on an SCI. SAR is for including the virilization concepts not to add additional controls.

Suggest reviewing the Applicable Systems of CIP-007 associated with management modules. The current language only refers to Management Modules of SCI hosting what about the management module of a BCA? Management Modules of SCI hosting would have more controls than Management Modules of BCA.

Request clarification on the term system (cybersecurity patches for systems), the objective is for the system to be patched or for the cyber asset composing the system to be patched?

Request clarification on the term system capability (Log security events, per system capability), logging from one cyber asset would be enough to comply with the requirement?

Karie Barczak - DTE Energy - Detroit Edison Company - 3, Group Name DTE Energy - DTE Electric	
Answer	No
Document Name	
Comment	
Referring to the Change Rationale for CIP-007 Part 1.1, DTE recognizes the clear direction shift from "ports" to "services". However, R1.1 infers that a port listing may still be required to justify the service. The “Measures” does not reference “services”. DTE would recommend additional measures that demonstrate potential compliance strategies that do not require the demonstration of “ports”. Without such reference it may be inferred that such a “port” list is a prescriptive requirement, which would not provide any relief to the entity's burden of compliance.

Comment

Concerns on the definitions caused this no vote for this standard.

The change the requirement title to "System Hardening" is unclear. "System hardening" is used in section 3.1 as an alternative to AV and as part of the TCA/RM requirements.

The TR states, "harden the applicable systems through limiting access to logical services and physical ports" but the requirement language states "Services and logical ports."

Services are typically associated with Cyber Assets running an operating system. There is no technical or risk basis for changing from ports to services. While an open port is associated with a running process (service), on firmware based Cyber Assets and some software appliances, they do not have the ability to discern the running process (service) which the port is open. Further, part of the attack surface of a Cyber Asset is determined by its open ports. Processes may or may not be discernable. Network accessible ports are consistent across any platform running a TCP stack and can be determined easily. While the new language in the requirement allows for documenting ports as a secondary mechanism, there is not technical merit or risk reduction in documenting services over network accessible ports. This also was not a part of the FERC order or SAR.

A requirement to control logical ports makes far more sense than services. If services is the term used, services needs to become a defined term. There are many ways to interpret the term services. Windows and Linux each have different approaches to managing and using the term services. Application frameworks use the term differently as well.

R1.2 - Additional clarification is needed to clearly determine what the term “non-programable communications components” means.

R2.1 – As written, it appears that patching can be performed at the “system” level vs at the individual CA level. Additional language should be added to clarify the intent of the team as the current language is ambiguous.

R4.1 – As written, it appears that logging should now be performed only at the system level and does not allow for additional logging at the CA level. Additional language should be added to clarify the intent of the team as the current language is ambiguous.

We support the NPCC TFIST and RSC comments and submit the following additional comments:

Suggest reviewing the applicable systems column should include SCI hosting High or Medium Impact BCS or their associated: PCA

Suggest reviewing the Requirements column for requirements 1.1 and 1.3, the objective is the same, yet the text isn't. It should have the same level of detail.

Suggest reviewing the Applicable Systems of CIP-007, should include Management Systems.

Suggest not to include PACS and EACMS into the scope in the context of SCI as this requirement doesn't exist for a PACS and EACMS not on a SCI. SAR is intended for virilization concepts, not to add additional controls.

Suggest reviewing the Applicable Systems of CIP-007 associated to management modules. The current langage only refers to a Management Modules of SCI hosting . What about a the management module of a BCA ? Management Modules of SCI hosting would have more controls than a Management Modules of BCA.

Request clarification on the term “system" (cyber security patches for systems). Is the objective for the system to be patched or for the cyber asset composing the system to be patched ?

Request clarification on the term system capability (Log security events, per system capability), logging from one cyber asset would be enough to comply with the requirement ?

Victoria Mordi - Entergy - 3,7,9 - SERC	
Answer	No
Document Name	
Comment	

Entergy cannot support this standard as written due to a lack of clarity regarding required documentation and adequate information to inform expected auditing approach. The standard states “or logical network accessible ports if unable to determine service” but the Requirements and the Measures, as well as the lack of a Guidelines & Technical Basis section, do not provide adequate guidance on what documentation is expected to enable only logical network accessible ports as opposed to services. If an entity identifies that they are "unable to determine service", what evidence, if any, would be required by the entity to justify the inability to determine service?

Additionally, although the Requirement has been changed to shift the focus from ports to services, the measures as written still focus on the documentation of ports and makes no mention of services, which leads to ambiguity for the entities on how to achieve compliance.

The SDT is recommended to provide additional clarity regarding evidenciary examples for a.) when the entity is unable to determine service and is instead limiting ports; and b.) update the measures to provide clarity on examples of evidence related to services and/or ports.

Part 1.1: Changes focus from ports to services, requiring enabling only needed services. Entity may fall back on port identification only when services cannot be identified. The shift to focusing on looking at services could restrict auditor visibility in the case where a service arbitrarily uses overly large port ranges. The part does include the language “including port ranges where needed to handle dynamic ports” however this would result in the auditor not knowing the port ranges associated with all services deemed necessary. The onus would then be put on the auditor to determine the ports associated with a particular service and whether the port ranges are reasonable or not. In addition, entities focus would be on authorized services and not on the actual system vulnerability of an increased attack surfaced created by ports that are not intentionally disabled. A recommended change may be “Disable all logical network accessible ports except those associated with network accessible services that have been determined to be needed by the Responsible Entity (or logical network accessible ports if unable to determine service, including port ranges where needed to handle dynamic ports), per system capability. If a system has no provision for disabling or restricting network accessible services (or logical ports) then those services (or logical ports), that are open are deemed needed.”

Comment	

ISO-NE finds the following requirement language unclear, “…network accessible services (or logical ports), that are open are deemed needed.” The language seems subjective and may be interpreted to mean ‘can be open’ or ‘open for a period of time’ which presents a compliance risk. For this reason, ISO-NE recommends defining network accessible services.

Additionally, CIP-007 Part 1.3 conflicts with Part 1.1, both parts should be combined because virtual hosts and physical hosts would run on the same ports. The physical attribute is the only aspect addressing ports; the distinction between virtual vs. physical adds confusion.

ISO-NE appreciates the removal of TFEs and understands that system capability requirements are still in place and will need to be documented.

Comments: We recommend revising SDT’s proposed language.

Recommendation:

- Revise the current CIP-007-6 language to read:

“Enable only logical network accessible ports or services determined to be needed by the Responsible Entity per system capability. If an applicable Cyber Asset or BCS has no provision for disabling or restricting network accessible ports or services on the Cyber Asset or BCS, then those open ports or services are deemed needed.”

1. SRP request clarification with the concept “If a system has no provision for disabling or restricting network accessible services (or logical ports) then those services (or logical ports), that are open are deemed needed.”

2. Is this requirement addressing just vitural environements or can the physical environment (current) version also be part of this new requirement. SRP has questions concerning backward compartible if we are not in a virtual environment. Or is this requirement speaking only to virtualization, and if this is the case - physical would have to be backward compatibility.

3. What is the value of removing ports if the phrase “(or logical ports)” is added every time services is used?

The change does not seem to pose any concerns from ports to services. There still continues to be a disconnect from CIP-007 R1.1 and CIP-010 R1.1. Is there a fundamental reason why CIP-007 R1.1 applies to Medium Impact systems that have ERC but the baselines requirements of CIP-010 R1.1 apply to all Medium Impact systems? Those two sub-requirements seem like they should sync up one way or the other.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name CHPD

Answer	Yes
Document Name	

Comment

While CHPD does not disagree with this change, it seems to be unnecessary as CIP-007 R1.1 already requires the entity to demonstrate the need for the port. In doing so, the entity indirectly documents the service by explaining the need for the port.

Comment

GSOC provides the following comments for the SDT’s review and consideration:

9. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

10. In the defined terms, Management Modules are specifically excluded from SCI; however, the applicable systems column references Management Modules of SCI. This verbiage creates the potential for confusion and ambiguity relative to Management Modules. The following clarification is suggest to reduce the potential for ambiguity:

Management Modules supporting [or associated with] SCI hosting High or Medium Impact BCS or their associated: • PCA; • PACS; or • EACMS

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	Yes
Document Name	

Comment

Yes, Southern supports these proposed revisions to shift the security objective to enabled services. Southern also requests that the SDT remove the phrase “per system capability” (along with “Where technically feasible”). The second sentence of R1.1 states that where a system has no provision for … which covers an entity in all situations and therefore a TFE or a “per system capability” exemption is not needed.

Additionally, Southern requests the SDT consider the potential for “double jeopardy” with regulators with regard to CIP-007 R1 and CIP-010 R1 when providing evidence to support compliance for enabled services. Any failure to authorize and document changes to services as per CIP-010 R1 can also result in a potential violation of CIP-007 R1 as services may be enabled without documented authorization; Southern requests the SDT consider modifications to eliminate the duplicative nature of the two requirements and remove the potential for double jeopardy.

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy

Answer	Yes
Document Name	

Comment

THE SELECTION SHOULD BE NO TO THE QUESTION.. THE SBS SYSTEM WILL NOT ALLOW FOR EDITS AFTER A SELECTION HAS BEEN SAVED.

Duke Energy agrees with the intent of a services based approach but does not agree with the revision as worded. Duke seeks clarification that entities may credit existing port controls and associated evidence without need to re-document explicit approval of services if the ports associated with their use are already approved. In addition, Duke seeks updated measures to provide examples of how services may be documented.

Duke Energy requests the inclusion of the “(or logical ports)” flexibility in Part 1.3 to mirror Part 1.1 particularly since Management Modules are included and are known to have poor documentation on older models such that open port data may only be available from port scans.

7. CIP-010 Requirement R1 currently requires Responsible Entities to develop a baseline configuration, authorize changes to the baseline, and document the changes. The SDT proposes to revise Requirement R1 to remove the reference to baseline configurations. The proposed revisions require the authorization of changes to Operating System(s), firmware, commercially available open-source software, custom software, logical network accessible ports, security patches applied, and SCI configurations. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer	No
Document Name	

Comment

Consider revising to clarify the lower threshold of what is included in the term *baseline.* Otherwise, this language may be interpreted to include administrative changes in nature and have no impact to the cybersecurity posture of the cyber asset.

Response

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

1. SRP interpret this to mean providing baselines will not be required for evidence. This does not state anything about physical, only virtual. Please clarify requirements for Physical, and backward compatability.

2. SRP recommends changing logical network accessible ports to logical network accessible services to be in alignment with the other proposed changes. SRP also believes SCI configurations is redundant. SCI configuration is included as part of the “Operating System(s), firmware, commercially available open-source software, custom software, logical network accessible services and security patches applied of the virtualization and storage system.

Comments: Refer to our comments in the QUESTION 1 definitions. Considerations could be existing revised language to meet the intent of the SAR and a revision to CIP-010 R1.1.

A. The baseline documentation requirement represents the current configuration of a BCS/BCA with the objective of maintaining the security posture of the BCS/BCA, otherwise the changes have no basis.

The virtual image shouldn't be captured as a baseline because: 1) for an active virtual image, it should be a VCA that has its own baseline; 2) for a dormant virtual image, it is similar to a powered off physical cyber asset, as long as you maintain a base image for compliance all the time, it can be used when the dormant virtual image is turned on. In addition, the configuration baselines are not for the proposed definitions and applicability for SCI, SCA and management modules (See our comments for Question 1).

Recommendation: Restore CIP-010-3 language.

Comment

ISO-NE agrees with the proposed revisions that remove references to baseline configuration because they provide significant relief from baseline tracking and seem to better align with general change management practices. However, the deletion of the term “configuration” from “configuration change management” throughout the revisions may cause a great deal of confusion. Change management covers a wide breadth of “changes” from items considered “baseline configurations” to other non-material changes that do not affect a baseline. Differences in interpretation or definition of “change management” could lead to a dispute with Regional Entities and present a compliance risk. ISO-NE recommends that the SDT make further revisions to clarify which “changes” that require change authorization and testing.

ISO-NE also recommends that the SDT remove CIP-010 R1 Part 1.1.6 and create a new requirement to align the applicability for SCI.

Furthermore, ISO-NE recommends that the added language to CIP-010 R1.3, “...that minimizes difference with the production environment…” be deleted because CIP-010 Part 1.3.2 requires that the differences between the test environment and production environment be documented.

In *CIP-003-3 we had requirement R6 that stated “Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.” CIP-010 R1 was developed to put an emphasis* *on configuration management . It now appears CIP-010-5 is reverting back to authorizing a change and not assuring that you have a trusted configuration.*

Baseline management is critical for system integrity, being able to detect and correct unauthorized changes, and insure that machines are properly configured, patched, and up-to-date. Removing the requirement to maintain baseline configurations will leave significant security gaps, would lead to significant visibility issues into the configuration state of the Cyber Asset, ultimately leaving Responsible Entities blind to unknown vulnerabilities within the Cyber Assets. Baselining tools are becoming more and more capable of automating the process for baselining an Entities' environment – so there is no reason to strip this out of the standard. Even with the addition of virtualization, one would be able to baseline (and monitor baselines) for any virtual machines that the entity uses.

R1.4 will require entities to monitor for unauthorized changes. Unless they have a baseline to compare to, they will not be able to know when a change is made.

Victoria Mordi - Entergy - 3,7,9 - SERC	
Answer	No
Document Name	
Comment	
While Entergy does agree with the approach being suggested, the switch from a port focus to a services focus adds an additional challenge. Network services are generally difficult to identify programmatically since many can be configured off default registered ports or use ports in theephemeral ranges that change with each use. The wording used here would seem to indicate that ports can only be used if the service cannot be identified, this would certainly lead to requiring a mixture of methodologies used for identification for each device. Entergy would recommend this wording be changed to identify that either the port or the service should be identified to give entities the flexibility to use either in order to maintain consistency in their program, which would reduce human performance errors. Additionally, more definition should be wrapped around what the Regulator means by service? Do they mean the network protocol or the service running on the asset that is network accessible. An example would be do they want https or Apache Web Service identified? This lack of definition would make it difficult to identify what monitoring would need to be put in place and what evidence would need to be gathered to meet this standard.

It is not clear if the maintenance and upkeep of the current baseline and previous baselines is still required. BC Hydro SME team requests that the wording of the CIP-010 Requirement R1 be clarified to reflect if baselines are not needed any more. The technical rationale for CIP-010 R1 also needs more clarity if the previous baselines are required to be maintained as change records (time period until they should be kept as record and maintained) and what additional controls are proposed, if any, if the baseline is only one of the controls.

SDT has created an uncalled for scenario where they have removed Baselines but left the baseline elements intact, which is causing significant confusion amongst SMEs. Requiring CM as method of compliance will set a serious challenge and will limit ability to secure system as CMs do not include security baseline information, only the proposed changes, but assessments are never included in CM, just a summary of results. This whole approach will result in inaccurate and subjective application and often result in contention with compliance and auditors. Current CIP-010 standards and requirements are matured and industry has made significant progress developing good controls. There is absolutely no reason to change as these changes do not improve security but are detrimental.

Texas RE is concerned security obligations will be reduced by removing the reference to baseline configurations. Establishing and maintaining baseline configurations represent best practices for system hardening. Texas RE recommends adhering to NIST Special Publication 800-53 (Rev. 4), CM-2 Baseline Configuration, which states, “*Maintaining baseline configurations requires creating new baselines as organizational information systems change over time. Baseline configurations of information systems reflect the current enterprise architecture*.”

Concerns on the definitions caused this no vote for this standard. We agree with the removal of the administrative function of documenting a baseline.	

Request c “minimal differences” be changed to “minimal differences, as determined by the entity”

Many of the Applicable Systems use only AND – some Applicable Systems use “OR” . For example, Part 1.1 says “SCI hosting High or Medium Impact BCS or their associated:” It is the "or their associated” that is in question. This probably means that the SCI is applicable but this is not clear.

SPP offers the following comments and questions for the SDT consideration for Question 7:

Recommend the SDT provide an interpretation of the definition for Self-Contained Application. As written, the definition seems confusing, and could have the potential to be misinterpreted.

Is the SDT asking for entities to include both firmware and OS? In the past, entities could not show firmware if an OS was present. This has the potential to broaden the scope, and includes authorized changes to the OS. Any changes to the OS would be included in scope and would have to be tested as part of 1.4 and 1.5. In the past, if the baseline was not changed, then the entity would not have concern about R1.4 and 1.5. This new standard will change that, and potentially add additional work for entities when a change is made. This could open entities to an investment in new tools because baseline is being removed.

Recommend the SDT define and provide an interpretation in the scope of what it means by “Authorized Changes”.

Three comments on R1.3. These comments are repeated for CIP-010 R3.2. 1) request removal of “minimizes differences with the production environment” because new language is a) subjective, b) better suited to the measures and c) the previous language is sufficient 2) if this language cannot be removed, request clarification that the entity determines “minimal differences” 3) suggest that the intent is to a) test and b) document what was tested. CIP-010 R1, request that the SCI requirement into a separate Part. Same comment made for CIP-010 R1. Request clarification – there are several ways to read the nested ORs included in the Applicable Systems section for SCI. Many of the Applicable Systems use only AND – some Applicable Systems use OR. For example, Part 1.1 says “SCI hosting High or Medium Impact BCS or their associated:” Suggest reviewing the definition for better clarity.

CIP-010, R1 - Removing “baseline configuration” does not change what needs to be done in practice. Entities will still need to retain a baseline configuration as evidence from which to establish the changes that were authorized. The proposed change decreases clarity (in terms of what must be done to demonstrate compliance).

Recommendation: Reinstate the concept of “*baseline configuration.*”

CIP-010, R1 - Likewise, removing the word “configuration” from the term “configuration change management” (both in the title of CIP-010, Table R1 and throughout the text of R1), may cause a great deal of confusion since the more generic term, “change management,” can be interpreted to include a wider breadth of “changes” than those limited to “baseline configuration” and may substantially expand the scope of this requirement with other non-material changes.

Recommendation: Reinstate the term “*configuration change management*” in the title of CIP-010, Table R1 and throughout the text of R1.

Part 1.1.3 – Typically, Self-Contained Applications are considered custom software which is already covered under the existing standard and as such would not require a revision.

Recommendation: Explain why this clarification is needed.

Part 1.1.4 – SRC agrees that logical network accessible ports alone only tell part of the story and supports the SDT's proposal to include services. That said, the shift away from logical network accessible ports to services does not significantly change the security benefit achieved; however, it does make it more difficult for an entity to define and may imply that defined ports do not need to be included.

Recommendation: SRC recommends the SDT retain the concept of ports and define a new term, "ephemeral ports;" i.e. the listening ports that initiate the conversation, as a focal point for protection and security. This would allow the industry to move away from port ranges.

Part 1.1.6 – The first three bullets are very specific and well defined. The fourth bullet is very vague and draws in everything else that is not defined, making it very difficult for entities to comply with.

Recommendation: Clarify the types of services intended by the fourth bullet so there is consistency across the ERO.

Southern supports the SDT's direction here to provide a forward-looking, objective-based requirement and eliminate the documentation exercise of maintaining baseline inventories. However, for R1.1.2, Southern requests the SDT consider adding the concept of "installed" back as it is done in R1.1.3. Also, please consider re-ordering the proposed requirements in order to potentially split requirements for stand-alone systems and Self-Contained Applications. For example, R1.1.3 could focus on authorizing change to the SCAs when they are changed in a repository and not as they are automatically deployed from there to each 'applicable systems'. Additionally, we request the SDT provide further guidance on the components of "SCI configurations" for which changes must be authorized. The bulleted list in CIP-010 R1.1.6 provides some guidance but is not encompassing. Under CIP-010 R1.1.6, Southern requests that the SDT consider removing the first bulleted item "Enforces electronic access controls that…" as that is essentially the same as the second bulleted item "Enforces logical isolation between…"	

Under CIP-010 R1, Southern requests the SDT consider addressing the scenario, and provide alternative requirement language, as to “when” authorization has to occur. For example – are changes to a virtual desktop image residing in a BCSI repository required to be authorized at the time the image is updated, or when the updated image is deployed into a production environment? Or both?

Under CIP-010 R1.2, Southern requests the SDT consider removing Part 1.2.1 based on its lack of practicality. In recent audits of this requirement Part, auditors have expressed the expectation that Part 1.2.2. should include a check of all security controls to ensure they were not adversely impacted, thereby making the performance of Part 1.2.1. moot. Additionally, Southern recognizes that with many types of changes, it is not possible to predict all possible security controls changes that may take place with a change, and therefore most entities have adopted best practices to thoroughly check security controls following the change, making Part 1.2.1 useless from a security standpoint.

Additionally, Southern is concerned that the language in CIP-010 R2.1 would still force entities to maintain “documentation” the same as or similar to a “baseline configuration” in order to comply with R2. Southern requests the SDT consider this dilema and possibly propose alternative language for R2 that would align it with the proposed changes to R1. For example – in R2, the phrase “items described in R1, Part 1.1” are essentially the components of the former “baseline”; in order to monitor those items every 35 days for changes to those items, you must first have documentation, lists, or scan results of those items so that you can compare and detect any unauthorized changes to them. Likewise, the requirement does not dictate that an entity must monitor authorized changes, but only “unauthorized” changes. Therefore, for an entity at audit that has had no “unauthorized” changes, the activity can become a deep-dive “prove-the-negative”.

To align the direction of R1 towards “change management”, Southern requests the SDT consider removing the word “configuration” in the Measures of R2.1 and replace it with something akin to:

R2.1: An example of evidence may include, but is not limited to, documentation or logs showing that monitoring for changes to the items in Part 1.1 is conducted, along with records of investigation for any unauthorized changes that were detected.

GSOC provides the following comments for the SDT’s review and consideration:

1. Consider whether the purpose statement should be revised to address the broader scope of the proposed revisions.

2. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

3. In the defined terms, Management Modules are specifically excluded from SCI; however, the applicable systems column references Management Modules of SCI. This verbiage creates the potential for confusion and ambiguity relative to Management Modules. The following clarification is suggest to reduce the potential for ambiguity:

Management Modules supporting [or associated with] SCI hosting High or Medium Impact BCS or their associated: • PCA; • PACS; or • EACMS

4. In requirement R1.1.6, the following revision is recommended for clarity:

1.1.6. Enforces electronic access control that permits only controlled communications that are [needed/necessary] between systems with different impact ratings hosted on SCI.

5. In the proposed revisions for requirement R1.3.1, the proposed verbiage is unclear. The following revision is recommended for clarity:

1.3.1. Prior to implementing any authorized change in the production environment, except during a CIP Exceptional Circumstance, test the authorized changes in a test environment that has minimal, documented/authorized differences when compared with the production environment…

While we appreciate the revisons to CIP-010 R1, is the expectation that we would just need to provide a set of tickets where we said the baseline changed, but not have to back it up with baseline documentation? Would the change ticket now need to be in more detail to clearly indicate what element(s) of CIP-010 R1.1 changed so we don't have to provide baseline documentation? For example, “updated Windows machines with patches for released in {MONTH] {YEAR}” or “updated machine X with SFTP service”? 8. The SDT modified CIP-010 Requirement R3 Part 3.3 to ensure that vulnerability assessments are performed prior to logically connecting Cyber Assets, VCA, and SCI. The revised requirement allows the use of remediation VLANs to perform active vulnerability assessments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

The SRC greatly appreciates the following changes and clarifications proposed by the SDT:

- Part 3.2: addition of “*per system capability*”
- Part 3.3: use of “*previously assessed configurations*” allows for the use of gold images

Recommendations:

- Replace the last sentence of Part 3.3; i.e. "*The production environment does not include devices being actively remediated and logically isolated*," with the following: "*Remediation or mitigation action items must be completed prior to production use*." This meshes with Part 3.4 and clarifies that all vulnerabilities must be remediated prior to production use as opposed to remediated prior to placing in an ESP environment.
- Clarify that annual active vulnerability assessments would not require the use of remediation VLANS

The use of an undefined term, “logically connecting” has the potential to create confusion when included within a NERC CIP Reliability Standard Requirement. The Standard Processes Manual provides direction for when a NERC Glossary of Terms definition is needed, notably that certain criteria should determine whether a new or revised definition is needed (see Appendix 3A (ROP) Standard Processes Manual, Section 5.1). The primary factor for determining whether a NERC defined term is needed rests on whether the term can be understood using a standard collegiate dictionary. For many IT terms commonly in use, the standard collegiate dictionary is rarely helpful. For example, the term logically connected is not defined by Merriam-Webster. The NIST Information Technology Laboratory (Computer Security Resource Center On-line Glossary of Terms (https://csrc.nist.gov/glossary) includes “logically connecting” and similar terms such as “logically connected, logical connection, etc.” Unfortunately, a definition that aligns with the term “logically connecting” that might provide insights necessary to ensure that those responsible for compliance have a common understanding of what is being proposed in Requirement R3, Part 3.3. is unavailable. EEI recommends the term be defined or direction be provided within the Technical Rationale to ensure a consistent understanding. EEI requests for clarification whether cyber vulnerability assessments must be performed in the VLAN environment and then switched to production.

Too much compartmentalization based on non-industry standard definition. Please review NIST Publication 800-125 (virtualization guidelines) and apply controls, based on Terms such as Management Systems, Guest, Hosts, Network virtualization, Infrastructure virtualization (Mixed Trust, Resources sharing, high-watermarking) and similar guidance that is used by Industry, SME and vendors. SDT approach is complicated and confusing which will result in different interpretation by SMEs and ERO.

The use of an undefined term, “logically connecting”, has the potential to create confusion when included within a NERC CIP Reliability Standard Requirement. Additional clarification is needed on whether cyber vulnerability assessments are required to be performed in the VLAN environment and then switched to production, or could a VCA or SCI be built in its production environment but not activated until the cyber vulnerability assessment is performed and is determined to be ready for activation in the production environment.

SIGE does not agree with the proposed changes since it is not clear how an entity is to perform a true vulnerability assessment on a Cyber Asset unless it is connected to the target network. Connecting a Cyber Asset to a network other than the target network will net differing results and require the reconfiguration of the Cyber Asset from the remediation network to the target network.

R3.3 ‘The production environment does not include devices being actively remediated and logically isolated.’ The language of this requirement lacks clarity around undefined terms: ‘logically connecting’, ’additional’, ‘devices’, ‘remediated’, and ‘logically isolated’, resulting in unenforceability. The requirement does not include consideration of CPU/memory sharing as seen with other logically isolated systems. The language also seems to be somewhat circular in that the ‘production environment’ includes an exclusion after the requirement language.
Suggested Comment:

R2.1 lacks inclusion of SCI and Management Systems for High Impact BCS and associated EACMS, PCAs. This does not align with their inclusion in most of the other requirements within the standard and reduces the protections required under the current standard language. The technical rationale does not address why it is not needed for SCI.

It is unclear to us whether a scan will be needed for all installations and that the previous concept of a group of baselines is no longer acceptable. This amount of additional work is excessive and does not alleviate any additional cybersecurity risk. We request that the SDT make it very clear using a scan from a previously installed Cyber Asset, VCA or SCI that is similarly configured is acceptable to demonstrate compliance with R3.3.

CIP-010 Requirement R3 Part 3.3 uses the undefined term "previously assessed configuration" which could be interpreted as a byte-for-byte copy of a golden image, or could be referring to the items defined in Part 1.1. ISO-NE has concerns that the industry will gravitate to the most conservative interpretation of the term. ISO-NE recommends that the SDT include Part 1.1 items in Part 3.3 to further clarify this requirement. ISO-NE recommends that the SDT clarify the level of logical isolation that is expected to keep the device out of the production environment when using a remediation VLAN.

Comments: The revisions to CIP-010-3 R3.3 are not clear (See our comments for QUESTION 1). We have not observed challenges with remediation VLANs in the existing CIP requirements. This is because remediation VLANs can be managed within the ESP as a hot standby VLAN when connected to a layer 2 (data link) BCA switch or connected to a non-CIP switch.

The language “The production environment does not include devices being actively remediated and logically isolated” does not resolve security concerns; i.e., depending on what type of logical isolation is acceptable? Additionally, this term is subjective. If logical isolation is allowable for a non-ESP model, it could also be allowable for an ESP model meaning as long as a Remediation VLAN is logically isolated from the BCS VLAN on the same switch, it doesn’t need to be within the ESP.

GSOC provides the following comments for the SDT’s review and consideration:

1. Generally, the formatting of applicable systems within the applicable systems column should be evaluated for consistency of format.

2. In the applicable systems column, the reference to SCI includes an “or” and not an “and.” This creates uncertainty as to whether both “their associated EACMS or PACS” must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are “and” focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

3. In the defined terms, Management Modules are specifically excluded from SCI; however, the applicable systems column references Management Modules of SCI. This verbiage creates the potential for confusion and ambiguity relative to Management Modules. The following clarification is suggest to reduce the potential for ambiguity:

Management Modules supporting [or associated with] SCI hosting High or Medium Impact BCS or their associated: • PCA; • PACS; or • EACMS

4. In the proposed revisions for requirement R3.2.1, the proposed verbiage is unclear. The following revision is recommended for clarity:

3.2.1. Perform an active vulnerability assessment in a test environment that has minimal, documented/authorized differences when compared with the production environment…

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy

Answer	Yes
Document Name	

Comment

Duke Energy generally agrees with the proposed modifications to ensure that vulnerability assessments are performed prior to logically connecting Cyber Assets, VCA, and SCI. Duke Energy recommends adding clarity on what constitutes “logically connecting”.

Duke Energy noticed that the approach and requirement language here seem inconsistent with the language in proposed CIP-005 requirements. It is not clear if it is intent that only the network interface for a VCA must be logically isolated into the remediation VLAN, or if the CPU/memory-sharing isolation requirements apply as well. Conceptually the intent makes sense, but the standard should be clear about what level of logical isolation is expected to keep the device out of the production environment when using a remediation VLAN.

9. CIP-002-5.1a includes exemption 4.2.3.2, which exempted Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. In the development of conforming changes, the SDT determined that the exemption should be split into two distinct exemptions to adequately cover all cyber systems associated with conforming changes. The SDT established those conforming changes in proposed Exemptions 4.2.3.2 & 4.2.3.3. Do the changes clearly identify the exempted cyber systems? If not, please provide the basis for your disagreement and an alternate proposal.

1. As SRP reads the definition of what is in scope is not clear from what is stated in the exemption. Clarity is needed due to the vagueness with more details or more of an explanation.

Comments: Due to the use of the ‘logical isolation’ term, and SCI term the changes to 4.2.3.2 & 4.2.3.3 are not needed.

A. Based on our comments in QUESTION 1 and Question 2, the logical isolation for non-routable connections between CIP Cyber Assets is not required by the SAR. The current exemption for communications equipment and links between ESPs implies multiple physical locations.

B. If the SDT intended to address the exclusions of discrete communications links between ESPs, then we suggest a revision to CIP-006-6 R1.10. If NERC is interested in addressing confidentiality and integrity between multiple ESPs (i.e., a super ESP), then we suggest a new SAR to add additional requirements.

Recommend:

- modifying 4.2.3.2 and removing 4.2.3.3.
- Change 4.2.3.2 to clarify the discrete ESPs to span one or more geographic locations such as:

“Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters, and where an individual ESP spans one or more geographic locations.”

Exemption 4.2.3.3 needs to be revised to provide further clarity. This appears to be an exclusion for “cyber systems” associated with communication links between discrete ESPs. The new language doesn’t provide the clarity of the approved exemption.

Comment

The replacement of Cyber Assets (a defined term) with cyber systems (an undefined term) introduces ambiguity and requires a Registered Entity to self-define cyber systems. This can lead to misinterpretations and disputes between Regional Entities and Registered Entities.

ISO-NE recommends either defining “cyber systems” or reverting back to the defined term Cyber Assets.

We appreciate the effort to be consistent with the other exemptions. We do not agree that the exemptions for 4.2.3.1, 4.2.3.2 and 4.2.3.3 clearly identify the exempted cyber systems. We believe term “cyber systems” indicates a broader scope than is intended. This could lead to developing each “cyber system” construct that could lead to under or over scoping BES Cyber System assets for CIP-002. We believe that “systems” as used in the other exemptions relates to things that are categorized beyond “cyber systems”. We do recognize “systems” could include cyber systems at these related assets. Example for 4.2.3.2 & 4.2.3.3: An entity could scope a cyber system as a communication system where the system would reasonably include substation RTUs, channel banks, digital cross connects, microwave radios, etc. Although in our current version, many entities have included RTUs as BES Cyber Assets, the proposed change would lend to 1) removing RTUs from our CIP Programs or 2) expanding the net to Cyber Assets that have been considered part of the current exception because they are now included as part of the communication system. We realize there are ways around this example, but we wanted to highlight this for the purposes of our discussion. For exemption 4.2.3.1 consider removing “cyber” as shown in the following edit: **4.2.3.1.** Systems at Facilities regulated by the Canadian Nuclear Safety Commission.	

For exemptions 4.2.3.2 & 4.2.3.3, we suggest keeping the exception scope to assets that are defined NERC Glossary terms as shown below:

4.2.3.2. Cyber Assets, Virtual Cyber Assets and Shared Cyber Infrastructure associated with communication links logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).

4.2.3.3. Cyber Assets, Virtual Cyber Assets and Shared Cyber Infrastructure associated with communication links between Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that extends to one or more geographic locations.

Also, please provide clarification why the edits included reducing from “communication networks and data communication links” to just “communication links.”

Note: These comments apply to all of the standards in this ballot.

CEHE does not agree with the proposed changes since they do not clearly identify the exempted cyber systems. The new version uses the undefined term cyber systems as opposed to the original using the defined Cyber Assets term. CEHE agrees that revisions are needed since the original resulted in equipment used by carriers to be exempted while the same equipment used by a Registered Entity on a private communications network was considered in scope. The following changes have been proposed. 4.2.3.2. Cyber assets whose function is only to provide connection to external communication networks, as defined by demarcations set by the Registered Entity, that are logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).	

4.2.3.3. Cyber assets whose function is only to provide connection to external communication networks, as defined by demarcations set by the Registered Entity, between Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that extends to one or more geographic locations.

It is still unclear what the phrase “logical isolation” will mean as it gets implemented in many different scenarios provided in this draft of the standards even though it has been used as an accepted term in the explanations provided with these drafts. Exemption 4.2.3.3. also uses this phrase as if it will be universally clear what devices will be used in the implementation of logical isolation. Logical isolation is not a defined term, and though it is attempting to be used as a replacement for ESP, plus more, there are many changes to the standards that are not places where ESP was used or required, and now logical isolation is being used as a universally accepted term without examples or further discussions. The exemptions as listed do not make it clear where that line of demarcation will be nor have examples been provided in meaningful ways. Similar to when CIP-003 was released, there were many diagrams and explanations provided to help entities walk through the different scenarious that could be used in implementation and to convey the intent of the standard.

Changes made to CIP-002 exemptions noted in 4.2.3.2 and 4.2.3.3 do not provide a clear understanding of what is exempted because both use terms that are undefined. For 4.2.3.2, the defined term “Cyber Asset” has been replaced by an undefined term “cyber system”. Additionally, the currently approved CIP-002-5.1a exempts communication networks and communication links between discrete ESPs, while the proposed new CIP-002-7 Reliability Standard only exempts the communication links thus implying that the communication networks may now be subject to CIP Requirements.	

In order to clearly define exempted Cyber Assets associated with communication networks, it is necessary for the Registered Entity to clearly designate the communication network components since communication network, communication systems or communication assets have no NERC definition. The following changes have been proposed;

- 4.2.3.2. Cyber Assets associated with communication networks, as defined by demarcations set by the Registered Entity, logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).
- 4.2.3.3. Cyber Assets associated with communication networks, as defined by demarcations set by the Registered Entity, between Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that extends to one or more geographic locations.

Lastly, the undefined term “logical isolation” is used in both exemptions. As stated in our comments for Question 1, this term should be defined to ensure a clear and common understanding of both the Requirements and Exemptions are contained within the body of CIP Reliability Standards.

AEPCO is signing on to ACES comments, please see below:

ACES does not agree with the new language. The definition of a Cyber Asset is very clear and well known by the industry. The new language “cyber systems” is not defined and could be interpreted differently by entities and auditors. An Entity can point to specific Cyber Assets easily. We also feel this change was not a part of the FERC order or in the scope of the SAR.

The language in *4.2.3.3* is problematic. It is unclear assets are performing the logical isolation in the Requirement. Cyber systems or the Cyber Assets, Virtual Cyber Assets, or SCI? While Dominion Energy is of the opinion, based on the language in the Requirement, that the latter assets (Cyber Assets, Virtual Cyber Assets, or SCI) are performing the activity, the current language could be interpreted as indicating the Cyber systems are performing the activity.

Suggested language is as follows:

Cyber systems associated with communication links between assets (Cyber Assets, Virtual Cyber Assets, or SCI) that perform logical isolation that extends to one or more geographic locations.

Texas RE recommends defining the term “cyber system.” While it is noted in the technical rationale, the phrase “cyber systems” is not defined in NERC Glossary of Terms. Texas RE recommends defining the term “cyber systems” in the NERC Glossary or, alternatively, use the description provided in the technical rationale to reduce ambiguity in the requirement language. It is unclear whether that undefined term is associated with “system” in CIP CIP-006-7, CIP-007-7, CIP-009-7, CIP-010-5, the “Applicable Systems” column in all CIP standards parts.

Texas RE inquires as to whether these changes would exclude Cyber Assets such as serial/IP converters, data diodes, protocol converters, etc. For example, a serial/IP converter may connect to a BCA serially but convert the protocol from serial to TCP/IP and is connected to a network Cyber Asset that operates at Layer 3 or higher of the OSI model.

Texas RE would recommend providing examples to reduce ambiguity.

Lastly, Texas RE seeks clarification on the phrase “one or more geographic locations.” Registered Entities have a variety of architectural layouts, which could result in confusion regarding the meaning of “one or more geographic locations.” For instance, entities may have two adjacent buildings that could be interpreted as either a single location or separate geographic locations.

We appreciate the effort to be consistent with the other exemptions. We do not agree that the exemptions for 4.2.3.1, 4.2.3.2 and 4.2.3.3 clearly identify the exempted cyber systems. We believe term “cyber systems” indicates a broader scope than is intended. This could lead to developing each “cyber system” construct that could lead to under or over scoping BES Cyber System assets for CIP-002. We believe that “systems” as used in the other exemptions relates to things that are categorized beyond “cyber systems”. We do recognize “systems” could include cyber systems at these related assets.

Example for 4.2.3.2 & 4.2.3.3: An entity could scope a cyber system as a communication system, where the system would reasonably include substation RTUs, channel banks, digital cross connects, microwave radios, etc. Although in our current version, many entities have included RTUs as BES Cyber Assets, the proposed change would lend to 1) removing RTUs from our CIP Programs or 2) expanding the net to Cyber Assets that have been considered part of the current exception because they are now included as part of the communication system. We realize there are ways around this example, but we wanted to highlight this for the purposes of our discussion.

The exemption language in section 4.2 of every CIP standard will need to be addressed.

For exemption 4.2.3.1 consider removing “cyber” as shown in the following edit:

4.2.3.1. Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

For exemptions 4.2.3.2 & 4.2.3.3, we suggest keeping the exception scope to assets that are defined NERC Glossary terms as shown below:

4.2.3.2. Cyber Assets, Virtual Cyber Assets and Shared Cyber Infrastructure associated with communication links logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).

4.2.3.3. Cyber Assets, Virtual Cyber Assets and Shared Cyber Infrastructure associated with communication links between Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that extends to one or more geographic locations.

Also, please provide clarification why the edits included reducing from “communication networks and data communication links” to just “communication links"

Neither 4.2.3.2 nor 4.2.3.3 provide a clear understanding of what is exempted because both use terms that are undefined. For 4.2.3.2, the defined term “Cyber Asset” has been replaced by an undefined term “cyber system”. Additionally, the currently approved CIP-002-5.1a exempts communication networks and communication links between discrete ESPs, while the proposed new CIP-002-7 Reliability Standard only exempts the communication links implying that the communications networks may now be subject to CIP Requirements. EEI recommends the restoration of the deleted language to ensure communications networks are exempt from the NERC Standards. Exemption 4.2.3.3 similarly identifies communication links but does not exempt communications networks. This should be corrected. Lastly, the undefined term “logical isolation” is used in both exemptions. As stated in our comments for Question 1, this term should be defined to ensure a clear and common understanding of both the Requirements and Exemptions are contained within the body of CIP Reliability Standards.

Two new undefined terms stand out as key concerns in the proposed modifications to the exemptions in CIP-002 (4.2.3.2 and 4.2.3.3): Cyber systems and the concept of logical isolation. "Cyber system" is not defined in the **Glossary of Terms Used in NERC Reliability Standards** (BES Cyber System, yes, but not Cyber system). Nor is there a definition for "logical isolation." Each entity would be required to define these terms. This leaves	

some of the identification of exempted cyber systems (sic) up to the responsible entity and may introduce some areas of dispute between compliance monitoring and entity implementation activity. **Recommendation:** Clarify the term “Cyber systems” and the concept of “logical isolation” so there is a level of consistency across the ERO.

Changes made to CIP-002 exemptions noted in 4.2.3.2 and 4.2.3.3 do not provide a clear understanding of what is exempted because both use terms (i.e. cyber systems and logical isolation) which are undefined. Undefined terms need to be defined to ensure a clear and common understanding..

Duke Energy generally agrees to the proposed modifications to split the exemptions into two distinct exemptions to adequately cover all cyber systems associated with conforming changes. Proposed 4.2.3.2 adequately addresses devices outside the identified logical isolation. Proposed 4.2.3.3 may exclude devices providing logical isolation that would otherwise be identified as EACMS. A lack of clarity with respect to the intended scope of this exclusion may result in auditor/entity interperetation disagreements. Assuming the intent is to exclude the connection between the devices, and not the e.g. VPN concentrators themselves, we propose modifying the language to something like "Cyber systems associated with communication links between "logical isolation" provided by Cyber Assets, Virtual Cyber Assets, or SCI where that isolation extends to one or more geographic locations."

Below is a replication of our response to Question 1, which also addresses this question.

Cyber System (Undefined Term) – Modifications have been made under the exemptions section in CIP-002-7 which move from a Cyber Asset focus to a “cyber system” focus without a corresponding definition of what that term encompasses. With the difficulty of understanding the scope of this undefined term in virtualized environments, Southern recommends developing a definition for “cyber system”, such as:

1. **Cyber System:** *one or more Cyber Assets, VCAs, or SCI used to perform or achieve a cyber-based objective by a Responsible Entity or other party.*

2. Additionally, Southern requests the SDT to consider that Exemption 4.2.3.3. should be a sub-set of Exemption 4.2.3.2. rather than a stand alone item. It appears the main difference between the two exemptions is the distance between the points performing the logical isolation.

• Neither exemptions 4.2.3.2 nor 4.2.3.3 provide a clear understanding of what is exempted, possibly due to the change from “Cyber Asset” to the undefined “Cyber system”. Please see our comments above for a proposed definition of “Cyber System”. Also, the undefined term “logical isolation” is used in both exemptions. As stated in our previous comments, this term should be defined to ensure a clear and common understanding of both the Requirements and Exemptions.

• In order to clearly define exempted cyber systems associated with communication networks, it is necessary for the Registered Entity to clearly designate the communication network components since communication networks, communication systems, or communication assets have no NERC definition. Southern agrees with EEI comments addressing the following recommendations, but clarifying that the second exemption should be a sub-bullet to 4.2.3.2.:

• 4.2.3.2. Cyber systems associated with communication networks, as defined by demarcations set by the Registered Entity, logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).

• 4.2.3.2.1 Cyber systems associated with communication networks, as defined by demarcations set by the Registered Entity, between Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that extends to one or more geographic locations.

BPA feels that the phrase “associated with” a BCS is less than desirable. The concept of “providing connectivity to” or “in the communications chain of but not providing the security controls to” a BCS describes the relationship more clearly.

GSOC supports the splitting of the exemptions to ensure appropriate coverage. However, it respectfully notes that additional clarity could be attained with small tweaks to the proposed exemption language: 4.2.3.2. Cyber systems associated with communication links that meet the following criteria: (1) are logically isolated from BES Cyber Systems or SCI; (2) do not provide logical isolation for BCS or SCI. 4.2.3.3. Cyber systems associated with communication links between Cyber Assets, Virtual Cyber Assets, or Shared Cyber Infrastructure performing logical isolation beyond one geographic location.

10. BCS and SCI are mutually exclusive by definition, however SCI poses a significant reliability risk to the Bulk Electric System. The SDT considered the risks associated with SCI and revised CIP-002 Requirement R1 to include the identification of SCI in Parts 1.3, 1.4, and 1.5. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Shannon Ferdinand - Capital Power Corporation - 5 - MRO,WECC,Texas RE,SERC

Answer	No
Document Name	

Comment

Capital Power would like clarification regarding how this proposed change will be applied to low-impact entities. Currently low impact entities are not required to provide a discreet low impact inventory list and the proposed revision seems to contradict this.

SCI does not present any more risk than EACMS. There is not a specific requirement to identify EACMS, PACS, or PCA in CIP-002. Similarly to EACMS, the association to the BCS is what brings the SCI into scope. SCI should be listed in applicable systems just like EACMS.

We disagree with the proposed changes. EACMS, PACS and PCAs are not included in the initial CIP-002 process; therefore, the SCI hosting EACMS PACS and PCAs should not be included in the initial CIP-002 process. We recommend revising R1.4 and R1.5as indicated below.

1.4. Identify associated SCI that hosts any portion of the high impact BCS identified in Part 1.1 above [delete: or their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs)]

1.5. Identify associated SCI that hosts any portion of the medium impact BCS identified in Part 1.2 above [delete: or their associated EACMS, PACS or PCAs.]

Comment

Concerns on the definitions caused this no vote for this standard.

Concerned about the use of the term “assets” and the Technical Rationale that states an “asset containing” could be a location of a Management System used to manage a distributed SCI. The TR also includes “control centers” and not “Control Centers”. This could require the inclusion of locations other than the CIP-002 Assets and the location of the device used for electronic security controls, becomes part of the CIP program. Extrapolating this concept out, the entire SCADA system could become part of the program if a portion of it is a BCA.

CIP-002 is the bridge between cyber security and reliability function, the inclusion of SCI which is not directly implementing a reliability function, does not seem related. Request explicit additional language for (EACMS, PACS and PCAs) or (remove SCI, EACM, PACS and PCAs addition). Auditors and entities needs clarity on when EACMS, PACS and PCAs are in scope

The definition of Shared Cyber Infrastructure is open to multiple interpretations as written. The confusion is compounded by the exclusion of Shared Cyber Asset from the definition of Cyber Asset (Cyber Asset itself a problematic definition at times). The intent of the SDT is unclear preventing recommending an alternative proposal. NERC, including the SDT, needs to be prepared and ensure that adequate CMEP SDT developed guidance is in place to broadly communicate the intent, implementation guidance, and interpretation of the new definitions on passage and prior to NERC Membership and our vendors beginning work to bring systems into compliance. In general terms, WVPA would have preferred that the SDT adopted the terms and directly adapted the definitions used by NIST in their documentation, such as NIST SP 800-125.

BCSI requirements are sufficient as in CIP-004 and CIP-011. Entities are compliant and appropriate controls are available to secure BCSI in current version.

Shared storage housing active BCS data should not be allowed for mixed trust environments and introduces significant risk to the BES.

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based in security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

The language that has been added R1.3, R1.4 and R1.5 is somewhat unclear. Is the intent to identify SCI that hosts BCS, EACMS, PACS, and PCAs, or is the intent to identify SCI that hosts BCS and to identify associated EACMS, PACs, and PCAs? It is not clear what the intent is from the currently proposed language. If the intent is only to identify systems hosted on SCI, then it continues to leave a gap in CIP-002. If the SDT wants to fix the holes in CIP-002, then it should be done correctly and not in pieces, which just compounds the issues. This should be done with a wider view to the breakdowns in how CIP-002 is written so that it improves the security objectives of CIP-002 and how the process of identification of BCS and applicable systems should be identified.

More clarification is needed pertaining to what is in scope and what is not in scope?	

As we stated earlier, there is a storage array issue - since storage array wasn't directly impacting assets, this would massively impact Basin - goes against how we have been defining that. PACS on to the storage array - which by these new definitions, implication would need separate storage array for assets that are in scope. Inherent separations are there such as encryption. Need to clearly identify what is contained here.

Comment

Management Modules are excluded from the definition of SCI, but not explicitly addressed within CAs. The requirements all explicitly address Management Modules of SCI, but not CAs (which should be inherent due to the lack of exclusion in the CA definition). This could lead to entities to exclude required protections for Management Modules on CAs – while implicit within the CA, they are not called out explicitly like in the SCI. Potentially missed requirements would include those around patching, user accounts, logging, change management, etc.

Additionally, for Self-contained Applicaitons defintion:

The term ‘immutable’ may limit the scope of the definition. While the base image may be immutable in a real-time sense, the running container does have the ability to have its configuration changed on an ongoing basis (while still reverting to the image upon termination).

Comments: *Changes from CIP-002-5.1 to CIP-002-7 include new terminology and applicability, in alignment with virtualization. Part 1.3 was revised to include identification of assets that contain a "low impact BCS and SCI that hosts any portion of a low impact BCS." The new Parts 1.4 & 1.5 added to include identification of associated SCI used for high/med impact BCS, EACMS, PACS or PCA, respectively. Identification of SCI within CIP-002 does address some of the risks associated with virtual infrastructure. However, as with other standards/requirements, CIP-002-7 depends upon approved SCI terminology and other definitions associated with virtualization as a whole.*

NRG does not agree with the proposed changes. The inclusion of EACMS and PACS as part of the proposed CIP-002 R1.4 and R1.5 is not consistent with the purpose of CIP-002 as a whole. CIP-002 primarily focuses on BES Assets and BES Cyber Systems, not the associated systems. If the intent of these proposed changes is to require an inventory of EACMS, PACS, and PCAs for high and medium impact BCSs, NRG recommends this proposed requirement be moved from CIP-002 to CIP-007.

This is a significant change to a foundational part of the CIP Standards. The SDT is proposing to modify the categorization process from a single step for each asset to a multiple step process of identifying BCS and then reviewing those BCS for associated SCI. Additionally, how does an entity perform this function for low impact SCI when they aren't required to develop a list of low impact BCS?

NRG does not agree with the proposed changes. The inclusion of EACMS and PACS as part of the proposed CIP-002 R1.4 and R1.5 is not consistent with the purpose of CIP-002 as a whole. CIP-002 primarily focuses on BES Assets and BES Cyber Systems, not the associated systems. If the intent of these proposed changes is to require an inventory of EACMS, PACS, and PCAs for high and medium impact BCSs, NRG recommends this proposed requirement be moved from CIP-002 to CIP-007.

This is a significant change to CIP asset accounting. We agree it is a necessary change to help account for virtualization assets. However, identification of SCI should be a result of association to BCS. TVA notes that the risk of a system is based on configuration rather than classification.

GSOC supports the addition and notes the following comments for the SDT's review and consideration:

1. Although the requirements have been modified to be inclusive of SCI and other supporting assets, proposed revisions to the purpose still focus solely on BCS identification. This could lead to confusion and should be revised to comport with the proposed revisions to the requirements. Revisions to the purpose could be as follows:

To identify and categorize cyber systems, assets, and infrastructure for the application of cyber security requirements commensurate with the adverse impact that loss, compromise, or misuse of those that could have on the reliable operation of the BES. Identification and categorization of these systems, assets, and SCI support appropriate protection against compromises that could lead to misoperation or instability in the BES.

2. The format and content utilized for the identification of SCI and associated assets varies between high/medium and low impact BCS. It is recommended that consistent formatting be utilized.

3. In the proposed revisions, it is unclear whether the addition of SCI and attendant systems are those associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., "…hosting [] impact BCS and the BCS's associated ….." or "….hosting [] impact BCS and the SCI's associated….."

4. In the proposed revisions, it is unclear as to whether the intent is to include all of the newly identified assets in the responsible entity's CIP-002 list or whether it is simply an additional identification activity to facilitate overall compliance. Further, the phrasing of the new revisions creates ambiguity relative to what ancillary/supporting assets (EACMS, PACS, and PCAs) are being identified relative. Specifically, the requirements should make clear whether the assets to be identified are:

a. Only the EACMS, PACS, and PCAs associated with SCI;

b. Only the EACMS, PACS, and PCAs associated with BCS AND hosted in SCI;

c. Only the EACMS, PACS, and PCAs associated with BCS that are hosted in SCI;

d. All of the EACMS, PACS, and PCAs associated with BCAs and BCS.

For this reason, clarification is requested. As an example, a revision that reflects option (d) above is provided below.

1.4 Identify associated SCI that hosts any portion of the high impact BCS identified in Part 1.1 above or the Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs) associated with the high impact BCS identified in Part 1.1 above.

1.5. Identify associated SCI that hosts any portion of the medium impact BCS identified in Part 1.2 above or the EACMS, PACS or PCAs associated with the medium impact BCS identified in Part 1.2 above.

5. The VSLs have been revised to incorporate the associated SCI, but not to include the required identification of additional, ancillary assets that are now included in the requirements. Consistency is needed between the requirement verbiage and the VSL verbiage. It is recommended that the revisions to the VSLs be revised to reflect the entirety of the revisions proposed in the requirements or that they be revised to reflect "applicable systems" to avoid the potential for misalignment resulting from revisions.

NERC should further clarify what it considers to be Shared Cyber Infrastructure. Additionally, we have a question: is an asset SCI only if it is shared between a non-CIP Applicable System and a CIP Applicable System?

We request clarification on SCI residing at non-BES Facility (for example a data center) which is not a BES asset per those identified in CIP-002 R1 (i) to (vi); need clarification on how we would identify that Facility.

The new R1.4 and R1.5 require the identification and categorization of SCI that hosts any portion BCS/EACMS/PACS/PCA. It is agreed that SCI hosting BCS shall be included such that that secure controls/requirements can be properly applied. However, SCI hosting EACMS/PCAS/PCA poses the same risk as the physical EACMS/PCAS/PCA which are not currently included in new CIP-002 requirements. Suggest clarifying that physical EACMS/PCAS/PCA are in scope of CIP-002 or removing the requirements of identifying SCI hosting EACMS/PACS/PCA.

11. In the current enforceable standards, there are no requirements that can be used to tie a non-identification of EACMS, PACS, and PCAs to a single requirement. The SDT revised CIP-002 to include the identification of SCI associated with EACMS, PACS, and PCAs to help address this issue within the virtualization scope of the current SAR. The proposed requirement could reduce possible non-compliance to a single issue if a Responsible Entity fails to properly identify SCI associated with EACMS, PACS, or PCAs. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer	No
Document Name	

Comment

Consider revising to include EACMS and PACS as associated systems in the Purpose for consistency. However, identification of EACMS, PACS, and PCAs should be a result of association to BCS.

Comments: Our SCI comments and recommendations in QUESTION 1 support the basis that existng requirements can be slightly modified to meet the SAR and requirments.

Currently there is a gap in CIP-002 that doesn’t require responsible entities to identify EACMS, PACS and PCA, but that aspect is not addressed by this SAR. If SDT intended to resolve this gap, we suggest adding lanaguate to R1.4 in CIP-002-5.1 as follows:

“Identify EACMS, PACS and PCAs that are associated with the high and medium impact BCS.”

ISO-NE agrees with the inclusion of SCI but disagrees with identifying an SCI’s associated systems. CIP-002 is written and designed to identify and categorize systems that impact reliability functions using a bright line criteria. The associated systems, PCA, EACMs, and PACS, are systems used to support security functions that protect the BCS or SCI. The additions also cause confusion because the identification of physical EACMS, PACS, and PCAs was not addressed.

Changes from CIP-002-5.1 to CIP-002-7 include new terminology and applicability, in alignment with virtualization. Part 1.3 was revised to include identification of assets that contain a "low impact BCS and SCI that hosts any portion of a low impact BCS." The new Parts 1.4 & 1.5 added to include identification of associated SCI used for high/med impact BCS, EACMS, PACS or PCA, respectively. It clarifies things to make identification of SCI explicit within CIP-002. However, as with other standards/requirements, CIP-002-7 depends upon approved SCI terminology and other definitions associated with virtualization as a whole. Approval of CIP-002-7 would be conditional, based upon approval of the entire suite of new standards associated with virtualization.

The idea of identifying EACMS, PACS, and PCAs at the level of CIP-002 is interesting, except the VRF should be adjusted to reflect the impact of the asset, i.e., BCS,BCA VRF high EACMS, PACS, and PCAs VRF medium. CIP-002 is based on functional impact on the grid, it’s not obvious to conclude the same impact on the functional impact. Suggest clarification on the requirements.

Meaghan Connell - Public Utility District No. 1 of Chelan County - 5, Group Name CHPD

Answer	No
Document Name	

Comment

While CHPD agrees that there is a concern with the current standards' lack of a requirement to identify EACMS, PACS, and PCAs, the identification of such is outside the scope of the SAR. CHPD believes the SDT should not create a two-tiered system where SCI based EACMS and PACS must comply with different requirements than physical ones that are not strictly virtualization based. Such a change should be part of a new SAR.

Comment

We disagree with these changes. Resulting from our comments for QUESTION 1, SCI is not required because our proposed modifications to the existing definitions can address this issue. Currently there is a gap in CIP-002 that doesn't require responsible entities to identify EACMS, PACS and PCA, but it is not addressed by this SAR. If SDT intended to resolve this gap, we suggest adding R1.4 to the CIP-002-5.1 as follows:

"Identify EACMS, PACS and PCAs that are associated with the high and medium impact BCS."

The language that has been added R1.3, R1.4 and R1.5 is somewhat unclear. Is the intent to identify SCI that hosts BCS, EACMS, PACS, and PCAs, or the is the intent to identify SCI that hosts BCS and to identify associated EACMS, PACs, and PCAs? It is not clear what the intent is from the currently proposed language. If the intent is only to identify systems hosted on SCI, then it continues to leave a gap in CIP-002. If the SDT wants to fix the holes in CIP-002, then it should be done correctly and not in pieces, which just compounds the issues. This should be done with a wider view to the breakdowns in how CIP-002 is written so that it improves the security objectives of CIP-002 and how the process of identification of BCS and applicable systems should be identified.

CIP-002 is the bridge between cyber security and reliability function, the inclusion of SCI which is not directly implementing a reliability function, does not seem related. Request explicit additional language for (EACMS, PACS and PCAs) or (remove SCI, EACM, PACS and PCAs addition). Auditors and entities needs clarity on when EACMS, PACS and PCAs are in scope

Request clarification on R1.5 (Medium Impact). It appears that adding SCI could bring more items into scope. Is that correct?

CIP-002 is the bridge between cybersecurity and reliability function, the inclusion of SCI which is not directly implementing a reliability function does not seem related. Request explicit additional language for (EACMS, PACS, and PCAs) or (remove SCI, EACM, PACS, and PCAs addition). Auditors and entities need clarity on when EACMS, PACS, and PCAs are in scope.

Request clarification on R1.5 (Medium Impact). It appears that adding SCI could bring more items into scope. Is that correct?

The idea of identifying EACMS, PACS, and PCAs at the level of CIP-002 is interesting, except the VRF should be adjusted to reflect the impact of the asset, i.e., BCS, BCA VRF high EACMS, PACS, and PCAs VRF medium.

CIP-002 is based on functional impact on the grid, it’s not obvious to conclude the same impact on the functional impact. Suggest clarification on the requirements.

There appears to be a gap in CIP-002 which doesn’t require responsible entities to identify EACMS, PACS and PCA. If SDT intended to resolve this gap, we suggest adding lanaguate to R1.4 in CIP-002-5.1 as follows: “Identify EACMS, PACS and PCAs that are associated with the high and medium impact BCS.”

SCI does not present any more risk than EACMS. There is not a specific requirement to identify EACMS, PACS, or PCA in CIP-002. Similarly to EACMS, the association to the BCS is what brings the SCI into scope. SCI should be listed in applicable systems just like EACMS.

Conceptually, the SRC supports what the SDT is attempting to do regarding the consolidation of requirements to identify EACMS, PACS and PCAs into a single requirement. CIP-002 should include requirement language specific to the identification of any necessary categories to support the use of the Applicable Systems specification throughout the rest of the CIP standards. To do otherwise introduces a potential gap in activity required to identify and protect critical infrastructure and the systems supporting such protection.

Duke Energy generally agrees with the proposed modifications. However, the proposed modification only seems to solve the problem for SCI and not existing issues with associated Cyber Assets. Duke Energy is concerned that the treatment of SCI in a manner not commensurate with other in-scope systems introduces discrepancies in enforcement methods that will present challenges in working with regions. The current SAR should be expanded to address inventories of all relevant devices.

Southern agrees with the SDT's intent to tie a non-identification of EACMS, PACS, and PCAs to a single requirement; however, Southern questions the usefulness in performing this activity only on virtual versions of these assets hosted on SCI that are being proposed for addition to CIP-002-7. Would physical Cyber Assets performing EACMS, PACS, or PCA functions not be just as important to identify and include? If the challenge of also including physical Cyber Assets alongside virtual ones in CIP-002 is a result of the scoping of the existing virtualization SAR, then… well, that is a shame and a gap in the ROP that should be addressed.

In the proposed revisions, it is unclear as to whether the intent is to include all of the newly identified assets in the responsible entity's CIP-002 list or whether it is simply an additional identification activity to facilitate overall compliance. Further, the phrasing of the new revisions creates ambiguity relative to what ancillary/supporting assets (EACMS, PACS, and PCAs) are being identified relative. Specifically, the requirements should make clear whether the assets to be identified are:

a. Only the EACMS, PACS, and PCAs associated with SCI;

b. Only the EACMS, PACS, and PCAs associated with BCS AND hosted in SCI;

c. Only the EACMS, PACS, and PCAs associated with BCS that are hosted in SCI;

d. All of the EACMS, PACS, and PCAs associated with BCAs and BCS.

For this reason, clarification is requested. As an example, a revision that reflects option (d) above is provided below.

1.4 Identify associated SCI that hosts any portion of the high impact BCS identified in Part 1.1 above or the Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs) associated with the high impact BCS identified in Part 1.1 above.

1.5. Identify associated SCI that hosts any portion of the medium impact BCS identified in Part 1.2 above or the EACMS, PACS or PCAs associated with the medium impact BCS identified in Part 1.2 above.

Texas RE agrees with the proposed changes. Additionally, although not specifically related to virtualization, it recommends the identification of all EACMS, PACS, and PCAs be required. If the identification of EACMS, PACS, or PCAs is only required for SCI, there is still "*no requirements that can be used to tie a non-identification of EACMS, PACS, and PCAs to a single requirement*" for EACMS, PACS or PCAs not associated with SCI. Texas RE recommends the following language:

- Identify each of the high impact BCS according to Attachment 1, Section 1, if any, at each asset; and their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs).
- Identify each of the medium impact BCS according to Attachment 1, Section 1, if any, at each asset; and their associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs).

We agree with this change; however, the qualifier of “at a single plant location” should be added. 2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units [insert: **at a single plant location**], the only BCS that meet this criterion are each discrete shared BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based in security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

The language needs to make it more clear that the individual BCS would have to be in support of the generating units that surpass the threshold. The language change doesn't seem to clarify the interpretation of the criteria over the previous language that was used.

Some of the proposed new terms (listed below) are ambiguous and arbitrary. Additional clarification and contextually relevant guidance is needed to better articulate the meaning of such Terms. For example, technical diagrams, examples of cyber assets, or infrastructure scenarios would be beneficial, before the standards are approved:

Management Module

Management Systems

Self-Contained Application

Shared Cyber Infrastructure

Barry Jones - Barry Jones On Behalf of: sean erickson, Western Area Power Administration, 1, 6; - Barry Jones

Answer	No

Document Name	
Comment	

Comments: We believe adding "discrete" in Criterion 2.1 does not resolve the clarification. Criterion 2.1 and 2.2 have the same issue regarding which shared BCS shoulde be identified as medium impact.

In our view, the focus should be on a totol loss of 1500MWs or 1000MVAR rather than the adverse impacts. If using adverse impact as the assessment basis, all BCS would be identified as the medium impact BCS. In addition, the "shared" wording should be removed since non-shared BCS could also result in a loss of 1500MW.

Recommendations:

Changes to the Criterion 2.1 and 2.2 to be:

- 2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. An individual BCS for a group of generating units, that could, within 15 minutes result in a total loss of 1500 MW or more in a single Interconnection.

We support the NPCC TFIST and RSC comments and submit the following additional comments:

The syntax should be the same for Criterion 2.2. and Criterion 2.1..

Criterion 2.1. is :

the only BCS that meet this criterion are each discrete shared BCS that could, within 15 minutes,

The current Criterion 2.2 is :

The only BCS that meet this criterion are those shared BCS that could, within 15 minutes,

CIP-003 Attachment 1 states, “Required Sections for Cyber Security Plan(s) for Assets Containing Low Impact BCS or their associated SCI.” Please verify the usage of and/or in this sentence. Could an entity have a plan for either the BCS or associated SCI or do they need a plan for both, if applicable? The intent is not difficult to infer, but the SDT could clarify the intent with revised language.

In relation to CIP-004 R2.1, the new definition of IRA and addition of IRA to this requirement will expand the scope to serially connected assets that have IRA, which has a significant impact due to the large number of BC Hydro assets which are Medium Impact without ERC.

BC Hydro SME team suggests that SDT either revise the IRA definition and include routing as suggested in our response to Question # 1, or restore the previous version of the standard for this requirement with newly added terms.

CIP-003 and CIP-004

Some of the proposed new terms (listed below) are ambiguous and arbitrary. Additional clarification and contextually relevant guidance is needed to better articulate the meaning of such Terms. For example, technical diagrams, examples of cyber assets, or infrastructure scenarios would be beneficial, before the standards are approved:

Management Module

Management Systems

Self-Contained Application

Shared Cyber Infrastructure

CIP-004

Comment: The change to this requirement would include all of the Medium Impact BCS.

However, additional clarity is needed on the new terms to see how this requirement affects an entity's facility that contain Medium Impact BCS.

The term “system(s)” in R2, Atch. 1, sections 3.1 is unclear whether itvrefers only to Cyber Assets and Virtual Cyber Assets. Would this term also include SCI? Since the Technical Rationale for Atch 1 Section 3.1 is the only place that describes the term “system(s)”, future revisions of the Technical Rationale should retain the description if still applicable. For clarity, the term "system" should be defined in the language of the requirement itself if it is intended to be applicable only to this instance of the usage of the term.

GSOC provides the following comments on the conforming changes to CIP-003 and CIP-004 for the SDT's review and consideration:

2. The introductory sentence for CIP-003, requirement R1 was revised to include "and associated SCI," however, the applicable bullets in the subset list still only address BCS. While not all topics are applicable to SCI, several are and, therefore, the singular reference to BCS in a sub-bullet could result in confusion and ambiguity relative to whether the policy should address SCI relative to that topic. For example, requirements R1.1.3 and R1.1.6 address topics that are also applicable to SCI, but include only references to BCS. The SDT should clarify as to whether content on these topics should address solely BCS or also SCI and give due consideration as to how these similarities and differences in treatment of BCS and SCI should be addressed in Requirement R1.

3. Requirement R1.1.2 in CIP-003 still refers to ESPs despite the proposal to retire the term included in this posting.

4. The proposed revisions include modifications to the titles of certain reliability standards, e.g., CIP-005 and CIP-010, and titles should be modified in others to reflect the expanded scopes (e.g., inclusion of SCI), e.g., CIP-006 and CIP-009. Several of the bullets included in requirement R1 do not reflect the revised titles. Accordingly, a quality check should be performed to ensure consistency between CIP-003 and the referenced CIP reliability standard’s titles with conforming revisions proposed where necessary. Alternatively, the topics could be revised to ensure broader applicability.

5. In the proposed revisions for CIP-004, for applicable systems, it is unclear why the construct/format utilized differs between requirements, e.g., requirement R1 and R2, and whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI

or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., "…hosting [] impact BCS and the BCS's associated ….." or "….hosting [] impact BCS and the SCI's associated….."

6. In the applicable systems column, the reference to SCI includes an "or" and not an "and." This creates uncertainty as to whether both "their associated EACMS or PACS" must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are "and" focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

It seems unneccesary to call out SCI in applicable systems column of CIP-004 R1.1 as other associated systems are not called out in the awareness training. There does not appear to be any real value gained by adding this qualifier to this section.

Answer	Yes
Document Name	

Comment

Issue 1:

The addition of “with IRA” to the Applicable Systems column in CIP-004 will add significant burden to authorize and revoke access to systems that were previously not required to be managed in this way under CIP-004. There are many instances of medium impact facilities that have their external communication limited to serial in order to limit risk, which had the added benefit of de-scoping many CIP Requirements (CIP-004 being one set).

Issue 2:

Tacoma Power noted the lack of Management Module inclusion in the Applicability column in CIP-004, and would like feedback from the SDT on whether this exclusion was intentional.

Issue 3:

Additionally, the Applicable Systems SCI references in CIP-004 R5 should be sub-bulleted. For example, “SCI hosting High Impact BCS or their associated EACMS or PACS” should be changed to “•EACMS” and “•PACS”.

14. The SDT modified the Applicable Systems column in CIP-006 to include SCI hosting PACs associated with Medium Impact BCS with ERC or IRA. The SDT made the proposed revisions to clarify the scope of requirements that apply when an entity implements serial IRA. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

No we disagree. In fact we don't even understand the questions based on the reading of the standard. So what ever the drafting team was trying to communicate isn't being conveyed in the current draft. What is the risk that this change is trying to address? Additionally, we agree with submitted comments from Duke Energy regarding the mention of serial IRA.

EEI recognizes the clear linkage between SCI hosting PACs associated with Medium Impact BCS with ERC within CIP-006, but there seems to be a gap in that linkage for IRA. Presently, IRA is not mentioned within the language of proposed CIP-006-7 or the technical rationale. EEI requests clarification how serial IRA is to be addressed within the framework of CIP-006-7 without clear linkage to IRA. At the present time, the only references to serial IRA are within the Technical Rationale for Definitions (see IRA). For this reason, EEI is unable to support the proposed changes.

Comment

ISO-NE disagrees with the addition of “SCI hosting High Impact BCS or their associated EACMS or PCA” and “SCI with ERC hosting Medium Impact BCS or their associated EACMs or PCA” to the applicable systems for CIP-006 R1.6 and CIP-006 R1.7. These additions are in conflict with the requirements language that focuses on the protections to Physical Access Control Systems themselves. Excerpt of Requirement Language for context. CIP-006 R1.6 “Monitor each Physical Access Control System for unauthorized physical access to a **Physical Access Control System**.” CIP-006 R1.7 “Issue an alarm or alert in response to detected unauthorized physical access to a **Physical Access Control System** to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.” ISO-NE agrees with the addition of “SCI hosting PACS associated with High Impact BCS” and “SCI hosting PACS associated with Medium impact BCS with ERC” as this correctly reflects the intention of the requirements.

GSOC provides the following comments for the SDT's review and consideration:

7. It is recommended that the SDT evaluate whether revisions to the title and purpose of CIP-006 are necessary to ensure consistency with its expanded scope.

8. In the applicable systems column, the reference to SCI includes an "or" and not an "and." This creates uncertainty as to whether both "their associated EACMS or PACS" must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are "and" focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

If the SDT specifically meant to address IRA, then it was not achieved. We do NOT see any reference to the term Interactive Remote Access or IRA in the proposed standard.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	Yes
Document Name	
Comment	
Southern acknowledges the clear linkage between SCI hosting PACs associated with Medium Impact BCS with ERC within CIP-006, but there seems to be a typo in this question related to IRA. Presently, IRA is not mentioned within the language of proposed CIP-006-7, as a qualifier for any Applicable System, or mentioned in the Technical Rationale. Southern recommends clarification as to how the implementation of serial IRA is to be addressed within the framework of CIP-006-7. Otherwise, Southern supports the ability to place the physical underlay of SCI hosting PACS associated with h/m BCS with ERC inside a PSP to meet the requirement.

In the proposed revisions for CIP-008 and CIP-009, for applicable systems, it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these across the body of CIP reliability Standards along with attendant revisions for clarity are requested e.g., "…hosting [] impact BCS and the BCS's associated …..." or "….hosting [] impact BCS and the SCI's associated….." Further, in the applicable systems column, the reference to SCI includes an "or" and not an "and." This creates uncertainty as to whether both "their associated EACMS or PACS" must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are "and" focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion.

The SRC agrees with combining Parts 2.1 and 2.2 under Requirement R2 and proposes to augment the proposed language by adding "that contain BCSI" as some BES Cyber Assets, such as PCA, may not contain BCSI at all.

Recommendation: Revise the Requirement in Part 2.1 as follows:

Method(s) to prevent the unauthorized retrieval of BCSI from applicable systems ***that contain BCSI*** *prior to their disposal or reuse (except for reuse within other systems identified in the "Applicable Systems" column).*

CIP-011 Part 2.1 does not mention cryptographic erasure. It is unclear what is meant by “cryptographic erasure.” It would be more appropriate for the SDT to directly address striping of data or other means that obfuscate information on disks in virtual storage. The second requirement is identified as R1. It should be R2.

Current standards are sufficient and these changes are cosmetic. No changes to CIP-007 is required to address Virtualization. Only applicability section needs to be modified along with BCS definition.

Mixed trust environment should not be permitted for BCS.

BCSI requirements are sufficient as in CIP-004 and CIP-011. Entities are compliant and appropriate controls are available to secure BCSI in current version.

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based on security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

Agree with SDT. If BCSI is not on the PCA, it should be identified as such because it would then not need to be protected. PCAs need to be included in to protect BCSI. Clarification in the guidance would be beneficial.

For CIP-011-3 R2, the SDT consolidated former Parts 2.1 and 2.2 into a single requirement. Similar to R1, the applicability is expanded with conforming terminology that includes virtualization: “SCI hosting High or Medium Impact BCS or their associated: EACMS; PACS; or PCA.”	

Removal of Part 2.2 is a positive step that would allow Responsible Entities greater flexibility in dealing with sanitization of virtual systems. However, use of Cryptographic Erasure(CE) is complex and would require additional documentation for things such as key management and destruction records in order to demonstrate that the data is permanently irretrievable. In addition, all backup copies of the respective BCSI or BCS systems require destruction as well. This would need to be included in that standards to ensure that the entity has proper documentation to address the additional processes needed to address Cryptographic Erasure.

Comments: We agree with the combination of R2 part 2.1 and 2.2 as long as the language is further refined to address some CIP cyber assets such as PCA which may not contain BCSI at all.

Recommendations:

- We suggest retaining the language "contains BCSI" from the existing version, and consider the following wording for the new part 2.1:
    - "Method(s) to prevent the unauthorized retrieval of BCSI from applicable systems that contain BCSI prior to upon their disposal or reuse (except for reuse within other systems identified in the "Applicable Systems" column). "

1. SRP is requesting a better description of what are the “allowing for cryptographic erasure in scenarios where BCSI cannot be mapped to particular disks within virtualized storage, and where BCSI is stored on SCI employing deduplication”. How would we perform an exercise for disposal an in Vitual world. Does cryptographic erasure need to be done on the virtual volume or in the physical storage?

2. SRP needs clarification on, “cryptographic erasure”. The term is not in the standard, only in the technical rationale. What does Virtual disposal look like? Please clarify what is necessary for evidence.

GSOC provides the following comments for the SDT's review and consideration: 9. In the proposed revisions for CIP-011, for applicable systems, it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., "…hosting [] impact BCS and the BCS's associated ….." or "….hosting [] impact BCS and the SCI's associated….." 10. In the applicable systems column, the reference to SCI includes an "or" and not an "and." This creates uncertainty as to whether both "their associated EACMS or PACS" must be managed or whether one or the other could be managed. This is different than what is used in current requirements and as related to BCS, which are "and" focused; thus, clarification and consistency in the listing of applicable systems is recommended to remove the potential for ambiguity and confusion. 11. A typographical error was identified in the form of duplicate R1s. It is suggested that the second R1 be revised to R2.

We can't say that we agree or disagree, it's not really clear what the intent is or what is being accomplished with the changes other than to add sci to the applicability column. Not sure I understand how the modification specifically allows for cryptographic erasure. We agree that management modules should be excluded from this requirement as that presumes that the module contains BCSI; this might be a stretch.

17. The SDT performed a review of the CIP Standards and determined that CIP Exceptional Circumstances could be applied to the following additional requirements: CIP-004-7 Requirement R2 Part 2.2, CIP-004-7 Requirement R3 Part 3.5, CIP-006-7 Requirement R1 Part 1.8, CIP-006-7 Requirement R1 Part 1.9, CIP-006-7 Requirement R2, CIP-010-5 Requirement Part 1.2, and CIP-010-5 Requirement R1 Part 1.3. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer	No

Comment

Any place where CEC is added to the CIP requirements is desirable. It should be added to all CIP requirements, but it is understood that that is outside of this project's charter.

Comments: We do not find issue with applying exceptions to the existing standards, however implementing separate and diverse exceptions approach for certain requirements/parts or sub-requirements can cause issues for entities processes for declaring, establishing, managing and closing an Exceptional Circumstance. Recommend finding a method to consolidate an Exceptional Circumstance into a single process language.

The parent requirement under CIP-006-7 R2 now includes “except during CIP Exceptional Circumstance” while the table seem to have removed “except during CIP Exceptional Circumstance” for Part 2.1. However, Part 2.2 has “except during CIP Exceptional Circumstance” included. The tables are used as our primary source of guidance and would be beneficial to have “except during CIP Exceptional Circumstance” in each of the applicable table(s).

CIP Exception Circumstance already applies to CIP-004 Part 2.2. The SDT should consider adding CIP Exceptional Circumstance language to CIP-007 Part 4.1. Does the SDT intend for CIP Exceptional Circumstance language to apply to all of CIP-010 Part 1.2 or only Part 1.2.1? Does the SDT intend for CIP Exceptional Circumstance language to apply to all of CIP-010 Part 1.3 or only Part 1.3.1?

Texas RE proposes expanding the CIP Exceptional Circumstances exception to apply to all requirements. CIP Exceptional Circumstances can cover a variety of scenarios, may come at unexpected times, and may have unanticipated effects on a Registered Entity's ability to comply.

Additionally, Texas RE recommends CIP-003 be revised to require Registered Entities to report to their Regional Entities when compliance obligations have not been met due to a CIP Exceptional Circumstance. Texas RE believes that an approach similar to the COVID-19 self-logs in which entities report issues associated with CIP Exceptional Circumstances to the ERO within a prescribed amount of time. While the ERO may review these CIP Exceptional Circumstance log submissions, the expectation is that such submissions will be resolved without further enforcement action.

18. Implementation Plan: The SDT proposes an Implementation Plan that makes the revised CIP Standards and definitions effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order. However, the implementation plan allows a Responsible Entity to elect to comply with the Revised CIP Standards and Definitions following their approval by the applicable governmental authority, but prior to the Effective Date. Do you agree with this proposal? If you think an alternate effective date is needed, please provide a detailed explanation of actions and time needed.

The proposed changes that impact the CIP standards require significant changes to entities compliance program and associated documentation. Perhaps a staggered implementation plan or implementation after the effective date.

EEI is concerned that, given the expansive changes proposed to accommodate virtualization, many entities will need additional time to implement changes. There is also a need for additional time because of the change from an asset-based approach to a systems-based approach. For many entities, this will require significant training and process modifications, as well as significant changes to existing compliance and asset management tools. While we appreciate the efforts being made to minimize entity impacts, even with those efforts, the industry will be faced with significant challenges and some naturally unexpected hurdles to ensure companies are adequately prepared. For this reason, we do not support a 24-month Implementation Plan but instead recommend the implementation of these change occur in a phased approach similar to the implementation for CIP Version 5

Will the Implementation Plan be updated? Currently shows CIP-012-1 as part of this project. We understand this project is not updating CIP-012. That CIP-012's initial mandatory date has not changed.

How will entities notify their Region? This question comes from the section titled "Compliance Dates for Early Adoption of Revised CIP Standards and Definitions." This section says "In such a case, the Responsible Entity shall notify the applicable Regional Entities of the date of compliance with the Revised CIP Standards and Definitions."

Can the Rules of Procedure be modified to allow phased implementation by the mandatory date?

Response

Casey Jones - Berkshire Hathaway - NV Energy - 5 - WECC

Answer	No
Document Name	

Comment

Given the extensive impact of the proposed changes to accommodate virtualization, an implementation timeline cannot be determined until the draft standards are closer to final.

When considering an implementation timeframe, we request the SDT consider the burden the new applicable systems, definitions and technology implementations will have to our current CIPv5 programs. There will be significant administrative burden to adjust documentation to accommodate the changes, as well as to revise programs and processes for requirements that are not backward compatible.

Concerned about the requirement for the entity to notify the region when adopting early. This process would force the entity to do an action but not force the Regions to facilitate the action. It does not seem that the notification would impact the CMEP. Does the entity have to adopt all of the Standards at one time or can this be phased in? Would notification be required as each portion of a phased implementation is completed? Suggest deletion of the requirement to notify regions.

AZPS believes the time would be spent on adhering to the new defnitions proposed and the program changes associated with them, and therefore would request a longer timeframe for the effective date. AZPS recommends 6 additional month totalling 30 months.

Duke Energy recommends an implementation plan of 48 months with early-adoption options. In particular, the changes to CIP-005 will need to be implemented in a deliberate manner that does not disrupt reliable BES operations. These changes potentially require entities to make significant changes to management network architecture. Entities cannot prudently make significant investment associated with these changes until after FERC approval is obtained, so a longer period after the approval date is necessary for this standard than would be required for changes where FERC's intent to approve is clearer.

The SRC supports the proposed 24-month Implementation Plan (as a minimum) and the added flexibility for entities to transition to the revised standards and definitions prior to the effective date should they choose to do so. This assumes the SDT addresses the concerns raised in response to Question #1 concerning backward compatibility. Left unaddressed, SRC is concerned that entities may be required to expend significant administrative effort, akin to the level required in transitioning from V3 to V5, to modify existing program documentation merely to maintain status quo; i.e. to continue to comply with CIP standards absent any changes to adopt virtualization.

19. Please provide any additional comments for the SDT to consider, if desired.

Masuncha Bussey - Duke Energy - 1,3,5,6 - MRO,Texas RE,SERC, Group Name Duke Energy

Answer	
Document Name	

Comment

In addition to the above comments, Duke Energy recommends the following:

The proposed applicability of CIP-005 R1 component parts to EACMS and PACS, and in particular Part 1.5, is a major expansion of scope reminiscent of the “spaghetti requirements” – although it is appropriate to apply these protections to SCI, applying them to virtual EACMS and PACS is excessive in comparison to existing EACMS and PACS requirements.

The revised standards introduces multiple anti-affinity requirements that will increase the number of physical hosts required in clusters to maintain cluster reliability and compliance. Duke Energy agrees that it is reasonable to separate Intermediate Systems given their specific risks and functions as the “bastion host,” but requiring additional “trust levels” that separate BCA, Management Systems, other EACMS like Logging solutions, etc. within the virtual environment will add significant cost and complexity without commensurate cybersecurity benefits. Separating IS from other systems should provide a adequate, cost-justified level of separation based on the security requirements applied to those other systems hosted on SCI.

The inclusion of SCI in the PACS Maintenance and Testing requirements (CIP-006 R3) does not appear to be necessary or make practical sense. This requirement is clearly aimed at maintaining the integrity of the Physical Security Perimeter. Including the local badge controller portion of the PACS is technically sound, but the inclusion of the PACS server in current requirments was already confusing and required clarity in the G&TB. Now, the addition of SCI further exacerbates the question of what it means to test the PACS. What should be performed on SCI to meet this requirement? Even tests of provisioning and deprovisioning access that can reasonably include the PACS application servers cannot be applied to the SCI portion of the Applicable Systems. We suggest that the SDT use this opportunity to clarify that the scope of this requirement is the PACS components themselves (i.e. local controllers, application software) and remove the broader systems from the requirements’ applicability. At minimum, the SDT must provide clarity in the requirement as to what portion of the testing would apply to SCI.

Overall, the SDT’s approach solves certain problems with Virtualization, but in doing so, creates discrepancies in how the standards are applied between traditional and newer technologies. The creation of additional “device types” while not resolving the overall inconsistency in treatment of devices (e.g. CIP-002 now addressing BCS and SCI but not EACMS and PACS, applying requirements to PACS hosted on SCI but not those hosted on Cyber Assets) may confuse entities and auditors. Duke Energy recommends that the SAR be adjusted as needed to ensure the revisions produce a coherent approach to compliance, or that the SDT confine their changes to be more consistent with the existing defined terminology.

Response

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer	
Document Name	

Comment

TVA welcomes changes to the standards that support innovation and increase security and reliability. However, the standards and supporting definitions as proposed lack sufficient clarity for effective implementation.

TVA supports an approach that embraces innovative technologies that enhance security and reliability. The proposed changes are myopic in requiring differentiation in virtualization technologies supporting compute, network, and storage resources. These distinctions are becoming increasingly indistinguishable as virtualization technologies evolve. Modern standards should make no distinctions in the treatment thereof, so as not to preclude adoption of emergent technology.

Comments:

The proposed changes would impact nearly all CIP standards. Edits to Applicability, for example, exceeds 170 changes. We believe the existing standard requirements could be revised more efficiently to meet the SAR requirements, ensure the virtualization security objectives are met, reduce the impact to entities' programs, and provide greater clarity to auditors.

Categorization: A virtual hardware platform operating multiple hosts including CIP and non-CIP hosts can be categorized as a single CIP Cyber Asset using the highest high water mark or with the multiple classifications. This clarifies compliance controls as technologies advance and operating systems, applications and components whether disks, arrays, solid state or chipsets. Once the virtual hardware platform operating multiple hosts are protected as the highest water marked CIP Cyber Asset, the CIP and non-CIP hosts can operate on the same hardware platform unless they share the CPU and memory.

Security Controls: The current CIP requirements for physical security, electronic access (authorization, authentication and accounting), software patch management, antimalware, vulnerability management, monitoring and logging, hardening, change and configuration management and supply chain establish security controls which prevent hosts within a hardware platform (virtual) from unauthorized communication or access to each. OSI layer 2 controls prevent communications ingress/egress each other (non-routed) on the hardware platform and virtual switch backplane.

Communications ingress/egress between the hardware platform (virtual server) hosts and non-hardware platform occurs at the OSI layer 3 and 4 via a routed protocol and identified EAP using the current language. This perspective allows an entity to use virtual hardware platforms independent of hosts categorizations.

Entities may not prefer to consolidate all hosts because of heightened risk (i.e. it puts many “eggs” in one basket) to the entire platform and/or system functions.

Using existing language and minor changes can give entities the flexibility to use virtual technologies. Virtual environments should contain differing levels of security within them. All physical Cyber Assets associated with a virtual environment, and associated software, should be high watermarked to the most secure classification.

The impacts to entities with the proposed changes are broad and deep. We recommend the SDT look to using existing language and concepts to address virtualization.

In our assessment, the risk of sharing infrastructure across different security zones (BES Cyber Systems vs. non-BES Cyber Systems) is higher than the benefit gained from such virtualization. Con Edison and Orange & Rockland Utilities fully concur on the benefits of virtualizing within same ‘level’ security zones, but entities should not be virtualizing across trusted to untrusted security zones. We do not believe it is appropriate for SCI to be share across BES Cyber Systems and non-BES Cyber Systems.

Richard Jackson - U.S. Bureau of Reclamation - 1	
Answer	
Document Name	
Comment	
Reclamation recommends that improved resilience or reliability of the BES be the primary consideration before an entity adopts any new or emerging technologies for BES reliability operating services.	

Reclamation also recommends utilizing existing FedRAMP criteria and air gapping Industrial Control Systems where possible from external communications.

Remove language in the new definitions and in any Requirement that refers to a third person (their).

Reclamation understands the driver for this round of comments, and requests that the SDT submit smaller packets of data for future rounds of commenting and balloting. This was a heavy lift for a resource-constrained entity to review with the depth and seriousness warranted.

Reclamation appreciates SDT efforts to incorporate NIST Framework into the NERC Standards and encourages the SDT to continue this practice moving forward by ensuring that requirements are not duplicated within the NERC Standards where they may overlap NIST Framework.

John Galloway - John Galloway On Behalf of: Michael Puscas, ISO New England, Inc., 2; - John Galloway

Answer	
Document Name	

Comment

ISO-NE believes that the SDT's approach solves certain problems with virtualization. However, as mentioned in earlier comments, it also creates increased complexity and discrepancies in how the definitions and requirements are applied. Because of the new definitions, there is a mixing/matching of virtual and physical systems. The creation of additional "device types" while not resolving the overall inconsistency in treatment of devices may confuse both Registered Entities and auditors. ISO-NE recommends that the SDT consider the suggestions presented in the comments above, as well as carefully review and adjust the "Applicable Systems" column for consistency and to limit confusion across all CIP Standards.

Furthermore, ISO-NE recommends the added language in CIP-010 R3.2, "...that minimizes difference with the production environment…" be deleted because CIP-010 Part 3.3.2 requires that the differences between the test environment and production environment be documented.

ISO-NE appreciates the opportunity to comment.

Under CIP-005-8 R1.5, Southern requests the SDT consider the following changes to the proposed edits to specify IP “network” communications:

Detect known or suspected malicious Internet Protocol (IP) ***network*** *communications for both inbound and outbound* ***network*** *communications entering or leaving the logical isolation required by Part 1.1 or Part 1.2.2.*

Additionally, under CIP-005-8 R1.5, the proposed revisions to remove EAPs associated with high BCS and mediums at Control Centers and add PACS and EACMS hosted on SCI significantly increases the scope and adds requirements previously not applicable to those Applicable Systems. As with our previous comment, the use of the conjunctions “and” and “or” when referring to “and their associated:” is not used here consistently; this further supports our comments that applying these new requirements to PACS and EACMS should only apply when those systems are “hosted on the same SCI as a h/m BCS”, and are not justified from a risk-based perspective when simply considering stand-alone virtual PACS or EACMS that are not hosted on the same SCI as a h/m BCS.

Although there was no question related to conforming changes for CIP-013-3, Southern supports the conforming change edits to CIP-013-3 given that the SDT is able to adequately address our other comments contained herein.

Management Systems for non-virtual environments should be protected at the same level as the Management Systems for SCI; we understand that the SAR limited the SDT. Likely this could be captured by FERC as a conditional approval item for the next version of CIP Standards.

Please keep ESP and EAP as NERC Glossary terms. This may avoid future auditor interpretation issues and allow consistent application of the concepts across industry. It also helps preserve backward compatibility.

Please provide a draft copy of the NERC CIP ERT for the new requirements with the next posting. This would help entities assess the impacts the proposed changes would have to managing audit preparation under the new requirements.

GSOC respectfully provides the following general comments:

1. Relative to VSLs, the proposed revisions inconsistently refer to the assets more explicitly, e.g., BCS, SCI, etc., in some instances while utilizing Applicable Systems in other instances. Consistency is recommended in the drafting and development of VSLs. Further, to reduce the potential for error, it is recommended that the term “applicable systems” be utilized whenever possible.

2. Relative to titles and purpose, GSOC noted several titles and purpose with proposed revisions as well as those that did not have proposed revisions despite revisions that broadened their overall scope and applicability. To ensure consistency amongst the reliability standards and with the broader scope of applicable systems, GSOC recommends that these be evaluated holistically to identify the need for any additional conforming revisions.

3. Generally, the formatting of applicable systems within the applicable systems column should be evaluated for consistency of format.

4. In the proposed revisions, for applicable systems, it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on

these along with attendant revisions for clarity are requested, e.g., “…hosting [] impact BCS and the BCS’s associated …..” or “….hosting [] impact BCS and the SCI’s associated…..”

5. In the applicable systems column, scoping of applicable systems with additional terms such as ERC, IRA, etc. seems to be inconsistently applied. While it is understood that these scope additions better tailor the requirements, inconsistent application and use of scoping verbiage can lead to ambiguity and confusion. For this reason, review of these scope additions and use of consistent scoping of verbiage is recommended.

6. Relative to CIP-013, which had conforming revisions only, GSOC provides the following comments for the SDT’s review and consideration:

a. In the proposed revisions for CIP-013, , it is unclear whether the addition of SCI and attendant bullets results in the inclusion of the EACMS and PACS associated with the SCI or whether it is the EACMS and PACS associated with the BCS that is being hosted by the SCI. Clarification on these along with attendant revisions for clarity are requested, e.g., “…hosting [] impact BCS and the BCS’s associated …..” or “….hosting [] impact BCS and the SCI’s associated…..”

b. The verbiage utilized in the VSLs differs from the verbiage utilized in the requirements and raises a questions as to whether the EACMS and PACS of SCI are in scope for the standard.

c. A typographical error was identified in requirement R1. Controlling should be revised to Control.

The CPU and memory isolation language in the PCA definition, CIP-005 R1.2, and CIP-005 R2.6 are a poison pill to this draft. They create a 4-tier structure to virtualization; BCAs/PCAs, Management Systems, Intermediate Systems, and all other VMs. On a non-CIP system, such VMs could be hosted on a 4-node cluster and have suitable redundancy. Under the draft standards, none of these classifications can share CPU or memory with any other classification. This represents a potential doubling and possibly more of the infrastructure required, as you would need to have at least 2 hosts for BCA/PCA, 2 hosts for Management Systems, 2 hosts for Intermediate systems, and 2 hosts for other systems (for total of at least 8, with the potential for more given TOP-001 redundancy requirements), along with vastly increased complexity to prevent VMs of different classifications from running on the same host.

This added complexity introduces risk, where a failure could render BCA unable to find an appropriate host to run, even when plenty of resources are available. All this cost and complexity is added to mitigate vulnerabilities that do not exist yet and are only theoretical (that is, a side channel remote execution or privilege escalation that crosses VM boundaries). The cited side channel attack by the SDT (row hammer) has not been seen in the wild and has not been shown to allow VM escape.

Possibly one of these isolation requirements would be acceptable, but 3 separete ones make this untenable.

Furthermore, these threats are already covered by two other CIP requirements. In the event that such vulnerabilities were discovered, either patches would be released that could be applied as required by CIP-007 R2 (or if the patches cannot be installed, a mitigation employed), or an entity would identify the vulnerability in their CIP-010 R3 vulnerability assessment and mitigate them as part of their action plan. With these proposed requirements, the SDT cripples the ability for entities to implement virtualization at all, essentially cutting off one’s hand to prevent getting a splinter.

These CPU/memory isolation requirements place virtualization out of the reach of smaller entities and greatly eliminate the benefits for even larger entities. Approval of this draft would require entities who have already implemented virtualization to completely rearchitect their systems, or potentially scrap their virtual infrastructure all together due to the added burden. It also mandates a specific control to address a concern (isolate VMs), rather than addressing the underlying need (mitigate side-channel vulnerabilities), which is counter to the SDT’s stated goal of not requiring the “how” but requiring the “what”. If the SDT wishes to address side-channel vulnerabilities, it should do so in a separate SAR that looks at how entities address vulnerabilities (similar to a previous draft that combined CIP-007 R2 and CIP-010 R3). We believe these changes introduce a poison pill to the new draft which significantly increases the likelihood of rejection by industry.

Suggest not to include PACS and EACMS in the scope in the context of SCI as this requirement doesn't exist for a PACS and EACMS not on a SCI. SAR is for including the virilization concepts not to add additional controls. Suggest reviewing the Applicable Systems of the different CIP associated to management modules. The current langage only refers to a Management Modules of SCI hosting. What about a the management module of a BCA ? Management Modules of SCI hosting would have more controls than a Management Modules of BCA. The SDT should look into the CMEP Practice Guides published on the NERC web site. The following documents; CMEP Practice Guide Virtual Systems, CMEP Practice Guide Virtual Network, CMEP Practice Guide Virtual Storage are pertaining to the virtualization and they contain enough elements for us to understand what needs to be done to be compliant. Those CMEP documents permit the usage of the virtualization with the current concepts and definitions. The SDT should use those documents and update the different CIPs documents with the required and corresponding wording.

Where technically feasible' -> 'Per system capability' **MRO Comment:** There are instances of 'per system capability' replacing 'where technically feasible' that could allow for fewer protections for those BCS. TFEs required "Compensating and mitigating measures" (NERC ROP Appendix 4D). This is no longer required and limits compliance monitoring. (Consider an EACMS or PACS, which do not require logical isolation, not requiring authentication [Part 5.1] or limiting authentication attempts [Part 5.7]. This poses an increased risk.) **Recommendation:** Modify the language of the requirements beyond just replacing 'where technical feasible' with 'per system capability' to better address risk posed by the lack of the required controls.

It seems as though there are some inconcistencies within the applicable systems column throughout the standards. Is that the intent of the SDT? For instance, the applicable systems column in CIP-005 R1.1 contains PCAs and PACs and EACMS hosted on SCI. However, thoughout most of the other standards, the requirements list SCI hosting High or Medium Impact BCS with the associate PACS, PCS, and EACMS. There are several things that are not completely clear in this approach. It is unclear what the purpose of the phrase “hosted on SCI” is associated with PACS and EACMS. Would the requirement not apply if the PACS or EACMS is hosted on SCI or not in the CIP-005 R1.1? Based on the requirement language, it seems as though it shouldn’t matter whether they are hosted on SCI or not. Further clarification is needed around the intent of either the phrase “hosted on SCI” or what the intent of requirement is. Additionally, when the phrasing is used that includes that language “SCI with ERC hosting High and Medium Impact BCS or their associated PACS, EACMS, or PCA,” is the intent that only the BCS must be hosted on the SCI and the associated systems do not need to be hosted on SCI? An example of this language can be found in CIP-007 R4.1.

LCRA views many of these revisions as administrative in nature. They will require additional resources to update and reformat a NERC CIP Program. The result is a change to how programs are documented but not to security. Additionally, the rapid revisions of CIP Standards result in entities having to continually tweak their internal processes for collecting evidence and to ensure consistency with new terminology. Again, this is a concern if security is not being enhanced.

JT Kuehne - AEP - 6

Answer	
Document Name	

Comment

AEP appreciates the work of the SDT in addressing potential gaps related to virtualization in the currently enforceable language of the CIP Standards. It has been AEP's experience that there is adequate flexibility in the application of the current CIP Standards/requirements to allow for the implementation of Virtualization both as BES Cyber Assets/Systems, as well as the associated EACMS, PACS and/or PCA. This experience is based in Regional Entity(ies) audit of the virtualized environments that are currently operating in production CIP environments. We would further point out that the security and auditability of these systems, within the framework of the existing Standards, is supported by the CMEP Practice Guides released by NERC on 3/1/2021 (on the subjects of Virtual Network, Virtual Storage, and Virtual Systems).

Given prior successful audit of virtualized Assets within AEP's CIP environments, AEP recommends to consider limiting the introduction of new terms/definition to only those areas where it is necessary to reach an end result of increased security, resiliency and/or sustainability. AEP does, however, commend the movement away from heavily burdensome time-based requirements in favor of security-driven and objective-based requirements.

Please Note: one of AEP's balloters accidentally selected "Negative Opinion" for the CIP-002-7 Non-binding Poll. The intent was to select "No Opinion". While unable to change a vote once cast, AEP felt it was important to inform the SDT of the true intent of the vote.

CIP-006, R2 added “except during CIP Exceptional Circumstances” to the root requirement, but removed it from part 2.1. Are we to assume that the root requirement allowing CIP Exceptional Circumstances would flow down to the sub-parts? If so, why was If not removed from 2.2? If not, does this mean that first responders would be required to escorted? Clarity to the intent of the applicablility of this phrase would be appreciated.

The definition of IRA still leaves some room for interpretation. While DOminion Energy supports simpolifying the definition, the IRA definition should address the communication session that ends with the destination asset. The session between the asset (physical or virtual Cyber Asset) and the Intermediate System is user initiated. The session between the Intermediate System and the destination asset is user initiated.

A management console, for this example, does not have constant communication sessions with client Cyber Assets/Virtual Cyber Assets unless the console needs to execute a command on a client. A user establishes a session with the console, via multi-factor authentication, and instructs the console to execute a command on a client. In order to execute the command, the console needs to establish a communication session with the client.

Is a connection from console to a Cyber Asset client also a user-initiated IRA if the user schedules on the console a configuration command that will execute one hour later by the console (and after the user had ended the communication session to the console)? What if the user schedules a command for execution by the console within 5 minutes? Is this user-initiated IRA too? Would the console itself be an Intermediate System? The current language is ambiguos on these issues.

In both scenarios, the console establishes the communication sessions to the client asset and the sessions are not between the user and the client. Rather than leave the interpretation to the Entities or Regional Entities, the IRA definition should have more clarity built-in to address such scenarios.

Answer	
Document Name	

Comment

Generic Formatting Comments

Issue 1:

The “Management Module” inclusion across the Standards is inconsistent with the inclusion of “Shared Cyber Infrastructure.” Tacoma Power believes there are additional locations where the risk posed by Management Modules is equivalent to the risk posed by the SCI itself and these should also include Management Modules as applicable. Tacoma Power suggests that there may be a way within the Applicability Section of the Standard to state that where SCI is included in the applicability of a requirement, any associated Management Modules are also included. This would avoid the issue of including one cyber asset within another, and the hall of mirrors that builds, which would happen if the SDT were to simply ensure Management Modules were included in the SCI definition. It would also simplify the Applicability Columns throughout. Another possible solution would be notating each SCI applicability inclusion with a footnote, then including the statement that each inclusion of SCI also includes any associated Management Modules, as a footnote on each applicable page.

Issue 2:

Review each Standard’s Applicability column to ensure the sub-bullet formatting and order of the “associated” PACS, EACMS, and PCA is consistent from unaltered to newly inserted items and across all Standards.

Issue 3:

The SDT should consider stating “per system or component capability” in the Requirement language instead of “per system capability”. Requirements are applied at either the system or component level. Because there is inconsistency with the “level” of a Requirement’s object across the CIP Standards, this change may add some necessary clarity.

CIP-005 General Comments

Issue 1:

Tacoma Power seeks clarification from the SDT on the directional language used in CIP-005. For example, the Standard uses “to and from”, “leaving and entering”, and “between”. This inconsistency could be confusing depending on the context, consistency of usage could add clarity throughout the Standard.

Issue 2:

Comment on CIP-005 Technical Rationale, “Shared infrastructure and ‘Mixed Trust’ Risks”: While Tacoma Power is not voting against this rationale document, we feel that affinity is not an adequate control to ensure SCI security in a mixed trust environment, because affinity controls exist on individual servers to split processor core access or RAM NUMA Node access.

In line with the above statement, perhaps changing the terminology used in describing the Affinity rule requirements (CIP-005 R1 Part 1.2, and CIP-005 R2 Part 2.6) to “Host or Cluster Affinity and Anti-Affinity rules” would provide more clarity to industry. Host Affinity is a VMWare Term, while Cluster Affinity is a Hyper-V term.

CIP-007 General Comments

Issue 1:

CIP-007 R1 Part 1.2 applicability column “Management Modules” entry includes PACS and EACMS where the rest of the Applicability entries do not, is this intentional? This appears to be a mistake.

Issue 2:

In CIP-007 R5 Part 5.7, the SCI entry in the Applicable Systems column includes “with ERC” which should be removed, as follows: “SCI at Control Centers hosting High Impact BCS, Medium Impact BCS or their associated:” Alternatively, Tacoma Power recommends the SDT re-word this applicability to state: “SCI hosting High Impact or Medium Impact at Control Centers or their associated:”

Issue 3:

While it may not be part of the SAR scope for Project 2016-02, Tacoma Power recommends that the SDT consider removing “at Control Centers” from the Applicability Statements from CIP-007 R5 Part 5.7 to enforce this control on those remote elements that are typically more exposed to attack.

CIP-010 General Comments

Issue 1:

The CIP-010 R2 Applicable Systems column omits SCI and Management Modules. Tacoma Power would like feedback from the SDT on whether this exclusion was intentional.

Issue 2:

Tacoma Power recommends that the SDT review and revise CIP-010, Attachment 1 to include SCI. There are instances of “BES Cyber System” which do not have the typical SCI redlined in.

Consistency with Project 2017-07

Project 2017-07 stated that “CIP-002-5.1a, CIP-003-6, CIP-003-7, CIP-004-6, CIP-005-5, CIP-005-6, CIP-006-6, CIP-007-6, CIP-008-5, CIP-009-6, CIP-010-2, and CIP-011-2 will not be revised at this time due to the current Project 2016-02 (Modifications to CIP Standards) and the CIP Standards Efficiency Review.” The currently posted redlines for Project 2016-02 do not include all of the Standards Alignment changes (e.g. “UFLS-only DP”). Tacoma Power recommends the SDT document whether this project or the CIP Standards Efficiency Review will closeout these updates.

Too much compartmentalization based on non-industry standard definition. Please review NIST Publication 800-125 (virtualization guidelines) and apply controls, based on Terms such as Management Systems, Guest, Hosts, Network virtualization, Infrastructure virtualization (Mixed Trust, Resources sharing, high-watermarking) and similar guidance that is used by Industry, SME and vendors. SDT approach is complicated and confusing which will result in different interpretation by SMEs and ERO.

SDT draft utilizes non-industry standards requirements and terminology, and will result in confusion and subjective and varying application. Recommend that SDT use Industry standard terminology such as NIST or PCI-DSS and security controls as laid out in such frameworks.

All definitions should be contextualized in relation to BES application.

Furthermore, require standard requirements to apply control application based on risk to the systems based industry standard approaches such as high watermarking practices instead of compartmentalizing security controls based on every unique device types that SDT has identified.

SDT has summarily discarded Industry standard practices such as baselining but replaces it with subjective terms such as hardening, which varies depending on environment and device types. Such scenario will lead to different conclusions by the auditors and entity SME.

It has taken four years for the industry to standardize the security and baselining requirement. New approach discards all the work done so far and creates confusing set of expectations.

Further, in CIP-010, tracking hardening requirements in change management tickets is an incorrect approach as CM is for tracking activities and not performing assessments and compare of configurations.

Request clarification on CIP-005 R1.4 “per system capability.” Who determines that capability? What evidence do the auditors expect?

Request clarification on CIP-005 R2.3 “Multi-Factor Authentication (MFA).” Years ago, two step verification (2SV) was generally accepted as MFA. 2SV uses SMS which is hackable. Does this MFA expectation include 2SV?

Request consistency between CIP-005 R2.4 and R2.5. R2.5 Requirement uses abbreviation (IRA). R2.4 does not.

Several comments on CIP-005 R2.6; 1) the Applicable System should be explicitly stated; 2) we are concerned with how complex (difficult) Applicable Systems and Definitions are to comprehend; 3) is an Intermediate System *only* an Intermediate System; 4) does R2.6.2 allow communications with a remote system? 5) if Intermediate System is used only in R2, it should not be a defined term. The explanation and use of Intermediate System should be in only R2

Three comments on CIP-010 R3.2. These comments were repeated for CIP-010 R1.3. 1) request removal of “minimizes differences with the production environment” because new language is a) subjective, b) better suited to the measures and c) the previous language is sufficient 2) if this language cannot be removed, request clarification that the entity determines “minimal differences” 3) suggest that the intent is to a) test and b) document what was tested

For CIP-010 R3, request that the SCI requirement into a separate Part. Same comment was made for CIP-010 R1

One comment on CIP-007 R1.3. Request consistent language on the exclusion of services that cannot be disabled. Consistent with R1.1.

One comment on CIP-007 R2. Concerned about this language. The proposed language is “systems.” However, patches are applied to assets. This concern is repeated in CIP-007 R4.1, R4.2, R4.3, R5.4, R5.5, R5.6

One comment on CIP-007 R3.1 Measures. This is a repeat of a general comment on CIP-007. The use of “system hardening” here seems different than “system hardening” elsewhere in CIP-007. Request consistent use of this label. How does one measure “system hardening.” What evidence will the auditors expect?

This is a significant change and overhaul of all the CIP Standards and Requirements that will require a significant re-analysis of stable and current CIP Standards and Requirements and definitions. Today, virtualization is used with the understanding that the VM host receives the “high water mark” of the VMs hosted, which is a simplified approach that doesn’t require new definitions. Texas RE cautions the splitting of compliance and security controls to components of VM host(s) in virtualization.

Wabash Valley appreciates the effort that the Standards Development Team has put into development of this standard. However, significant additional work and documented guidance such as those that would previously have been found in the Guidelines and Technical Basis Section of the CIP Standards is needed and should be a mandatory consideration of CMEP teams. The removal of these sections has been a detriment to the CIP Reliability Standards.

Management Systems for non-virtual environments should be protected at the same level as the Management Systems for SCI; we understand that the SAR limited the SDT. Likely this could be captured by FERC as a conditional approval item for the next version of CIP Standards.

Please keep ESP and EAP as NERC Glossary terms. This may avoid future auditor interpretation issues and allow consistent application of the concepts across industry. It also helps preserve backward compatibility.

Please provide a draft copy of the NERC CIP ERT for the new requirements with the next posting. This would help entities assess the impacts the proposed changes would have to managing audit preparationunder the new requirements.

The exemption language in section 4.2 of every CIP standard needs to be addressed, please see our response for Question 9 for details.

Elizabeth Davis - Elizabeth Davis On Behalf of: Tom Foster, PJM Interconnection, L.L.C., 2; - Elizabeth Davis

Answer

Document Name

Comment

PJM signs on to the comments provided by the SRC and submits the following additional comments:

1) PJM requests additional clarity surrounding the removal of the term “or” in CIP-007 R2.3. Does this change the context of the standard or was the second “or” kept intentionally to provide choice in the list of actions? Recommendation: remove the second “or” for consistency.

2) PJM identifies that the CIP 011 requirements are being modified to focus on the BCSI itself and not the actual Cyber Assets identified in the “Applicable Systems” column. PJM recommends that the applicable systems column should include "BCSI repositories" rather than the Cyber Assets identified in the “Applicable Systems” column, given that the requirements are being modified to focus on the BCSI itself and not the Cyber Assets.

3) PJM also requests SDT to confirm intention of listing SCI with EACMS, PACS, and PCA in the applicable system sections which seems repetitive. The new definitions for EACMS, PACs, and PCAs now includes SCI which makes the Applicable Systems section repetitive when listing “SCI hosting High or medium impact BCS or their associated EACMS, PACS, and PCA”.

Request clarification on CIP-005 R1.4 “per system capability.” Who determines that capability? What evidence do the auditors expect?

Request clarification on CIP-005 R1.5. The proposed language does not include the combination of non-IP and malicious. Is this acceptable?

Request clarification on CIP-005 R2.3 “Multi-Factor Authentication (MFA).” Years ago, two-step verification (2SV) was generally accepted as MFA. 2SV uses SMS which is hackable. Does this MFA expectation include 2SV?

Suggest a CIP Standard should not explicitly reference a Standard not in NERC’s purview in Requirement language. If the inclusion is necessary, request correction of CIP-005 R2.4’s references to GOOSE protocol - “IEC TR-61850-90-5 R_GOOSE.” We believe SDT should reference 1) IEC/TR 61850-90-5:2012 / Part 90-5: Use of IEC 61850 to transmit Synchrophasor information according to IEEE C37.118 and 2) IEC 61850-8-1 GOOSE (Generic Object-Oriented Substation Event message) and IEC 61850-9-2 SV packets. CIP-003 may have shared this concern.

Request consistency between CIP-005 R2.4 and R2.5. R2.5 Requirement uses abbreviation (IRA). R2.4 does not.

Several comments on CIP-005 R2.6; 1) the Applicable System should be explicitly stated; 2) we are concerned with how complex (difficult) Applicable Systems and Definitions are to comprehend; 3) is an Intermediate System *only* an Intermediate System; 4) does R2.6.2 allow communications with a remote system? 5) if Intermediate System is used only in R2, should not be a defined term. The explanation and use of the Intermediate System should be in only R2

Two comments on CIP-005 R3. 1) system to system communications is not currently defined. Is system to system included in R3? The issue is that that “system to system” is nebulous; 2) request an illustration/diagram since this is hard to follow

Three comments on CIP-010 R3.2. These comments were repeated for CIP-010 R1.3. 1) request removal of “minimizes differences with the production environment” because new language is a) subjective, b) better suited to the measures and c) the previous language is sufficient 2) if this language cannot be removed, request clarification that the entity determines “minimal differences” 3) suggest that the intent is to a) test and b) document what was tested

For CIP-010 R3, request that the SCI requirement into a separate Part. The same comment was made for CIP-010 R1

One comment on CIP-007 R1.3. Request “consistent” language on the exclusion of services that cannot be disabled. Consistent with R1.1.

One comment on CIP-007 R2. Concerned about this language. The proposed language is “systems.” However, patches are applied to assets. This concern is repeated in CIP-007 R4.1, R4.2, R4.3, R5.4, R5.5, R5.6

One comment on CIP-007 R3.1 Measures. This is a repeat of a general comment on CIP-007. The use of “system hardening” here seems different than “system hardening” elsewhere in CIP-007. Request consistent use of this label. How does one measure “system hardening?” What evidence will the auditors expect?

Suggest not to include PACS and EACMS into the scope in the context of SCI as this requirement doesn’t exist for a PACS and EACMS, not on an SCI. SAR is for including the virilization concepts not to add additional controls.

Suggest reviewing the Applicable Systems of the different CIP associated with management modules. The current language only refers to Management Modules of SCI hosting what about the management module of a BCA? Management Modules of SCI hosting would have more controls than Management Modules of BCA.

SDT should look into the CMEP Practice Guides publish on the NERC website. The following documents; CMEP Practice Guide Virtual Systems, CMEP Practice Guide Virtual Network, CMEP Practice Guide Virtual Storage is pertaining to virtualization and they contain enough elements for us to understand what needs to be done to be compliant. Those CMEP documents permit the usage of virtualization with the current concepts and definitions. SDT should use those documents and update the different CIPs documents with the required and corresponding wording.

Every CIP Reliability Standard currently in effect makes every Distribution Provider that owns underfrequency (UFLS) systems that meets the subparts identified in 4.1.2.1.1 and 4.1.2.1.2 applicable to the CIP Standards, however, UFLS only Distribution Providers that may also meet these criteria are not currently applicable to any of these standards. EEI requests that this gap be addressed by adding UFLS only Distribution Provides that meet the identified criteria to be made applicable to these Reliability Standards. EEI seeks clarification CIP-005 R1.2.1 to understand the reason for restricting management systems to only share CPU with other Management Systems. We recommend the language be revised to state that BCS can only share CPU with other BCS. Additionally, should CPU be shared across Management Systems for BCAs and Management Systems for Non-BES Cyber Assets? EEI request clarification on whether segmentation can be achieved through policies or does segmentation need to occur on separate physical blades (air gap)? CIP-005, Requirement R2, Part 2.2: states, “Protect the confidentiality and integrity (e.g., encryption) of IRA between the client and the Intermediate System.” EEI understands this to mean that encryption is only required between user/client and the IS and not between the IS and the BCS. In the substation remote access case the Intermediate System may be at a central location (Control Center/Data Center) and the link to the BCS may travel many miles over links owned by providers (i.e., telecom carriers). This appears to imply that not encrypting this communication is acceptable. This appears to be a gap that should be addressed or clarified.

With the revisions to CIP-005 R1.5 and move to allow a zero trust model it is unclear in the revision what measure would meet this for a single device with its own logical isolation. The host may not have an IDS or application layer firewall. Would a host with AVAM used for CIP-007 R3 be sufficient to met this requirement?

We have a concern about CIP-010 R2.1. The monitoring would now expand in scope to R1.1.6 items. Items R1.1.1 through R1.1.5 are properties of a device and R1.1.6 is security settings applied to a device. One of these things are not like the others. So why does the monitoring have to include only the security settings in R1.1.6 but not the other CIP-005 or CIP-007 securty controls? We recommend striking R1.1.6 from being in scope for CIP-010 R2.1.

While the Implementation does allow for early adoption it is unclear if the requirements must be adopted all at once or if an entity can adopt part of the standards and have a staggered implementation. If such a staggered implementation is allowed then is there an order that some must be adopted first as others are dependent on the first?

N&ST believes that as drafted, CIP-005-8 Requirements R2 and R3 are contradictory. Specifically:

R2 Part 2.1, which mandates the use of an Intermediate System for IRA, applies to SCI with IRA hosting High or Medium Impact BCS or their associated, PCA, PACS, or EACMS. At the same time:

R3, originally developed for vendor remote access to EACMS and PACS, and which does NOT mandate the use of an Intermediate System, applies to SCI hosting EACMS or PACS associated with High or Medium impact BCS.

As written, both R2 and R3 would seem to apply to an SCI hosting, for example, EACMS associated with High Impact BCS.

N&ST also believes allowing “no IS” vendor remote access to SCI that happen to be hosting only EACMS and/or PACS (and their associated Management Modules) creates an unacceptable security risk. We believe that all vendor remote connections to ANY SCI should require the use of an Intermediate System if there’s a person typing on a keyboard at the vendor location. We believe, further, that this position is consistent with the SDT’s stated goal of addressing security risks associated with serial IRA.

N&ST believes these issues can be simply resolved by making the following changes: For R2 Parts 2.1, 2.4, and 2.5, revise "Applicability" so those parts apply to SCI hosting High or Medium Impact BCS or their associated PCA, PACS, or EACMS. Make the same applicability changes for Management Modules. For R3, delete ALL proposed changes. N&ST believes CIP-005-7 R3 already covers both virtual and physical EACMS and PACS as written.

Comment	
Although the acronyms for BCS, SCI, and BCSI are addressed at the beginning of the standards, ERCOT suggests all terms should be spelled out at the beginning of applicable requirement language because the requirement language is the most used and referenced part of a reliability standard. This will aid in readability. ERCOT appreciates the work to address virtualization. However, based on the differences in technology between legacy system and virtualized systems, the SDT should consider moving the virtualization requirements into a separate standard that addresses only the requirements applicable to virtualized environments. The SDT has received comments over time regarding the confusion that will be created by intermingling the legacy requirements and virtualization. If an entity has no intention of using virtualized systems, they may be confused by which requirements they should follow and how they would apply. In the purpose of CIP-013, "and their associated cyber systems" was added. Using "cyber systems" may lead to confusion and inconsistent applicability by using undefined terms.

• **CIP-005, Requirement 1, Part 1.3** – the SDT proposes to eliminate the requirement to "Require inbound and outbound access permissions…and deny all other access by default." This, coupled with the elimination of the ESP and EAP concepts, increases the complexity of demonstrating where security starts and stops. What keeps the sprawl in check? Could the SDT describing their thinking on this in the Technical Rational document?	

- **CIP-005, Requirement 1, Part 1.5** – the proposed changes are problematic because an entity "must detect" as opposed to "having a method to detect." How can an entity know or demonstrate that they are able to detect *all* known or suspected malicious Internet Protocol communications?

Recommendation: SRC proposes the following lanuguage for Part 1.5: "**Have one or more method(s) for detecting** known or suspected malicious Internet Protocol (IP) communications…"

Comment

In general, AWS supports the proposed requirements revisions to accommodate on-premises use of virtualization. Understanding that this SDT is focused on virtualization as it relates to on-premises, we read the revisions with the multiple uses of virtualization and emerging technologies in mind to consider language for both current and future applicability.

Comment #1

Virtualization technology provides powerful capabilities for logical separation. The Technical Rationale documentation makes clear that logical isolation methods are as effective as physical methods, including when used in mixed trust environments. The proposed requirements like those in CIP-005 R1 Part 1.2; CIP-005 R2 Part 2.6; and, CIP-010 R1 Part 1.1, do not differentiate or explicitly state that logical or physical isolation methods are acceptable, which we read as providing the Responsible Entities the flexibility to use either logical or physical isolation to meet the requirements. If this is the intent then a useful addition would be for the requirements to explicitly state this either with a universal, over-arching statement or within the requirement language.

Comment #2

The CIP-004 or CIP-011 requirements do not state that encryption of BCSI is sufficient in demonstrating prevention of unauthorized access of BCSI. It's important that the requirements are clear on this point, therefore we recommend that they explicitly state that individuals obtaining encrypted BCSI without the ability to use it within a meaningful timeframe should be considered as not having access. This is in accordance with the CMEP Practice Guide BES Cyber System Information. We recognize that a separate drafting team is addressing BCSI. We raise it here to encourage coordination and avoid unnecessary revision in the future.

Thanks to the SDT for the hard work to revise the requirement language and support adoption of technology in a secure and compliant manner.

Comments received from Paul Shipps – Lakeland Electric

1. The SDT added, revised, and retired several defined terms to incorporate virtualization and future technologies within the CIP Standards. Do you agree with the proposed changes to the NERC Glossary terms? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Definitions changes are extremely confusing and do not follow Industry standard terminologies. Many terminologies do not reference BES and hence its extemly confusing.

Further, most new definitions are not required and just BCS definition is sufficient. All other elements must follow, high watermarking and security controls and standards must apply.

2. CIP-005 Requirement R1 part 1.1 was revised to permit only needed and controlled communications to and from applicable systems either individually or as a group and logically isolate all other communications. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

There is no need to change a pre-established definition such as ESP. New application creates extreme confusion for application of security for cyber assets. Compartmentalization should be based on security enclaving but high water marking. A VLAN should be high water marked to Cyber Asset level as BES function will be impacted if it is compromised.

It seems SDT has compartmentalized assets in order to limit compliance application. Selective application of controls will result in significant security risks.

3. The SDT modified CIP-005 Requirement R1 Part R1.2 to establish logical isolation requirements for Management Systems, Management Interfaces, and associated SCI. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

System should continue to follow security model of complete distrust. Only communication that is required must be allowed. This can only be established if rules are explicit including, Source, destination, Ports and Protocol. New application is very subjective and confusing. Industry is currently using Goose and still compliant, why change configuration and standards must be technology neutral.

4. The SDT modified CIP-005 Requirement R1 Part1.3 to protect the confidentiality and integrity of data traversing communication links that span multiple Physical Security Perimeters. Does the proposed requirement fulfill the directive from FERC Order 791, paragraph 150? Please provide the basis for your response.

○ Yes

● No

Applicability section is confusing. Too much compartmentalization of devices and non-industry standard definition are not needed. BCS definitions should be updated to address logical assets and apply high water marking.

Current approach limits security with assumption that associated devices can be compromised externally, but BES impact must be considered if Cyber system is compromised and made unavailable.

5. The SDT modified CIP-005 Requirement R2 to ensure remote access management requirements align with the new and revised virtualization terms. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

"Ensure that authorized IRA is through an Intermediate System. " – Can we communicate through the firewall. Previous standard was accurate. New standard is subjective and will create confusion.

6. The SDT revised CIP-007 Requirement R1 Part 1.1 to shift the security objective from logical network accessible ports to services. The proposed revisions require Responsible Entities to enable only network accessible services that have been determined to be needed by the Responsible Entity. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Unnecessary confusion. Previous standard language was sufficient for design of security controls and application. Revert to old standard, which industry has worked hard to standardize and create controls that have been effective.

7. CIP-010 Requirement R1 currently requires Responsible Entities to develop a baseline configuration, authorize changes to the baseline, and document the changes. The SDT proposes to revise Requirement R1 to remove the reference to baseline configurations. The proposed revisions require the authorization of changes to Operating System(s), firmware, commercially available open-source software, custom software, logical network accessible ports, security patches applied, and SCI configurations. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

SDT has created an uncalled for scenario where, they have removed Baselines but left the baseline elements intact, this is causing significant confusion amongst SME.

Requiring CM as method of compliance will set a serious challenge and will limit ability to secure system as CMs do not include security baseline information, only the proposed changes, but assessment are never included in CM, just a summary of results.

This whole approach will result in inaccurate and subjective application and often result in contention with compliance and auditors.

Current CIP-010 standards and requirements are matured and industry has made significant process developing good controls. There is absolutely no reason to change as these changes do not improve security but are detrimental.

8. The SDT modified CIP-010 Requirement R3 Part 3.3 to ensure that vulnerability assessments are performed prior to logically connecting Cyber Assets, VCA, and SCI. The revised requirement allows the use of remediation VLANs to perform active vulnerability assessments. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Too much compartmentalization based on non-industry standard definition. Please review NIST Publication 800-125 (virtualization guidelines) and apply controls, based on Terms such as Management Systems, Guest, Hosts, Network virtualization, Infrastructure virtualization (Mixed Trust, Resources sharing, high-watermarking) and similar guidance that is used by Industry, SME and vendors. SDT approach is complicated and confusing which will result in different interpretation by SMEs and ERO.

9. CIP-002-5.1a includes exemption 4.2.3.2, which exempted Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. In the development of conforming changes, the SDT determined that the exemption should be split into two distinct exemptions to adequately cover all cyber systems associated with conforming changes. The SDT established those conforming changes in proposed Exemptions 4.2.3.2 & 4.2.3.3. Do the changes clearly identify the exempted cyber systems? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Many entities have virtualized systems and were compliant with CIP in recent audits. Please do not over complicate. Focus on security or where gaps exists. Only changes to BCS to include virtual environment and logical asset configuration is required.

10. BCS and SCI are mutually exclusive by definition, however SCI poses a significant reliability risk to the Bulk Electric System. The SDT considered the risks associated with SCI and revised CIP-002 Requirement R1 to include the identification of SCI in Parts 1.3, 1.4, and 1.5. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

BCSI requirements are sufficient as in CIP-004 and CIP-011. Entities are compliant and appropriate controls are available to secure BCSI in current version.

Shared storage housing active BCS data should not be allowed for mixed trust environments and introduces significant risk to BES.

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based in security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

11. In the current enforceable standards, there are no requirements that can be used to tie a non-identification of EACMS, PACS, and PCAs to a single requirement. The SDT revised CIP-002 to include the identification of SCI associated with EACMS, PACS, and PCAs to help address this issue within the virtualization scope of the current SAR. The proposed requirement could reduce possible non-compliance to a single issue if a Responsible Entity fails to properly identify SCI associated with EACMS, PACS, or PCAs. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Based on comments above, these changes are confusion and are detrimental to security.

12. The SDT modified CIP-002 Attachment 1, Criterion 2.1 to align with a previously approved Request for Interpretation (RFI) regarding "shared BES Cyber Systems." The SDT modified the criterion to reference each discrete shared BCS. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based in security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

13. The SDT made conforming changes to CIP-003 and CIP-004. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Current standards are sufficient and these changes are cosmetic. No changes to CIP-004 is required to address Virtualization. Only applicability section needs to be modified along with BCS definition.

14. The SDT modified the Applicable Systems column in CIP-006 to include SCI hosting PACs associated with Medium Impact BCS with ERC or IRA. The SDT made the proposed revisions to clarify the scope of requirements that apply when an entity implements serial IRA. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

● Yes

○ No

15. The SDT made conforming changes to CIP-008 and CIP-009. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Current standards are sufficient and these changes are cosmetic. No changes to CIP-008 or 009 is required to address Virtualization. Only applicability section needs to be modified along with BCS definition.

16. The SDT modified CIP-011 Requirement R2 part 2.1, which will allow cryptographic erasure in scenarios where BCSI can't be mapped to particular disks in virtualized storage. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Current standards are sufficient and these changes are cosmetic. No changes to CIP-007 is required to address Virtualization. Only applicability section needs to be modified along with BCS definition.

Mixed trust environment should not be permitted for BCS.

BCSI requirements are sufficient as in CIP-004 and CIP-011. Entities are compliant and appropriate controls are available to secure BCSI in current version.

Term Shared BES Cyber System is confusing. Host sharing BCS system will have same impact on any of the guests and hence need for enclaving based in security impact. Compartmentalizing application of security will result in significant confusion and use of non-industry standards definitions is very misleading for security controls.

17. The SDT performed a review of the CIP Standards and determined that CIP Exceptional Circumstances could be applied to the following additional requirements: CIP-004-7 Requirement R2 Part 2.2, CIP-004-7 Requirement R3 Part 3.5, CIP-006-7 Requirement R1 Part 1.8, CIP-006-7 Requirement R1 Part 1.9, CIP-006-7 Requirement R2, CIP-010-5 Requirement Part 1.2, and CIP-010-5 Requirement R1 Part 1.3. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

○ Yes

● No

Current standards are sufficient and these changes are cosmetic. No changes to CIP-007 is required to address Virtualization. Only applicability section needs to be modified along with BCS definition

18. Implementation Plan: The SDT proposes an Implementation Plan that makes the revised CIP Standards and definitions effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order. However, the implementation plan allows a Responsible Entity to elect to comply with the Revised CIP Standards and Definitions following their approval by the applicable governmental authority, but prior to the Effective Date. Do you agree with this proposal? If you think an alternate effective date is needed, please provide a detailed explanation of actions and time needed.

● Yes

○ No

19. Please provide any additional comments for the SDT to consider, if desired.

Too much compartmentalization based on non-industry standard definition. Please review NIST Publication 800-125 (virtualization guidelines) and apply controls, based on Terms such as Management Systems, Guest, Hosts, Network virtualization, Infrastructure virtualization (Mixed Trust, Resources sharing, high-watermarking) and similar guidance that is used by Industry, SME and vendors. SDT approach is complicated and confusing which will result in different interpretation by SMEs and ERO.

1. SDT draft utilizes non-industry standards requirements and terminology and, will result in confusion and subjective and varying application. Recommend that SDT use Industry standard terminology such as NIST or PCI-DSS and security controls as laid out in such frameworks.

2. All definitions be contextualized in relation to BES application.

3. Furthermore, require standard requirements to apply control application based on risk to the systems based industry standard approaches such as high watermarking practices instead of compartmentalizing security controls based on every unique device types that SDT has identified.

4. SDT has summarily discarded Industry standard practices such as baselining but replaces with subjective terms such as hardening, which varies depending on environment and device types. Such a scenario will lead to different conclusions by the auditors and entity SME.

5. It has taken four years for the industry to standardize the security and baselining requirement. New approach discards all the work done so far and creates confusing set of expectations.

6. Further, In CIP-10, tracking hardening requirements in a change management tickets is incorrect approach as CM are for tracking activities and not performing assessments and compare of configurations.

Consideration of Comments

Project 2016-02 Modification to CIP Standards

Comments Received Summary

There were 91 sets of responses, including comments from approximately 210 different people from approximately 133 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact Vice President of Engineering and Standards Howard Gugel (via email) or at (404) 446-9693.

Consideration of Comments

The Project 2016-02 thanks all of industry for your time and comments.

NERC Glossary of Terms (Proposed new, modified, and retired terms)
Overall Themes concerning definitions in Q1 and SDT responses:

- Complex and difficult matrix of applicability that needs simplification
    - The SDT has made several changes in order to help simplify the "Applicable Systems" column in the standards.
- Wholesale changes are not needed, work virtualization into existing concepts with only a few virtualization specific terms needed.
    - The SDT continues to simplify and has incorporated this comment by making the "all-in scenario" possible where a virtualized infrastructure and all its components are all treated as part of its highest impact hosted BCS. This will greatly simplify and cause the least amount of changes for those using this scenario, while keeping other options open for other entities.
- Definitions are not limited in scope to virtualization only scenarios.
    - The SDT views the NERC Glossary the same as any dictionary with a purpose of simply defining what a term means, but not as a primary scoping mechanism for requirements within the standards. The glossary term and its definition should be able to be used across the NERC standards with differing scopes for different requirements, which can't be done if the scope is part of the definition.
- The changes are not applicable to cloud, hindering NERC's ability to move forward into cloud-based apps.

    - Enabling BES Cyber Systems to be hosted "in the cloud" on Cyber Assets outside of the entity's physical control is not included in the scope of our current SAR. The possibility of hosting BCS in the cloud is the subject of a forthcoming NERC report on the risks and benefits of such.

- The term "cyber system" has been added in exemptions and in requirements but is undefined.
    - The SDT agrees and is providing a proposed glossary definition in the next draft and will capitalize the term where used.
- "Controlled communications" and "System hardening" added and not defined
    - For 'controlled communications', the SDT is using that to mean that the communications are to be controlled and the remainder of the requirement defines what that 'control' means: permit necessary traffic and deny all other traffic. As an example, it's the opposite of 'uncontrolled communications' which would be traffic that does not pass through any type of access control (firewall as an EAP, zero trust policy mechanism, etc.). 'System hardening' is simply the label of a table in CIP-007 and is a common IT discipline term for reducing the attack surface of a computer system. In the next draft, one of the non-network-oriented controls will be moved to this requirement, so it will be broader than simply ports and services and 'system hardening' is a broader term.
- BCS definition modification is all that's needed for virtualization
    - The SDT is incorporating the ability to have an "all-in scenario" where all the virtualization infrastructure can be included as part of an entity's BCS in addition to allowing entities to identify it separately.
- Use the terms "virtual machine, hypervisor, virtualized host, virtualization, container" borrowed from NIST glossary
    - The SDT is using VCA and SCI in order to make some distinctions from the way others may use similar terms. For example, SCI is broader than just the software layer that virtualizes the underlay resources. It includes that, but also includes the hardware and storage controllers that share storage, as well as the management interface. We needed a more encompassing term than hypervisor alone in order to help simplify applicability. The SDT agrees with using "container" and see the response on the SCA definition comments below.
- Please clarify "Internet Protocol (IP)" as used in CIP-005 R1
    - The SDT is referring to the Internet Protocol (IP) as defined by DARPA in RFC 791 and upon which the term "TCP/IP" is based.

BCSI Definition

- "ESP names" was deleted as an example, suggest replacing with "logical isolation names"

  - The SDT deleted this because the term ESP was proposed for retirement in draft 1. In response to other stakeholder feedback, the ESP term will not be retired and this will be added back to the BCSI definition.

- The definition includes SCI, but not Management Modules or Management Interfaces.
  - The SDT agrees and has changed the nesting of these terms so that it is more all-inclusive.

Cyber Assets Definition

- Changed from plural to singular but still plural in the definition
  - The SDT agrees and will align with the currently approved definition, which is plural.
- The CA definition should not exclude SCI. SCI is a CA with a specific purpose.
  - The SDT concluded that to include SCI within the Cyber Asset definition would require a complete rewrite of that very foundational definition in a non-backward compatible way. A core issue is how the current CA definition is inclusive of all HW, SW, and data “in the device” and is problematic when the point of virtualization is to abstract and separate the 1:1 relationship of the HW from the OS/SW.

EACMS Definition

- Broaden EACMS to include and replace SCI
  - The SDT concluded that EACMS is already a very broad definition. Electronic access control is a function and as the future progresses towards Zero Trust or other architectures practically everything could become an EACMS. Additionally, the SDT is defining SCI separately so that its management interface which should be subjected to higher requirements for hypervisors hosting many BCS can be scoped to requirements without it also applying to every firewall and domain controller as an example.
- Excludes access control and monitoring to the BCS themselves, its now only to the logical isolation. Domain controllers, etc. could fall out of being EACMS if they aren’t directly related to “logical isolation”
  - The SDT agrees and will make changes to reincorporate this. When changing the “of the ESP or BES Cyber Systems” to “logical isolation of the BES Cyber Systems”, an unintended consequence was removing the BCS out of direct scope. Thanks for the comment and this will be addressed in draft 2.
- Should be singular, not plural (System, not Systems)
  - The SDT agrees with the point, but that is a change that would have a documentation only ripple effect through every entity’s CIP program. The SDT declines to make that change at this point.

ERC Definition

- Confusing (external to what?) without ESP reference – each BCS in a rack could have ERC to its neighbor in a highly segmented network. Meant to scope the external connectivity, not within a rack.
    - The SDT agrees. With architectures such as Zero Trust shrinking ESPs to ever more granular levels, it becomes increasingly less useful as the boundary for ERC. the SDT has changed ERC to clarify that 'external' in ERC is external to the asset containing the Cyber System, which fits better with its intended scoping use as well.
- The 'from' (CA or VCA) is irrelevant. Its founded in communication, not cyber assets.
    - The SDT agrees and has removed that from the definition. It was used in the previous draft to help define what "external" meant.
- If routable protocol is being used but not through an EACMS, its not ERC.
    - While true under the previous draft definition alone, the entity would still be required to meet CIP-005 R1 which would require an EACMS to protect the applicable BCS.
- Between ERC and EACMS, one says "controlling comms" and the other says "restricting IRA". What's the difference in controlling and restricting?
    - The SDT has redefined both definitions so they use neither term.

ESP/EAP Definitions

- High degree of support for not retiring
    - The SDT is proposing to keep and redefine ESP for draft 2 in response to comments. The new proposed definition is broadened to allow for single, static perimeters around a network segment or many, dynamic "perimeters" around a session in zero trust models.
- Traditional ESPs will be used by entities for many years to come
    - The SDT agrees that the static network segment-based perimeter model has no discernable end-of-life; it will co-exist with other models such as zero trust for the foreseeable future. The SDT proposed retirement of the ESP/EAP terms in order to be more architecture agnostic, but due to feedback is reinstating both terms with broadened definitions that can accommodate other architectures.

Intermediate System Definition

- Overly broad – could potentially label other EACMS as IS. A FW restricts IRA so is any FW an IS?
    - The SDT is modifying the proposed definition to reinstate that the restriction of IRA is "to only authorized users" which was not in the previous draft. The SDT asserts this should help with clarity around this issue.
- Address IS as its own applicable system without including it in with EACMS to allow for more granular controls for IS.

    - The SDT asserts that Intermediate Systems is its own definition such that it can be called out for specific, more granular requirements in CIP-005 R2. However, it is included as an EACMS such that it is included in all the other CIP standards that apply to associated EACMS. Otherwise, Intermediate Systems would have to be added as a separate item in all other applicability columns that apply to EACMS.
- Adjust definition to recognize it could be one or more EACMS used to restrict IRA.
    - The SDT agrees and has made this modification.
- Needs the "to authorized users". Can be read that all users must be restricted from using it.
    - The SDT agrees and has made this modification.

IRA Definition

- Need to clearly distinguish between 'engineering access' and operators operating through a system.
    - The SDT agrees and has reinstated the concept of IRA being from "outside of any of the responsible entity's ESPs".
- "outside the asset" – asset is undefined, does it mean CIP-002 R1 assets? "Outside the logical isolation" – unclear
    - The SDT agrees with providing clarity around the issue of "outside of what" and has reinstated the use of ESP.
- Not limited to routable protocol, includes all serial only comms. Huge scope increase with Intermediate System implications for serial only.
    - The SDT is incorporating clarity on IP to serial conversions that allow users to interact in real time with a serial-only device (and thus not within an ESP) that is accessible via routable protocol. The SDT is reinstating the "using a routable protocol" phrase to clarify that the user is using such a protocol, but also clarifying that accessing an applicable system through a subsequent IP to serial conversion is also IRA. The SDT asserts this clarifies that serial ONLY communications are not included.
- Does not need to remove "or other remote access technology" – if no 'client' then not IRA
    - The SDT also received comments on clarifying the meaning of remote access clients or technology. The SDT proposes that the addition of "user-initiated real-time access by a person" along with "from outside of the Responsible Entity's ESPs" helps clarify the definition of IRA.
- VLANs used for logical isolation and thus IRA could occur inside of what was the ESP.
    - The SDT agrees and has reinstated the ESP within the definition.
- Every time you connect to a CIP asset in the same logical isolation area, you are doing ERC.

  - The SDT is reinstating ESP in place of logical isolation and has modified the related definitions in accordance.

Logical Isolation

- Universal support for defining this as its critical to not only CIP-005 but numerous other definitions
  - The SDT agrees. Logical isolation is indeed a foundational concept and the SDT used the term in at least four different forms which restricted us from making one definition. In response to comments, the SDT has decided to reinstate and broaden the ESP definition and reinstate its use in place of logical isolation throughout the standards.
- Need to clarify the relationship of physical isolation and logical isolation
  - See above. The SDT is reinstating the ESP term in place of logical isolation.
- Is logical isolation that is part of a system (Windows FW) the same as logical isolation of the system? If so, that makes all comms to that Cyber Asset ERC.
  - The SDT agrees and has made several changes and clarifications, including the removal of the ‘logical isolation’ term. We’ve also changed CIP-005 R1 to state “Host-based firewalls (that only protect the host on which they reside) are not a sufficient control to meet this requirement.”

Management Interfaces Definition

- Include within BCS definition
  - The SDT is providing this as an option by including this definition within the SCI definition and then providing an “all-in” option where the SCI can be a part of the BCS.
- A relay control panel or on/off button could meet the definition. Is a local display ‘monitoring’?
  - The SDT agrees and has added an explicit exclusion to the definition.

Management Modules Definition

- Include within the SCI or BCS definition
- Need to define ‘autonomous subsystem’ or otherwise clarify that an internal RAID controller that is providing management and monitoring capability is or isn’t a mgt module.
- Is Wake On LAN a management module?
- Is a module part of a Cyber Asset or its own separate cyber asset?
- Should Management Modules be explicit in requiring PSPs?
  - In reference to all comments on Management Module definition, the SDT has decided to simplify and collapse Management Module and Management System into a new singular Management Interface definition and then have requirements for controlling the access to Management Interfaces.

Management Systems Definition

- Conflicts with SCI definition
- Appears to be a hypervisor, but straddles between virtual and non-virtual environments.
- Tools such as Ghost that image systems can meet this definition.
    - In reference to all comments on Management Systems definition, the SDT has decided to simplify and collapse Management Module and Management System into a new singular Management Interface definition and then have requirements for controlling the access to Management Interfaces.

PACS Definition

- Has an “or SCI” – can SCI by itself perform the PACS function?
    - The SDT agrees that normally SCI doesn’t perform the PACS function directly, but it can support the PACS function and the SDT did not want to preclude SCI in this instance from being able to be considered part of a PACS.

PCA Definition

- Makes virtualization untenable for smaller scales
    - The SDT agrees that these clarifications may require additional hypervisors in order to mitigate vulnerabilities of systems of differing impact levels sharing the same underlying hardware. The clarifications are intended to mitigate the risks of HW-based side channel or VM escape attacks from peer hosted VCAs on the same hypervisor. However, there is now an “all-in” option within CIP-002 that could help alleviate this issue.
- Not clear what is being ‘actively remediated’
    - The SDT has included this exclusion to account for remediation VLANs in which CAs or VCAs may boot in a logically isolated state, checked against policy and remediated (patched, AV updates, etc.), and then logically connected to their production network. While this automated process occurs, it may share CPU or memory with a BCS, but should not be reclassified as a PCA for that short time period of remediation.
- Is a serially connected device to a BCS now a PCA? Unclear from undefined ‘logical isolation’.
    - The SDT agrees and is reinstating a modified ESP definition.
- Is the exclusion necessary – it requires logical connection and therefore already excludes assets that are not logically connected
    - The SDT asserts the exclusion is necessary as a VCA that is being instantiated in a remediation VLAN and being checked against policy before its logically connected to a “production” network could still be sharing CPU/memory with a BCS on the same hypervisor for that brief time. The SDT asserts it should not be a PCA during the time it is being remediated simply due to this possibility.

Removable Media Definition

- How is this directly connected to a network? What's the difference in "a network not logically isolated from" and a PCA?
  - The SDT is reinstating the ESP definition and restoring the definition to its former approved state with the addition of SCI to the scope.
- Was PCA intentionally removed?
  - The SDT agrees and has reinstated PCA back into the RM definition.

Reportable CSI Definition

- The ''currently approved" doesn't match what is currently in the glossary
  - The SDT does not find any differences in the currently approved definition in our proposed document and the NERC glossary.
- Doesn't include Management Module/Management Interface (CSI definition as well)
  - The SDT agrees and has made changes in the definitions and their nesting that will include such in the next draft.

SCA Definition

- "isolated" interpreted in a network context
- Could include JRE
- Running containers can be mutable during runtime, thus fall out of the definition. Many comments on the 'immutable'
- No definition needed, use common IT terms, point CIP-010 R1 to 'application container repositories'
- Seems to allude to a software appliance/package such as a virtual FW or virtual router
  - The SDT agrees with numerous comments on the SCA definition and will not be proposing a separate definition in subsequent drafts but will instead refer to common IT terms ("application containers") in CIP-010 R1 as suggested.

SCI Definition

- Includes but conflicts with the Management System definition in the "and/or" of "initialize, deploy, and/or configure"
  - The SDT agrees and has consolidated this reference into a single instance in the "Management Interface" definition using the "and" conjunction.
- What is the scope of "share"? BCS shares resources with itself – is every physical standalone box SCI? Clarify that share is with something besides itself.

  - The SDT has modified the definition to include that SCI shares CPU and memory resources "with one or more Virtual Cyber Assets…" which should clarify this issue.
- Consider replacing SCI as high-watermarked BCA
  - The SDT has made modifications to CIP-002 to allow for such an "all-in" scenario where high-watermarked SCI can be included in a BCS, while still allowing the flexibility to identify the SCI separately. See discussion in CIP-002 Technical Rationale document.
- Virtual environments could reside within specified physical security zones thus eliminating the need for a Shared Cyber Infrastructure (SCI) definition
  - The SDT agrees that SCI must have physical security protections (per CIP-006 and CIP-003 for lows) and asserts that the SCI requires its own definitional term so that further requirements can be placed on electronic access to its management interface as one example.
- Modify CA to include entire virtualization HW infrastructure
  - The SDT concluded that would require a complete rewrite of this very foundational definition in a non-backward compatible way. A core issue is how the current CA definition is inclusive of all HW, SW, and data "in the device" and is problematic when the point of virtualization is to abstract and separate the 1:1 relationship of the HW and OS/SW.
- Modify EACMS and PACS to include underlying HW
  - The SDT has made the requested modification.
- Defines two types of objects – the hypervisor and the management system.
  - The SDT agrees it combines differing types of objects, including the shared HW itself, the hypervisor software, and the management interface as one and led to this being defined as an 'infrastructure' rather than a device. The SDT asserts this leads to more simplified applicability within the standards.
- Interpreting to mean totally separate storage array is needed if hosting any CIP asset
  - The SDT asserts a storage array that is sharing its storage resources with a BCS or associated system is within the CIP standards scope, however it does not mean that the storage array must be dedicated to only CIP systems.
- Scoping SCI 'software' - Is firmware on a server blade SCI?
  - The SDT has modified the SCI definition and asserts that the term software is included in the list of items that "share CPU and memory with one or more VCAs…" and is intended to refer to the hypervisor software.
- Doesn't include network services, but the proposed definition could include network devices
  - The SDT has purposefully not included within the SCI definition devices that share network resources, as that would include every network hub or switch as SCI, which is not the

  - intent. A network device, such as a switch, that is used to configure and isolate different VLAN network segments would become an EACMS, not SCI.

- Many CA’s could meet SCI definition. A video card is a programmable electronic device. It shares CPU and memory with the motherboard. RAID controllers share their storage resources with the CA they are installed in.
  - The SDT asserts that both SCI and “Cyber Assets” begin with the same “programmable electronic devices” phrasing which sets them both to the same level, thus since a video card isn’t considered its own Cyber Asset, it should not be SCI either. The SDT has made clarifications that SCI must share CPU and memory with one or more Virtual Cyber Assets which the SDT asserts will help with clarity.
- Could be recursive – the Management System used to configure SCI is SCI itself. Suggest splitting.
  - The SDT has removed the proposal for a Management System definition and has included that functionality in a modified “Management Interface” definition that the SDT asserts helps with clarity in this issue.

TCA Definition

- “not logically isolated” would include devices that are physically isolated
  - The SDT is reinstating the ESP definition which will help clarify this situation.

VCA Definition

- Clarify short-lived VMs. Is a VM image the VCA or the images spawned?
  - The SDT has defined Virtual Cyber Asset such that it begins with “A logical instance of…” to clarify that an executing instance is the intended target. Image files are not a VCA, but their handling is clarified in CIP-010.

NERC Reliability Standard CIP-005

Overall Themes and SDT responses:

1. Logical Isolation- Define and Clarify

    - The SDT thanks you for your many detailed comments on logical isolation. Logical isolation is indeed a foundational concept and the SDT used the term in at least four different forms which restricted us from making one definition. In response to comments, the SDT has decided to reinstate and broaden the ESP definition and reinstate its use in place of logical isolation throughout the standards.

2. EACMS and PACS- Clarity of use in requirements, - PACS or EACMS hosted on standalone hardware, relationship of virtual PACS and EACMS to SCI

    - The SDT thanks you for your comments on EACMS and PACS. In response to comments, the SDT have modified the Applicable Systems for the requirements in R1. Changes have also been made to the Requirements, and a new Requirement 1.3 created.

3. Needed and Controlled Communication- Define and Clarify

    - The SDT thanks you for your comments on needed and controlled communications. The SDT is using that to mean that the communications are to be controlled and the remainder of the requirement defines what that ‘control’ means: permit necessary traffic and deny all other traffic. As an example, it’s the opposite of ‘uncontrolled communications’ which would be traffic that does not pass through any type of access control (firewall as an EAP, zero trust policy mechanism, etc.).

4. Needed and Controlled Communication- Suggested changes - Identify needed communications and control permitted communications to and from applicable systems either individually or as a group and logically isolate all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).

    - The SDT thanks you for your comments on needed and controlled communications. The requirement has been rewritten to read “Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.”

5. “Define and Clarify the term Group”

    - The SDT thanks you for your comments on the wording of Requirement 1.1. In response to comments, the SDT has rewritten the requirement to read “Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.”

6. Clarify/simplify protocol IEC TR-61850-90-5 R-GOOSE
    - The SDT thanks you for your comments on the protocols listed in the requirement as examples. The requirement has been rewritten to remove the references and now reads “Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.”
7. Backwards Compatibility
    - The SDT thanks you for your comments on backwards compatibility. In response to comments, the SDT has decided to reinstate and broaden the ESP definition. The requirement has been rewritten to read “Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.”
8. Requirement 1.1 Overall - Changes to 1.1 not required, Keep the ESP Term
    - The SDT thanks you for your comments on R1.1. Logical isolation is indeed a foundational concept and the SDT used the term in at least four different forms which restricted us from making one definition. In response to comments, the SDT has decided to reinstate and broaden the ESP definition and reinstate its use in place of logical isolation throughout the standards.

CIP-005 Requirement R1 Part 1.2.

1. The SDT modified CIP-005 Requirement R1 Part R1.2 to establish logical isolation requirements for Management Systems, Management Interfaces, and associated SCI. Do you agree with the proposed changes? If not, please provide the basis for your disagreement and an alternate proposal.

- Clarity on if addition of SCI results in inclusion of associated systems
    - ▪ *The SDT thanks you for your comments and has made proposed changes to the Standard to address this confusion.*
- Clarity on applicable systems and expansion
    - ▪ *The SDT has made several changes in order to help simplify the “Applicable Systems” column in the standards.*
- Defined Term (Management Module) excludes SCI, applicable systems includes SCI of Management Systems
    - ▪ *In reference to all comments on Management Systems definition, the SDT has decided to simplify and collapse Management Module and Management System into a new singular*

  - *Management Interface definition and then have requirements for controlling the access to Management Interfaces.*

- Need definition of Logical Isolation
  - *The SDT thanks you for your many detailed comments on logical isolation. Logical isolation is indeed a foundational concept and the SDT used the term in at least four different forms which restricted us from making one definition. In response to comments, the SDT has decided to reinstate and broaden the ESP definition and reinstate its use in place of logical isolation throughout the standards.*
- Need clarification of requirements with applicable systems of EACMS
  - *The SDT thanks you for your comments on EACMS and PACS. In response to comments, the SDT has modified the Applicable Systems for the requirements in R1. Changes have also been made to the Requirements, and a new Requirement 1.3 created.*
- Use existing definition
  - *The SDT thanks you for your comments on R1.1. Logical isolation is indeed a foundational concept and the SDT used the term in at least four different forms which restricted us from making one definition. In response to comments, the SDT has decided to reinstate and broaden the ESP definition and reinstate its use in place of logical isolation throughout the standards.*
- Need better separation for requirements between SCI and non-SCI
  - *The SDT thanks you for your comments and has made proposed changes to the Standard to address this confusion.*
- Need clarity for backward compatibility
  - *The SDT thanks you for your comments on backwards compatibility. In response to comments, the SDT has decided to reinstate and broaden the ESP definition.*
- Need better examples in Measures
  - *The SDT thanks you for your comment. The SDT has included more examples within the measures of the proposed changes.*
- Need clarity on requirements with management modules of SCI
  - *In reference to all comments on Management Systems definition, the SDT has decided to simplify and collapse Management Module and Management System into a new singular Management Interface definition and then have requirements for controlling the access to Management Interfaces.*
- Management Modules should also apply to BCAs, PACS, and EACMS that are not on the SCI. Texas RE seeks clarification on whether management modules on current applicable BCAs, PACS, EACMS that are not on SCI are applicable to the CIP Requirements and Parts in the Applicable Systems column.

  - *In reference to all comments on Management Systems definition, the SDT has decided to simplify and collapse Management Module and Management System into a new singular Management Interface definition and then have requirements for controlling the access to Management Interfaces.*
- Need to protect physical systems of virtual systems
  - *The SDT has made the requested modification.*
- Need more clarity on "controlled communication"
  - *The SDT thanks you for your comments on needed and controlled communications. The requirement has been rewritten to read "Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement."*

CIP-005 Requirement R1 Part 1.3.

SAR Related

- Language would require protections between two PSPs within a substation. This extends the requirement to medium impact BES Cyber Systems even non virtualized ones, which is beyond the scope of the SAR.
- Including PACS is a problem as PACS are not required to be within a PSP.
- Define "communication networks".
- Communication Networks needs to be define per Order 791 paragraph 150.
- Beyond the scope of the SAR (failed to understand we are extending a single ESP). Recommendation to revert changes.
- Should be moved back to CIP-006.

The SDT thanks you for your comments. Based on this group of comments the SDT has made modifications to the proposed language in an attempt to alleviate the concerns related to changes that are outside the scope of the SAR.

Encryption

- Suggestion to require a minimum level of encryption.
- Encryption reference should be in measures.
- Provide clarity for the "confidentiality and integrity" verbiage.
- Specific technology examples should be added to the IG as was presented in the Webinars.
- Suggestion to add "equally effective logical protection".

- Specific protocols in the requirements area should be moved to the measures area.

The SDT thanks you for your comments. Based on the comments related to encryption technologies the SDT will ensure that technology examples are added to the IG where applicable. Additionally, we will review the usage of the encryption verbiage in the requirement to evaluate if it is better placed in the measures area. Lastly, the phrase “confidentiality and integrity” is commonly understood to mean that the use of cryptographic mechanism is required to protect the data traversing between the described endpoints.

Exclusion

- Rewording of CIP-012 exclusion since Real-time Assessment and Real-time Monitoring are not clearly defined.
- Suggest changing the exclusion to "time-sensitive protection or control functions" to enable all such protocols to be included.
- Remove GOOSE exclusion and describe the general requirements of a such a protocol to enable similar protocols to be excluded.
- Exclusion should be expanded to also exclude communication to a Control Center owned by other entities.
- Exclusion should include voice communication.

The SDT thanks you for your comments. The SDT has modified the verbiage of the exclusion to remove specific protocols and utilized more generic verbiage to describe these protocols and use cases. The exclusion concerns “…data while being transmitted between Control Centers *subject to CIP-012*” and CIP-012 excludes voice communication. This requirement part, which could overlap CIP-012, includes this “subject to CIP-012” exclusion simply to avoid double jeopardy.

Physical Controls

- Confidentiality and Integrity includes physical controls, so specifically stating physical controls is redundant.
- Is physical protection enough rather than logical protection? Hardened conduits as an example.
- Add evidence of physical controls in the measures since physical controls are listed as being acceptable in the requirement.

The SDT thanks you for your comments. The phrase “confidentiality and integrity” is commonly understood to mean that the use of cryptographic mechanism is required to protect the data traversing between the described endpoints, so the SDT feels that specifically identifying physical protections is appropriate. The SDT feels that physical controls are adequate to meet this requirement assuming that those controls are properly implemented and documented per the requirement and the associated measures which have been added to the most recent draft.

Applicability

- Applicable systems uses "or" instead of "and" and is not consistent with the rest of the standard.
- Applicability is confusing.
- Applicability column is hard to read.

The SDT thanks you for your comments. The SDT agrees that the applicability column should be more easily understood and therefore it has been significantly reworked in an effort to provide additional clarity in the most recent draft.

Others

- Limits security and assumes associated devices can be compromised externally.
- Confusion about requirement when equipment is entity owned vs third party owned.
- Requires significant modifications without indicating how these changes can be accomplished in a compliant way.
- Unclear how this improves security.

The SDT thanks you for your comments. The SDT disagrees with the assertion that the draft language limits security or does not improve the security of the BES. Multiple requirements have been added or modified in an effort to better protect virtualized systems and the infrastructure that hosts the virtualized infrastructure. This has historically been an area with no associated requirements and frequently overlooked by entities. While the draft language does require significant modifications for some entities to become or remain compliant, it is up to the entity to evaluate their environment, requirements, and architecture to best construct a compliant solution.

Reliability Standard CIP-005 Requirement R2

The comments provided by industry on the posting of CIP-005-8 R2 fell into several common themes:

1. The change in the IRA definition has left the term “system to system” undefined
    - The SDT thanks you for your comments. While the approved definition of IRA stated that it is not “system to system” communications, the SDT asserts that many entities have defined “system to system communications” within their existing compliance programs. If the SDT were to define “system to system” communications, this may conflict with those entities defined definitions
2. Entities suggested that the sequence of Requirement R2 Parts 2.1 to 2.3 be changed to Parts 2.2, 2.1, 2.3.
    - The SDT thanks you for your comments. The SDT has discussed a possible change in sequence however, it concluded that this change would result in unneeded additional administrative burden on entities.

3. The IRA definition – needs to be more precise to take into account where all connections are serial based. For example, in a totally serial based system, the HMI control consoles would be considered IRA, but none of the proposed CIP-005-8 Requirement R2 controls could be applied.
    - The SDT thanks you for your comments. The SDT agrees with your comments. The SDT has updated the definition of IRA to include the qualifier "*using a routable protocol*" so as to scope out the CIP-005 Requirement R2 controls for these types of systems
4. The proposed Intermediate System definition should be "an EACMS that restrict its IRA"
    - The SDT thanks you for your comments. The SDT agrees with your comments. The SDT has updated the definition of Intermediate System to "*One or more Electronic Access Control or Monitoring Systems that are used to restrict Interactive Remote Access to only authorized users*"
5. PACS and EACMS should not be added to scope for IRA (CIP-005-8 Requirement R2 Part 2.1). EACMS also causes a "hall of mirrors" issue for Intermediate Systems (which are also EACMS)
    - The SDT thanks you for your comments. The SDT agrees some with your comments. The SDT has updated the proposed Applicable Systems of CIP-005 Requirement 2 Part 2.1 with the following additions:
        - *EACMS that enforces an ESP for the Applicable Systems in Part 1.1.*
        - *SCI identified independently supporting an Applicable System above*

      The SDT asserts that the addition of "*EACMS that enforces an ESP for the Applicable Systems in Part 1.1.*" (i.e. CIP-005-8 Requirement R1 Part 1.1) is needed to provide the appropriate level of protection for the integrity of the ESP
6. In the proposed CIP-005-8 Requirement R2 Part 2.1, the word "*Ensure*" is too absolute
    - The SDT thanks you for your comments. The SDT agrees some with your comments. The SDT has updated the wording of CIP-005 Requirement 2 Part 2.1 to "*Permit authorized IRA, if any, only through an Intermediate System*…."
7. For the proposed CIP-005-8 Requirement R2 Part 2.6, why is affinity needed for virtualized Intermediate Systems?
    - The SDT thanks you for your comments. The SDT asserts that some entities have architected their Intermediate Systems to allow remote users to connect directly from the Internet. The SDT asserts that this type of architecture dramatically increases the cyber-attack surface area beyond that which would be normally associated with an internal corporate / business cyber system. As a result, the SDT asserts that the affinity requirement for Intermediate Systems is needed to cover this type of situation.
8. In the proposed IRA definition, what is a "remote access client"?
    - The SDT thanks you for your comments. The SDT has updated the proposed definition of IRA to "*User-initiated real-time access by a person…*" to eliminate this confusion.

9. When and where is encryption required for IRA?

    - The SDT thanks you for your comments. The SDT asserts that the proposed wording of CIP-005-8 Requirement R2 Part 2.2 is clear enough such that these controls are only required between the client and the Intermediate System.

NERC Reliability Standard CIP-007

The comments provided by industry on the posting of CIP-007-7 fell into several common themes:

1. The clarity, and value of requirement language was questioned, as well as the security concern over dynamic port allocations and over broad port ranges, with the shift from logical network accessible ports to network accessible services.

    - The SDT thanks you for your comments and is working to modify the ports and services requirements to address multiple clarity and security concerns present in the original wording.

2. There were several comments that indicated that a disparity exists with respect to how the term “system hardening” is used throughout CIP-007-7.

    - The SDT thanks you for your comments, however the team feels that the term is consistently used throughout CIP-007-7 and does not intend to modify the use of the term. The SDT will likely incorporate additional discussion of system hardening in the forthcoming Implementation Guidance.

3. There were several comments that indicated that many of the changes were not backwards compatible, especially with respect to SCI.

    - The SDT thanks you for your comments and has identified a path forward that will allow entities to include SCI within a BCS, EACMS or PACS, or identify the SCI independently. The entity benefit to the former is simplicity, where Requirement Applicability is modified to allow entities to treat their SCI as just a part of a BCS, and therefor increasing the backwards compatibility of the proposed language. The entity benefit of the option to identify SCI independently is the increased flexibility in hosting systems of differing impact on one SCI.

NERC Reliability Standard CIP-010

The comments provided by industry on the posting of CIP-010-5 fell into several common themes:

1. Many of the comments dealt with the removal of the “baseline” from the requirement language in CIP-010 R1. Some suggested that there was a security concern in doing so, others simply asked for additional clarity in the change.

    - The SDT thanks you for your comments and has chosen to include a description of the use of the “baseline” concept within the measures of CIP-010. In taking this step the SDT hopes to provide the requested clarity. The SDT has chosen to respond to the comments suggesting a security concern over the authorization of the software that is initially installed on a system, by stating that this is not a requirement in the current version of CIP-010. The authorization required by CIP-010-4 is to changes to the current baseline, and therefore the initial authorization of the baseline is not a required step. While this is a positive security control, it is not required by CIP-010.

2. Many comments suggested that the SCI entries in the Applicability column were extremely confusing and difficult to understand.
   - The SDT thanks you for your comments, and agrees with the stated concerns, and has addressed this concern by simplifying both the Management related definitions down to one, and the SCI Applicability column insertions. These SCI Applicability column insertions as much simpler and the SDT hopes easier to understand by referring to the other Applicable Systems.
3. There were also many comments that provided feedback on unintended scope changes found within the proposed Requirement language.
   - The SDT thanks you for your feedback and has modified the Requirement language to reinstate the scope that was originally found within the language wherever possible. There still remain some aspects of the Standard that are not backwards compatible with respect to scope, but the SDT believes to have resolved each case of unintended scope change.
4. Many commenters suggested that the inclusion of Self-Contained Application (SCA) as a defined term, and to have is then appear within the scope of CIP-010 was unnecessary, as these should already have been included.
   - The SDT thanks you for your comments, and has removed the SCA as a defined term, and resolved to use the common term “application container” in its place. The reason the SDT chose to continue to include this term is to reinforce the concept that this is truly just software, and not to be construed as a Virtual Cyber Asset.
5. There were a number of commenters that suggested that inclusion of “images used to derive operating systems or firmware” in the Requirement language of CIP-010 is unnecessary since they should have been included already.
   - The SDT thanks you for your comments and has included the addition of “images used to derive operating systems or firmware” found in Requirement Part 1.1.1 to account for the concept of virtualized systems based on a “parent image.” These images may be updated separately from a derived virtual machine and become active as soon as the virtual machine is rebooted. In this case, changes to this parent image must follow the management requirements found in Requirement R1. The SDT asserts that while it may be included by implication, the inclusion provides needed clarity and focus around this scenario.
6. There were several comments that indicated a challenge with the shift to service, from ports, with respect to SCI, and that did not coincide with the shift in CIP-007.
   - The SDT has made changes to move SCI only Requirement language to a separate sub-part of R1, and coordinate ports and services language with the updated CIP-007 R1 Part 1.1 Requirement language.

7. There were also comments that indicated that the inclusion of SCI only requirement language within CIP-010 R1 Part 1.1 along with all the other portions caused confusion and created unintended challenges.
    - The SDT thanks you for your comments and has chosen move SCI only Requirement language to a new sub-part of CIP-010 R1.
8. There were also a few comments that indicated that the new CIP-010 R1 Part 1.1. change authorization requirement did not include a timing element.
    - The SDT thanks you for your comments and has chosen not to alter the Requirement language to include the timing element. This is consistent with the current version of CIP-010-4 and offers the most flexibility with respect to how an entity should implement this requirement. Additionally, this can be used to avoid the need for a CIP Exceptional Circumstance exception to the requirement, if an entity builds in an emergency change authorization concept to expedite these changes.

NERC Reliability Standards with Conforming Changes

1. Some commenters expressed concern regarding the conforming changes to the language for Exemptions 4.2.3.2 and 4.2.3.3 regarding cyber systems
    - The SDT agrees with your comments. The SDT has added a definition for Cyber System
2. Some commenters expressed concern regarding some of the conforming changes to CIP-002. They appear to be missing Management Modules. In addition, SCI is missing from Attachment 1, Criteria 2.1.
    - The SDT has modified the proposed definition of “Management Interface” so as to incorporate “Management Modules” into “SCI”. The SDT has also modified Attachment 1, Criterion 2.1 to incorporate SCI
3. Some commenters requested the SDT develop additional Technical Rationale.
    - The SDT updated the TR where necessary and encourages review of the updates.
4. Some commenters requested the SDT consider the addition of CEC in other respective areas of the CIP Standards.
    - The SDT thanks you for your comment and the current CEC changes are within the scope of our SAR. Overall changes to the CEC concept are outside the scope at this time.

Implementation Plan

There were some commenters who supported the 24 month implementation plan; however, some entities requested between 30 and 48 months. In addition, there were some requests for a phased-in/staggered implementation option.

- The SDT thanks you for your comments and has chosen not to change the implementation plan. 24-months should be sufficient time for the type of changes needed before becoming compliant. In addition, the SDT choose not to add a phased-in/staggered approach as the early adoption or two years should suffice.

Additional Comments Received

1. Some commenters asked the SDT to be consistent across the applicability columns.
    - The SDT focused on this during their draft 2 changes and the applicability columns are in a consistent state across the standards where applicable.
2. Some commenters expressed that more requirements were focused on virtualized assets versus physical assets.
    - The SDT charge for this project is to make modifications to clarify virtualized environments within CIP. There are additional requirements for virtualized systems due to the risks inherent in sharing underlying infrastructure (SCI) and access to the management interfaces that configure and control the SCI. These risks are not present with dedicated physical assets.
3. Some commenters expressed that virtualized environments can already be used and are not needed.
    - The SDT agrees that virtualization is allowed under the current CIP standards. The charge of this project is to provide additional clarity and to address risks from sharing cyber infrastructure. The SDT in draft 2 is including an “All-In” option which will preserve current state to a large degree for those with a dedicated virtualized environment where all parts are considered part of the BCS, but is allowing flexibility such that this is not the one prescribed way to treat SCI.
4. Some commenters expressed concern that the changes do not allow full backwards compatibility.
    - The SDT asserts that all modifications being made are being made with backwards compatibility in mind. For non-virtualized systems, backwards compatibility is being maintained with a few exceptions that are driven by security risks, such as protecting access to the Management Interfaces of EACMS that enforce ESPs
5. Some commenters expressed that there were too many modifications made to the standards.
    - The SDT thanks entities for this feedback and has reinstated terms such as ESP that have allowed draft 2 to revert a number of the draft 1 changes back to currently approved language. Note that the redlines posted with Draft 2 are against Draft 1 and thus do not reflect the degree of change from currently approved standards.
6. Some commenters expressed “change fatigue” and that the changes are administrative in nature.

- The SDT can't address concerns with the amount of version revisions by various SDTs. The SDT assumes that the comment on 'administrative changes' is due to the need to redefine all SCI in CIP-002 and treat is separately from the BCS it supports. The SDT has added flexibility in Draft 2 that allows for an "All-in" scenario that can help alleviate this concern.

7. Some commenters requested the GTB be inserted back into the standards.
    - The SDT thanks you for your comments; however, this is a NERC initiative across all standards and the GTB has been incorporated into technical rationale and implementation guidance respectively. Documents will be able to be accessed via the project page.
8. Some commenters acknowledged inconsistent format across all CIP Standards.
    - The SDT thanks you for your comments and has reviewed the standards to ensure format consistency across the CIP Standards.
9. Some commenters question the simultaneous posting between virtualization and BCSI projects.
    - The BCSI project has concluded and passed final ballot in June 2021. Draft 2 of the virtualization changes have been made to the final BCSI documents and now include those changes. BCSI was assigned a –X version number and virtualization a –Y version number. This allowed both projects to conclude a comment and ballot period during the same time and will assign correct version numbering upon completion of the projects.
10. Some commenters requested the SDT add identification of all systems to CIP-002.
    - The SDT reviewed and determined that adding identification of all systems (EACMS, PACS, PCA, etc.) is outside the scope of the SAR of this project.
11. Some commenters expressed concern regarding crossover from the standard modifications and the CMEP Practice Guides.
    - The SDT reviewed the respective CMEP practice guides. In addition, discussion was held with NERC compliance and determined that practice guides are used for currently enforceable standards and are reviewed as modified standards are completed and approved.

REMINDER
Standards Announcement
Project 2016-02 Modifications to CIP Standards

Initial Ballots and Non-binding Polls Open through March 22, 2021

Now Available

The initial ballots and associated Violation Risk Factors and Violation Severity Level non-binding polls for the **CIP Virtualization suite of standards (outlined below)** are open through **8 p.m. Eastern, Monday, March 22, 2021**.

- CIP-002-7 - Cyber Security – BES Cyber System Categorization
- CIP-003-9 - Cyber Security – Security Management Controls
- CIP-004-7 - Cyber Security – Personnel & Training
- CIP-005-8 - Cyber Security – BES Cyber System Logical Isolation
- CIP-006-7 - Cyber Security – Physical Security of BES Cyber Systems
- CIP-007-7 - Cyber Security – Systems Security Management
- CIP-008-7 - Cyber Security – Incident Reporting and Response Planning
- CIP-009-7 - Cyber Security – Recovery Plans for BES Cyber Systems
- CIP-010-5 - Cyber Security – Configuration Change Management and Vulnerability Assessments
- CIP-011-3 - Cyber Security – Information Protection
- CIP-013-3 - Cyber Security – Supply Chain Risk Management

Balloting
Use the Standards Balloting and Commenting System (SBS) to submit votes.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Applications" drop-down menu and specify “Project 2016-02 Modifications to CIP Standards Observer List” in the Description Box. Standards Announcement

Project 2016-02 Modifications to CIP Standards

Formal Comment Period Open through March 22, 2021
Ballot Pools Forming through February 19, 2021

Now Available

A 60-day formal comment period for the **CIP Virtualization suite of standards (outlined below)** is open through **8 p.m. Eastern, Monday, March 22, 2021**.

- CIP-002-7 – Cyber Security - BES Cyber System Categorization
- CIP-003-9 – Cyber Security - Security Management Controls
- CIP-004-7 – Cyber Security - Personnel & Training
- CIP-005-8 – Cyber Security - BES Cyber System Logical Isolation
- CIP-006-7 – Cyber Security - Physical Security of BES Cyber Systems
- CIP-007-7 – Cyber Security - Systems Security Management
- CIP-008-7 – Cyber Security - Incident Reporting and Response Planning
- CIP-009-7 – Cyber Security - Recovery Plans for BES Cyber Systems
- CIP-010-5 – Cyber Security - Configuration Change Management and Vulnerability Assessments
- CIP-011-3 – Cyber Security - Information Protection
- CIP-013-3 – Cyber Security - Supply Chain Risk Management

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. Contact Wendy Muller regarding issues using the SBS**.** An unofficial Word version of the comment form is posted on the project page**.**

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Friday, February 19, 2021.** Registered Ballot Body members can join the ballot pools here. Note that there is a separate ballot and non-binding poll for each of the standards, so it is necessary to join each ballot pool in order to submit votes on all of the standards and their associated Violation Risk Factors and Violation Severity Levels.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **March 12-22, 2021**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2016-02 Modifications to CIP Standards Observer List” in the Description Box. For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at (404) 446-2589.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	May 11 – June 24, 2021
45-day formal comment period with ballot	August 29–October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — BES Cyber System Categorization
2. **Number:** CIP-002-7
3. **Purpose:** To identify and categorize BES Cyber Systems (BCS) and their associated BES Cyber Assets (BCA) for the application of cyber security requirements commensurate with the adverse impact that loss, compromise, or misuse of those BCS could have on the reliable operation of the BES. Identification and categorization of BCS support appropriate protection against compromises that could lead to misoperation or instability in the BES.
4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. **Balancing Authority**

   4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-002-7:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See “Project 2016-02 Modification to CIP Standards Implementation Plan”.

B. Requirements and Measures

R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3: *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

i. Control Centers and backup Control Centers;

ii. Transmission stations and substations;

iii. Generation resources;

iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;

v. RAS that support the reliable operation of the Bulk Electric System; and

vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

1.1. Per Attachment 1, Section 1, identify each BES Cyber System as either of the following, if any, at each asset;

- A high impact BCS including any supporting SCI as part of the BCS; or
- A high impact BCS and independent SCI supporting any part of the high impact BCS or its associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs).

1.2. Per Attachment 1, Section 2, identify each BES Cyber System as either of the following, if any, at each asset;

- A medium impact BCS including any supporting SCI as part of the BCS; or
- A medium impact BCS and independent SCI supporting any part of the medium impact BES Cyber System or its associated EACMS, PACS or PCAs.

1.3. Per Attachment 1, Section 3, identify any asset that contains a low impact BCS, or SCI that supports any part of a low impact BCS (a discrete list of low impact BCS or SCI that supports any part of a low impact BCS is not required).

M1. Acceptable evidence includes, but is not limited to, dated electronic or physical lists required by Requirement R1.

R2. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1 Review the identifications in Requirement R1 and its parts (and update them if there are changes identified) at least once every 15 calendar months, even if it has no identified items in Requirement R1, and

2.2 Have its CIP Senior Manager or delegate approve the identifications required by Requirement R1 at least once every 15 calendar months, even if it has no identified items in Requirement R1.

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has reviewed and updated, where necessary, the identifications required in Requirement R1 and its parts, and has had its CIP Senior Manager or delegate approve the identifications required in Requirement R1 and its parts at least once every 15 calendar months, even if it has none identified in Requirement R1 and its parts, as required by Requirement R2.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels (CIP-002-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**High**	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, five percent or fewer BES assets have not been considered according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, 2 or fewer BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BCS or independently identified SCI, five percent or fewer of identified BCS or independently identified SCI, have not	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than five percent but less than or equal to 10 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than two, but fewer than or equal to four BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BCS or independently identified SCI, more	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than 10 percent but less than or equal to 15 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than four, but fewer than or equal to six BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high or medium impact BCS or independently identified SCI, more than 10 percent but	For Responsible Entities with more than a total of 40 BES assets in Requirement R1, more than 15 percent of BES assets have not been considered, according to Requirement R1; OR For Responsible Entities with a total of 40 or fewer BES assets, more than six BES assets in Requirement R1, have not been considered according to Requirement R1; OR For Responsible Entities with more than a total of 100 high and medium impact BES Cyber Systems, more than 15 percent of identified BCS or independently identified SCI, have not been categorized or

Attachment 1 – Impact Rating Criteria

Impact Rating Criteria

The criteria defined in Attachment 1 do not constitute stand-alone compliance requirements, but are criteria characterizing the level of impact and are referenced by requirements.

1. **High Impact Rating**
   Each BCS used by and located at any of the following:

   1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.

   1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority: 1) for generation equal to or greater than an aggregate of 3000 MW in a single Interconnection, or 2) for one or more of the assets that meet criterion 2.3, 2.6, or 2.9.

   1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator for one or more of the assets that meet criterion 2.2, 2.4, 2.5, 2.7, 2.8, 2.9, or 2.10.

   1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generator Operator for one or more of the assets that meet criterion 2.1, 2.3, 2.6, or 2.9.

2. **Medium Impact Rating**
   Each BCS, not included in Section 1 above, associated with any of the following:

   2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BCS that meet this criterion are:

   - Each discrete shared BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection; or
   - Any SCI (which must be included in a shared BCS) supporting one or more BCS that together could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

   2.2. Each BES reactive resource or group of resources at a single location (excluding generation Facilities) with an aggregate maximum Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities). The only BCS that meet this criterion are each discrete shared BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR.

2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates, and informs the Generator Owner or Generator Operator, as necessary to avoid an Adverse Reliability Impact in the planning horizon of more than one year.

2.4. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2.5. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

2.6. Generation at a single plant location or Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

2.7. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

2.8. Transmission Facilities, including generation interconnection Facilities, providing the generation interconnection required to connect generator output to the Transmission Systems that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the generation Facilities identified by any Generator Owner as a result of its application of Attachment 1, criterion 2.1 or 2.3.

2.9. Each RAS or automated switching System that operates BES Elements, that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed or cause a reduction in one or more IROLs if destroyed, degraded, misused, or otherwise rendered unavailable.

2.10. Each system or group of Elements that performs automatic Load shedding under a common control system, without human operator initiation, of 300 MW or more implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) under a load shedding program that is subject to one or more requirements in a NERC or regional reliability standard.

2.11. Each Control Center or backup Control Center, not already included in High Impact Rating above, used to perform the functional obligations of the Generator Operator for an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection.

2.12. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator not included in High Impact Rating, above.

2.13. Each Control Center or backup Control Center, not already included in High Impact Rating above, used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

3. Low Impact Rating

BCS not included in Sections 1 or 2 above that are associated with any of the following assets and that meet the applicability qualifications in Section 4 - Applicability, part 4.2 – Facilities, of this standard:

3.1. Control Centers and backup Control Centers.

3.2. Transmission stations and substations.

3.3. Generation resources.

3.4. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements.

3.5. RAS that support the reliable operation of the BES.

3.6. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~initial~~ second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016

Anticipated Actions	Date
45-day formal comment period with ballot	May 11 – June 24, 2021
45-day formal comment period with ballot	August ~~3~~29–~~September 16~~October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — BES Cyber System Categorization

2. **Number:** CIP-002-7~~5.1a~~

3. **Purpose:** To identify and categorize BES Cyber Systems (BCS) and their associated BES Cyber Assets (BCA) for the application of cyber security requirements commensurate with the adverse impact that loss, compromise, or misuse of those ~~BES Cyber Systems~~BCS could have on the reliable operation of the BES. Identification and categorization of ~~BES Cyber Systems~~BCS support appropriate protection against compromises that could lead to misoperation or instability in the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each ~~Special Protection System or~~ Remedial Action Scheme (RAS) where the ~~Special Protection System or Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

~~**4.1.5. Interchange Coordinator or Interchange Authority**~~

~~4.1.6.~~**4.1.5. Reliability Coordinator**

~~4.1.7.~~**4.1.6. Transmission Operator**

~~4.1.8.~~**4.1.7. Transmission Owner**

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each ~~Special Protection System or Remedial Action Scheme~~RAS where the ~~Special Protection System or Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-002-7~~5.1a~~:

4.2.3.1. Cyber ~~Assets~~ Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~ Systems associated with communication ~~networks and data communication~~ links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~**4.2.3.4.**~~**4.2.3.5.** For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See "Project 2016-02 Modification to CIP Standards Implementation Plan".

~~1. **24 Months Minimum –** CIP-002-5.1a shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.~~

~~2. In those jurisdictions where no regulatory approval is required CIP-002-5.1a shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~6. **Background:**~~

~~This standard provides "bright-line" criteria for applicable Responsible Entities to categorize their BES Cyber Systems based on the impact of their associated Facilities, systems, and equipment, which, if destroyed, degraded, misused, or otherwise rendered unavailable, would affect the reliable operation of the Bulk Electric System. Several concepts provide the basis for the approach to the standard.~~

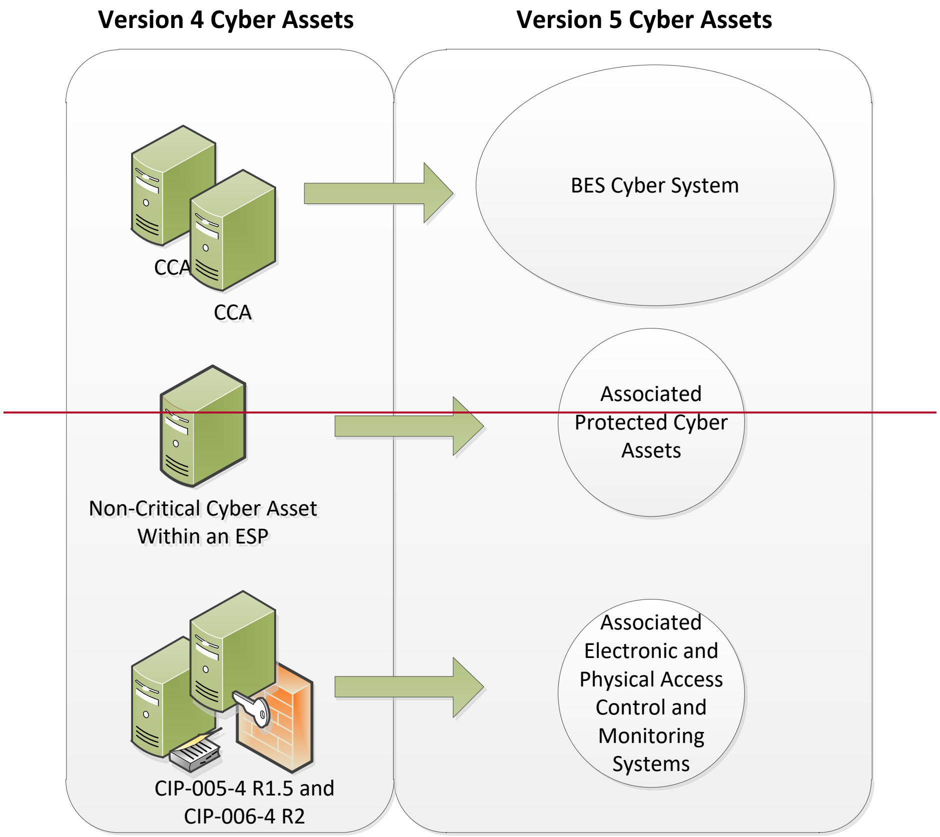
~~Throughout the standards, unless otherwise stated, bulleted items in the requirements are items that are linked with an "or," and numbered items are items that are linked with an "and."~~

~~Many references in the Applicability section and the criteria in Attachment 1 of CIP-002 use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~**BES Cyber Systems**~~

~~One of the fundamental differences between Versions 4 and 5 of the CIP Cyber Security Standards is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change results from the drafting team's review of the NIST Risk~~

~~Management Framework and the use of an analogous term "information system" as the target for categorizing and applying security controls.~~



~~In transitioning from Version 4 to Version 5, a BES Cyber System can be viewed simply as a grouping of Critical Cyber Assets (as that term is used in Version 4). The CIP Cyber Security Standards use the "BES Cyber System" term primarily to provide a higher level for referencing the object of a requirement. For example, it becomes possible to apply requirements dealing with recovery and malware protection to a grouping rather than individual Cyber Assets, and it becomes clearer in the requirement that malware protection applies to the system as a whole and may not be necessary for every individual device to comply.~~

~~Another reason for using the term "BES Cyber System" is to provide a convenient level at which a Responsible Entity can organize their documented implementation of the requirements and compliance evidence. Responsible Entities can use the well-developed concept of a *security plan* for each BES Cyber System to document the programs, processes, and plans in place to comply with security requirements.~~

~~It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System. For example, the Responsible Entity might choose to view an entire plant control system as a single BES Cyber System, or it might choose to view certain~~

~~components of the plant control system as distinct BES Cyber Systems. The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.~~

~~Reliable Operation of the BES~~

~~The scope of the CIP Cyber Security Standards is restricted to BES Cyber Systems that would impact the reliable operation of the BES. In order to identify BES Cyber Systems, Responsible Entities determine whether the BES Cyber Systems perform or support any BES reliability function according to those reliability tasks identified for their reliability function and the corresponding functional entity's responsibilities as defined in its relationships with other functional entities in the NERC Functional Model. This ensures that the *initial* scope for consideration includes only those BES Cyber Systems and their associated BES Cyber Assets that perform or support the reliable operation of the BES. The definition of BES Cyber Asset provides the basis for this scoping.~~

~~Real-time Operations~~

~~One characteristic of the BES Cyber Asset is a real-time scoping characteristic. The time horizon that is significant for BES Cyber Systems and BES Cyber Assets subject to the application of these Version 5 CIP Cyber Security Standards is defined as that which is material to real-time operations for the reliable operation of the BES. To provide a better defined time horizon than "Real-time," BES Cyber Assets are those Cyber Assets that, if rendered unavailable, degraded, or misused, would adversely impact the reliable operation of the BES within 15 minutes of the activation or exercise of the compromise. This time window must not include in its consideration the activation of redundant BES Cyber Assets or BES Cyber Systems: from the cyber security standpoint, redundancy does not mitigate cyber security vulnerabilities.~~

~~Categorization Criteria~~

~~The criteria defined in Attachment 1 are used to categorize BES Cyber Systems into impact categories. Requirement 1 only requires the discrete identification of BES Cyber Systems for those in the high impact and medium impact categories. All BES Cyber Systems for Facilities not included in Attachment 1 – Impact Rating Criteria, Criteria 1.1 to 1.4 and Criteria 2.1 to 2.11 default to be low impact.~~

~~This general process of categorization of BES Cyber Systems based on impact on the reliable operation of the BES is consistent with risk management approaches for the purpose of application of cyber security requirements in the remainder of the Version 5 CIP Cyber Security Standards.~~

~~**Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets that are associated with BES Cyber Systems**~~

~~BES Cyber Systems have associated Cyber Assets, which, if compromised, pose a threat to the BES Cyber System by virtue of: (a) their location within the Electronic Security Perimeter (Protected Cyber Assets), or (b) the security control function they perform (Electronic Access Control or Monitoring Systems and Physical Access Control Systems). These Cyber Assets include:~~

> ~~**Electronic Access Control or Monitoring Systems ("EACMS")** – Examples include: Electronic Access Points, Intermediate Systems, authentication servers (e.g., RADIUS servers, Active Directory servers, Certificate Authorities), security event monitoring systems, and intrusion detection systems.~~
>
> ~~**Physical Access Control Systems ("PACS")** – Examples include: authentication servers, card systems, and badge control systems.~~
>
> ~~**Protected Cyber Assets ("PCA")** – Examples may include, to the extent they are within the ESP: file servers, ftp servers, time servers, LAN switches, networked printers, digital fault recorders, and emission monitoring systems.~~

B. Requirements and Measures

R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3: *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

i. Control Centers and backup Control Centers;
ii. Transmission stations and substations;
iii. Generation resources;
iv. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;
v. ~~Special Protection Systems~~ RAS that support the reliable operation of the Bulk Electric System; and
vi. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

1.1. Per ~~Identify each of the high impact BES Cyber Systems according to~~ Attachment 1, Section 1, identify each BES Cyber System as either of the following, if any, at each asset;

- A high impact BCS including any supporting SCI as part of the BCS; or
- A high impact BCS and independent SCI supporting any part of the high impact BCS or its associated Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS) or Protected Cyber Assets (PCAs).

1.2. Per ~~Identify each of the medium impact BES Cyber Systems according to~~ Attachment 1, Section 2, identify each BES Cyber System as either of the following, if any, at each asset;~~ and~~

- A medium impact BCS including any supporting SCI as part of the BCS; or
- A medium impact BCS and independent SCI supporting any part of the medium impact BES Cyber System or its associated EACMS, PACS or PCAs.

1.3. Per ~~Identify each asset that contains a low impact BES Cyber System according to~~ Attachment 1, Section 3, identify any asset that contains a low impact BCS, or SCI that supports any part of a low impact BCS ~~if any~~ (a discrete list of low impact ~~BES Cyber Systems~~ BCS or SCI that supports any part of a low impact BCS is not required).

~~M2.~~M1. Acceptable evidence includes, but is not limited to, dated electronic or physical lists required by Requirement R1~~, and Parts 1.1 and 1.2~~.

R2. ~~The~~ Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1 Review the identifications in Requirement R1 and its parts (and update them if there are changes identified) at least once every 15 calendar months, even if it has no identified items in Requirement R1, and

2.2 Have its CIP Senior Manager or delegate approve the identifications required by Requirement R1 at least once every 15 calendar months, even if it has no identified items in Requirement R1.

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has reviewed and updated, where necessary, the identifications required in Requirement R1 and its parts, and has had its CIP Senior Manager or delegate approve the identifications required in Requirement R1 and its parts at least once every 15 calendar months, even if it has none identified in Requirement R1 and its parts, as required by Requirement R2.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

~~1.3.~~1.2. **Evidence Retention:**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

~~1.4.~~1.3. **Compliance Monitoring and ~~Assessment Processes~~** Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

- ~~Compliance Audit~~
- ~~Self-Certification~~
- ~~Spot Checking~~
- ~~Compliance Investigation~~
- ~~Self-Reporting~~
- ~~Complaint~~

~~**1.5. Additional Compliance Information**~~

- ~~None~~

~~Table of Compliance Elements~~

~~CIP-002-5.1a - Attachment 1~~

Attachment 1 – Impact Rating Criteria

Impact Rating Criteria

The criteria defined in Attachment 1 do not constitute stand-alone compliance requirements, but are criteria characterizing the level of impact and are referenced by requirements.

1. High Impact Rating ~~(H)~~

Each ~~BES Cyber System~~BCS used by and located at any of the following:

1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.

1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority: 1) for generation equal to or greater than an aggregate of 3000 MW in a single Interconnection, or 2) for one or more of the assets that meet criterion 2.3, 2.6, or 2.9.

1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator for one or more of the assets that meet criterion 2.2, 2.4, 2.5, 2.7, 2.8, 2.9, or 2.10.

1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generator Operator for one or more of the assets that meet criterion 2.1, 2.3, 2.6, or 2.9.

2. Medium Impact Rating ~~(M)~~

Each ~~BES Cyber System~~BCS, not included in Section 1 above, associated with any of the following:

2.1. Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only ~~BES Cyber Systems~~BCS that meet this criterion are:

- ~~those~~ Each discrete shared ~~BES Cyber Systems~~BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection; or
- Any SCI (which must be included in a shared BCS) supporting one or more BCS that together could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.

~~2.1.~~2.2. Each BES reactive resource or group of resources at a single location (excluding generation Facilities) with an aggregate maximum Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities). The only ~~BES Cyber Systems~~BCS that meet this criterion are ~~those~~ each discrete shared ~~BES Cyber Systems~~BCS that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR.

~~2.2.~~2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates, and informs the Generator Owner or Generator Operator, as necessary to avoid an Adverse Reliability Impact in the planning horizon of more than one year.

~~2.3.~~2.4. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

~~2.4.~~2.5. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

~~2.5.~~2.6. Generation at a single plant location or Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

~~2.6.~~2.7. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

~~2.7.~~2.8. Transmission Facilities, including generation interconnection Facilities, providing the generation interconnection required to connect generator output to the Transmission Systems that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the generation Facilities identified by any Generator Owner as a result of its application of Attachment 1, criterion 2.1 or 2.3.

~~2.8.~~2.9. Each ~~Special Protection System (SPS), Remedial Action Scheme (~~RAS~~),~~ or automated switching System that operates BES Elements, that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed or cause a reduction in one or more IROLs if destroyed, degraded, misused, or otherwise rendered unavailable.

~~2.9.~~2.10. Each system or group of Elements that performs automatic Load shedding under a common control system, without human operator initiation, of 300 MW or more implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) under a load shedding program that is subject to one or more requirements in a NERC or regional reliability standard.

~~2.10.~~2.11. Each Control Center or backup Control Center, not already included in High Impact Rating ~~(H)~~ above, used to perform the functional obligations of the Generator Operator for an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection.

~~2.11.~~2.12. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator not included in High Impact Rating ~~(H)~~, above.

~~2.12.~~2.13. Each Control Center or backup Control Center, not already included in High Impact Rating ~~(H)~~ above, used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

3. Low Impact Rating ~~(L)~~

~~BES Cyber Systems~~BCS not included in Sections 1 or 2 above that are associated with any of the following assets and that meet the applicability qualifications in Section 4 - Applicability, part 4.2 – Facilities, of this standard:

3.1. Control Centers and backup Control Centers.

3.2. Transmission stations and substations.

3.3. Generation resources.

3.4. Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements.

3.5. ~~Special Protection Systems~~ RAS that support the reliable operation of the ~~Bulk Electric System~~BES.

3.6. For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.

~~Guidelines and Technical Basis~~

~~Section 4 – Scope of Applicability of the CIP Cyber Security Standards~~

~~Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.~~

~~Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.~~

~~Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the qualified set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards. This section is especially significant in CIP-002-5.1a and represents the total scope of Facilities, systems, and equipment to which the criteria in Attachment 1 apply. This is important because it determines the balance of these Facilities, systems, and equipment that are Low Impact once those that qualify under the High and Medium Impact categories are filtered out.~~

~~For the purpose of identifying groups of Facilities, systems, and equipment, whether by location or otherwise, the Responsible Entity identifies assets as described in Requirement R1 of CIP-002-5.1a. This is a process familiar to Responsible Entities that have to comply with versions 1, 2, 3, and 4 of the CIP standards for Critical Assets. As in versions 1, 2, 3, and 4, Responsible Entities may use substations, generation plants, and Control Centers at single site locations as identifiers of these groups of Facilities, systems, and equipment.~~

~~CIP-002-5.1a~~

~~CIP-002-5.1a requires that applicable Responsible Entities categorize their BES Cyber Systems and associated BES Cyber Assets according to the criteria in Attachment 1. A BES Cyber Asset~~

~~includes in its definition, "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact the reliable operation of the BES."~~

~~The following provides guidance that a Responsible Entity may use to identify the BES Cyber Systems that would be in scope. The concept of BES reliability operating service is useful in providing Responsible Entities with the option of a defined process for scoping those BES Cyber Systems that would be subject to CIP-002-5.1a. The concept includes a number of named BES reliability operating services. These named services include:~~

~~Dynamic Response to BES conditions~~

~~Balancing Load and Generation~~

~~Controlling Frequency (Real Power)~~

~~Controlling Voltage (Reactive Power)~~

~~Managing Constraints~~

~~Monitoring & Control~~

~~Restoration of BES~~

~~Situational Awareness~~

~~Inter-Entity Real-Time Coordination and Communication~~

~~Responsibility for the reliable operation of the BES is spread across all Entity Registrations. Each entity registration has its own special contribution to reliable operations and the following discussion helps identify which entity registration, in the context of those functional entities to which these CIP standards apply, performs which reliability operating service, as a process to identify BES Cyber Systems that would be in scope. The following provides guidance for Responsible Entities to determine applicable reliability operations services according to their Function Registration type.~~

~~Entity Registration~~	**~~RC~~**	**~~BA~~**	**~~TOP~~**	**~~TO~~**	**~~DP~~**	**~~GOP~~**	**~~GO~~**
~~Dynamic Response~~		~~X~~	~~X~~	~~X~~	~~X~~	~~X~~	~~X~~

~~Situation Awareness~~	~~X~~	~~X~~	~~X~~			~~X~~	
~~Inter-Entity coordination~~	~~X~~	~~X~~	~~X~~	~~X~~		~~X~~	~~X~~

~~Dynamic Response~~

~~The Dynamic Response Operating Service includes those actions performed by BES Elements or subsystems which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition. The types of dynamic responses that may be considered as potentially having an impact on the BES are:~~

~~Spinning reserves (contingency reserves)~~

~~Providing actual reserve generation when called upon (GO,GOP)~~

~~Monitoring that reserves are sufficient (BA)~~

~~Governor Response~~

~~Control system used to actuate governor response (GO)~~

~~Protection Systems (transmission & generation)~~

~~Lines, buses, transformers, generators (DP, TO, TOP, GO, GOP)~~

~~Zone protection for breaker failure (DP, TO, TOP)~~

~~Breaker protection (DP, TO, TOP)~~

~~Current, frequency, speed, phase (TO,TOP, GO,GOP)~~

~~Special Protection Systems or Remedial Action Schemes~~

~~Sensors, relays, and breakers, possibly software (DP, TO, TOP)~~

~~Under and Over Frequency relay protection (includes automatic load shedding)~~

~~Sensors, relays & breakers (DP)~~

~~Under and Over Voltage relay protection (includes automatic load shedding)~~

~~Sensors, relays & breakers (DP)~~

~~Power System Stabilizers (GO)~~

~~Balancing Load and Generation~~

~~The Balancing Load and Generation Operations Service includes activities, actions and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time. Aspects of the Balancing Load and Generation function include, but are not limited to:~~

~~Calculation of Area Control Error (ACE)~~

~~Field data sources (real time tie flows, frequency sources, time error, etc) (TO, TOP)~~

~~Software used to perform calculation (BA)~~

~~Demand Response~~

~~Ability to identify load change need (BA)~~

~~Ability to implement load changes (TOP,DP)~~

~~Manually Initiated Load shedding~~

~~Ability to identify load change need (BA)~~

~~Ability to implement load changes (TOP, DP)~~

~~Non-spinning reserve (contingency reserve)~~

~~Know generation status, capability, ramp rate, start time (GO, BA)~~

~~Start units and provide energy (GOP)~~

~~Controlling Frequency (Real Power)~~

~~The Controlling Frequency Operations Service includes activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Frequency function include, but are limited to:~~

~~Generation Control (such as AGC)~~

~~ACE, current generator output, ramp rate, unit characteristics (BA, GOP, GO)~~

~~Software to calculate unit adjustments (BA)~~

~~Transmit adjustments to individual units (GOP)~~

~~Unit controls implementing adjustments (GOP)~~

~~Regulation (regulating reserves)~~

~~Frequency source, schedule (BA)~~

~~Governor control system (GO)~~

~~Controlling Voltage (Reactive Power)~~

~~The Controlling Voltage Operations Service includes activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Voltage function include, but are not limited to:~~

~~Automatic Voltage Regulation (AVR)~~

~~Sensors, stator control system, feedback (GO)~~

~~Capacitive resources~~

~~Status, control (manual or auto), feedback (TOP, TO,DP)~~

~~Inductive resources (transformer tap changer, or inductors)~~

~~Status, control (manual or auto), feedback (TOP,TO,DP)~~

~~Static VAR Compensators (SVC)~~

~~Status, computations, control (manual or auto), feedback (TOP, TO,DP)~~

~~Managing Constraints~~

~~Managing Constraints includes activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES. Aspects of the Managing Constraints include, but are not limited to:~~

~~Available Transfer Capability (ATC) (TOP)~~

~~Interchange schedules (TOP, RC)~~

~~Generation re-dispatch and unit commit (GOP)~~

~~Identify and monitor SOL's & IROL's (TOP, RC)~~

~~Identify and monitor Flow gates (TOP, RC)~~

~~Monitoring and Control~~

~~Monitoring and Control includes those activities, actions and conditions that provide monitoring and control of BES Elements. An example aspect of the Control and Operation function is:~~

~~All methods of operating breakers and switches~~

~~SCADA (TOP, GOP)~~

~~Substation automation (TOP)~~

~~Restoration of BES~~

~~The Restoration of BES Operations Service includes activities, actions and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Aspects of the Restoration of BES function include, but are not limited to:~~

~~Restoration including planned cranking path~~

~~Through black start units (TOP, GOP)~~

~~Through tie lines (TOP, GOP)~~

~~Off-site power for nuclear facilities. (TOP, TO, BA, RC, DP, GO, GOP)~~

~~Coordination (TOP, TO, BA, RC, DP, GO, GOP)~~

~~Situational Awareness~~

~~The Situational Awareness function includes activities, actions and conditions established by policy, directive or standard operating procedure necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions. Aspects of the Situation Awareness function include:~~

~~Monitoring and alerting (such as EMS alarms) (TOP, GOP, RC,BA)~~

~~Change management (TOP,GOP,RC,BA)~~

~~Current Day and Next Day planning (TOP)~~

~~Contingency Analysis (RC)~~

~~Frequency monitoring (BA, RC)~~

~~Inter-Entity Coordination~~

~~The Inter-Entity coordination and communication function includes activities, actions, and conditions established by policy, directive, or standard operating procedure necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES. Aspects of the Inter-Entity Coordination and Communication function include:~~

~~Scheduled interchange (BA,TOP,GOP,RC)~~

~~Facility operational data and status (TO, TOP, GO, GOP, RC, BA)~~

~~Operational directives (TOP, RC, BA)~~

~~Applicability to Distribution Providers~~

~~It is expected that only Distribution Providers that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. Distribution Providers that do not own or operate any facility that qualifies are not subject to these standards. The qualifications are based on the requirements for registration as a Distribution Provider and on the requirements applicable to Distribution Providers in NERC Standard EOP-005.~~

~~Requirement R1:~~

~~**Requirement R1 implements the methodology for the categorization of BES Cyber Systems according to their impact on the BES. Using the traditional risk assessment equation, it reduces the measure of the risk to an impact (consequence) assessment, assuming the vulnerability index of 1 (the Systems are assumed to be vulnerable) and a probability of threat of 1 (100 percent). The criteria in Attachment 1 provide a measure of the impact of the BES assets supported by these BES Cyber Systems.**~~

~~**Responsible Entities are required to identify and categorize those BES Cyber Systems that have high and medium impact. BES Cyber Systems for BES assets not specified in Attachment 1, Criteria 1.1 – 1.4 and Criteria 2.1 – 2.11 default to low impact.**~~

~~Attachment 1~~

~~Overall Application~~

~~**In the application of the criteria in Attachment 1, Responsible Entities should note that the approach used is based on the impact of the BES Cyber System as measured by the bright-line criteria defined in Attachment 1.**~~

~~**When the drafting team uses the term "Facilities", there is some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases, the criteria refer to a group of Facilities in a given location that supports the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to consider only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that supports reliable operation of the BES, as the Facilities that are subject to the criteria for categorization of BES Cyber Systems. Generation Facilities are separately discussed in the Generation section below. In CIP-002-5.1a, these groups of Facilities, systems, and equipment are sometimes designated as BES assets. For example, an identified BES asset may be a named substation, generating plant, or Control Center. Responsible Entities have flexibility in how they group Facilities, systems, and equipment at a location.**~~

~~**In certain cases, a BES Cyber System may be categorized by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that result in the categorization. This will avoid inadvertent miscategorization when it no longer meets one of the criteria, but still meets another.**~~

~~**It is recommended that each BES Cyber System should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities**~~

~~should formally agree on the designated Responsible Entity responsible for compliance with the standards.~~

~~High Impact Rating (H)~~

~~This category includes those BES Cyber Systems, used by and at Control Centers (and the associated data centers included in the definition of Control Centers), that perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), or Generator Operator (GOP), as defined under the Tasks heading of the applicable Function and the Relationship with Other Entities heading of the functional entity in the NERC Functional Model, and as scoped by the qualification in Attachment 1, Criteria 1.1, 1.2, 1.3 and 1.4. While those entities that have been registered as the above-named functional entities are specifically referenced, it must be noted that there may be agreements where some of the functional obligations of a Transmission Operator may be delegated to a Transmission Owner (TO). In these cases, BES Cyber Systems at these TO Control Centers that perform these functional obligations would be subject to categorization as high impact. The criteria notably specifically emphasize functional obligations, not necessarily the RC, BA, TOP, or GOP facilities. One must note that the definition of Control Center specifically refers to reliability tasks for RCs, Bas, TOPs, and GOPs. A TO BES Cyber System in a TO facility that does not perform or does not have an agreement with a TOP to perform any of these functional tasks does not meet the definition of a Control Center. However, if that BES Cyber System operates any of the facilities that meet criteria in the Medium Impact category, that BES Cyber System would be categorized as a Medium Impact BES Cyber System.~~

~~The 3000 MW threshold defined in criterion 1.2 for BA Control Centers provides a sufficient differentiation of the threshold defined for Medium Impact BA Control Centers. An analysis of BA footprints shows that the majority of Bas with significant impact are covered under this criterion.~~

~~Additional thresholds as specified in the criteria apply for this category.~~

~~Medium Impact Rating (M)~~

~~Generation~~

~~The criteria in Attachment 1's medium impact category that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are criteria 2.1, 2.3, 2.6, 2.9, and 2.11. Criterion 2.13 for BA Control Centers is also included here.~~

~~Criterion 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002, whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance." In particular, it requires that "as a minimum, the Balancing~~

~~**Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Bas in all regions.**~~

~~**In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements as proposed by NERC standard MOD-024 and current development efforts in that area.**~~

~~**By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of 1500 MW or more of generation at a single plant for a unit or group of units are adequately protected.**~~

~~**The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.**~~

~~**In Criterion 2.3, the drafting team sought to ensure that BES Cyber Systems for those generation Facilities that have been designated by the Planning Coordinator or Transmission Planner as necessary to avoid BES Adverse Reliability Impacts in the planning horizon of one year or more are categorized as medium impact. In specifying a planning horizon of one year or more, the intent is to ensure that those are units that are identified as a result of a "long term" reliability planning, i.e that the plans are spanning an operating period of at least 12 months: it does not mean that the operating day for the unit is necessarily beyond one year, but that the period that is being planned for is more than 1 year: it is specifically intended to avoid designating generation that is required to be run to remediate short term emergency reliability issues. These Facilities may be designated as "Reliability Must Run," and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.**~~

~~**If it is determined through System studies that a unit must run in order to preserve the reliability of the BES, such as due to a Category C3 contingency as defined in TPL-003, then BES Cyber Systems for that unit are categorized as medium impact.**~~

~~**The TPL standards require that, where the studies and plans indicate additional actions, that these studies and plans be communicated by the Planning Coordinator or Transmission Planner in writing to the Regional Entity/RRO. Actions necessary for the implementation of these plans by affected parties (generation owners/operators and Reliability Coordinators or other necessary party) are usually formalized in the form of an agreement and/or contract.**~~

~~**Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2,** Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.**~~

~~**IROLs may be based on dynamic System phenomena such as instability or voltage collapse. Derivation of these IROLs and their associated contingencies often considers the effect of generation inertia and AVR response.**~~

~~**Criterion 2.9 categorizes BES Cyber Systems for Special Protection Systems and Remedial Action Schemes as medium impact. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Generator Operators which own BES Cyber Systems for such Systems and schemes designate them as medium impact.**~~

~~**Criterion 2.11 categorizes as medium impact BES Cyber Systems used by and at Control Centers that perform the functional obligations of the Generator Operator for an aggregate generation of 1500 MW or higher in a single interconnection, and that have not already been included in Part 1.**~~

~~**Criterion 2.13 categorizes as medium impact those BA Control Centers that "control" 1500 MW of generation or more in a single interconnection and that have not already been included in Part 1. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.**~~

~~Transmission~~

~~***The SDT uses the phrases "Transmission Facilities at a single station or substation" and "Transmission stations or substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.***~~

~~**Criteria 2.2, 2.4 through 2.10, and 2.12 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a System to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). Criterion 2.2 includes BES Cyber Systems**~~

~~for those Facilities in Transmission Systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.~~

~~Criterion 2.4 includes BES Cyber Systems for any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion in the medium impact category.~~

~~It must be noted that if the collector bus for a generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation in Criterion 2.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility, and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface." This collector bus would not be a facility for a medium impact BES Cyber System because it does not significantly affect the 500kV Transmission grid; it only affects a plant which is below the generation threshold.~~

~~Criterion 2.5 includes BES Cyber Systems for facilities at the lower end of BES Transmission with qualifications for inclusion if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for significant impact on the BES, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES. The drafting team:~~

~~Excluded radial facilities that would only provide support for single generation facilities.~~

~~Specified interconnection to at least three transmission stations or substations to ensure that the level of impact would be appropriate.~~

~~The total aggregated weighted value of 3,000 was derived from weighted values related to three connected 345 kV lines and five connected 230 kV lines at a transmission station or substation. The total aggregated weighted value is used to account for the true impact to the BES, irrespective of line kV rating and mix of multiple kV rated lines.~~

~~Additionally, in NERC's document "Integrated Risk Assessment Approach – Refinement to Severity Risk Index", Attachment 1, the report used an average MVA line loading based on kV rating:~~

~~230 kV –> 700 MVA~~

~~345 kV –> 1,300 MVA~~

~~500 kV –> 2,000 MVA~~

~~765 kV –> 3,000 MVA~~

~~In the terms of applicable lines and connecting "other Transmission stations or substations" determinations, the following should be considered:~~

~~**For autotransformers in a station, Responsible Entities have flexibility in determining whether the groups of Facilities are considered a single substation or station location or multiple substations or stations. In most cases, Responsible Entities would probably consider them as Facilities at a single substation or station unless geographically dispersed. In these cases of these transformers being within the "fence" of the substation or station, autotransformers may not count as separate connections to other stations. The use of common BES Cyber Systems may negate any rationale for any consideration otherwise. In the case of autotransformers that are geographically dispersed from a station location, the calculation would take into account the connections in and out of each station or substation location.**~~

~~**Multiple-point (or multiple-tap) lines are considered to contribute a single weight value per line and affect the number of connections to other stations. Therefore, a single 230 kV multiple-point line between three Transmission stations or substations would contribute an aggregated weighted value of 700 and connect Transmission Facilities at a single station or substation to two other Transmission stations or substations.**~~

~~**Multiple lines between two Transmission stations or substations are considered to contribute multiple weight values per line, but these multiple lines between the two stations only connect one station to one other station. Therefore, two 345 kV lines between two Transmission stations or substations would contribute an aggregated weighted value of 2600 and connect Transmission Facilities at a single station or substation to one other Transmission station or substation.**~~

~~**Criterion 2.5's qualification for Transmission Facilities at a Transmission station or substation is based on 2 distinct conditions.**~~

~~**The first condition is that Transmission Facilities at a single station or substation where that station or substation connect, at voltage levels of 200 kV or higher to three (3) other stations or substations, to three other stations or substations. This qualification is meant to ensure that connections that operate at voltages of 500 kV or higher are included in the count of connections to other stations or substations as well.**~~

~~**The second qualification is that the aggregate value of all lines entering or leaving the station or substation must exceed 3000. This qualification does not include the consideration of lines operating at lower than 200 kV, or 500 kV or higher, the latter already qualifying as medium impact under criterion 2.4. : there is no value to be assigned to lines at voltages of less than 200 kV or 500 kV or higher in the table of values for the contribution to the aggregate value of 3000.**~~

~~**The Transmission Facilities at the station or substation must meet both qualifications to be considered as qualified under criterion 2.5.**~~

~~Criterion 2.6 include BES Cyber Systems for those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, Establish and Communicate System Operating Limits, R5.1.1 and R5.1.3.~~

~~Criterion 2.7 is sourced from the NUC-001 NERC standard, Requirement R9.2.2, for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown." In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.~~

~~Criterion 2.8 designates as medium impact those BES Cyber Systems that impact Transmission Facilities necessary to directly support generation that meet the criteria in Criteria 2.1 (generation Facilities with output greater than 1500 MW) and 2.3 (generation Facilities generally designated as "must run" for wide area reliability in the planning horizon). The Responsible Entity can request a formal statement from the Generation owner as to the qualification of generation Facilities connected to their Transmission systems.~~

~~Criterion 2.9 designates as medium impact those BES Cyber Systems for those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching Systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these BES Cyber Systems would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.~~

~~Criterion 2.10 designates as medium impact those BES Cyber Systems for Systems or Elements that perform automatic Load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of Criterion 2.10, and chose the term "Each" to represent that the criterion applied to a discrete System or Facility. In the drafting of this criterion, the drafting team sought to include only those Systems that did not require human operator initiation, and targeted in particular those underfrequency load shedding (UFLS) Facilities and systems and undervoltage load shedding (UVLS) systems and Elements that would be subject to a regional Load shedding requirement to prevent Adverse Reliability Impact. These include automated UFLS systems or UVLS systems that are capable of Load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as medium impact. The 300 MW threshold has been defined as the aggregate of the highest MW Load value, as defined by the applicable regional Load Shedding standards, for the preceding 12 months to account for seasonal fluctuations.~~

~~This particular threshold (300 MW) was provided in CIP, Version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value~~

~~of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market. In general, similar demand response programs that are not part of the NERC or regional reliability Load shedding programs, but are offered as components of an ancillary services market do not qualify under this criterion.~~

~~The language used in section 4 for UVLS and UFLS and in criterion 2.10 of Attachment 1 is designed to be consistent with requirements set in the PRC standards for UFLS and UVLS.~~

~~Criterion 2.12 categorizes as medium impact those BES Cyber Systems used by and at Control Centers and associated data centers performing the functional obligations of a Transmission Operator and that have not already been categorized as high impact.~~

~~Criterion 2.13 categorizes as Medium Impact those BA Control Centers that "control" 1500 MW of generation or more in a single Interconnection. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1.~~

~~Low Impact Rating (L)~~

~~BES Cyber Systems not categorized in high impact or medium impact default to low impact. Note that low impact BES Cyber Systems do not require discrete identification.~~

~~Restoration Facilities~~

~~Several discussions on the CIP Version 5 standards suggest entities owning Blackstart Resources and Cranking Paths might elect to remove those services to avoid higher compliance costs. For example, one Reliability Coordinator reported a 25% reduction of Blackstart Resources as a result of the Version 1 language, and there could be more entities that make this choice under Version 5.~~

~~In response, the CIP Version 5 drafting team sought informal input from NERC's Operating and Planning Committees. The committees indicate there has already been a reduction in Blackstart Resources because of increased CIP compliance costs, environmental rules, and other risks; continued inclusion within Version 5 at a category that would very significantly increase compliance costs can result in further reduction of a vulnerable pool.~~

~~The drafting team moved from the categorization of restoration assets such as Blackstart Resources and Cranking Paths as medium impact (as was the case in earlier drafts) to categorization of these assets as low impact as a result of these considerations. This will not relieve asset owners of all responsibilities, as would have been the case in CIP-002, Versions 1-4 (since only Cyber Assets with routable connectivity which are essential to restoration assets are included in those versions). Under the low impact categorization, those assets will be protected in the areas of cyber security awareness, physical access control, and electronic access control, and they will have obligations regarding incident response. This represents a~~

~~net gain to bulk power system reliability, however, since many of those assets do not meet criteria for inclusion under Versions 1-4.~~

~~Weighing the risks to overall BES reliability, the drafting team determined that this re-categorization represents the option that would be the least detrimental to restoration function and, thus, overall BES reliability. Removing Blackstart Resources and Cranking Paths from medium impact promotes overall reliability, as the likely alternative is fewer Blackstart Resources supporting timely restoration when needed.~~

~~BES Cyber Systems for generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan default to low impact. NERC Standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan, as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired.~~

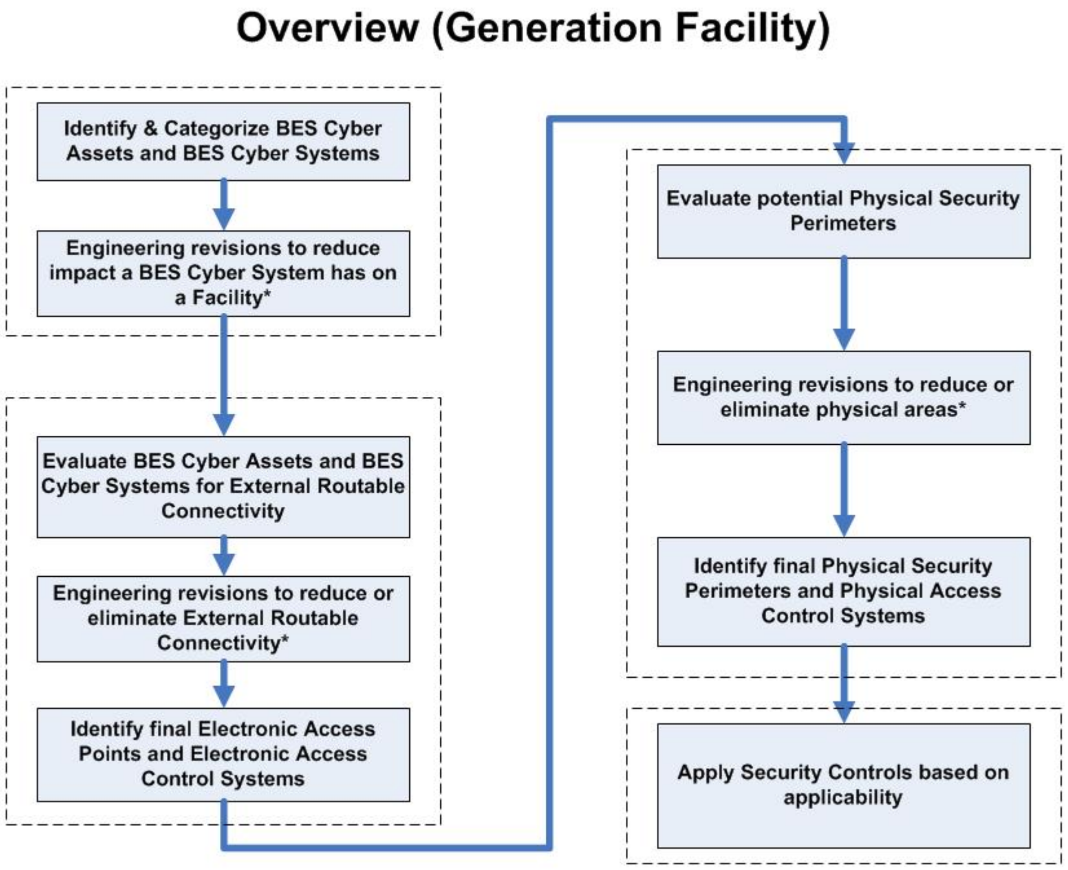
~~Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC Standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."~~

~~BES Cyber Systems for Facilities and Elements comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first Interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, default to the category of low impact: however, these systems are explicitly called out to ensure consideration for inclusion in the scope of the version 5 CIP standards. This requirement for inclusion in the scope is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started.~~

~~Distribution Providers may note that they may have BES Cyber Systems that must be scoped in if they have Elements listed in the Transmission Operator's Restoration Plan that are components of the Cranking Path.~~

~~Use Case: CIP Process Flow~~

~~The following CIP use case process flow for a generator Operator/Owner was provided by a participant in the development of the Version 5 standards and is provided here as an example of a process used to identify and categorize BES Cyber Systems and BES Cyber Assets; review, develop, and implement strategies to mitigate overall risks; and apply applicable security controls.~~



* - Engineering revisions will need to be reviewed for cost justification, operational\safety requirements, support requirements, and technical limitations.

~~Guidelines and Technical Basis~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~BES Cyber Systems at each site location have varying impact on the reliable operation of the Bulk Electric System. Attachment 1 provides a set of "bright-line" criteria that the Responsible Entity must use to identify these BES Cyber Systems in accordance with the impact on the BES. BES Cyber Systems must be identified and categorized according to their impact so that the appropriate measures can be applied, commensurate with their impact. These impact categories will be the basis for the application of appropriate requirements in CIP-003-CIP-011.~~

~~Rationale for R2:~~

~~The lists required by Requirement R1 are reviewed on a periodic basis to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. The miscategorization or non-categorization of a BES Cyber System can lead to the application of inadequate or non-existent cyber security controls that can lead to compromise or misuse that can affect the real-time operation of the BES. The CIP Senior Manager's approval ensures proper oversight of the process by the appropriate Responsible Entity personnel.~~

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	

3	12/16/09	Updated version number from -2 to -3. Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5.1	9/30/13	Replaced “Devices” with “Systems” in a definition in background section.	Errata
5.1	11/22/13	FERC Order issued approving CIP-002-5.1.	
5.1a	11/02/16	Adopted by the NERC Board of Trustees.	
5.1a	12/14/2016	FERC letter Order approving CIP-002-5.1a. Docket No. RD17-2-000.	
6		Criteria 2.12 Modifications Withdrawn	
7		Virtualization modifications.	

Appendix 1

~~Requirement Number and Text of Requirement~~

~~CIP-002-5.1, Requirement R1~~

~~R1. Each Responsible Entity shall implement a process that considers each of the following assets for purposes of parts 1.1 through 1.3:~~

~~Control Centers and backup Control Centers;~~

~~Transmission stations and substations;~~

~~Generation resources;~~

~~Systems and facilities critical to system restoration, including Blackstart Resources and Cranking Paths and initial switching requirements;~~

~~Special Protection Systems that support the reliable operation of the Bulk Electric System; and~~

~~For Distribution Providers, Protection Systems specified in Applicability section 4.2.1 above.~~

~~Identify each of the high impact BES Cyber Systems according to Attachment 1, Section 1, if any, at each asset;~~

~~Identify each of the medium impact BES Cyber Systems according to Attachment 1, Section 2, if any, at each asset; and~~

~~Identify each asset that contains a low impact BES Cyber System according to Attachment 1, Section 3, if any (a discrete list of low impact BES Cyber Systems is not required).~~

~~Attachment 1, Criterion 2.1~~

~~Medium Impact Rating (M)~~

~~Each BES Cyber System, not included in Section 1 above, associated with any of the following:~~

~~Commissioned generation, by each group of generating units at a single plant location, with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. For each group of generating units, the only BES Cyber Systems that meet this criterion are those shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection.~~

~~Questions~~

~~Energy Sector Security Consortium, Inc. (EnergySec) submitted a Request for Interpretation (RFI) seeking clarification of Criterion 2.1 of Attachment 1 in Reliability Standard CIP-002-5.1 regarding the use of the phrase "shared BES Cyber Systems."~~

~~The Interpretation Drafting Team identified the following questions in the RFI:~~

~~**Whether the phrase “shared BES Cyber Systems” means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?**~~

~~**Whether the phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?**~~

~~**If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?**~~

~~**Responses**~~

~~Question 1: Whether the phrase “shared BES Cyber Systems,” means that the evaluation for Criterion 2.1 shall be performed individually for each discrete BES Cyber System at a single plant location, or collectively for groups of BES Cyber Systems?~~

~~**The evaluation as to whether a BES Cyber System is shared should be performed individually for each discrete BES Cyber System. In the standard language of CIP-002-5.1, there is no reference to or obligation to group BES Cyber Systems. Requirement R1, part 1.2 states “Identify *each* of the medium impact BES Cyber Systems according to Attachment 1, Section 2…” Further, the preamble of Section 2 of CIP-002-5.1 Attachment 1 states “*Each BES Cyber System*…associated with any of the following [criteria].” (emphasis added)**~~

~~**Additionally, the Background section of CIP-002-5.1 states that “[i]t is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System.” The Background section also provides:**~~

~~**The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.**~~

~~Question 2: Whether the phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple units, or groups of BES Cyber Systems that could collectively impact multiple units?~~

~~**The phrase “shared BES Cyber Systems” refers to discrete BES Cyber Systems that are shared by multiple generation units.**~~

~~**The use of the term “shared” is also clarified in the NERC Frequently Asked Questions (FAQ) document issued by NERC Compliance to support implementation of the CIP Reliability Standards. FAQ #49 provides:**~~

~~**Shared BES Cyber Systems are those that are associated with any combination of units in a single Interconnection, as referenced in CIP-002-5.1, Attachment 1, impact rating criteria 2.1 and 2.2. For criterion 2.1 "BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW in a single Interconnection." For criterion 2.2: "BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of any combination of resources that in aggregate equal or exceed 1000 MVAR. Also refer to the Lesson Learned for CIP-002-5.1 Requirement R1:**~~ ~~Impact Rating of Generation Resource Shared BES Cyber Systems~~ ~~**for further information and examples.**~~

~~Question 3: If the phrase applies collectively to groups of BES Cyber Systems, what criteria should be used to determine which BES Cyber Systems should be grouped for collective evaluation?~~

~~**The phrase applies to each discrete BES Cyber System.**~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29–October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-Y

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

    4.1.1. Balancing Authority

    4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

    4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

    4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

    4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

    4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

    4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

    4.1.3. Generator Operator

    4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-Y:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).

4.2.3.3. Cyber Systems, associated with communication links, between Cyber Systems providing confidentiality and integrity of an

Electronic Security Perimeter (ESP) that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation; and

1.2.6. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and SCI that supports any part of a low impact BCS, that include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or SCI that supports any part of a low impact BCS is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-Y)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BCS but did not address one of the nine topics required by Requirement R1. 			identify, assess, and correct language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BCS.
6	1/21/16	FERC Order issued approving CIP-003-6. Docket No. RM15-14-000	
7	2/9/17	Adopted by the NERC Board of Trustees.	Revised to address FERC Order No. 822 directives regarding (1) the definition of LERC and (2) transient devices.
7	4/19/18	FERC Order issued approving CIP-003-7. Docket No. RM17-11-000	
8	5/9/19	Adopted by the NERC Board of Trustees.	Removed SPS references. Revised to address FERC Order No. 843 regarding mitigating the risk of malicious code.
8	7/31/2019	FERC Order issued approving CIP-003-8. Docket No. RD19-5-000.	
Y	TBD	Virtualization conforming changes	

Attachment 1

Required Sections for Cyber Security Plan(s) for Assets Containing Low Impact BCS or SCI that supports any part of a Low Impact BCS

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, (2) the asset or the locations of the SCI supporting low impact BCS within the asset, and (3) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BCS and each asset containing SCI that supports any part of a low impact BCS identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. Between:

- a low impact BCS; or
- an SCI that supports any part of a low impact BCS,

and a system(s) outside:

  - the asset containing the low impact BCS; or
  - the asset containing the SCI that supports any part of a low impact BCS; and

ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or the asset containing the SCI that supports any part of a low impact BCS; and

iii. not used for time-sensitive protection or control functions between intelligent electronic devices.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or SCI that supports any part of a low impact BCS, per system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, or SCI that supports any part of a low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting the TCA to a low impact BCS or the SCI that supports any part of a low impact BCS (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review of controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code;
- Review of system hardening used by the party; or
- Review of other method(s) to mitigate the introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or SCI that supports any part of a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code prior to connecting the Removable Media to a low impact BCS or SCI that supports any part of a low impact BCS.

Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BCS or SCI that supports any part of a low impact BCS

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact BCS or the SCI that supports any part of a low impact BCS within the asset; and
  b. The Cyber Asset(s), VCA, or SCI specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets containing low impact BCS, or SCI that supports any part of a low impact BCS, routable communication between a low impact BCS, or SCI that supports any part of a low impact BCS, and systems outside the asset is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communication is used for time-sensitive protection or control functions between intelligent electronic devices. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) between the low impact BCS, or SCI that supports any part of a low impact BCS, and systems outside the asset containing low impact BCS, or SCI that supports any part of a low impact BCS, or lists of implemented electronic access controls (e.g., access control lists

restricting IP addresses, ports, or services; implementing unidirectional gateways).

2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS or SCI that supports any part of a low impact BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, controls to maintain the known good state of the OS and software, application whitelisting practices, or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of controls to maintain the

known good state of the OS and software, or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~initial~~ second draft of proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
~~45~~60-day formal comment period with ballot	January 21–~~February 8~~March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
~~45-day formal comment period with ballot~~	~~May 11–June 24, 2021~~
45-day formal comment period with ballot	August ~~3~~29–~~September 16~~October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-Y~~9~~

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-003-Y~~9~~:

4.2.3.1. Cyber ~~s~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~s~~Systems associated with communication links logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI).

4.2.3.3. Cyber ~~s~~Systems, associated with communication links, between Cyber ~~Assets~~Systems providing confidentiality and integrity of an Electronic Security Perimeter (ESP) ~~which~~ that ~~, Virtual Cyber Assets (VCA), or SCI performing logical isolation that~~ extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. **Effective Dates:** See "Project 2016-02 ~~Virtualization~~ Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. For its high impact and medium impact BCS~~ and associated SCI~~, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BCS (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BCS (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2. For its assets identified in CIP-002 containing low impact BCS~~ and associated SCI~~, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls;

1.2.4. Cyber Security Incident response;

1.2.5. Transient Cyber Assets (TCA) and Removable Media malicious code risk mitigation; and

1.2.6. Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BCS shall implement one or more documented cyber security plan(s) for its low impact BCS, and ~~their associated~~ SCI that supports any part of a low impact BCS, that

include the sections in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BCS or ~~their associated~~ SCI that supports any part of a low impact BCS is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the sections in Attachment 1 and additional evidence to demonstrate implementation of the cyber security plan(s). Additional examples of evidence per section are located in Attachment 2.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Attachment 1

Required Sections for Cyber Security Plan(s) for Assets Containing Low Impact BCS ~~or their associatedand~~or SCI that supports any part of a Low Impact BCS

Responsible Entities shall include each of the sections provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple-impact BCS ratings can utilize policies, procedures, and processes for their high or medium impact BCS to fulfill the sections for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

Section 1. Cyber Security Awareness: Each Responsible Entity shall reinforce, at least once every 15 calendar months, cyber security practices (which may include associated physical security practices).

Section 2. Physical Security Controls: Each Responsible Entity shall control physical access, based on need as determined by the Responsible Entity, to (1) the asset or the locations of the low impact BCS within the asset, (2) the asset or the locations of the SCI ~~hosting~~ supporting low impact ~~BES Cyber Assets~~BCS within the asset, and (3) the Cyber Asset(s) or VCA, as specified by the Responsible Entity, that provide electronic access control(s) implemented for Section 3.1, if any.

Section 3. Electronic Access Controls: For each asset containing low impact BCS and each asset containing ~~or its associated~~ SCI that supports any part of a low impact BCS identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to:

3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are:

i. ~~b~~Between:

- a low impact- BCS; or ~~and a system(s) outside the asset containing low impact BCS;~~
- ~~between~~ an SCI ~~hosting~~ that supports any part of~~ing~~ a low impact BCS,~~ and a system(s) outside the asset(s) containing the SCI hosting a low impact BCS;~~

and a system(s) outside:

- the asset containing the low impact BCS; or
- the asset containing the SCI that supports any part of~~ing~~ a low impact BCS; and

~~i.~~ii. using a routable protocol when entering or leaving the asset containing the low impact BCS or ~~their associated~~ the asset containing the SCI that supports any part of~~ing~~ a low impact BCS; and

~~ii.~~iii. not used for time-sensitive protection or control functions between intelligent electronic devices~~ (e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE)~~.

3.2 Authenticate all Dial-up Connectivity, if any, that provides access to low impact BCS or ~~their associated~~ SCI that supports any part of a low impact BCS, per ~~Cyber Asset or VCA~~ system capability.

Section 4. Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents;

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;

4.4 Incident handling for Cyber Security Incidents;

4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident; and

4.6 Updating the Cyber Security Incident response plan(s), if needed, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation: Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more plan(s) to achieve the objective of mitigating the risk of the introduction of malicious code to low impact BCS, or ~~its associated~~ SCI that supports any part of~~ing~~ a low impact BCS, through the use of TCA or Removable Media. The plan(s) shall include:

5.1 For TCA managed by the Responsible Entity, if any, the use of one or a combination of the following in an ongoing or on-demand manner (per TCA capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code;

- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

5.2 For TCA managed by a party other than the Responsible Entity, if any:

5.2.1 Use one or a combination of the following prior to connecting the TCA to a low impact BCS or ~~its associated~~the SCI that supports any part of~~ing~~ a low impact BCS (per TCA capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review of controls that maintain the state of the operating system and software such that it is in a known state prior to execution that mitigates the risk of introduction of malicious code ~~use of live operating system and software executable only from read-only media~~;
- Review of system hardening used by the party; or
- Review of ~~O~~other method(s) to mitigate the introduction of malicious code.

5.2.2 For any method used pursuant to 5.2.1, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the TCA.

5.3 For Removable Media, the use of each of the following:

5.3.1 Method(s) to detect malicious code on Removable Media using a Cyber Asset or VCA other than a BCS or ~~its associated~~the SCI that supports any part of~~ing~~ a low impact BCS; and

5.3.2 Mitigation of the threat of detected malicious code ~~on the Removable Media~~ prior to connecting the Removable Media to a low impact BCS or ~~its associated~~the SCI that supports any part of~~ing~~ a low impact BCS.

Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BCS or ~~their associated~~the SCI that supports any part of~~ing~~ a low impact BCS

Section 1. Cyber Security Awareness: An example of evidence for Section 1 may include, but is not limited to, documentation that the reinforcement of cyber security practices occurred at least once every 15 calendar months. The evidence could be documentation through one or more of the following methods:

- Direct communications (for example, e-mails, memos, or computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

Section 2. Physical Security Controls: Examples of evidence for Section 2 may include, but are not limited to:

- Documentation of the selected access control(s) (e.g., card key, locks, perimeter controls), monitoring controls (e.g., alarm systems, human observation), or other operational, procedural, or technical physical security controls that control physical access to both:
  a. The asset, if any, or the locations of the low impact BCS or ~~their associated~~the SCI that supports any part of~~ing~~ a low impact BCS within the asset; and
  b. The Cyber Asset(s), VCA, or SCI specified by the Responsible Entity that provide(s) electronic access controls implemented for Attachment 1, Section 3.1, if any.

Section 3. Electronic Access Controls: Examples of evidence for Section 3 may include, but are not limited to:

1. Documentation showing that at each asset or group of assets containing low impact BCS, or SCI that supports any part of a low impact BCS, routable communication between a low impact BCS, or SCI that supports any part of a low impact BCS, and -systems outside the asset is restricted by electronic access controls to permit only inbound and outbound electronic access that the Responsible Entity deems necessary, except where an entity provides rationale that communication is used for time-sensitive protection or control functions between intelligent electronic devices. Examples of such documentation may include, but are not limited to representative diagrams that illustrate control of inbound and outbound communication(s) between the low impact BCS, or SCI that supports any part of a low impact BCS, and systems outside the asset containing low impact BCS, or SCI that supports any part of a low impact BCS, or

lists of implemented electronic access controls (e.g., access control lists restricting IP addresses, ports, or services; implementing unidirectional gateways).

2. Documentation of authentication for Dial-up Connectivity (e.g., dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, or access control on the BCS or SCI that supports any part of a low impact BCS).

Section 4. Cyber Security Incident Response: An example of evidence for Section 4 may include, but is not limited to, dated documentation, such as policies, procedures, or process documents of one or more Cyber Security Incident response plan(s) developed either by asset or group of assets that include the following processes:

1. to identify, classify, and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and for notifying the Electricity Information Sharing and Analysis Center (E-ISAC);
2. to identify and document the roles and responsibilities for Cyber Security Incident response by groups or individuals (e.g., initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g., containment, eradication, or recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to update, as needed, Cyber Security Incident response plan(s) within 180 calendar days after completion of a test or actual Reportable Cyber Security Incident.

Section 5. TCA and Removable Media Malicious Code Risk Mitigation:

1. Examples of evidence for Section 5.1 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, controls to maintain the known good state of the OS and software, application whitelisting practices, ~~processes to restrict communication,~~ or other method(s) to mitigate the introduction of malicious code. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the TCA does not have the capability.
2. Examples of evidence for Section 5.2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update

process, the use of application whitelisting, ~~use of live operating systems~~use of controls to maintain the known good state of the OS and software, or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for TCA managed by a party other than the Responsible Entity. If a TCA does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the TCA does not have the capability.

Examples of evidence for Attachment 1, Section 5.2.2 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigation is necessary and has been implemented prior to connecting the TCA managed by a party other than the Responsible Entity.

3. Examples of evidence for Section 5.3.1 may include, but are not limited to, documented process(es) of the method(s) used to detect malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Examples of evidence for Section 5.3.2 may include, but are not limited to, documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and the mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21– March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29– October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 2021

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-Y

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting BCS.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

   4.1.5. Reliability Coordinator

   4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-Y:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002-5.1a identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. Effective Dates: See "Project 2016-02 Modification to CIP Standards Implementation Plan"

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-Y Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-Y Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-Y Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS Medium Impact BCS SCI identified independently supporting an Applicable System above	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-Y Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-Y Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-Y Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium Impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BCSI and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with electronic interconnectivity and interoperability with other Cyber Systems, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-Y Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to Applicable Systems that collectively include each of the applicable requirement parts in *CIP-004-Y Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-Y Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-Y Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-Y Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-X Table R3 – Personnel Risk Assessment Program

Part	Applicable Systems	Requirements	Measures
3.3	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed, except during CIP Exceptional Circumstances, according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-Y Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-Y Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-Y Table R4 – Access Management Program			
Part	Applicable Systems	Requirements	Measures
4.1	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; and 4.1.2. Unescorted physical access into a Physical Security Perimeter	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access and unescorted physical access in a Physical Security Perimeter.

CIP-004-Y Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-Y Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-Y Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-Y Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-Y Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access (IRA) upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-Y Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-Y Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-Y Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: - Workflow or sign-off form showing password reset within 30 calendar days of the termination; - Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or - Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the "Applicable Systems" identified in *CIP-004-Y Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-Y Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-Y Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-Y Table R6 – Access Management for BES Cyber System Information

Part	Applicable Systems	Requirements	Measures
6.1	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Prior to provisioning, authorize (unless already authorized according to Part 4.1.) based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 6.1.1. Provisioned electronic access to electronic BCSI; and 6.1.2. Provisioned physical access to physical BCSI.	Examples of evidence may include, but are not limited to, individual records or lists that include who is authorized, the date of the authorization, and the justification of business need for the provisioned access.

CIP-004-Y Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.2	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	Verify at least once every 15 calendar months that all individuals with provisioned access to BCSI: 6.2.1. have an authorization record; and 6.2.2. still need the provisioned access to perform their current work functions, as determined by the Responsible Entity.	Examples of evidence may include, but are not limited to, the documentation of the review that includes all of the following: • List of authorized individuals; • List of individuals who have been provisioned access; • Verification that provisioned access is appropriate based on need; and • Documented reconciliation actions, if any.
6.3	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C. Compliance

1. Compliance Monitoring Process:

1.1. **Compliance Enforcement Authority:** “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Program:**
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-Y)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR The Responsible Entity implemented a cyber security training program but failed to include four

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	

Version	Date	Action	Change Tracking
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-004-6. Docket No. RM15-14-000	

Version	Date	Action	Change Tracking
7	TBD	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
~~45~~60-day formal comment period with ballot	January 21 ~~February 8~~– March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29~~3~~– ~~September 16~~ October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 2021

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-Y~~X~~

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems (BCS) by requiring an appropriate level of personnel risk assessment, training, security awareness, and access management in support of protecting ~~BES Cyber Systems~~BCS.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as “Responsible Entities.” For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-Y~~X~~:

4.2.3.1. Cyber ~~Assets~~ Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~Assets~~ Systems associated with communication ~~networks and data communication~~ links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

~~**4.2.3.3.**~~**4.2.3.4.** The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

~~4.2.3.4.~~4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no ~~BES Cyber Systems~~ BCS categorized as high impact or medium impact according to the CIP-002-5.1a identification and categorization processes.

4.3. “Applicable Systems” Columns in Tables: Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modification to CIP Standards Implementation Plan” ~~for CIP-004-X~~.

~~**Background:**~~

~~Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~

~~Most requirements open with, “*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*” The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.~~

~~The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.~~

~~The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.~~

~~Similarly, the term *program* may refer to the organization’s overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.~~

~~Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.~~

~~Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.~~

~~Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."~~

~~Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.~~

~~**"Applicable Systems" Columns in Tables:**~~

~~Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.~~

~~**High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1a identification and categorization processes.~~

~~**Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1a identification and categorization processes.~~

~~**Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.~~

~~**Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.~~

~~**Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.~~

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-Y~~X~~ Table R1 – Security Awareness Program

Part	Applicable Systems	Requirements	Measures
1.1	High Impact ~~BES Cyber Systems~~BCS Medium Impact ~~BES Cyber Systems~~BCS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to ~~BES Cyber~~ Applicable Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-Y~~X~~ Table R2 – Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
2.1	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. Electronic Access Control or Monitoring Systems (EACMS); and 2. Physical Access Control Systems (PACS) Medium Impact ~~BES Cyber Systems~~BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of ~~BES Cyber System Information~~BCSI and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for ~~BES Cyber Systems~~BCS; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with ~~a BES Cyber System's~~ electronic interconnectivity and interoperability with other Cyber ~~Assets~~Systems, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-Y~~X~~ Table R2 – Cyber Security Training Program

Part	Applicable Systems	Requirements	Measures
2.2	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to ~~applicable Cyber Assets~~Applicable Systems, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.

CIP-004-Y~~X~~ Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to ~~BES Cyber Systems~~Applicable Systems that collectively include each of the applicable requirement parts in *CIP-004-~~X~~Y Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*.

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ Y Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~X~~ Y Table R3 – Personnel Risk Assessment Program

Part	Applicable Systems	Requirements	Measures
3.1	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

3.3	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed, except during CIP Exceptional Circumstances, according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ Y Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ Y Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~X~~ Y Table R4 – Access Management Program

Part	Applicable Systems	Requirements	Measures
4.1	High Impact ~~BES Cyber Systems~~ BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~ BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; and 4.1.2. Unescorted physical access into a Physical Security Perimeter	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access and unescorted physical access in a Physical Security Perimeter.

CIP-004-~~X~~ Y Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~X~~ Y Table R4 – Access Management Program

Part	Applicable Systems	Requirements	Measures
4.3	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-Y~~X~~ Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-Y~~X~~ Table R5 – Access Revocation

Part	Applicable Systems	Requirements	Measures
5.1	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access (IRA) upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~X~~ Y Table R5 – Access Revocation			
Part	Applicable Systems	Requirements	Measures
5.2	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with ~~External Routable Connectivity~~ ERC and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~X~~Y Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact ~~BES Cyber Systems~~BCS and their associated: - EACMS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Part 5.1) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

5.4	High Impact ~~BES Cyber Systems~~BCS and their associated: - EACMS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: - Workflow or sign-off form showing password reset within 30 calendar days of the termination; - Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or - Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

R6. Each Responsible Entity shall implement one or more documented access management program(s) to authorize, verify, and revoke provisioned access to BCSI pertaining to the “Applicable Systems” identified in *CIP-004-~~X~~ Y Table R6 – Access Management for BES Cyber System Information* that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ Y Table R6 – Access Management for BES Cyber System Information*. To be considered access to BCSI in the context of this requirement, an individual has both the ability to obtain and use BCSI. Provisioned access is to be considered the result of the specific actions taken to provide an individual(s) the means to access BCSI (e.g., may include physical keys or access cards, user accounts and associated rights and privileges, encryption keys). *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M6. Evidence must include each of the applicable documented programs that collectively include the applicable requirement parts in *CIP-004-~~X~~ Y Table R6 – Access Management for BES Cyber System Information* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~X~~ Y Table R6 – Access Management for BES Cyber System Information			
Part	**Applicable Systems**	**Requirements**	**Measures**
6.1	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Prior to provisioning, authorize (unless already authorized according to Part 4.1.) based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 6.1.1. Provisioned electronic access to electronic BCSI; and 6.1.2. Provisioned physical access to physical BCSI.	Examples of evidence may include, but are not limited to, individual records or lists that include who is authorized, the date of the authorization, and the justification of business need for the provisioned access.

CIP-004-~~X~~ Y Table R6 – Access Management for BES Cyber System Information

6.2	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	Verify at least once every 15 calendar months that all individuals with provisioned access to BCSI: 6.2.1. have an authorization record; and 6.2.2. still need the provisioned access to perform their current work functions, as determined by the Responsible Entity.	Examples of evidence may include, but are not limited to, the documentation of the review that includes all of the following: - List of authorized individuals; - List of individuals who have been provisioned access; - Verification that provisioned access is appropriate based on need; and - Documented reconciliation actions, if any.
6.3	High Impact ~~BES Cyber Systems~~BCS and their associated: 1. EACMS; and 2. PACS Medium Impact ~~BES Cyber Systems~~BCS with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS SCI identified independently supporting an ~~a~~Applicable ~~s~~System above	For termination actions, remove the individual's ability to use provisioned access to BCSI (unless already revoked according to Part 5.1) by the end of the next calendar day following the effective date of the termination action.	Examples of dated evidence may include, but are not limited to, access revocation records associated with the terminations and dated within the next calendar day of the termination action.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- The applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~X~~Y)			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR The Responsible Entity implemented a cyber

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~X~~Y)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			The Responsible Entity implemented a cyber security training program but failed to train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train one individual with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	The Responsible Entity implemented a cyber security training program but failed to train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train two individuals with authorized electronic or authorized unescorted physical access within 15	The Responsible Entity implemented a cyber security training program but failed to train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train three individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	security training program but failed to include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to

5.1	9/30/13	Modified two VSLs in R4	Errata
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-004-6. Docket No. RM15-14-000	
7	TBD	Adopted by the NERC Board of Trustees	Revised to enhance BES reliability for entities to manage their BCSI.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29–October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-8

3. **Purpose:** To protect BES Cyber Systems (BCS) against compromise by permitting only known and controlled communication to reduce the likelihood of misoperations or instability in the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-8:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an Electronic Security Perimeter (ESP) that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. Effective Date: See "Project 2016-02 Modification to CIP Standards Implementation Plan".

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – Electronic Security Perimeter(s)*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – Electronic Security Perimeter(s)* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R1 – Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated Protected Cyber Asset (PCA) Medium Impact BCS and their associated PCA	Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems such as: • Electronic Access Point (EAP) configuration or policies; • Network infrastructure configuration or policies (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • SCI configuration or policies (hypervisor, fabric, backplane, or SAN configuration); that enforces an ESP and documents the business need.

CIP-005-8 Table R1 – Electronic Security Perimeter(s)			
Part	Applicable Systems	Requirements	Measures
1.2	SCI identified independently supporting an Applicable System from Part 1.1. EACMS that enforces an ESP for the Applicable Systems in Part 1.1.	Permit only needed and controlled communications to and from Management Interfaces, and deny all other communications.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems that enforce access control and ESP such as: • Logical network infrastructure configuration (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment), • Physically isolated out-of-band network for dedicated Management Interfaces, or • SCI configuration or policies showing the isolation of the management plane resources (hypervisor, fabric, back-plane, or SAN configuration).

CIP-005-8 Table R1 – Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3.	SCI identified independently supporting an Applicable System from Part 1.1.	Deny network communications from Applicable Systems of Part 1.1 to the Management Interface, per system capability.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems that enforce access control such as: • SCI configuration or policies showing the isolation of the management plane resources (hypervisor, fabric, back-plane, or SAN configuration); • Logical network infrastructure configuration (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • Physically isolated out-of-band network for dedicated Management Interfaces.

CIP-005-8 Table R1 – Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BCS Medium Impact BCS at Control Centers	Protect the data traversing communication links used to span a single ESP between Physical Security Perimeters (PSP) through the use of: • confidentiality and integrity controls (such as encryption), or • physical controls that restrict access to the cabling and other nonprogrammable communication components in those instances when such cabling and components are located outside of a PSP, Excluding: i. Real-time Assessment and Real-time monitoring data while being transmitted between Control Centers subject to CIP-012; and **ii.** time-sensitive protection or control functions between intelligent electronic devices.	An example of evidence may include, but is not limited to, documentation of methods used to protect the confidentiality and integrity of the data, such as: • Configurations or policies used to enforce encryption; or • The physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays).

CIP-005-8 Table R1 – Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BCS with Dial-up Connectivity and their associated: 1. PCA; 2. PACS hosted on SCI; and 3. EACMS hosted on SCI Medium Impact BCS with Dial-up Connectivity and their associated: 1. PCA; 2. PACS hosted on SCI; and 3. EACMS hosted on SCI SCI identified independently supporting an Applicable System above.	Perform authentication when establishing Dial-up Connectivity with Applicable Systems, per system capability.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.
1.6	EACMS that enforces an ESP for the Applicable Systems in Part 1.1. at Control Centers	Detect known or suspected malicious Internet Protocol (IP) communications entering or leaving an ESP.	An example of evidence may include, but is not limited to, documentation that malicious Internet Protocol (IP) communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

R2. For all IRA and vendor remote access, excluding Dial-up Connectivity, the Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, per system capability, in *CIP-005-8 Table R2 –Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R2 –Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: • PCA Medium Impact BCS with ERC and their associated: • PCA EACMS that enforces an ESP for the Applicable Systems in Part 1.1. SCI identified independently supporting an Applicable System above Intermediate Systems used to access Applicable Systems of Part 2.1	Permit authorized IRA, if any, onlythrough an Intermediate System.	Examples of evidence may include, but are not limited to, network diagrams, architecture documents, or Management Systems reports that show all IRA is through an Intermediate System.
2.2	Intermediate Systems used to access Applicable Systems of Part 2.1	Protect the confidentiality and integrity (e.g., encryption) of IRA between the client and the Intermediate System.	An example of evidence may include, but is not limited to, architecture documents or configuration detailing where confidentiality and integrity controls initiate and terminate.

CIP-005-8 Table R2 – Remote Access Management			
Part	Applicable Systems	Requirements	Measures
2.3	Intermediate Systems used to access Applicable Systems of Part 2.1	Require multi-factor authentication to the Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

CIP-005-8 Table R2 – Remote Access Management			
Part	Applicable Systems	Requirements	Measures
2.4	High Impact BCS with vendor remote access and their associated: • PCA Medium Impact BCS with vendor remote access and their associated: • PCA SCI identified independently supporting an Applicable System above	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including IRA and system-to-system remote access), such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BCS with vendor remote access and their associated: • PCA Medium Impact BCS with vendor remote access and their associated: • PCA SCI identified independently supporting an Applicable System above	Have one or more method(s) to disable active vendor remote access (including IRA and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including IRA and system-to-system remote access.
2.6	Intermediate Systems used to access Applicable Systems of Part 2.1	Implement for Applicable Systems as follows: **2.6.1.** Restrict VCAs of Intermediate Systems to only share CPU and memory with other Intermediate Systems and their associated SCI. **2.6.2.** Permit only needed and controlled communications between Intermediate Systems and Applicable Systerms of Part 2.1.	Examples of evidence may include, but are not limited to, documentation that includes the following: • Configuration showing that the CPU and memory can only be shared with other IS. Configuration showing how communications are controlled between the IS and applicable systems.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts in *CIP-005-8 Table R3 –Vendor Remote Access Management for EACMS and PACS*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M3. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	EACMS and PACS associated with High Impact BCS EACMS and PACS associated with Medium Impact BCS with ERC SCI identified independently supporting an Applicable System above	Have one or more method(s) to determine authenticated vendor-initiated remote connections.	Examples of evidence may include, but are not limited to, documentation of the methods used to determine authenticated vendor-initiated remote connections, such as: • Methods for accessing logged or monitoring information to determine authenticated vendor-initiated remote connections.
3.2	EACMS and PACS associated with High Impact BCS EACMS and PACS associated with Medium Impact BCS with ERC SCI identified independently supporting an Applicable System above	Have one or more method(s) to terminate authenticated vendor-initiated remote connections and control the ability to reconnect.	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to terminate authenticated vendor-initiated remote connections to applicable systems. Examples include terminating an active vendor-initiated shell/process/session or dropping an active vendor-initiated connection in a firewall. Methods to control the ability to reconnect, if necessary,

CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS			
Part	**Applicable Systems**	**Requirements**	**Measures**
			could be: disabling an Active Directory account; disabling a security token; restricting IP addresses from vendor sources in a firewall; or physically disconnecting a network cable to prevent a reconnection.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.			The Responsible Entity did not have a method for detecting known or suspected malicious Internet Protocol (IP) communications entering or leaving the ESP required by Part 1.1 or Part 1.2.2.	The Responsible Entity did not document one or more processes for *CIP-005-8 Table R1 – ESP*. (Requirement R1) OR The Responsible Entity did not permit only needed and controlled communications to and from applicable systems either individually or as a group and ESP all other communications. (Part 1.1) OR The Responsible Entity did not implement, for applicable systems, a method for restricting Management Systems to only share CPU and memory with its associated SCI and other Management Systems, per system

3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	
6	07/20/17	Modified to address certain directives in FERC Order No. 829.	Revised
6	08/10/17	Adopted by the NERC Board of Trustees.	
6	10/18/2018	FERC Order approving CIP-005-6. Docket No. RM17-13-000.	
7	TBD	Modified to address directives in FERC Order No. 850	
8	TBD	Virtualization modifications and ERC/IRA	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~initial~~ second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
~~45~~60-day formal comment period with ballot	January 21–~~February 8~~March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
~~45-day formal comment period with ballot~~	~~May 11–June 24, 2021~~
45-day formal comment period with ballot	August ~~3~~29–~~September 16~~October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — ~~BES Cyber System Logical Isolation~~Electronic Security Perimeter(s)

2. **Number:** CIP-005-8

3. **Purpose:** To protect BES Cyber Systems (BCS) against compromise by permitting only known and controlled communication to ~~and from the system and logically isolating all other communication to~~ reduce the likelihood of misoperations or instability in the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-8:

4.2.3.1. Cyber ~~s~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber ~~s~~Systems associated with communication links ~~logically isolated from, but not providing logical isolation for, BCS or~~

~~Shared Cyber Infrastructure (SCI)~~between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber ~~s~~Systems, associated with communication links, between the Cyber ~~Assets~~Systems providing confidentiality and integrity of an Electronic Security Perimeter (ESP) that ~~, Virtual Cyber Assets, or SCI performing logical isolation that~~ extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~ part applies. ~~This concept was adapted from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.~~

5. Effective Date: See "Project 2016-02 ~~Virtualization~~ Modification to CIP Standards Implementation Plan".

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – ~~Logical Isolation~~Electronic Security Perimeter(s)*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-8 Table R1 – Electronic Security Perimeter(s)~~Logical Isolation~~* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R1 – Electronic Security Perimeter(s)~~Logical Isolation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS ~~connected to a network via a routable protocol~~ and their associated ~~:~~ Protected Cyber Asset (PCA)~~;~~ ~~(VCA) Physical Access Control Systems (PACS) hosted on SCI; and~~ ~~Electronic Access Control or Monitoring System (EACMS) hosted on SCI~~ ~~•~~ Medium Impact BCS ~~connected to a network via a routable protocol~~ and their associated PCA~~:~~ ~~PCA;~~ ~~PACS hosted on SCI; and~~ ~~EACMS hosted on SCI~~	Applicable Systems connected to a network via a routable protocol must be protected by an ESP that permits only needed communications and denies ~~Permit only needed and controlled communications to and from applicable systems either individually or as a group and logically isolate~~ all other communications, excluding time-sensitive protection or control functions between intelligent electronic devices. ~~(e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).~~ Host-based firewalls that only protect the host on which they reside are not a sufficient control to meet this requirement.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems such as: • Electronic Access Point (EAP) configuration or policies; • Network infrastructure configuration or policies (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • SCI configuration or policies (hypervisor, fabric, backplane, or SAN configuration); that enforces an ESP ~~electronic access control and logical isolation~~ and documents the business need.

CIP-005-8 Table R1 – Electronic Security Perimeter(s)~~Logical Isolation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	SCI identified independently ~~hosting~~supporting an Applicable System from Part 1.1. ~~High or Medium Impact BCS or their associated:~~ ~~• PCA;~~ ~~• PACS; or~~ ~~• EACMS~~ ~~Management Modules of SCI hosting High or Medium Impact BCS or their associated:~~ ~~• PCA;~~ ~~• PACS; or~~ ~~• EACMS~~ EACMS that enforces an ESP for the Applicable Systems in Part 1.1. ~~perform logical isolation for a High Impact BCS~~ ~~EACMS that perform logical isolation for a Medium Impact BCS~~	~~Implement for applicable systems as follows:~~ ~~1.2.1. Restrict Management Systems to only share CPU and memory with its associated SCI and other Management Systems, per system capability.~~ ~~1.2.2.~~ Permit only needed and controlled communications to and from Management Interfaces, and ~~Management Systems, logically isolating~~deny all other communications. ~~1.2.3. Deny communications from BCS and their associated PCAs to the Management Interfaces and Management Systems, per system capability.~~	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems that enforce access control and ESP~~logical isolation~~ such as: • Logical~~ly isolated out-of-band~~ network infrastructure configuration (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment), • Physically isolated out-of-band network for dedicated Management Interfaces, or~~Management Modules, or Management Systems~~ • SCI configuration or policies showing the isolation of the management plane resources (hypervisor, fabric, back-plane, or SAN configuration).

CIP-005-8 Table R1 – Electronic Security Perimeter(s)~~Logical Isolation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3.	SCI identified independently supporting an Applicable System from Part 1.1.	Deny network communications from Applicable Systems of Part 1.1 to the Management Interface, per system capability.	Examples of evidence may include, but are not limited to, documentation that includes the configuration of systems that enforce access control such as: • SCI configuration or policies showing the isolation of the management plane resources (hypervisor, fabric, back-plane, or SAN configuration); • Logical network infrastructure configuration (ACL, VLAN, VXLAN, MPLS, VRF, multi-context, or multi-tenant environment); • Physically isolated out-of-band network for dedicated Management Interfaces.

CIP-005-8 Table R1 – ~~Logical Isolation~~Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4~~3~~	High Impact BCS Medium Impact BCS at Control Centers ~~Impact BCS and their associated:~~ ~~PCA;~~ ~~PACS hosted on SCI; and~~ ~~EACMS hosted on SCI~~ ~~Medium Impact BCS connected to a network via routable protocol and their associated:~~ ~~PCA;~~ ~~PACS hosted on SCI; and~~ ~~EACMS hosted on SCI~~ ~~SCI connected to a network via routable protocol hosting High or Medium Impact BCS or their associated:~~ ~~PCA;~~ ~~PACS; or~~ ~~EACMS~~	Protect the data traversing communication links used to span a single ESP between ~~, where the logical isolationto spans a sindifferentmultiple~~ Physical Security Perimeters (PSP)~~,~~ through the use of: • confidentiality and integrity controls (such as encryption), or • ~~Physical~~ physical controls that restrict access to the cabling and other nonprogrammable communication components in those instances when such cabling and components are located outside of a ~~Physical Security Perimeter~~PSP, Excluding: i. Real-time Assessment and Real-time monitoring data while being transmitted between Control Centers subject to CIP-012; and ~~i.~~ii. ~~excluding~~ time-sensitive protection or control functions between intelligent electronic devices. ~~(e.g., communications using protocol IEC TR-61850-90-5 R-GOOSE).~~	An example of ~~E~~evidence may include, but is not limited to, ~~architecture~~ documentations ~~detailing the~~of methods used to protect the confidentiality and integrity of the data, such as: ~~(e.g., encryption).~~ • Configurations or policies used to enforce encryption; or • The physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays).

CIP-005-8 Table R1 – ~~Logical Isolation~~Electronic Security Perimeter(s)			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.~~5~~4	High Impact BCS with Dial-up Connectivity and their associated: 1. PCA; 2. PACS hosted on SCI; and 3. EACMS hosted on SCI Medium Impact BCS with Dial-up Connectivity and their associated: 1. PCA; 2. PACS hosted on SCI; and 3. EACMS hosted on SCI SCI identified independently supporting an Applicable System above. ~~with Dial-up Connectivity hosting High or Medium Impact BCS or their associated:~~ ~~PCS;~~ ~~PACS; or~~ ~~EACMS~~	Perform authentication when establishing Dial-up Connectivity with ~~a~~Applicable ~~s~~Systems, per system capability.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-8 Table R1 – ~~Logical Isolation~~Electronic Security Perimeter(s)			
Part	Applicable Systems	Requirements	Measures
1.6~~5~~	EACMS that enforces an ESP for the Applicable Systems in Part 1.1. at Control Centers ~~High Impact BCS and their associated:~~ ~~PCA;~~ ~~PACS hosted on SCI; and~~ ~~EACMS hosted on SCI~~ ~~Medium Impact BCS at Control Centers and their associated:~~ ~~PCA;~~ ~~PACS hosted on SCI; and~~ ~~EACMS hosted on SCI~~ ~~SCI at Control Centers hosting High or Medium Impact BCS or their associated:~~ ~~PCA;~~ ~~PACS, or~~ ~~EACMS~~	Detect known or suspected malicious Internet Protocol (IP) communications entering or leaving an ESP ~~the logical isolation required by Part 1.1 or Part 1.2.2~~.	An example of evidence may include, but is not limited to, documentation that malicious Internet Protocol (IP) communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

R2. For all IRA and vendor remote access, ~~that does not originate from applicable systems in Requirement R1 Part 1.1 or Part 1.2.2,~~ excluding Dial-up Connectivity ~~and TCAs~~, the Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, per system capability, in *CIP-005-8 Table R2 –Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R2 –Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R2 – Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: - PCA Medium Impact BCS with ~~Interactive Remote Access (IRA)~~ERC and their associated: - PCA EACMS that enforces an ESP for the Applicable Systems in Part 1.1. SCI identified independently supporting an Applicable System above ~~SCI with IRA hosting High or Medium Impact BCS or their associated:~~	~~Ensure that~~Permit authorized IRA, if any, only ~~is~~ through an Intermediate System.	Examples of evidence may include, but are not limited to, network diagrams, architecture documents, or Management Systems reports that show all IRA is through an Intermediate System.

	- ~~PCA;~~ - ~~PACS; or~~ - ~~EACMS~~ ~~Management Modules with IRA of SCI hosting High or Medium Impact BCS or their associated:~~ - ~~PCA;~~ - ~~PACS; or~~ ~~EACMS~~		
2.2	Intermediate Systems used to access Applicable Systems of Part 2.1	Protect the confidentiality and integrity (e.g., encryption) of IRA between the client and the Intermediate System.	An example of evidence may include, but is not limited to, architecture documents or configuration detailing where confidentiality and integrity controls initiate and terminate.
2.3	Intermediate Systems used to access Applicable Systems of Part 2.1	Require multi-factor authentication to the Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, - Something the individual knows such as passwords or PINs. This does not include User ID; - Something the individual has such as tokens, digital

			certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.
2.4	High Impact BCS with vendor remote access and their associated: • PCA Medium Impact BCS with vendor remote access and their associated: • PCA SCI identified independently supporting an Applicable System above ~~SCI with vendor remote access hosting High or Medium Impact BCS or their associated:~~ ~~PCA~~ ~~Management Modules with vendor remote access of SCI hosting High or Medium Impact BCS or their associated:~~ ~~PCA~~	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including IRA and system-to-system remote access), such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.

2.5	High Impact BCS with vendor remote access and their associated: • PCA Medium Impact BCS with vendor remote access and their associated: • PCA SCI identified independently supporting an Applicable System abovee ~~SCI with vendor remote access hosting High or Medium Impact BCS or their associated:~~ ~~• PCA~~ ~~Management Modules with vendor remote access of SCI hosting High or Medium Impact BCS or their associated:~~ ~~PCA~~	Have one or more method(s) to disable active vendor remote access (including IRA and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including IRA and system-to-system remote access.
2.6	Intermediate Systems used to access ~~a~~Applicable ~~s~~Systems of Part 2.1	Implement for ~~a~~Applicable ~~s~~Systems as follows: **2.6.1.** Restrict VCAs of Intermediate Systems to only share CPU and memory with other	Examples of evidence may include, but are not limited to, documentation that includes the following: • Configuration showing that the CPU and memory can only be shared with other IS.

		Intermediate Systems and their associated SCI. **2.6.2.** Permit only needed and controlled communications between Intermediate Systems and ~~a~~Applicable ~~ms~~ Systerms of Part 2.1.	• Configuration showing how communications are controlled between the IS and applicable systems.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts in *CIP-005-8 Table R3 –Vendor Remote Access Management for EACMS and PACS*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M3. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	EACMS and PACS associated with High Impact BCS EACMS and PACS associated with Medium Impact BCS with ~~External Routable Connectivity (~~ERC~~)~~ SCI identified independently supporting an Applicable System above ~~SCI hosting EACMS or PACS associated with High or Medium impact BCS~~ ~~Management Modules of SCI hosting EACMS or PACS associated with High or Medium impact BCS~~	Have one or more method(s) to determine authenticated vendor-initiated remote connections.	Examples of evidence may include, but are not limited to, documentation of the methods used to determine authenticated vendor-initiated remote connections, such as: • Methods for accessing logged or monitoring information to determine authenticated vendor-initiated remote connections.
3.2	EACMS and PACS associated with High Impact BCS EACMS and PACS associated with Medium Impact BCS with ERC	Have one or more method(s) to terminate authenticated vendor-initiated remote connections and control the ability to reconnect.	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to terminate authenticated vendor-initiated remote connections to applicable

CIP-005-8 Table R3 – Vendor Remote Access Management for EACMS and PACS			
Part	Applicable Systems	Requirements	Measures
	SCI identified independently supporting an Applicable System above ~~SCI hosting EACMS or PACS associated with High or Medium impact BCS~~ ~~Management Modules of SCI hosting EACMS or PACS associated with High or Medium impact BCS~~		systems. Examples include terminating an active vendor-initiated shell/process/session or dropping an active vendor-initiated connection in a firewall. Methods to control the ability to reconnect, if necessary, could be: disabling an Active Directory account; disabling a security token; restricting IP addresses from vendor sources in a firewall; or physically disconnecting a network cable to prevent a reconnection.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting known or suspected malicious Internet Protocol (IP) communications entering or leaving the ~~logical isolation~~ESP required by Part 1.1 or Part 1.2.2.	The Responsible Entity did not document one or more processes for *CIP-005-8 Table R1 – ~~Logical Isolation~~ESP*. (Requirement R1) OR The Responsible Entity did not permit only needed and controlled communications to and from applicable systems either individually or as a group and ~~logically isolate~~ESP all other communications. (~~Requirement R1~~ Part 1.1) OR The Responsible Entity did not implement, for applicable systems, a method for restricting Management Systems to only share CPU and memory with its associated SCI and other Management

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Systems, per system capability (Requirement R1 Part 1.2.1) OR The Responsible Entity did not implement, for applicable systems, a method for permitting only needed and controlled communications to and from Management Interfaces and Management Systems, ~~logically isolating~~ESP all other communications. (Requirement R1 Part 1.2.2) OR The Responsible Entity did not implement, for applicable systems, a method for denying communications from BCS and their associated PCAs to the Management Interfaces and Management Systems, per system capability (Requirement R1 Part 1.2.3)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity did not implement a method to protect the data traversing communication links, where the ~~logical isolation~~ESP spans multiple Physical Security Perimeters, through the use of confidentiality and integrity controls (such as encryption); or physical controls that restrict access to the cabling and other nonprogrammable communication components (Requirement R1 Part 1.3) OR The Responsible Entity did not perform authentication when establishing Dial-up Connectivity with the applicable systems. (Requirement R1 Part 1.4)
R2.	The Responsible Entity does not have documented	The Responsible Entity did not implement processes	The Responsible Entity did not implement processes	The Responsible Entity did not implement processes

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	
6	07/20/17	Modified to address certain directives in FERC Order No. 829.	Revised
6	08/10/17	Adopted by the NERC Board of Trustees.	
6	10/18/2018	FERC Order approving CIP-005-6. Docket No. RM17-13-000.	
7	TBD	Modified to address directives in FERC Order No. 850	
8	TBD	Virtualization modifications and ERC/IRA	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016

45-day formal comment period with ballot	June 30 – August, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29–October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Physical Security of BES Cyber Systems

2. **Number:** CIP-006-7

3. **Purpose:** To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1 **Balancing Authority**

   4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3 **Generator Operator**

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication links, between CyberSystems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. Effective Dates: See "Project 2016-02 Modification to CIP Standards Implementation Plan"

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-7 Table R1 – Physical Security Plan

Part	Applicable Systems	Requirements	Measures
1.1	Medium Impact BCS without External Routable Connectivity (ERC) SCI without ERC hosting Medium Impact BCS Physical Access Control Systems (PACS) associated with: • High Impact BCS • Medium Impact BCS with ERC SCI, identified independently supporting an Applicable System above, not included in the Applicable Systems of Part 1.2 or Part 1.3	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI, identified independently supporting an Applicable System above, not included in the Applicable Systems of Part 1.3	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.
1.3	High Impact BCS and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Utilize two or more different physical access controls (this does not require two completely independent PACS) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access, per system capability.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-7 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.
1.5	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident response plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.

CIP-006-7 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	Physical Access Control Systems (PACS) associated with: - High Impact BCS, or Medium Impact BCS with ERC SCI identified independently supporting an Applicable System above	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.
1.7	Physical Access Control Systems (PACS) associated with: - High Impact BCS, or - Medium Impact BCS with ERC SCI identified independently supporting an Applicable System above	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident response plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-7 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.
1.9	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

R2. Each Responsible Entity shall implement, except during CIP Exceptional Circumstances, one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-7 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-7 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-7 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-7 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2.	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with EERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BCS and their associated: 1. EACMS; and 2. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-7 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-7 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-7 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BCS • Medium Impact BCS with ERC • SCI identified independently supporting a High Impact BCS; or • SCI identified independently supporting a Medium Impact BCS with ERC Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BCS • Medium Impact BCS with ERC • SCI identified independently supporting a High Impact BCS; or • SCI identified independently supporting a Medium Impact BCS with ERC	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (Requirement R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (Requirement R1 Part 1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (Requirement R1 Part 1.2) OR The Responsible Entity has documented and implemented physical access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (Requirement R1 Part 1.3) OR The Responsible Entity does not have a process to monitor for unauthorized access through a physical access point into a

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Physical Security Perimeter. (Requirement R1 Part 1.4) OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a Physical Security Perimeter or to communicate such alerts within 15 minutes to identified personnel. (Requirement R1 Part 1.5) OR The Responsible Entity does not have a process to monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control Systems. (Requirement R1 Part 1.6) OR The Responsible Entity does not have a process to alert for unauthorized physical access to Physical Access Control Systems or to communicate such alerts within 15 minutes to identified personnel. (Requirement R1 Part 1.7) OR The Responsible Entity does not have a process to log authorized physical entry into

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				each Physical Security Perimeter with sufficient information to identify the individual and date and time of entry. (Requirement Part 1.8) OR The Responsible Entity does not have a process to retain physical access logs for 90 calendar days. (Requirement R1 Part 1.9)
R2	N/A	N/A	N/A	The Responsible Entity has failed to include or implement a visitor control program that requires continuous escorted access of visitors within any Physical Security Perimeter. (Requirement R2 Part 2.1) OR The Responsible Entity has failed to include or implement a visitor control program that requires logging of the initial entry and last exit dates and times of the visitor, the visitor's name, and the point of contact. (Requirement R2 Part 2.2) OR The Responsible Entity failed to include or implement a visitor control program to retain visitor logs for at least ninety days. (Requirement R2 Part 2.3)

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Responsible Entity has documented and implemented a maintenance and testing program for Physical Access Control Systems and locally mounted hardware or devices at the Physical Security Perimeter, but did not complete required testing within 24 calendar months but did complete required testing within 25 calendar months. (Requirement R3 Part 3.1)	The Responsible Entity has documented and implemented a maintenance and testing program for Physical Access Control Systems and locally mounted hardware or devices at the Physical Security Perimeter, but did not complete required testing within 25 calendar months but did complete required testing within 26 calendar months. (Requirement R3 Part 3.1)	The Responsible Entity has documented and implemented a maintenance and testing program for Physical Access Control Systems and locally mounted hardware or devices at the Physical Security Perimeter, but did not complete required testing within 26 calendar months but did complete required testing within 27 calendar months. (Requirement R3 Part 3.1)	The Responsible Entity did not document or implement a maintenance and testing program for Physical Access Control Systems and locally mounted hardware or devices at the Physical Security Perimeter. (Requirement R3 Part 3.1) OR The Responsible Entity has documented and implemented a maintenance and testing program for Physical Access Control Systems and locally mounted hardware or devices at the Physical Security Perimeter, but did not complete required testing within 27 calendar months. (Requirement R3 Part 3.1)

45-day formal comment period with ballot	August ~~3~~29–~~September 16~~October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Physical Security of BES Cyber Systems

2. **Number:** CIP-006-7

3. **Purpose:** To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

      4.1.1 **Balancing Authority**

      4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

         4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

            4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

            4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

         4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

         4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

      4.1.3 **Generator Operator**

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-7:

4.2.3.1 Cyber ~~s~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~s~~Systems associated with communication links between discrete Electronic Security Perimeters (ESP)

~~logically isolated from, but not providing logical isolation for, BCS or Shared Cyber Infrastructure (SCI)~~.

4.2.3.3 Cyber ~~s~~Systems, associated with communication links, ~~that are~~ between Cyber ~~Assets~~Systems~~, Virtual Cyber Assets (VCA), or SCI performing logical isolation that~~ providing confidentiality and integrity of an ESP ~~which~~that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

4.3. “Applicable Systems” Columns in Tables: Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~ part applies. ~~This concept was adapted from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.~~

5. Effective Dates: See “Project 2016-02 ~~Virtualization~~ Modification to CIP Standards Implementation Plan”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-7 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-7 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BCS without External Routable Connectivity (ERC) SCI without ERC hosting Medium Impact BCS Physical Access Control Systems (PACS) associated with: • High Impact BCS • Medium Impact BCS with ERC SCI, identified independently supporting an Applicable System above, not included in the Applicable Systems of Part 1.2 or Part 1.3 ~~• SCI hosting High Impact BCS or their associated EACMS or PCA; or~~ ~~• SCI with ERC hosting Medium Impact BCS or their associated EACMS or PCA~~ ~~SCI hosting PACS associated with High Impact BCS~~ ~~SCI hosting PACS associated with Medium Impact BCS with ERC~~	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (Requirement R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (Requirement R1 Part 1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (Requirement R1 Part 1.2) OR The Responsible Entity has documented and implemented physical access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (Requirement R1 Part 1.3) OR The Responsible Entity does not have a process to monitor for unauthorized access through a physical access point into a Physical Security Perimeter. (Requirement R1 Part 1.4)

R #	Violation Severity Levels (CIP-006-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a Physical Security Perimeter or to communicate such alerts within 15 minutes to identified personnel. (Requirement R1 Part 1.5) OR The Responsible Entity does not have a process to monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control Systems. (Requirement R1 Part 1.6) OR The Responsible Entity does not have a process to alert for unauthorized physical access to Physical Access Control Systems or to communicate such alerts within 15 minutes to identified personnel. (Requirement R1 Part 1.7) OR The Responsible Entity does not have a process to log authorized physical entry into each Physical Security Perimeter with sufficient information to identify the individual and date and time of entry. (Requirement Part 1.8) OR The Responsible Entity does not have a process

R #	Violation Severity Levels (CIP-006-7)

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	

Version	Date	Action	Change Tracking
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed FERC directives from Order No. 791.
6	1/21/16	FERC order issued approving CIP-006-6. Docket No. RM15-14-000	
7	TBD	Virtualization conforming changes and CEC language added	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29–October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — System Security Management

2. **Number:** CIP-007-7

3. **Purpose:** To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 **Balancing Authority**

4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 **Generator Operator**

4.1.4 **Generator Owner**

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems” Columns in Tables:** Each table has an “Applicable Systems” column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See “Project 2016-02 Modification to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R1–System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS with ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above.	Enable only network accessible Internet Protocol (IP) ports (or services if unable to determine ports) determined to be needed by the Responsible Entity, including port ranges where needed to handle dynamic ports, per system capability. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled network accessible IP ports or services, individually or by group. • Listings of the listening ports, individually or by group, from either configuration files, command output (such as netstat), or network scans of open ports; or • Configuration of host-based firewalls, policy, or other mechanisms that only allow needed IP ports or services and deny all others.

CIP-007-7 Table R1–System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BCS and their associated: 1. PCA; and 2. Non-programmable communications components located inside both a PSP and ESP. Medium Impact BCS at Control Centers and their associated: 1. PCA; and 2. Non-programmable communications components located inside both a PSP and ESP. SCI identified independently supporting an Applicable System above	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

CIP-007-7 Table R1–System Hardening			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	SCI identified independently supporting: • High Impact BCS and their associated: 1. EACMS 2. PACS; and 3. PCA • Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prevent the sharing of the CPU and memory of Management Interfaces of SCI with non-CIP Systems.	Examples of evidence may include, but is not limited to, documentation of the configuration showing that the CPU and memory cannot be shared with non-CIP Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above.	A patch management process for tracking, evaluating, and installing cyber security patches. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for systems that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	At least once every 35 calendar days, evaluate cyber security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each cyber security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-7 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Protection [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R3 – Malicious Code Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R3 – Malicious Code Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, white-listing, privileged introspection, etc.).

CIP-007-7 Table R3 – Malicious Code Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.

CIP-007-7 Table R3 – Malicious Code Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an applicable system above	Log security events, per system capability, for identification of, and after-the-fact investigations of, Cyber Security Incidents that include, at a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; and 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BCS is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Generate alerts for security events that the Responsible Entity determines necessitates an alert that includes, at a minimum, each of the following types of events, per system capability: 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-7 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Retain applicable security event logs identified in Part 4.1 for at least the last 90 consecutive calendar days, per system capability, except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BCS and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R5 – System Access Controls			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS with External Routable Connectivity (ERC) and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Have a method(s) to enforce authentication of interactive user access, per system capability.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.
5.2	High Impact BCS and their associated: 1. EACMS; 2. PACS; and	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems,	An example of evidence may include, but is not limited to, a listing of accounts by account types showing

CIP-007-7 Table R5 – System Access Controls			
Part	**Applicable Systems**	**Requirements**	**Measures**
	3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	by location, or by system type(s).	the enabled or generic account types in use.
5.3	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Identify individuals who have authorized access to shared accounts.	An example of evidence may include, but is not limited to, listing of shared accounts and the individuals who have authorized access to each shared account.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Change known default passwords, per system capability.	Examples of evidence may include, but are not limited to: - Records of a procedure that passwords are changed when new devices are in production; or - Documentation in system manuals or other vendor documents showing default vendor passwords were generated pseudo-randomly and are thereby unique.
5.5	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For password-only authentication for interactive user access, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is, at least, the lesser of eight characters or the maximum length supported by the Applicable System; and 5.5.2 Minimum password complexity that is the lesser of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Applicable System.	Examples of evidence may include, but are not limited to: - System-generated reports or screen-shots of the system-enforced password parameters, including length and complexity; or Attestations that include a reference to the documented procedures that were followed.

CIP-007-7 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.6	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For password-only authentication for interactive user access, either technically or procedurally enforce password changes or an obligation to change the password at least once every 15 calendar months, per system capability.	Examples of evidence may include, but are not limited to: • System-generated reports or screenshots of the system-enforced periodicity of changing passwords; or • Attestations that include a reference to the documented procedures that were followed.
5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Limit the number of unsuccessful authentication attempts or generate alerts after a threshold of unsuccessful authentication attempts, per system capability.	Examples of evidence may include, but are not limited to: • Documentation of the account lockout parameters; or Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority: As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-007-7)			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	The Responsible Entity has implemented and documented processes for system hardening but had no methods to protect against unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media. (Requirement R1 Part 1.2) OR The Responsible Entity has implemented and documented processes for system hardening, but has not prevented the sharing of the CPU and memory of Management Interfaces of SCI with non-CIP Systems. (Requirement R1 Part 1.4)	The Responsible Entity has implemented and documented processes for determining necessary system hardening, but had one or more unneeded network accessible services enabled. (Requirement R1 Part 1.1) OR The Responsible Entity has implemented and documented processes for determining necessary system hardening, but had one or more unneeded services enabled. (Requirement R1 Part 1.3)	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-7 Table R1. (Requirement R1)
R2	The Responsible Entity has documented and implemented one or more process(es) to evaluate uninstalled released security patches for	The Responsible Entity has documented or implemented one or more process(es) for patch management but did not include any processes, including the identification of sources, for	The Responsible Entity has documented or implemented one or more process(es) for patch management but did not include any processes for	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-7

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to

Version	Date	Action	Change Tracking
			use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/15/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-007-6. Docket No. RM15-14-000	
7	TBD	Virtualization modifications	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~initial~~ second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
~~45~~60-day formal comment period with ballot	January 21–~~February 8~~March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

45-day formal comment period with ballot	August ~~3~~29–~~September 16~~October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — System Security Management

2. **Number:** CIP-007-7

3. **Purpose:** To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems (BCS) against compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-7:

4.2.3.1 Cyber S~~s~~ystems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber S~~s~~ystems associated with communication links ~~logically isolated from, but not providing logical isolation for, BCS or~~

~~Shared Cyber Infrastructure (SCI)~~between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber ~~s~~Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that~~Cyber Assets, Virtual Cyber Assets, or SCI performing logical isolation that~~ extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002~~-5.1~~ identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~ part applies. ~~This concept was adapted from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.~~

5. Effective Dates:

See "Project 2016-02 ~~Virtualization~~ Modification to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-7 Table R1 – System Hardening* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-7 Table R1–System Hardening

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS with ~~External Routable Connectivity~~ERC and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above.	Enable only ~~logical~~ network accessible Internet Protocol (IP) ports (or services if unable to determine ports) ~~that have been~~ determined to be needed by the Responsible Entity, ~~(or logical network accessible ports if unable to determine service,~~ including port ranges where needed to handle dynamic ports~~)~~, per system capability. If a device has no provision for disabling or restricting ~~network accessible services (or~~ logical ports~~)~~ on the device~~,~~ then those ~~services (or logical~~ ports~~),~~ that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled network accessible IP ports or services, individually or by group. • Listings of the listening ports, individually or by group, from either configuration files, command output (such as netstat), or network scans of open ports; or • Configuration of host-based firewalls, policy, or other mechanisms that only allow needed IP ports or services and deny all others.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	

Version	Date	Action	Change Tracking
6	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
6	2/15/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
6	1/21/16	FERC order issued approving CIP-007-6. Docket No. RM15-14-000	
7	TBD	Virtualization modifications	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 29– October 11, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Incident Reporting and Response Planning

2. **Number:** CIP-008-7

3. **Purpose:** To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2 Each Remedial Action Scheme where the Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3 Generator Operator

   4.1.4 Generator Owner

   4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Remedial Action Scheme where the Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-008-7:

4.2.3.1 Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems (BCS) categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **"Applicable Systems" Columns in Tables:** Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See "Project 2016-02 Modifications to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	One or more processes to identify, classify, and respond to Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process(es) to identify, classify, and respond to Cyber Security Incidents.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	One or more processes: 1.2.1 That include criteria to evaluate and define attempts to compromise; 1.2.2 To determine if an identified Cyber Security Incident is: • A Reportable Cyber Security Incident; or • An attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the "Applicable Systems" column for this Part; and 1.2.3 To provide notification per Requirement R4.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents or a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the "Applicable Systems" column including justification for attempt determination criteria and documented processes for notification.
1.3	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	The roles and responsibilities of Cyber Security Incident response groups or individuals.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BCS and their associated: • EACMS Medium ImpactBCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	Incident handling procedures for Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing

Part	Applicable Systems	Requirements	Measures
2.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations-based exercises.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	Applicable Systems	Requirements	Measures
2.2	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident, responding to a Cyber Security Incident that attempted to compromise a system identified in the "Applicable Systems" column for this Part, or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident response or exercise.
2.3	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above	Retain records related to Reportable Cyber Security Incidents and Cyber Security Incidents that attempted to compromise a system identified in the "Applicable Systems" column for this Part as per the Cyber Security Incident response plan(s) under Requirement R1.	An example of evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents and a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the "Applicable Systems" column.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication.*

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, the following: 1. Dated documentation of post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the Responsible Entity determines would impact the ability to execute the plan: 3.2.1. Update the Cyber Security Incident response plan(s); and 3.2.2. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates.	An example of evidence may include, but is not limited to: 1. Dated and revised Cyber Security Incident response plan with changes to the roles or responsibilities, responders or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

R4. Each Responsible Entity shall notify the Electricity Information Sharing and Analysis Center (E-ISAC) and, if subject to the jurisdiction of the United States, the United States Cybersecurity & Infrastructure Security Agency (CISA)CISA, or their successors, of a Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria from Requirement R1, Part 1.2.1, a system identified in the "Applicable Systems" column, unless prohibited by law, in accordance with each of the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M4. Evidence must include, but is not limited to, documentation that collectively demonstrates notification of each determined Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise a system identified in the "Applicable Systems" column according to the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents.*

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above	Initial notifications and updates shall include the following attributes, at a minimum, to the extent known: 4.1.1 The functional impact; 4.1.2 The attack vector used; and 4.1.3 The level of intrusion that was achieved or attempted.	Examples of evidence may include, but are not limited to, dated documentation of initial notifications and updates to the E-ISAC and CISA.

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above	After the Responsible Entity's determination made pursuant to documented process(es) in Requirement R1, Part 1.2, provide initial notification within the following timelines: - One hour after the determination of a Reportable Cyber Security Incident. - By the end of the next calendar day after determination that a Cyber Security Incident was an attempt to compromise a system identified in the "Applicable Systems" column for this Part.	Examples of evidence may include, but are not limited to, dated documentation of notices to the E-ISAC and CISA.
4.3	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above	Provide updates, if any, within 7 calendar days of determination of new or changed attribute information required in Part 4.1.	Examples of evidence may include, but are not limited to, dated documentation of submissions to the E-ISAC and CISA.

C. Compliance

1. Compliance Monitoring Process:

1.1. **Compliance Enforcement Authority:** The Regional Entity shall serve as the Compliance Enforcement Authority (“CEA”) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Processes:** As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning**	**Lower**	N/A	N/A	The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include the roles and responsibilities of Cyber Security Incident response groups or individuals. (Requirement R1 Part 1.3) OR The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include incident handling procedures for Cyber Security Incidents. (Requirement R1 Part 1.4) OR	The Responsible Entity has not developed a Cyber Security Incident response plan with one or more processes to identify, classify, and respond to Cyber Security Incidents. (Requirement R1 Part 1.1) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to identify Reportable Cyber Security Incidents or a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to provide notification per Requirement R4. (Requirement R1 Part 1.2) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes that include criteria to evaluate and define attempts to compromise. (Requirement R1 Part 1.2)	from Part 1.2.1, a system identified in the "Applicable Systems" column for Part 1.2. (Requirement R1 Part 1.2)
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 15	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 16	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 17	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 18

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			calendar months, not exceeding 16 calendar months between tests of the plan(s). (Requirement R2 Part 2.1)	calendar months, not exceeding 17 calendar months between tests of the plan(s). (Requirement R2 Part 2.1)	calendar months, not exceeding 18 calendar months between tests of the plan(s). (Requirement R2 Part 2.1) OR The Responsible Entity did not document deviations, if any, from the plan during a test or when a Reportable Cyber Security Incident or a Cyber Security Incident that was an attempt to compromise a system identified in the "Applicable Systems" column for Part 2.2 occurs. (Requirement R2 Part 2.2)	calendar months between tests of the plan(s). (Requirement R2 Part 2.1) OR The Responsible Entity did not retain relevant records related to Reportable Cyber Security Incidents or Cyber Security Incidents that were an attempt to compromise a system identified in the "Applicable Systems" column for Part 2.3. (Requirement R2 Part 2.3)
R3	**Operations Assessment**	**Lower**	The Responsible Entity has not notified each person or group with a defined role in the Cyber Security	The Responsible Entity has not updated the Cyber Security Incident response plan based on any	The Responsible Entity has neither documented lessons learned nor documented the	The Responsible Entity has neither documented lessons learned nor documented the

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			Incident response plan of updates to the Cyber Security Incident response plan within greater than 90 but less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.3)	documented lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.2) OR The Responsible Entity has not notified each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.3) OR	absence of any lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.1) OR The Responsible Entity has not updated the Cyber Security Incident response plan based on any documented lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.2) OR The Responsible Entity has not updated the Cyber Security	absence of any lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.1)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
				The Responsible Entity has not updated the Cyber Security Incident response plan(s) or notified each person or group with a defined role within 60 and less than 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (Requirement R3 Part 3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.	Incident response plan(s) or notified each person or group with a defined role within 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (Requirement R3 Part 3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.

5	7/9/14	FERC Letter Order issued approving VRFs and VSLs revisions to certain CIP standards.	CIP-008-5 Requirement R2, VSL table under Severe, changed from 19 to 18 calendar months.
6	TBD	Modified to address directives in FERC Order No. 848	
7	TBD	Virtualization conforming changes	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~final~~ second draft of the proposed standard~~ being posted for a 5-day final ballot period~~.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
~~45~~60-day formal comment period with ballot	January 21–~~February 8~~March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
~~45-day formal comment period with ballot~~	~~May 11–June 24, 2021~~
45-day formal comment period with ballot	August ~~3~~29– October 11~~September 16~~, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Incident Reporting and Response Planning

2. **Number:** CIP-008-7

3. **Purpose:** To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2 Each Remedial Action Scheme where the Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3 Generator Operator

   4.1.4 Generator Owner

   4.1.5 Reliability Coordinator

4.1.6 Transmission Operator

4.1.7 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Remedial Action Scheme where the Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**: All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-008-7:

4.2.3.1 Cyber ~~s~~Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber ~~s~~Systems associated with communication links ~~logically isolated from, but not providing logical isolation for, BES Cyber~~

~~Systems or SCI~~between discrete Electronic Security Perimeters (ESP).

4.2.3.3 Cyber ~~S~~systems, associated with communication links, between the Cyber ~~Assets~~Systems providing confidentiality and integrity of an ESP ~~, Virtual Cyber Assets, or Shared Cyber Infrastructure performing logical isolation~~ that extends to one or more geographic locations.

4.2.3.4 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6 Responsible Entities that identify that they have no BES Cyber Systems (BCS) categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. **“Applicable Systems” Columns in Tables:** Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~ part applies. ~~This concept was adapted from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.~~

5. Effective Dates:

See “Project 2016-02 ~~Virtualization~~ Modifications to CIP Standards Implementation Plan.”

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*.

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	One or more processes to identify, classify, and respond to Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process(es) to identify, classify, and respond to Cyber Security Incidents.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications

Part	Applicable Systems	Requirements	Measures
1.2	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS.~~	One or more processes: 1.2.1 That include criteria to evaluate and define attempts to compromise; 1.2.2 To determine if an identified Cyber Security Incident is: • A Reportable Cyber Security Incident; or • An attempt to compromise, as determined by applying the criteria from Part 1.2.1, one or more systems identified in the “Applicable Systems” column for this Part; and 1.2.3 To provide notification per Requirement R4.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents or a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the “Applicable Systems” column including justification for attempt determination criteria and documented processes for notification.

CIP-008-7 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	The roles and responsibilities of Cyber Security Incident response groups or individuals.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.
1.4	High Impact BCS and their associated: - EACMS Medium ImpactBCS and their associated: - EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Incident handling procedures for Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations-based exercises.

CIP-008-7 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	Applicable Systems	Requirements	Measures
2.2	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident, responding to a Cyber Security Incident that attempted to compromise a system identified in the “Applicable Systems” column for this Part, or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident response or exercise.
2.3	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Retain records related to Reportable Cyber Security Incidents and Cyber Security Incidents that attempted to compromise a system identified in the “Applicable Systems” column for this Part as per the Cyber Security Incident response plan(s) under Requirement R1.	An example of evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents and a Cyber Security Incident that is determined to be an attempt to compromise a system identified in the “Applicable Systems” column.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication.*

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, the following: 1. Dated documentation of post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: - Emails; - USPS or other mail service; - Electronic distribution system; or - Training sign-in sheets.

CIP-008-7 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~- EACMS~~	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the Responsible Entity determines would impact the ability to execute the plan: 3.2.1. Update the Cyber Security Incident response plan(s); and 3.2.2. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates.	An example of evidence may include, but is not limited to: 1. Dated and revised Cyber Security Incident response plan with changes to the roles or responsibilities, responders or technology; and 2. Evidence of plan update distribution including, but not limited to: - Emails; - USPS or other mail service; - Electronic distribution system; or - Training sign-in sheets.

R4. Each Responsible Entity shall notify the Electricity Information Sharing and Analysis Center (E-ISAC) and, if subject to the jurisdiction of the United States, the United States Cybersecurity & Infrastructure Security Agency (CISA)~~National Cybersecurity and Communications Integration Center (NCCIC~~CISA~~)~~, ~~[1]~~ or their successors, of a Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria from Requirement R1, Part 1.2.1, a system identified in the “Applicable Systems” column, unless prohibited by law, in accordance with each of the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M4. Evidence must include, but is not limited to, documentation that collectively demonstrates notification of each determined Reportable Cyber Security Incident and a Cyber Security Incident that was an attempt to compromise a system identified in the “Applicable Systems” column according to the applicable requirement parts in *CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents.*

~~[1] The National Cybersecurity and Communications Integration Center (NCCIC) is the successor organization of the Industrial Control Systems Cyber Emergency Response Team (ICS-CERT). In 2017, NCCIC realigned its organizational structure and integrated like functions previously performed independently by the ICS-CERT and the United States Computer Emergency Readiness Team (US-CERT).~~

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	Applicable Systems	Requirements	Measures
4.1	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Initial notifications and updates shall include the following attributes, at a minimum, to the extent known: 4.1.1 The functional impact; 4.1.2 The attack vector used; and 4.1.3 The level of intrusion that was achieved or attempted.	Examples of evidence may include, but are not limited to, dated documentation of initial notifications and updates to the E-ISAC and ~~NCCIC~~CISA.

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	Applicable Systems	Requirements	Measures
4.2	High Impact BCS and their associated: - EACMS Medium Impact BCS and their associated: - EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	After the Responsible Entity's determination made pursuant to documented process(es) in Requirement R1, Part 1.2, provide initial notification within the following timelines: - One hour after the determination of a Reportable Cyber Security Incident. - By the end of the next calendar day after determination that a Cyber Security Incident was an attempt to compromise a system identified in the "Applicable Systems" column for this Part.	Examples of evidence may include, but are not limited to, dated documentation of notices to the E-ISAC and ~~NCCIC~~CISA.

CIP-008-7 Table R4 – Notifications and Reporting for Cyber Security Incidents			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BCS and their associated: • EACMS Medium Impact BCS and their associated: • EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~EACMS~~	Provide updates, if any, within 7 calendar days of determination of new or changed attribute information required in Part 4.1.	Examples of evidence may include, but are not limited to, dated documentation of submissions to the E-ISAC and ~~NCCIC~~CISA.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority (“CEA”) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Processes:

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning**	**Lower**	N/A	N/A	The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include the roles and responsibilities of Cyber Security Incident response groups or individuals. (Requirement R1 Part 1.3) OR The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include incident handling procedures for Cyber Security Incidents. (Requirement R1 Part 1.4) OR	The Responsible Entity has not developed a Cyber Security Incident response plan with one or more processes to identify, classify, and respond to Cyber Security Incidents. (Requirement R1 Part 1.1) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to identify Reportable Cyber Security Incidents or a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to provide notification per Requirement R4. (Requirement R1 Part 1.2) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes that include criteria to evaluate and define attempts to compromise. (Requirement R1 Part 1.2)	from Part 1.2.1, a system identified in the “Applicable Systems” column for Part 1.2. (Requirement R1 Part 1.2)
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 15	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 16	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 17	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 18

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			calendar months, not exceeding 16 calendar months between tests of the plan(s). (Requirement R2 Part 2.1)	calendar months, not exceeding 17 calendar months between tests of the plan(s). (Requirement R2 Part 2.1)	calendar months, not exceeding 18 calendar months between tests of the plan(s). (Requirement R2 Part 2.1) OR The Responsible Entity did not document deviations, if any, from the plan during a test or when a Reportable Cyber Security Incident or a Cyber Security Incident that was an attempt to compromise a system identified in the "Applicable Systems" column for Part 2.2 occurs. (Requirement R2 Part 2.2)	calendar months between tests of the plan(s). (Requirement R2 Part 2.1) OR The Responsible Entity did not retain relevant records related to Reportable Cyber Security Incidents or Cyber Security Incidents that were an attempt to compromise a system identified in the "Applicable Systems" column for Part 2.3. (Requirement R2 Part 2.3)
R3	**Operations Assessment**	**Lower**	The Responsible Entity has not notified each person or group with a defined role in the Cyber Security	The Responsible Entity has not updated the Cyber Security Incident response plan based on any	The Responsible Entity has neither documented lessons learned nor documented the	The Responsible Entity has neither documented lessons learned nor documented the

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			Incident response plan of updates to the Cyber Security Incident response plan within greater than 90 but less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.3)	documented lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.2) OR The Responsible Entity has not notified each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.3) OR	absence of any lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.1) OR The Responsible Entity has not updated the Cyber Security Incident response plan based on any documented lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.2) OR The Responsible Entity has not updated the Cyber Security	absence of any lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (Requirement R3 Part 3.1.1)

R #	**Time Horizon**	**VRF**	**Violation Severity Levels (CIP-008-7)**			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
				The Responsible Entity has not updated the Cyber Security Incident response plan(s) or notified each person or group with a defined role within 60 and less than 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (Requirement R3 Part 3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.	Incident response plan(s) or notified each person or group with a defined role within 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (Requirement R3 Part 3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.	
R4	**Operations Assessment**	**Lower**	The Responsible Entity notified E-ISAC and ~~NCCIC~~CISA, or their	The Responsible Entity failed to notify E-ISAC or ~~NCCIC~~CISA, or their	The Responsible Entity notified E-ISAC and ~~NCCIC~~CISA, or their	The Responsible Entity failed to notify E-ISAC and ~~NCCIC~~CISA, or

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-7)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			successors, of a Cyber Security Incident that was an attempt to compromise a system identified in the "Applicable Systems" column for Part 4.2 but failed to notify or update E-ISAC or ~~NCCIC~~CISA, or their successors, within the timelines pursuant to Part 4.2. (Requirement R4 Part 4.2) OR The Responsible Entity notified E-ISAC and ~~NCCIC~~CISA, or their successors, of a Reportable Cyber Security Incident or a Cyber Security Incident that was an attempt to compromise a system identified in the "Applicable Systems" column for Part 4.3	successors, of a Cyber Security Incident that was an attempt to compromise, as determined by applying the criteria from Requirement R1, Part 1.2.1, a system identified in the "Applicable Systems" column. (Requirement R4 Part R4)	successors, of a Reportable Cyber Security Incident but failed to notify or update E-ISAC or ~~NCCIC~~CISA, or their successors, within the timelines pursuant to Part 4.2. (Requirement R4 Part 4.2) OR The Responsible Entity failed to notify E-ISAC or ~~NCCIC~~CISA, or their successors, of a Reportable Cyber Security Incident. (Requirement R4)	their successors, of a Reportable Cyber Security Incident. (Requirement R4)

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change “Control Center” to “control center.”	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-008-5.	

Version	Date	Action	Change Tracking
5	7/9/14	FERC Letter Order issued approving VRFs and VSLs revisions to certain CIP standards.	CIP-008-5 Requirement R2, VSL table under Severe, changed from 19 to 18 calendar months.
6	TBD	Modified to address directives in FERC Order No. 848	
7	TBD	Virtualization conforming changes	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard.

Completed Actions	Date
Standards Committee (SC) approved Standard Authorization Request (SAR) for posting	March 9, 2016
SAR posted for comment	March 23–April 21, 2016
SAR posted for comment	June 1–June 30, 2016
SC Accepted the SAR	July 20, 2016
60-day formal comment period with ballot	January 21–March 22, 2021
45-day formal comment period with ballot	June 30 – August 13, 2021

Anticipated Actions	Date
45-day formal comment period with ballot	August 3–September 16, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Recovery Plans for BES Cyber Systems

2. **Number:** CIP-009-7

3. **Purpose:** To recover reliability functions performed by BES Cyber Systems (BCS) by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. **Applicability:**

   4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. **Balancing Authority**

   4.1.2. **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. **Generator Operator**

   4.1.4. **Generator Owner**

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-009-7:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between the Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BCS categorized as high impact or medium impact according to the CIP-002-7 identification and categorization processes.

4.3. **"Applicable Systems" Columns in Tables:** Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. **Effective Dates:** See "Project 2016-02 Modification to CIP Standards Implementation Plan"

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	Applicable Systems	Requirements	Measures
1.2	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	One or more processes for the backup and storage of information required to recover applicable system functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover applicable system functionality.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS at Control Centers and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	One or more processes to preserve data, per system capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-7 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-7 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BBCS at Control Centers and their associated: 1. PACS; and 2. EACMS SCI hosting High or Medium Impact BCS at Control Centers or their associated: • PACS; or • EACMS SCI identified independently supporting an Applicable System above	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS at Control Centers and their associated: 1. PACS; and 2. EACMS SCI hosting High or Medium Impact BCS at Control Centers or their associated: • PACS; or • EACMS SCI identified independently supporting an Applicable System above	Test a representative sample of information used to recover applicable system functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover applicable system functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).

CIP-009-7 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BCS SCI identified independently supporting an Applicable System above	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS at Control Centers and their associated: 1. PACS: and 2. EACMS SCI identified independently supporting an Applicable System above	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-7 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BSC at Control Centers and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. **Compliance Monitoring Process:**

   1.1. **Compliance Enforcement Authority:** As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

   - Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
   - If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
   - The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

   1.3. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels (CIP-009-7)			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Requirement R1 Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Requirement R1 Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for applicable systems. OR The Responsible Entity has created recovery plan(s) for applicable systems, but the plan(s) does not address the conditions for activation in Requirement R1 Part 1.1. OR The Responsible Entity has created recovery plan(s) for applicable systems, but the plan(s) does not address three or more of the requirements in Parts Requirement R11.2 through 1.5.
R2.	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan. (Requirement R2 Part 2.1)	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. (Requirement R2 Part 2.1) OR The Responsible Entity has not tested a representative sample of the information	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 17 calendar months, not exceeding 18 calendar months between tests of the plan. (Requirement R2 Part 2.1) OR	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 18 calendar months between tests of the plan. (Requirement R2 Part 2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of Applicable System functionality according to R2 Part 2.2 within 18

~~45-day formal comment period with ballot~~	May 11–June 24, 2021
45-day formal comment period with ballot	August 3–September 16, 2021
Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security — Recovery Plans for BES Cyber Systems

2. **Number:** CIP-009-7

3. **Purpose:** To recover reliability functions performed by BES Cyber Systems (BCS) by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-009-7:

4.2.3.1. Cyber S~~s~~ystems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber S~~s~~ystems associated with communication links ~~logically isolated from, but not providing logical isolation for, BES Cyber~~

~~Systems or Shared Cyber Infrastructure (SCI)~~between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber ~~S~~systems, associated with communication links, between the Cyber ~~Assets~~Systems~~, Virtual Cyber Assets, or SCI performing logical isolation that~~ providing confidentiality and integrity of an ESP that ~~-~~extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no ~~BES Cyber Systems~~BCS categorized as high impact or medium impact according to the CIP-002-7 identification and categorization processes.

4.3. **“Applicable Systems” Columns in Tables:** Each table has an “Applicable Systems” column to ~~further~~ define the scope of systems to which a specific requirement ~~row~~ part applies. ~~This concept was adapted from the National Institute of Standards and Technology (“NIST”) Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics.~~

5. **Effective Dates:** See “Project 2016-02 ~~Virtualization~~ Modification to CIP Standards Implementation Plan”

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-7 Table R1 – Recovery Plan Specifications*.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ - ~~PACS; or~~ - ~~EACMS~~	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~• PACS; or~~ • ~~EACMS~~	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact BCS and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS or their associated:~~ ~~• PACS; or~~ • ~~EACMS~~	One or more processes for the backup and storage of information required to recover applicable system functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover applicable system functionality.

CIP-009-7 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BCS and their associated: 1. PACS; and 2. EACMS Medium Impact- BCS at Control Centers and their associated: 1. PACS; and 2. EACMS SCI identified independently supporting an Applicable System above ~~SCI hosting High or Medium Impact BCS at Control Centers or their associated:~~ • ~~PACS; or~~ • ~~EACMS~~	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.

An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: - Emails; - USPS or other mail service; - Electronic distribution system; or - Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

Final Ballot	October 19–28, 2021
Board adoption	November 4, 2021

A. Introduction

1. **Title:** Cyber Security —Change Management and Vulnerability Assessments

2. **Number:** CIP-010-5

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-5:

4.2.3.1. Cyber Systems at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Systems associated with communication links between discrete Electronic Security Perimeters (ESP).

4.2.3.3. Cyber Systems, associated with communication links, between Cyber Systems providing confidentiality and integrity of an ESP that extends to one or more geographic locations.

4.2.3.4. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.5. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.6. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002 identification and categorization processes.

4.3. "Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to define the scope of systems to which a specific requirement part applies.

5. Effective Date: See "Project 2016-02 Modification to CIP Standards Implementation Plan."

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented change management process(es) that collectively include each of the applicable requirement parts in *CIP-010-5 Table R1 –Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R1 –Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R1 – Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems (BCS) and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Authorize changes to: 1.1.1. Operating system(s) (OS); or firmware where no independent OS exists; or images used to derive operating systems; or firmware; 1.1.2. Commercially available or open-source application software, including application containers ; 1.1.3. Custom software installed, including-applications containers; and 1.1.4. Any logical network accessible ports (or services if unable to determine ports).	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change. • Documentation of authorization for cyber security patch implementation.
1.2	SCI identified independently supporting an Applicable System from Part 1.1.	Authorize changes to SCI configuration that:	Examples of evidence may include, but are not limited to:

CIP-010-5 Table R1 – Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
		1.2.1. Controls sharing of CPU or memory between systems with different impact ratings, including non-CIP Systems, hosted on SCI; and 1.2.2. Enforces an ESP between systems with different impact ratings, including non-CIP Systems, hosted on SCI.	• Documentation of authorization for changes to configuration of host affinity control between systems with different impact ratings; • Documentation of authorization for changes to policies or configurations for an ESP between systems with different impact ratings.
1.3	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	For each change to the items listed in Part 1.1: 1.3.1. Prior to the change, except during CIP Exceptional Circumstances, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.3.2. Following the change, verify that required cyber security controls determined in 1.3.1 are not adversely affected; and 1.3.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.
1.4	High Impact BCS SCI identified independently supporting an Applicable System above	For each change to the items listed in Part 1.1 or Part 1.2, per system capability:	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with

CIP-010-5 Table R1 – Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
		1.4.1. Prior to implementing any change in the production environment, except during a CIP Exceptional Circumstance, test the changes in a test environment that minimizes differences with the production environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.4.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including the date of the test.
1.5	High Impact BCS and their associated: 1. EACMS; and 2. PACS Medium Impact BCS and their associated:	Prior to a change associated with Parts 1.1.1 and 1.1.2 and when the method to do so is available to the Responsible Entity from the software source: 1.5.1. Verify the identity of the	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed prior to the baseline

CIP-010-5 Table R1 – Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PACS SCI identified independently supporting an Applicable System above Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.5: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	software source; and 1.5.2. Verify the integrity of the software obtained from the software source.	change or a process which documents the mechanisms in place that would automatically ensure the identity of the software source and integrity of the software.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-5 Table R2 – Change Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R2 – Change Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R2 – Change Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Monitor at least once every 35 calendar days for unauthorized changes to the items listed in Requirement R1, Part 1.1. and Part 1.2. Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-5 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-5 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	Applicable Systems	Requirements	Measures
3.2	High Impact BES Cyber Systems SCI identified independently supporting an Applicable System above	At least once every 36 calendar months, per system capability: 3.2.1 Perform an active vulnerability assessment in a test environment that minimizes differences with the production environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BCS and their associated: 1. EACMS; and 2. PCA SCI identified independently supporting an Applicable System above	Prior to becoming a new Applicable System, perform an active vulnerability assessment of the new Applicable System, except for: • like replacements of the same type of Cyber System with a configuration of the previous or other existing Cyber System; or • CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to: • The output of any tools used to perform the assessment, or • Reports from automated assessment and remediation mechanisms (remediation VLANs, quarantine systems, 802.1x mechanisms that assess and remediate, etc.) that documents the date of the assessment performed prior to becoming a new Applicable System.

CIP-010-5 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.4	High Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BCS and their associated: 1. EACMS; 2. PACS; and 3. PCA SCI identified independently supporting an Applicable System above	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to: • Reports or logs from SCI mechanisms and remediation of VCAs at instantiation; or • Documention listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets (TCA) and Removable Media that include the sections in Attachment 1, except for use on low impact BCS or SCI supporting only low impact BCS(s). *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for TCAs and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for TCAs and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use TCAs or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use TCAs or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. **Compliance Enforcement Authority:** “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. **Evidence Retention:** The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- Each applicable entity shall retain evidence of each requirement in this standard for three calendar years.
- If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity has documented and implemented a change authorization process(es) that includes only four or more of the required items listed in 1.1.1 through 1.1.4. (Requirement R1 Part 1.1)	The Responsible Entity has documented and implemented a change authorization process(es) that includes only three of the required items listed in 1.1.1 through 1.1.4. (Requirement R1 Part 1.1)	The Responsible Entity has documented and implemented a change authorization process(es) that includes only two of the required items listed in 1.1.1 through 1.1.4. (Requirement R1 Part 1.1) OR The Responsible Entity has documented and implemented a change authorization process(es) that includes only one of the required items listed in 1.2.1 through 1.2.2. (Requirement R1 Part 1.2) OR The Responsible Entity has a process as specified in Part 1.5 to verify the identity of the software source (1.5.1) but does not have a process as specified in Part 1.5 to verify the integrity of the software provided by the	The Responsible Entity has not documented or implemented any change authorization process(es). (Requirement R1) OR The Responsible Entity has documented and implemented a change authorization process(es) that includes only one of the required items listed in 1.1.1 through 1.1.4. (Requirement R1 Part 1.1) OR The Responsible Entity does not have a change authorization process(es) that requires authorization of changes to items listed in 1.1.1-1.1.4. (Requirement R1 Part 1.1) OR The Responsible Entity does not have a change
